 - v. C612: Specification for Mineral Fiber Block and Board Thermal Insulation.

- w. C755: Standard Practice for Selection of Water Vapor Retarders for Thermal Insulation.
 - x. C795: Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel.
 - y. C916: Standard Specification for Adhesives for Duct Thermal Insulation.
 - z. C921: Practice for Determining Properties of Jacketing Materials for Thermal Insulation.
 - aa. C1071: Standard Specification for Thermal and Acoustical Insulation.
 - bb. C1104: Standard Test Method for Determining the Water Vapor Sorption of Unfaced Mineral Fiber Insulation.
 - cc. C1136: Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation.
 - dd. C1338: Standard Test Method for Determining Fungi Resistance of Insulation Materials and Facings.
 - ee. C1393: Standard Specification for Perpendicularly Oriented Mineral Fiber Roll and Sheet Thermal Insulation for Pipes and Tanks.
 - ff. C1617-05: Standard Practice for Quantitative Accelerated Laboratory Evaluation of Extraction Solutions Containing Ions Leached from Thermal Insulation on Aqueous Corrosion of Metals
 - gg. E84: Test Method for Surface Burning Characteristics of Building Materials.
 - hh. E119: Test for Fire Resistance.
 - ii. G21: Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.
 - jj. G22: Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Bacteria.
- 2. American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE): Provide and install pipe and duct insulation in accordance with the following ASHRAE Standard:
 - a. 90: Energy Conservation in New Building Design.
 - 3. National Fire Protection Association (NFPA): Manufacture insulation in accordance with the following NFPA standards:
 - a. 255: Test Methods, Surface Burning Characteristics of Building Materials.
- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
 - C. Do not provide materials with flame proofing treatments subject to deterioration due to the effects of moisture or high humidity.

- D. Flame/Smoke Rating: Provide composite mechanical insulation (insulation, jackets, coverings, sealers, mastics and adhesives) with flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E84 (NFPA 255) Method where installed in a return air plenum or in a ventilation intake or mechanical room. In addition, the products, when tested, shall not drip flame particles, and flame shall not be progressive. Provide Underwriters Laboratories, Inc., label or listing; or satisfactory certified test report from an approved testing laboratory to prove the fire hazard ratings for materials proposed for use do not exceed those specified.
- E. Corrosiveness: Passes ASTM C1617-05, Standard Practice for Quantitative Accelerated Laboratory Evaluation of Extraction Solutions Containing Ions Leached from Thermal Insulation on Aqueous Corrosion of Metals.
- F. Insulation thickness shall be the greater standard of that specified here or the State energy conservation requirements.
- G. Sustainable Project Requirements:
 - 1. Formaldehyde Free: Third party certified with UL Environment or Scientific Certification Systems (SCS) Validation.
 - 2. Biosoluble: As determined by research conducted by the International Agency for Research on Cancer (IARC) and supported by revised reports from the National Toxicology Program (NTP) and the California Office of Environmental Health Hazard Assessment. Certified by European Certification Board for Mineral Wool Products (EUCEB).
 - 3. Low Emitting Materials: For all thermal and acoustical applications of Glass Mineral Wool Insulation Products, provide materials complying with the testing and products requirements of GREENGUARD Certification.

1.07 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of mechanical insulation. Submit schedule showing manufacturer's product number, K-value, thickness, and furnished accessories for each mechanical system requiring insulation.
- B. Products containing the following prohibited chemicals for use as flame retardants or for other purposes will not be acceptable when present in quantities greater than 0.1% by mass. Provide a statement with the submittal indicating that no product submitted contains an amount equal to or greater than 0.10% by mass of the following chemicals:
 - 1. Pentabrominated diphenyl ether (CAS#32534-81-9).
 - 2. Octabrominated diphenyl ether (CAS#32536-52-0).
 - 3. Decabrominated diphenyl ether (CAS#1163-19-50).
- C. TT. Maintenance Data: Submit maintenance data and replacement material lists for each type of mechanical insulation. Include this data and product in maintenance manual.

1.08 LEED ACTION SUBMITTALS:

- A. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.

- B. Product Data for Credit MR 5 Regional Materials: For products and materials to comply with requirements for regional materials, provide documentation indicating location of product or material, manufacturing location and the point of extraction, harvest or recovery for each raw material. Include distance to Project, contractor cost for each regional material, and percent by weight that is considered regional.
 - C. LEED v 4, Product Data for Credit EA 2: For products and materials significant to the energy performance of a structure, provide documentation that indicates that insulation levels are significant to increasing the level of energy performance beyond the prerequisite standard.
 - D. LEED v 4, Product Data for Credit MR 2: For products and materials to comply with Building Product Disclosure & Optimization, provide data/evidence that substantiates Environmental Product Declaration and Multi Attribute Optimization requirements.
 - E. LEED v 4: Product Data for Credit MR 3: For products and materials to comply with requirements for regional materials, provide documentation indicating location of product or material, manufacturing location and the point of extraction, harvest or recovery for each raw material. Include distance to Project, contractor cost for each regional material, and percent by weight that is considered regional.
 - F. LEED v 4, Product Data for Credit MR 4: For products having recycled content documentation; indicating percentages by weight of post-consumer and pre-consumer recycled content. Include statement indicating cost for each product having recycled content.
 - G. LEED v 4, Product Data for Credit EQ 2: For products and materials to comply with low emittance standards, provide documentation substantiating that insulation products comply with requisite low emittance standards.
 - H. LEED v 4, Product Data for Credit EQ 5: For products and materials to meet the standard for both thermal comfort design and thermal comfort control, provide data to support that insulation products are significant to thermal comfort design and thermal comfort control.
 - I. LEED v 4, Product Data for Credit EQ 9: For products and materials that contribute to the design and performance of workspaces that promote occupant's well-being, productivity, and communication, provide data/documentation supporting acoustical benefits of Glass Mineral Wool insulation products.
 - J. Laboratory Test Reports for Credit IEQ 4: For adhesives and sealants, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- 1.09 DELIVERY, STORAGE, AND HANDLING
- A. Deliver insulation, coverings, cements, adhesives, and coating to the site in containers with manufacturer's stamp or label affixed showing fire hazard indexes of products.
 - B. Store and protect insulation against dirt, water, chemical, and mechanical damage. Do not install damaged or wet insulation; remove from project site.
- 1.10 WARRANTY
- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.

- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 GENERAL REQUIREMENTS

- A. Comply with requirements in "Part 3, Table 1: Piping Services, Fluid Temperature, and Insulation Type Required" for application of insulating materials. Products shall not contain asbestos, lead, mercury or mercury compounds if possible. Products shall meet UL GREENGUARD certification standards for low-emitting products.
- B. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C795.
- C. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- D. Each insulation material has been provided a descriptive key code, such as PI-A, to simplify the organization and application of materials in following sub-sections.
- E. Thickness of insulation is based on meeting or exceeding the minimum requirement of applicable energy code and/or maximum allowable external temperature in relation to adjacent combustible material or other equipment. Exterior surface temperature shall not exceed 140°F at maximum operating capacity except as noted below for generator applications.
- F. Acceptable manufacturers include Knauf Insulation, Johns Manville, Owens-Corning, Armstrong, Pittsburgh-Corning, Trymer, IIG, Certainteed, Halstead, Rubatex, 3M FireMaster, Pabco, Aeroflex, Armacell, Reflectix, Pacor or equal. Manufacturer and insulation types listed below indicate a minimum acceptable level of quality required for each product classification.

2.02 PIPE INSULATIONS (IDENTIFIED BY KEY CODE PI BELOW AND IN TABLE 1)

- A. PI-A, Preformed Mineral Wool or Fiberglass:
 - 1. Materials: Mineral wool or fiberglass bonded with a thermosetting resin. Product to be validated GREENGUARD Gold for low VOC's. In addition, pipe insulation to have a validated EPD from UL Environment or Scientific Certification Systems.
 - 2. Applications: Insulation of piping and fittings with thickness as required by local energy code.
 - 3. Compliant with ASTM C335, C356, C411, C447, C547, C585, C795, C1045, C1104 E96, and E84.
 - 4. Compliant with ASTM C547 Type I, 850°F (454°C) or Type IV, 1000°F (538°C).
 - 5. Thermal conductivity (K-value): 0.24 Btu•in./(hr•ft²•°F) or less, at 100°F (38°C).
 - 6. Service Temperature Range: 0°F to 850°F (-18°C to 454°C).
 - 7. Water Vapor Absorption, % of volume: <5% (maximum) as tested per ASTM C1104.
 - 8. Vapor Retarder Jacket: Factory applied ASJ or ASJ+ with SSL, white kraft paper interleaving reinforced with glass fiber scrim yarn and bonded to aluminum foil, secure with self-sealing longitudinal laps and butt strips.
 - 9. Nominal density is 2.5 lbs./cu. ft., greater.

10. Surface Burning Characteristics: Flame Spread Index ≤ 25 and Smoke Developed Index ≤ 50 ratings as tested per ASTM E84.
 11. Manufacturers: Knauf #ECOSE Earthwool 1000°, Johns Manville #Micro-Lok or #Micro-Lok, Owens Corning, CertainTeed, Manson or equal.
- B. PI-B, Flexible Closed-Cell Elastomeric, Neoprene or Polyethylene:
1. Applications: Insulation of piping and fittings with thickness as required by local energy code.
 2. Compliant with UL 181, ASTM C411, C518, C534, G21/C1338, G22, D1056 and E84.
 3. Service Temperature Range: -297°F to 220°F (-183°C to 105°C).
 4. Thermal conductivity (K-value): $0.28 \text{ Btu}\cdot\text{in.}/(\text{hr}\cdot\text{ft}^2\cdot^{\circ}\text{F})$ or less, at 75°F (24°C).
 5. Water Vapor Absorption, % of volume: $<0.2\%$ (maximum) compliant with ASTM C209.
 6. Nominal density is 2.5 lbs./cu. ft. or greater.
 7. Surface Burning Characteristics: Flame Spread Index ≤ 25 and Smoke Developed Index ≤ 50 ratings as tested per ASTM E84.
 8. Seal all seams and joints with contact adhesive or factory self-seal system with lap seal tape.
 9. Manufacturers: Armacell #AP Armaflex, Rubatex #K-Flex ECO, Aeroflex #Aerocel or equal.
- C. PI-C, Rigid Closed-Cell Phenolic Foam:
1. Applications: Insulation of piping and fittings with thickness as required by local energy code.
 2. Compliant with ASTM C209, C518, C795, C1126, D1621, D1622, D2856, D6226 and E84.
 3. Service Temperature Range: -290°F to 250°F (-178°C to 121°C).
 4. Thermal conductivity (K-value): $0.18 \text{ Btu}\cdot\text{in.}/(\text{hr}\cdot\text{ft}^2\cdot^{\circ}\text{F})$ or less, at 75°F (24°C).
 5. Vapor Retarder Jacket – straight sections: Factory applied ASJ with SSL.
 6. Water Vapor Absorption, % of volume: $<0.87\%$ (maximum) as tested per ASTM C209.
 7. Nominal density is 2.5 lbs./cu. ft. or greater.
 8. Surface Burning Characteristics: Flame Spread Index ≤ 25 and Smoke Developed Index ≤ 50 ratings as tested per ASTM E84.
 9. Manufacturers: ITW Trymer #Supercel, Kingspan #Koolphen K, Resolco #Insul-phen or equal.
- D. PI-D, Rigid Closed-Cell Polyisocyanurate Foam:
1. Applications: Rigid preformed insulation of piping, fittings, vessels, and equipment with thickness as required by local energy code. Not for use in return air plenums or ventilation ductworks.
 2. Compliant with ASTM C272, C591, C755, C1136, C920, D6226, E96, and E84.
 3. Service Temperature Range: -297°F to 300°F (-183°C to 149°C).
 4. Thermal conductivity (K-value): $0.19 \text{ Btu}\cdot\text{in.}/(\text{hr}\cdot\text{ft}^2\cdot^{\circ}\text{F})$ or less, at 75°F (24°C).
 5. Water Absorption, % of volume: 0.7 (maximum) as tested per ASTM C272.

6. Vapor Retarder Jacket: Saran 540/SSL or Mylar laminate.
 7. Nominal density is 2 lbs./cu. ft. or greater.
 8. Surface Burning Characteristics: Flame Spread Index ≤ 25 and Smoke Developed Index ≤ 450 ratings as tested per ASTM E84. Not compliant for use in return air plenums.
 9. Manufacturers: Trymer #2000 XP, Dyplast #ISO, HiTherm or equal.
- E. PI-E, Rigid Preformed Hydrous Calcium Silicate:
1. Applications: High temperature insulation for piping and equipment and for placement at piping hangers and supports.
 2. Compliant with ASTM C165, C302, C356, C447, C533, C665, C1338 and E84.
 3. Maximum Service Temperature: 1200°F (650°C).
 4. Thermal conductivity (K-value): 0.389 Btu•in./(hr•ft²•°F) or less, at 200°F (93°C).
 5. Nominal density is 14 lbs./cu. ft. or greater.
 6. Compressive Strength (block): Minimum of 100 psi to produce 5% compression as tested per ASTM C165.
 7. Surface Burning Characteristics: Flame Spread Index =0 and Smoke Developed Index =0 ratings as tested per ASTM E84.
 8. Tie Wire: 16-gauge stainless steel with twisted ends on maximum 12" centers.
 9. Product must contain corrosion inhibiting chemistry.
 10. Manufacturers: Johns Manville Industrial Insulation Group #Thermo-12 Gold or equal.
- F. PI-F, Rigid Closed-Cell Cellular Glass:
1. Applications: Rigid closed cell glass impermeable to water and water vapor for insulating buried piping, as well as traditional application on other piping and equipment.
 2. Compliant with ASTM C165, C240, C303, C450, C552, C585, E136, E1461, and E84.
 3. Service Temperature Range: -450°F to 900°F (-268°C to 482°C).
 4. Thermal conductivity (K-value): 0.29 Btu•in./(hr•ft²•°F) or less, at 75°F (24°C).
 5. Water Vapor Absorption, % of volume: <0.2% (maximum) compliant with ASTM C240.
 6. Nominal density is 8 lbs./cu. ft. or greater.
 7. Compressive Strength (block): Minimum of 90 psi to produce 5% compression as tested per ASTM C165.
 8. Surface Burning Characteristics: Flame Spread Index =0 and Smoke Developed Index =0 ratings as tested per ASTM E84.
 9. Manufacturer: Pittsburgh-Corning #Foamglas One or equal.
- G. PI-G, Flexible Low Temperature Aerogel (Cold Fluid Piping and Equipment):
1. Applications: High performance flexible insulation for specialty insulation of low temperature piping and equipment with reduced available space or where higher thermal performance is required.
 2. Compliant with ASTM C1728, C165, C1101/1101M, C1104/1104M, C1336, C1617, C1763 and E84.
 3. Service Temperature Range: -200°F to 200°F (-129°C to 93°C).

4. Thermal conductivity (K-value): 0.12 Btu•in./(hr•ft²•°F), or less, at 75°F (24°C).
 5. Water Vapor Absorption, % of volume: ≤5% (maximum) as tested per ASTM C1104compliant with ASTM C240.
 6. Nominal density is 10 lbs./cu. ft. or greater.
 7. Compressive Strength: ≥ 5 psi to produce 10% compression as tested per ASTM C165.
 8. Surface Burning Characteristics: Flame Spread Index ≤25 and Smoke Developed Index ≤50 ratings as tested per ASTM E84.
 9. Manufacturer: Pacor #Cryogel X201 or equal.
- H. PI-H, Flexible High Temperature Aerogel (Hot Fluid Piping and Equipment):
1. Applications: High performance flexible insulation for specialty insulation of high temperature piping and equipment with reduced available space or where higher thermal performance is required.
 2. Compliant with ASTM C177, C1728, C165, C1101/1101M, C1104/1104M, C1336, C1617, C1763, and E84.
 3. Service Temperature Range: 32°F to 482°F (0°C to 250°C).
 4. Thermal conductivity (K-value): 0.12 Btu•in./(hr•ft²•°F), or less, at 212°F (100°C).
 5. Water Vapor Absorption, % of volume: ≤5% (maximum) as tested per ASTM C1104compliant with ASTM C240.
 6. Nominal density is 10 lbs./cu. ft. or greater.
 7. Compressive Strength: ≥ 5 psi to produce 10% compression as tested per ASTM C165.
 8. Surface Burning Characteristics: Flame Spread Index ≤5 and Smoke Developed Index ≤10 ratings as tested per ASTM E84.
 9. Manufacturer: Pacor #Pryogel 2250.
- I. PI-I, Flexible Extreme High Temperature Aerogel (High Temperature Exhaust Piping and Equipment):
1. Applications: High performance flexible insulation for specialty insulation of extreme high temperature piping and equipment with reduced available space or where higher thermal performance is required.
 2. Compliant with ASTM C177, C1728, C165, C1101/1101M, C1104/1104M, C1336, C1617, C1763, and E84.
 3. Service Temperature Range: 32°F to 1200°F (0°C to 650°C).
 4. Thermal conductivity (K-value): 0.16 Btu•in./(hr•ft²•°F), or less, at 212°F (100°C).
 5. Water Vapor Absorption, % of volume: ≤5% (maximum) as tested per ASTM C1104compliant with ASTM C240.
 6. Nominal density is 12.5 lbs./cu. ft. or greater.
 7. Compressive Strength: ≥ 5 psi to produce 10% compression as tested per ASTM C165.
 8. Surface Burning Characteristics: Flame Spread Index ≤5 and Smoke Developed Index ≤10 ratings as tested per ASTM E84.
 9. Manufacturer: Pacor #Pryogel XTE.

2.03 FACTORY-APPLIED JACKETS

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
 2. ASJ+: White, polypropylene-coated, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
 3. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
 4. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
 5. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C 1136, Type II.
 6. Vinyl Jacket: White vinyl with a permeance of 1.3 perms (0.86 metric perm) when tested according to ASTM E 96/E 96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.04 JACKETING MATERIALS

- A. Field Applied Jackets (For Indoor Applications):
1. All longitudinal seams shall be located on bottom of pipes.
 2. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.
 3. PVC Plastic:
 - a. High-impact-resistant, UV-resistant PVC as tested per ASTM C553, C547, C665, C795, C1338, D1784, E96, C1136 and D3679.
 - b. One piece molded type fitting covers and jacketing material.
 - c. Adhesive: As recommended by jacket material manufacturer.
 - d. Color: White.
 - e. Thickness: 20 mil (0.5 mm), minimum.
 - f. Service Temperature Range: 0°F to 150°F (-18°C to 66°C).
 - g. Surface Burning Characteristics: Flame Spread Index ≤25 and Smoke Developed Index ≤50 ratings as tested per ASTM E84.
 - h. Manufacturers: Johns Manville #Zeston 2000, Proto #LoSmoke or equal by PIC Plastics, Proto Corporation, Speedline Corporation or equal.
 4. Aluminum Jacket:
 - a. Comply with ASTM B209/B209M.
 - b. Aluminum alloy 3003, 3005, 3105 or 5005 with an H-14 temper.
 - c. Thickness: 0.016" thick sheet (minimum).
 - d. Finish: Smooth or stucco embossed
 - e. Moisture Barrier: 3 mil thick polysurlyn or 3 mil thick polyethylene.
 - f. Longitudinal slip joints and 2" laps, die shaped fitting covers with factory attached protective liner. Secure with 3/8" or 1/2" stainless steel bands on 12" centers.
 - g. Surface Burning Characteristics: Flame Spread Index ≤25 and Smoke Developed Index ≤50 ratings as tested per ASTM E84.

- h. Manufacturers: Pabco, Childers, RPR, ITW or equal.
- 5. Canvas Jacket:
 - a. Cotton or fiberglass cloth.
 - b. UL listed fabric treated with dilute fire retardant.
 - c. Lagging adhesive per manufacturer.
 - d. Manufacturers: GJC General, GLT Products, Foster #Mast-A-Fab, Childers #Chil-Glas No. 5 or equal.
- B. Field Applied Jackets (For Outdoor Applications): All longitudinal seams, on horizontal pipe runs, shall be installed on the bottom of pipes.
- 1. Secure stainless steel or aluminum jackets with 3/8" or 1/2" stainless steel bands on 12" centers and at each joint.
 - 2. PVC Jacket: Not allowed for outdoor applications.
 - 3. Canvas Jacket: Not allowed for outdoor applications.
 - 4. Aluminum Jacket:
 - a. Comply with ASTM B209/B209M.
 - b. Aluminum alloy 3003, 3005, 3105 or 5005 with an H-14 temper.
 - c. Thickness: 0.016" thick sheet (minimum).
 - d. Finish: Smooth, stucco embossed or corrugated surface.
 - e. Color: White with surface emittance of 0.8, or greater, per ASTM C1371 for piping and equipment exposed to sunlight.
 - f. Moisture Barrier: 3 mil thick polysurlyn or 3 mil thick polyethylene.
 - g. Longitudinal slip joints and 2" laps, die shaped fitting covers with factory attached protective liner. Secure with 3/8" or 1/2" stainless steel bands on 12" centers.
 - h. Manufacturers: Pabco, Childers, RPR, ITW or equal.
 - 5. Self-Adhesive Aluminum Jacket:
 - a. Comply with ASTM D774, C1338, C1371, E96 and D882.
 - b. Thickness: 56 mils (minimum).
 - c. Multi-ply UV-resistant aluminum foil/polymer laminated vapor barrier and waterproofing membrane for installation over insulation located aboveground outdoors; consisting of a rubberized bituminous resin on a cross-laminated polyethylene film covered with stucco-embossed aluminum-foil facing.
 - d. Color: White with surface emittance of 0.8, or greater, per ASTM C1371 for piping and equipment exposed to sunlight.
 - e. Weight: 0.3 lbs./sf, minimum.
 - f. Service Temperature Range: -15°F to 160°F (-26°C to 71°C).
 - g. Manufacturer: Polyguard Products #Alumaguard or equal.
 - 6. Stainless Steel Jacket:
 - a. Comply with ASTM A240 and A666.
 - b. Stainless steel alloy T-304 or T-316. T-316 shall be used in corrosive environments including close proximity to coast.

- c. Thickness: 0.016" thick sheet (minimum).
 - d. Dull Finish: Smooth, stucco embossed or corrugated surface.
 - e. Color: White with surface emittance of 0.8, or greater, per ASTM C1371 for piping and equipment exposed to sunlight.
 - f. Moisture Barrier: 3 mil thick polysurlyn or 3 mil thick polyethylene.
 - g. Longitudinal slip joints and 2" laps, die shaped fitting covers with factory attached protective liner. Secure with 3/8" or 1/2" stainless steel bands on 12" centers.
 - h. Manufacturers: Pabco, Childers, RPR, ITW or equal.
- C. S. Removable Covers:
- 1. Provide removable covers on indoor pumps, valves, air separators, air vent fittings, flanges, strainers, traps, etc., where periodic maintenance or removal of insulation is required.
 - a. Pre-molded insulation covers:
 - 1) Cold Systems: Provide PVC covers over insulated elbows, fittings and flanges.
 - 2) Cold Systems: Provide flexible closed cell foam or removable cloth insulating blankets for valves, pumps and strainers.
 - 3) Hot Systems: Provide PVC covers over insulated elbows, fittings and flanges.
 - 4) Hot Systems: Provide removable cloth insulating blankets on valves, pumps, and strainers.
 - b. Removable cloth insulating blankets:
 - 1) Service Operating Temperature: 0-350°F.
 - 2) Jacket and Liner: silicon or teflon impregnated mineral wool cloth.
 - 3) Liner Reinforcement: stainless steel mesh cloth.
 - 4) Insulation: Fiberglass matt or Pacor #Aerogel, 2" thick (minimum) or R-8 equivalent (minimum), and thicker as required by local energy code.
 - 5) Fastening: 2" Nomex Velcro or 1" straps and stainless steel D-rings or 12-gage stainless steel hooks and stainless steel wire.
 - 6) Thread: Kevlar/stainless steel thread.
 - 7) Outdoor Applications: Jacket shall be UV and ozone resistant with Velcro attachment.
 - 8) Manufacturers: Thermal Energy Products, Coverflex, Thermaxx, Pacor, Unitherm, Advance Thermal, Fit Tight Covers, Alpha or equal.

2.05 ADHESIVES

- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. Calcium Silicate Adhesive:
 - 1. Fibrous, sodium-silicate-based adhesive with a service temperature range of 50 to 1200°F (10 to 649°C).

2. For indoor applications, adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 3. Manufacturers: Childers Brand #CP-97, Johns Manville #CalBond Gold, Marathon Industries #290, Foster Brand #81-27, Mon-Eco Industries #22-30, Vimasco Corporation #760 or equal.
- C. Cellular-Glass Adhesive:
1. Two-component, thermosetting urethane adhesive containing no flammable solvents, with a service temperature range of minus 100 to plus 200°F (minus 73 to plus 93°C).
 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 3. Manufacturers: Foster Brand #81-84 or equal.
- D. Phenolic and Polyisocyanurate Adhesive:
1. Solvent-based resin adhesive, with a service temperature range of minus 75 to plus 300°F (minus 59 to plus 149°C).
 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 3. Manufacturers: Childers Brand #CP-96, Foster Brand #81-33 or equal.
- E. Flexible Elastomeric and Polyolefin Adhesive:
1. Comply with MIL-A-24179A, Type II, Class I.
 2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 3. Manufacturers: Armaflex #520 Adhesive, Foster Brand #85-75, K-Flex USA #R-373, Aeroflex USA, Aeroseal, Armacell, or equal.
- F. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
1. For indoor applications, adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Manufacturers: Childers Brand #CP-127, Eagle Bridges - Marathon Industries #225, Foster Brand #85-60/85-70, Mon-Eco Industries, Inc.#22-25 or equal.
- G. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Manufacturers: Childers Brand #CP-82, Eagle Bridges - Marathon Industries #225, Foster Brand #85-50, Mon-Eco Industries, Inc.#22-25 or equal.
- H. PVC Jacket Adhesive: Compatible with PVC jacket.
1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 2. Manufacturers: Dow Corning Corporation #739, Dow Silicone, Johns Manville #Zeston Perma-Weld, CEEL-TITE #Solvent Welding Adhesive, P.I.C. Plastics, Inc. #Welding Adhesive, Speedline Corporation #Polyco VP Adhesive or equal.

2.06 MASTICS

- A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-PRF-19565C, Type II.
1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Vapor-Barrier Mastic: Water based for indoor use.
1. Water-Vapor Permeance: ASTM E 96/E 96M, Procedure B, 0.013 perm (0.009 metric perm) at 43-mil (1.09-mm) dry film thickness.
 2. Service Temperature Range: Minus 20 to plus 180°F (Minus 29 to plus 82°C).
 3. Vapor Safe Coating: Shall meet requirements of LEED IEQ Low-Emitting Materials. VOC 33 g/l, less water and exempt solvents.
 4. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
 5. Color: White.
 6. Manufacturers: Foster Brand #30-80/30-90, Vimasco Corporation #749 or equal.
- C. Vapor-Barrier Mastic: Solvent based for outdoor use.
1. Water-Vapor Permeance: ASTM F 1249, 0.05 perm (0.033 metric perm) at 30-mil (0.8-mm) dry film thickness.
 2. Service Temperature Range: Minus 50 to plus 220°F (Minus 46 to plus 104°C).
 3. Solids Content: ASTM D 1644, 33 percent by volume and 46 percent by weight.
 4. Color: White.
 5. Manufacturers: Childers Brand #Encacel X CP-40, Eagle Bridges - Marathon Industries #570, Foster Brand #60-95/60-96 or equal.
- D. Breather Mastic: Water based for indoor and outdoor use.
1. Water-Vapor Permeance: ASTM F 1249, 1.8 perms (1.2 metric perms) at 0.0625-inch (1.6-mm) dry film thickness.
 2. Service Temperature Range: Minus 20 to plus 180°F (Minus 29 to plus 82°C).
 3. Solids Content: 60 percent by volume and 66 percent by weight.
 4. Color: White.
 5. Manufacturers: Childers Brand #CP-10/CP-11, Eagle Bridges - Marathon Industries #550, Foster Brand #46-50, Mon-Eco Industries, Inc. #55-50, Vimasco Corporation #WC-1/WC-5 or equal.

2.07 LAGGING ADHESIVES

- A. Adhesives shall be compatible with insulation materials, jackets, and substrates.
1. Comply with MIL-A-3316C, Class I, Grade.
 2. For indoor applications, use lagging adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 3. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over duct insulation.
 4. Service Temperature Range: 0 to 180°F (-18 to 82°C).

5. Color: White.
6. Manufacturers: Childers Brand #CP-50 AHV2, Foster Brand #30-36, Vimasco Corporation #713/714 or equal.

2.08 SEALANTS

A. Joint Sealants:

1. Joint Sealants for Cellular-Glass, Phenolic, and Polyisocyanurate.
 - a. Manufacturers: Childers Brand #CP-76, Marathon Industries#405, Foster Brand #30-45, Mon-Eco Industries, Inc.#44-05, Pittsburgh Corning Corporation #Pittseal 444 or equal.
2. Joint Sealants for Polystyrene.
 - a. Manufacturers: Childers Brand #CP-70, Marathon Industries #405, Foster Brand #30-45, Mon-Eco Industries, Inc.#44-05 or equal.
3. Materials shall be compatible with insulation materials, jackets, and substrates.
4. Permanently flexible, elastomeric sealant.
5. Service Temperature Range: -100 to 300°F (-73 to 149°C).
6. Color: White or gray.
7. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24). Shall be compliant with requirements of LEED IEQ Low-Emitting Materials.

B. FSK and Metal Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250°F (Minus 40 to plus 121°C).
4. Color: Aluminum.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
6. Manufacturers: Childers Brand #CP-76, Eagle Bridges - Marathon Industries #405, Foster Brand #95-44, Mon-Eco Industries, Inc. #44-05 or equal.

C. ASJ Flashing Sealants, and Vinyl and PVC Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250°F (Minus 40 to plus 121°C).
4. Color: White.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
6. Manufacturers: Childers Brand #CP-76 or equal.

2.09 TAPES

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
1. Width: 3 inches (75 mm).
 2. Thickness: 11.5 mils (0.29 mm).
 3. Adhesion: 90 ounces force/inch (1.0 N/mm) in width.
 4. Elongation: 2 percent.
 5. Tensile Strength: 40 lbf/inch (7.2 N/mm) in width.
 6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
 7. Manufacturers: ABI, Ideal Tape Division #428 AWF ASJ, Avery Dennison Corporation #Fasson 0836, Compac Corporation #105, 3M Venture Tape #1540 CW Plus/1542 CW Plus/1542 CW Plus/SQ or equal.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Width: 3 inches (75 mm).
 2. Thickness: 6.5 mils (0.16 mm).
 3. Adhesion: 90 ounces force/inch (1.0 N/mm) in width.
 4. Elongation: 2 percent.
 5. Tensile Strength: 40 lbf/inch (7.2 N/mm) in width.
 6. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
 7. Manufacturers: ABI Tape #491 AWF FSK, Avery Dennison Corporation #Fasson 0827, Compac Corporation #110 and 111, 3M Venture Tape #1525 CW NT/1528 CW/1528 CW/SQ or equal.
- C. LL. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
1. Width: 2 inches (50 mm).
 2. Thickness: 6 mils (0.15 mm).
 3. Adhesion: 64 ounces force/inch (0.7 N/mm) in width.
 4. Elongation: 500 percent.
 5. Tensile Strength: 18 lbf/inch (3.3 N/mm) in width.
 6. Manufacturers: ABI Tape #370 White PVC tape, Compac Corporation #130, Venture Tape #1506 CW NS or equal.
- D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Width: 2 inches (50 mm).
 2. Thickness: 3.7 mils (0.093 mm).
 3. Adhesion: 100 ounces force/inch (1.1 N/mm) in width.
 4. Elongation: 5 percent.
 5. Tensile Strength: 34 lbf/inch (6.2 N/mm) in width.
 6. Manufacturers: ABI Tape #488 AWF, Avery Dennison Corporation #Fasson 0800, Compac Corporation #120, 3M Venture Tape #3520 CW or equal.

2.10 SECUREMENTS

A. Bands:

1. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type 304, 0.020 inch (0.50 mm) thick, 1/2 inch (13 mm) or 3/4 inch (19 mm) wide with wing seal.
2. Aluminum: ASTM B 209 (ASTM B 209M), Alloy 3003, 3005, 3105 or 5005; Temper H-14, 0.020 inch (0.51 mm) thick, 1/2 inch (13 mm) or 3/4 inch (19 mm) wide with wing seal. Springs: Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application. Manufacturers: ITW Insulation Systems, Gerrard Strapping and Seals, RPR Products, Inc., Insul-Mate Strapping, Seals, and Springs or equal.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- (2.6-mm-) diameter shank, length to suit depth of insulation indicated.
 - a. Manufacturers: AGM Industries #CWP-1, GEMCO #CD, Midwest Fasteners #CD, Nelson Stud Welding #TPA/TPC/TPS or equal.
2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- (2.6-mm-) diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch (38-mm) galvanized carbon-steel washer.
 - a. Manufacturers: AGM Industries #CHP-1, GEMCO #Cupped Head Weld Pin, Midwest Fasteners #Cupped Head, Nelson Stud Welding #CHP or equal.
3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch (0.76 mm) thick by 2 inches (50 mm) square.
 - b. Spindle: Copper- or zinc-coated, low-carbon steel, Aluminum or Stainless steel coordinated with application, fully annealed, 12 gauge, 0.106-inch- (2.6-mm-) diameter shank, length to suit depth of insulation indicated.
 - c. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
 - d. Manufacturers: AGM Industries, Inc. #Tactoo Perforated Base Insul-Hangers, GEMCO #Perforated Base, Midwest Fasteners, Inc. #Spindle or equal.
4. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Baseplate: Perforated, nylon sheet, 0.030 inch (0.76 mm) thick by 1-1/2 inches (38 mm) in diameter.
 - b. Spindle: Nylon, 0.106-inch- (2.6-mm-) diameter shank, length to suit depth of insulation indicated, up to 2-1/2 inches (63 mm).

- c. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
 - d. Manufacturers: GEMCO #Nylon Hangers, Midwest Fasteners, Inc.#Nylon Insulation Hangers or equal.
- 5. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Baseplate: Galvanized carbon-steel sheet, 0.030 inch (0.76 mm) thick by 2 inches (50 mm) square.
 - b. Spindle: Copper- or zinc-coated, low-carbon steel, Aluminum, Stainless steel, fully annealed, as coordinated with application. 12 gauge, 0.106-inch - (2.6-mm-) diameter shank, length to suit depth of insulation indicated.
 - c. Adhesive-backed base with a peel-off protective cover.
 - d. Manufacturers: AGM Industries, Inc. #Tactoo Self-Adhering Insul-Hangers, GEMCO #Peel & Press, Midwest Fasteners #Self Stick or equal.
- 6. Insulation-Retaining Washers: Self-locking washers formed from 0.015-inch- (0.41-mm-) thick, galvanized-steel, aluminum or stainless-steel sheet, as coordinated with application with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches (38 mm) in diameter.
 - a. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
 - b. Manufacturers: AGM Industries #RC-150, GEMCO #R-150, Midwest Fasteners #WA-150, Nelson Stud Welding #Speed Clips or equal.
- 7. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- (0.41-mm-) thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches (38 mm) in diameter.
 - a. Manufacturers: GEMCO, Midwest Fasteners, Inc or equal.
- C. Staples: Outward-clinching insulation staples, nominal 3/4-inch- (19-mm-) wide, stainless steel or Monel.
- D. Wire: 0.062-inch (1.6-mm) soft-annealed, stainless steel.
 - 1. Manufacturers: C & F Wire or equal.

2.11 ACOUSTICAL PIPE WRAP

- A. Acoustical pipe lagging for noisy pipes. Barrier material shall meet the sound transmission loss and physical properties performance requirements as follows:
 - 1. Vinyl noise barrier with reinforced foil facing on one side.
 - 2. Service Temperature Range: -40°F to 220°F (-40°C to 104°C).
 - 3. Nominal density: 2 lbs./sf or greater.
 - 4. Surface Burning Characteristics: Flame Spread Index ≤ 25 and Smoke Developed Index ≤ 450 ratings as tested per ASTM E84. Not compliant for use in return air plenums without metal jacket.
 - 5. Sound transmission class: 31

6. Sound Transmission Loss (dB) Table per ASTM E90:

dB Reduction at each Octave Band Center Frequency (Hz)						
125 hz	250 hz	500 hz	1000 hz	2000 hz	4000 hz	STC
16	22	26	32	35	40	31

7. Manufacturers: Sound Seal #B-20 LAG/QFA-9, Kinetics #KNM-100AL Series or equal.

PART 3 EXECUTION

3.01 EXAMINATION AND PREPARATION

- A. Verify that piping has been tested for leakage in accordance with specifications before applying insulation materials. All piping and ductwork shall be inspected by Owner's Representative prior to installation of insulation. Any insulation applied prior to inspection shall be removed and new insulation applied at no additional cost to Owner. Notify Owner's Representative five (5) working days prior to insulation installation.
- B. Verify that all surfaces are clean, dry and free of foreign material.

3.02 INSTALLATION

- A. General:
 1. Install materials in accordance with manufacturer's recommendations, building codes and industry standards.
 2. Remove and replace any insulation that has become wet or damaged during the construction process.
 3. Pipe fittings, valves, pipe flanges, pumps, strainers, gauge fittings, etc., shall be insulated to the same insulation thickness as adjoining piping and as required by local energy code.
- B. Piping Insulation:
 1. Locate insulation and cover seams in least visible locations unless otherwise specified.
 2. Neatly finish insulation at supports, protrusions, and interruptions.
 3. Provide vapor retardant jackets with self-sealing laps on insulated cold pipes conveying fluids below ambient temperature. Insulate complete system. Staples used on pipes conveying fluids below ambient temperatures (cold systems) must be covered with approved mastic.
 4. For insulated pipes conveying fluids above ambient temperature, secure jackets with self-sealing lap or outward clinched, expanded staples. Seal ends of insulation at equipment, flanges, and unions.
 5. Provide insert between support shield and piping on piping 1-1/2" diameter and larger. Fabricate insert using hydrous calcium silicate or other heavy density insulating material suitable for temperature and required insulation thickness. Insulation inserts shall not be less than the following lengths:
 - a. 1-1/2" to 2-1/2" pipe size: 10" long
 - b. 3" to 6" pipe size: 12" long
 - c. 8" to 10" pipe size: 16" long
 - d. 12" and over: 22" long
 6. Use of metal saddles is acceptable as specified in Section 230500. Fill interior voids with segments of insulation matching adjoining pipe insulation.
 7. Use of pipe hangers designed as an insulation coupling is acceptable in lieu of saddles and other devices.

8. For insulated pipe exposed in mechanical equipment rooms or in finished spaces below seven (7) feet above finished floor, cover insulation with PVC or metal jacketing.
9. Where pumps, valves (manual and control types), strainers, etc., with insulation require periodic opening for maintenance, repair or cleaning, install insulation in such a manner that it can be easily removed and replaced without damage.
 - a. Cold Systems: Provide elastomeric foam for pumps and strainers.
 - b. Hot Systems: Provide removable blanket covers on valves, pumps, and strainers.
10. For exterior applications:
 - a. Apply weather-resistant protective finish to flexible elastomeric insulation. Insulation seams shall be located on the bottom side of horizontal piping.
 - b. All lateral and longitudinal insulation joints to be sealed with low VOC, UV inhibitive adhesive.
 - c. Provide weather protection jacket over insulation. Insulated pipe lengths, pumps, fittings, joints, and valves shall be covered with aluminum jacket or stainless steel jacket. PVC or plastic jackets are not allowed exterior to the building. Jacket seams shall be located on bottom side of horizontal piping. All lateral jacket joints shall be caulked with a minimum 20-year silicone sealant (clear). All longitudinal jacket joints, except those at the bottom of a horizontal pipe run, shall be caulked with a minimum 20-year silicone sealant (clear).
11. For underground installations, install per manufacturer's written instructions and recommendations.
12. When maintenance or service access for equipment will result in foot traffic over floor mounted insulated piping the contractor is to fabricate a permanent removable walkway to prevent damage to the piping and insulation.
13. Special Application Requirements for Chilled Water Systems:
 - a. Non-factory vapor retarded piping and fittings: Spiral wrap insulation with vapor retarder tape. Cover with PVC jacket.
 - b. 90/45/tee fittings: Provide material routed out of bun stock to the shape of the elbow, cut in half and applied to the fitting and spiral wrapped with vapor retarder tape. Cover with PVC fitting cover.
 - c. Installation shall conform to insulation manufacturer's installation guide.
 - d. Longitudinal jacket laps for pipe insulation installed on piping systems with operating temperatures below ambient shall be vapor sealed with factory-applied pressure-sensitive adhesive vapor retarder, self-sealing lap. For proper sealing, firmly rub lap joints with reasonable pressure being applied with a plastic squeegee or sealing tool. Vapor seal all circumferential joints with factory-furnished, matching pressure-sensitive butt strips installed with reasonable pressure being applied with a plastic squeegee or sealing tool. Additionally, coat raw edges of pipe insulation sections with vapor retarder mastic at 12 foot to 21 foot intervals; at Engineer's discretion on straight piping, and on either side of all fittings, flanges or valves. Vapor retarder mastic shall completely coat the ends of the pipe and extend onto the bore of the pipe insulation and onto the jacketing a minimum of 2 inches.
 - e. Where pipe attachments or seismic supports are bolted or welded directly to the pipe provide insulation and vapor barrier around such metal support elements, that extend beyond the pipe insulation, as required to prevent condensation from forming on exposed metal and bolts.

14. Jacket Locations for Pipe, Valve and Fittings. Provide protective insulation jackets for the following locations where not defined elsewhere in the specifications for piping systems:

15.

Insulation Jacket Location	Jacket Material
Indoors: Concealed in Accessible Ceiling Voids.	None.
Indoors: Concealed in Inaccessible Ceiling Voids.	None.
Indoors: Concealed in Accessible Portions of Shafts or Chaseways.	None.
Indoors: Concealed in Inaccessible Portions of Shafts or Chaseways.	None.
Indoors: Mechanical Rooms.	PVC or Aluminum or Stainless Steel to seven (7) feet AFF.
Indoors: Exposed to view in normally occupied spaces such offices, conference rooms, restaurants and retail spaces.	PVC.
Indoors: Exposed to view in warehouse, storage and manufacturing spaces.	None.
Outdoors: Exposed to weather.	Aluminum or stainless steel with white coating for low emissivity.
Outdoors: Exposed in covered outdoor areas such as garages or under canopies.	Aluminum or stainless steel.
Outdoors: Located in vaults or accessible concrete trenches.	Aluminum or stainless steel.

3.03 PIPING INSULATION SCHEDULE

A. TABLE 1: PIPING SERVICES, FLUID TEMPERATURE, AND INSULATION TYPE REQUIRED.

1. All insulation thicknesses shall meet or exceed state energy code requirements as noted below. Increase thickness by 1/2" (minimum) where insulated pipe is exposed to exterior ambient air. Minimum thermal resistance shall comply with building code minimum ranges and may exceed those minimum levels. Insulation thicknesses may be adjusted for equivalent insulation values for materials with superior "K" factors. Refer to "PART 2-PRODUCTS" for characteristics of each insulation material listed below.

PIPE INSULATION INDEX	
INSULATION KEY CODE	INSULATION TYPE
PI-A	Preformed Flexible Mineral Wool or Fiberglass.
PI-B	Preformed Flexible Closed-Cell Elastomeric, Neoprene or Polyethylene.
PI-C	Preformed Rigid Closed-Cell Phenolic Foam.
PI-D	Preformed Rigid Closed-Cell Polyisocyanurate Foam. Limited to non-plenum rated applications.
PI-E	Rigid Preformed Hydrous Calcium Silicate.
PI-F	Rigid Closed-Cell Cellular Glass.
PI-G	Flexible Low Temperature Aerogel.
PI-H	Flexible High Temperature Aerogel.
PI-I	Flexible Extreme High Temperature Aerogel.

TABLE 1: PIPING SERVICES, FLUID TEMPERATURE, AND INSULATION TYPE REQUIRED		
SERVICE	INSULATION KEY CODE	THICKNESS/REMARKS (Minimum)
Insulated pipes at pipe hangers and supports with saddles or 360° shields.	PI-E	Thickness as required by State Energy Code. See Table 2 below. Refer to 230500 Basic HVAC Materials and Methods for length of saddles and shields based on pipe size. Required on pipe sizes 1-1/2" and larger.
Chilled water supply and return systems and fittings (40°F to 60°F).	PI-A, B, C, D, G	Thickness as required by State Energy Code. See Table 2 below.
Chilled water supply and return systems and fittings (39°F and below).	PI-A, B, C, D, G	Thickness as required by State Energy Code. See Table 2 below.
Heating water supply and return systems and fittings (up to 200°F).	PI-A, B, C, E, H	Thickness as required by State Energy Code. See Table 2 below.
Cooling coil condensate drain piping and traps located inside spaces within the building, and above ceilings and in attics.	PI-A or B	Provide 1/2" (minimum) thickness insulation, all pipe sizes. Refer to Division 22.
Cooling coil condensate drain piping and traps located inside the building, in mechanical rooms located in buildings located in humid climates defined as "A-Moist" or "C-Marine" in the IECC.	PI-A or B	Provide 1/2" (minimum) thickness insulation, all pipe sizes. Refer to Division 22.

TABLE 1: PIPING SERVICES, FLUID TEMPERATURE, AND INSULATION TYPE REQUIRED		
SERVICE	INSULATION KEY CODE	THICKNESS/REMARKS (Minimum)
Cooling coil condensate drain piping and traps located outdoors.	N/A	Not required.
Refrigerant suction piping.	PI-B	Provide 3/4" (minimum) thickness insulation or increased thickness as required by State Energy Code. See Table 2 below.
Refrigerant liquid and hot-gas piping.	PI-B	Provide 3/4" (minimum) insulation for all warm/hot piping in close proximity to human contact and where located in enclosed ceiling, shaft or chase spaces.
Refrigerant piping for heat pump and VRF systems.	PI-B	Provide 3/4" (minimum) thickness insulation on all piping.
Low pressure steam supply and condensate systems (250°F and below).	PI-A, C, D, F, H	Thickness as required by State Energy Code. See Table 2 below.
Medium and high pressure steam supply and condensate systems (Greater than 250°F).	PI-A, E, F, H, I	Thickness as required by State Energy Code. See Table 2 below.
Steam condensate pump discharge systems (141°F-200°F).	PI-A, D, F, H	Thickness as required by State Energy Code. See Table 2 below.
Boiler feed systems (201°F-250°F).	PI-A, D, F, H	Thickness as required by State Energy Code. See Table 2 below.
Boiler blow down systems.	PI-A, D, F, H	Provide 1" insulation thickness, all piping sizes.
Steam safety valve vent piping systems.	PI-A, D, F, H	Provide 1" insulation thickness, all piping sizes. Provide aluminum jacket on exterior insulated piping.

TABLE 1: PIPING SERVICES, FLUID TEMPERATURE, AND INSULATION TYPE REQUIRED		
SERVICE	INSULATION KEY CODE	THICKNESS/REMARKS (Minimum)
Interior and exterior geothermal condenser water supply and return systems and fittings (59°F and below).	PI-A, B, C, D, E	Above grade piping only. Below grade not insulated.
Generator engine exhaust piping, including flanges, fittings, mufflers, filters, etc.	PI-E	4" (100 mm). Thickness is based on desired exterior surface temperature defined by code and not to exceed 158°F per UL2200 for casual contact.
	PI-I	2" (50 mm). Thickness is based on desired exterior surface temperature defined by code and not to exceed 158°F per UL2200 for casual contact.
Electric heat traced systems.	Per fluid type	Provide aluminum jacket on exterior insulated piping.

B. TABLE 2: MINIMUM PIPING INSULATION THICKNESS BASED ON FLUID TEMPERATURE AND PIPING SIZE. California

Table 2							
Insulation Based on California T-24 Energy Code Table 120.3-A							
Minimum Pipe Insulation Thicknesses or Greater							
FLUID TEMPERATURE RANGE (°F)	CONDUCTIVITY RANGE (in Btu-inch per hour per square foot °F)	INSULATION MEAN RATING TEMPERATURE (°F)	NOMINAL PIPE DIAMETER (in inches)				
			Less than 1	1 and 1-1/4	1-1/2 to 3	4 to 6	8 and larger
			INSULATION THICKNESS REQUIRED (in inches)				
Space heating systems (steam, steam condensate and hot water) and Domestic Services Water Heating Systems							
Above 350	0.32-0.34	250	4.5	5.0	5.0	5.0	5.0
251-350	0.29-0.31	200	3.0	4.0	4.5	4.5	4.5

3.04 ACOUSTIC PIPE WRAP

A. Acoustic pipe wrap is to be used in piping system which occur over occupied spaces for the following:

1. Horizontal condenser water riser offsets.
2. Pipe, valves and fittings where water velocity exceeds 8 feet per second.

END OF SECTION

This page intentionally left blank

SECTION 23 09 00

BUILDING AUTOMATION SYSTEM (BAS) CONTROLS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include but not necessarily be limited to the following:
1. Provide new direct digital Building Automation System (BAS) for the new building with all hardware, software, controller, devices, sensors, conduit, wiring, and labor as required to provide complete and operational systems.
 2. Provide Tridium front end to interface existing building BAS systems with new building BAS.
- B. General Requirements
1. The work includes designing, providing and installing a complete and fully operable building automation system as described in this Section of the Specification and as shown on the contract construction drawings and shall be in accordance with rules, regulations and standards as required by the authorities having jurisdiction. The system shall be non-proprietary. Any alternations to the quantity or location of the control panels shall be coordinated with the Electrical Contractor and General Contractor prior to bidding. Any BAS changes after bidding must be coordinated with Electrical Contractor and General Contractor at no additional cost to Owner.
 2. Submit shop drawings of the entire control system components fully coordinated with major equipment suppliers' requirements. Provide proposed programming logic sequences of control functions on each system.
 3. Installation of control components other than valves, dampers and sensing wells as required for a complete and workable system.
 4. This Contractor shall furnish, install and coordinate the interlock and control wiring as specified and/or required for a complete and workable control system.
 5. Controls dampers are specified and furnished in Section 233113 of these specifications. Provide damper actuators, wiring and conduit as required to operate all dampers as shown.
 6. Upon completion of the installation, data entry and programming, provide complete validation and adjustment of specified control system through period of testing and Owner's acceptance. The control contractor shall perform a point-to-point check out of all newly installed points to verify point existence, proper end to end connection and correct SI units with the Owners Representative.

7. The entire program and sequence of operation with the final points list shall be verified by the Control Contractor, the Owner's Representative, and signed by both parties. A copy of the final program, sequence of operation, and points list shall be submitted to the Engineer for approval and inclusion with the operation and maintenance manuals.
8. Owner training on operation of the control system.
9. One-year warranty on workmanship and materials.
10. Interlocking of electrical systems and motors as shown on Drawings, except where specifically shown on electrical drawings.

1.03 RELATED WORK IN OTHER SECTIONS

- A. Refer to Division 0 and Division 1 for related contractual requirements.
- B. Provide certificates of calibration for all sensors required for control and monitoring including temperature and pressure.
- C. Refer to Division 23 and the following sections for Mechanical or Electrical Provision.
 1. Division 01 - Submittal Procedures
 2. Division 01 - Commissioning
 3. Section 23 05 00 - Basic HVAC Materials and Methods
 4. Section 23 05 93 - Testing, Adjusting, and Balancing
 5. Section 23 09 02 - Variable Frequency Drives
 6. Section 23 21 13 - Hydronic Piping, Valves and Specialties
 7. Section 23 21 23 - Hydronic Pumps
 8. Section 23 31 13 - Air Distribution
 9. Sections 23 70 00 through 23 89 99 equipment
 10. Division 26 – Electrical Materials and Methods
 11. Division 28 – Electronic Safety and Security
- D. Refer to Division 26 sections for Electrical Provisions. Sources of 120-volt electrical power as indicated on the electrical drawings and specifications for control system components furnished by this section. The controls contractor shall be responsible for all additional electrical distribution from these connection points to the control panels and other controls devices.
- E. BAS contractor will furnish, but not install the following:
 1. Air flow measuring stations: furnish to mechanical installer and coordinate per manufacturer's requirements.
 2. Flow meters: furnish to mechanical installer and coordinate per manufacturer's requirements.
 3. Flow switches: furnish to mechanical installer and coordinate per manufacturer's requirements.
 4. Hydronic pressure and temperature sensor wells: furnish to mechanical installer and coordinate per manufacturer's requirements.
 5. Control valves: furnish to mechanical installer and coordinate per manufacturer's requirements.

1.04 REFERENCE STANDARDS

- A. The latest edition of the following standards and codes in effect and amended as of supplier's proposal date, and any applicable subsections thereof, shall govern design and selection of equipment and material supplied:
1. American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE).
 2. ANSI/ASHRAE Standard 135-2012, BACnet.
 3. International Building Code (IBC), including local State and Local amendments.
 4. UL 916 Underwriters Laboratories Standard for Energy Management Equipment. Canada and the US.
 5. National Electrical Code (NEC).
 6. FCC Part 15, Subpart J, Class A.
 7. EMC Directive 89/336/EEC (European CE Mark).
 8. UL-864 UUKL listing for Smoke Controls for any equipment used in smoke control sequences.
- B. City, county, state, and federal regulations and codes in effect as of contract date.
- C. Except as otherwise indicated, the system supplier shall secure and pay for all permits, inspections, and certifications required for his work, and arrange for necessary approvals by the governing authorities.

1.05 GENERAL REQUIREMENTS

- A. Furnish a distributed logic BACnet-based control system including operator's workstation. The operator's workstation, all building controllers, application controllers, and all input/output devices shall communicate using the protocols and network standards as defined by ANSI/ASHRAE Standard 135-2012, BACnet. Provide all necessary BACnet-compliant hardware and software to meet the system's functional specifications. Provide Protocol Implementation Conformance Statement (PICS) for Windows-based control software and every controller in system, including unitary controllers.
- B. Prepare individual hardware layouts, interconnection drawings, and software configuration from project design data.
- C. Implement the detailed design for all analog and binary objects, system databases, graphic displays, logs, and management reports based on control descriptions, logic drawings, configuration data, and bid documents.
- D. Design, provide, and install all equipment cabinets, panels, data communication network cables needed, and all associated hardware.
- E. Provide and install all interconnecting cables between supplied cabinets, application controllers, and input/output devices.
- F. Provide and install all interconnecting cables between all operator's terminals and peripheral devices (such as printers, etc.) supplied under this section.
- G. Provide complete manufacturer's specifications for all items that are supplied. Include vendor name of every item supplied.

- H. Provide supervisory specialists and technicians at the job site to assist in all phases of system installation, startup, and commissioning.
- I. Provide a comprehensive operator and technician training program as described herein.
- J. Provide as-built documentation, operator's terminal software, a software key for a minimum of one additional computer (coordinate with Owner's Representative if additional keys are required), diagrams, and all other associated project operational documentation (such as technical manuals) on approved media, the sum total of which accurately represents the final system.
- K. Provide new sensors, dampers, valves, and install only new electronic actuators. No used components shall be used as any part or piece of installed system.
- L. Provide each global controller (i.e. JACE 9000) with a 5-year software maintenance plan.

1.06 TRIDIUM REQUIREMENTS

- A. The Building Automation System (BAS) specified herein is an "integrated" system that utilizes a Tridium Niagara (N4) front end with BAS contractor's native BACnet controllers. The BAS contractor shall furnish and install all Tridium Niagara (N4) based front end, hardware systems, and equipment to access and interface with a BACnet control system that utilizes unitary controllers to control all mechanical equipment, including all unitary equipment such as VAV boxes, fan-coils, etc., and all air handlers, boilers, chillers, and any other listed equipment.
- B. The BAS contractor shall develop, test, and commission all Tridium Niagara (N4) and GUI (Graphic User Interface) software applications for the HVAC control system. Additionally, the BAS contractor shall configure and commission the Ethernet communication network for the HVAC system.
- C. Only BAS contractors that are Factory Authorized to sell and install the Niagara (N4) hardware and software are authorized to bid. The Niagara (N4) Authorized Contractor will have a minimum of three factory trained programmers. The programmers will have completed the Niagara (N4) Certification Program and work as full time employees, not sub-contractors.
- D. It is the owner's express goal to implement an open system that will allow products from various suppliers to be integrated into unified systems in order to provide flexibility for expansion, maintenance, and service of the system. The owner shall be the named license holder of all software associated with any and all incremental work on the project(s). All Niagara (N4) software licenses shall have the 'accept.station.in="*"'; accept.station.out="*", accept.wb.in="*" and 'accept.wb.out="*" section of the software licenses. The intent is to insure that the installed Niagara (N4) products may be completely open for integrations. The Owner shall be free to direct the modifications of the any software license, regardless of supplier. In addition, the Owner shall receive ownership of all job specific software configurations documentation, data files, and application-level software developed for the project. This shall include all custom job specific software code and documentation for all configuration and programming that is generated for a given project and/or configured for use within Niagara (N4) Framework (Niagara (N4)) based controllers and/or servers and any related LAN/ WAN Intranet and Internet connected routers and devices. Any and all required Ids and passwords for access to any component or software program shall be provided to the Owner.

- E. Furnish a distributed logic BACnet-based control system, compatible operator's workstation. The operator's workstation, all building controllers, application controllers, and all input/output devices shall communicate using the protocols and network standards as defined by ANSI/ASHRAE Standard 135-2012, BACnet. Provide all necessary BACnet-compliant hardware and software to meet the system's functional specifications. Provide Protocol Implementation Conformance Statement (PICS) for Windows-based control software and every controller in system, including unitary controllers.
- F. The Web Server is a flexible network server for multiple connected Niagara controllers. The Web Supervisor is designed to harness the power of the Internet and provide efficient integration and aggregation of the information from multiple controllers. In effect, the Web Supervisor creates a single view of these multiple devices, while providing a powerful network environment with comprehensive database management, alarm management, and messaging services. In addition, the Web Supervisor provides the engineering environment used to set up and manage the systems and the graphical user interface. The software is designed to run on 64-bit Windows 8.1 Enterprise, Windows Server 2012 Standard, 2012 R2 Standard, or better. The browser interface utilizes HTML5. JAVA is not required for the system and graphics to operate.
 - 1. Processor: Intel Xeon CPU E5-2640 x64, or better, and is compatible with dual and quad core processors.
 - 2. RAM: 4 Gb of memory minimum.
 - 3. Hard disk: minimum 4 TB hard drive and additional space for archiving purposes.

1.07 SYSTEM DESCRIPTION

- A. A distributed logic control system complete with all software and hardware functions shall be provided and installed. System shall be completely based on ANSI/ASHRAE Standard 135-2012, BACnet and achieved listing under the BACnet Testing Laboratories BACnet - Advanced Workstation Software (B-AWS). This system is to control all mechanical equipment, including all unitary equipment such as VAV boxes, fan-coils, air handlers, boilers, chillers, and any other listed equipment using native BACnet-compliant components. Non-BACnet-compliant or proprietary equipment or systems (including gateways) shall not be acceptable and are specifically prohibited.
- B. The Building Automation System (BAS) application program shall be written to communicate specifically utilizing BACnet protocols. Software functions delivered on this project shall include password protection, scheduling (including optimum start), alarming, logging of historical data, full graphics including animation, after-hours billing program, demand limiting, and a full suite of field engineering tools including graphical programming and applications.
- C. Building controllers shall include complete energy management software, including scheduling building control strategies with optimum start and logging routines. All energy management software and firmware shall be resident in field hardware and shall not be dependent on the operator's terminal. Operator's terminal software is to be used for access to field-based energy management functions only. Provide zone-by-zone direct digital logic control of space temperature, scheduling, runtime accumulation, equipment alarm reporting, and override timers for after-hours usage.
- D. All application controllers for every piece of controlled equipment shall be fully programmable. Application controllers shall be mounted next to controlled equipment and communicate with building controller through BACnet LAN.

- E. Room sensors shall be provided with digital readout that allow the user to view room temperature, CO2 or relative humidity, adjust the room setpoint within preset limits and set desired override time. User shall also be able to start and stop unit from the digital sensor. Include all necessary wiring and firmware such that room sensor includes field service mode. Field service mode shall allow a technician to balance VAV zones and access any parameter in zone controller directly from the room sensor. Field service mode shall have the ability to be locked out.

1.08 QUALITY ASSURANCE

- A. The BAS shall be designed, installed, commissioned, and serviced by contractor authorized and trained personnel. System provider shall have an in-place support facility within two (2) hours response time of the site with technical staff, spare parts inventory, and necessary test and diagnostic equipment.
- B. The manufacturer and installer shall have a minimum of 5 years of demonstrated technical expertise and experience in the manufacture, installation and maintenance of BAS systems similar in size and complexity to this project. A list of successful past projects of similar type, size and complexity shall be submitted. In addition, a reference list of names, addresses and telephone numbers of the design Engineer and the Owner's Representative for each installation shall be provided. The references may be contacted and questioned about the timely delivery, installation, operation and service received for each installation.
- C. The contractor shall provide experienced project manager for this work, responsible for direct supervision of the design, installation, start-up and commissioning of the BAS system.
- D. The Bidder shall be regularly engaged in the design, installation and maintenance of BAS systems and shall have demonstrated technical expertise and experience in the manufacture, installation and maintenance of BAS systems similar in size and complexity to this project. Bidders shall provide a list of at least 10 projects, similar in size and scope to this project completed within the past 3 years.
- E. Materials and equipment shall be manufacturer's latest standard design that complies with the specification requirements.
- F. All BAS peer-to-peer network controllers, central system controllers and local user displays shall be UL Listed under Standard UL 916, category PAZX.
- G. All electronic equipment shall conform to the requirements of FCC Regulation, Part 15, Governing Radio Frequency Electromagnetic Interference and be so labeled.
- H. Control system shall be engineered, programmed and supported completely by representative's local office that must be within 100 miles of project site.
- I. Control components shall be products of the same manufacturer only, unless indicated otherwise and approved by Owner's Representative. Example – all valves shall be by one manufacturer and all temperature sensors shall be by one manufacturer.

1.09 SUBMITTALS

- A. Drawings
 - 1. The system supplier shall submit point-to-point engineered drawings, control sequence, and bill of materials for approval.
 - 2. Drawings shall be submitted in a standard size of 11" x 17" (ANSI B), or larger.

3. Eight complete sets (copies) of submittal drawings shall be provided.
4. Drawings shall be available on portable memory device, DVD or CD disk media.

B. System Documentation

1. Include the following in submittal package:
 - a. System configuration diagrams in simplified block format.
 - b. All input/output object listings and an alarm point summary listing.
 - c. Electrical drawings that show all system internal and external connection points, terminal block layouts, and terminal identification.
 - d. Complete bill of materials, valve schedule with Cv, valve pressure drop at design flow, and damper schedule.
 - e. Manufacturer's instructions and drawings for installation, maintenance, and operation of all purchased items.
 - f. Overall system operation and maintenance instructions—including preventive maintenance and troubleshooting instructions.
 - g. For all system elements—operator's workstation(s), building controller(s), application controllers, routers, and repeaters—provide BACnet Protocol Implementation Conformance Statements (PICS) as per ANSI/ASHRAE Standard 135-2012.
 - h. Provide complete description and documentation of any proprietary (non-BACnet) services and/or objects used in the system.
 - i. A list of all functions available and a sample of function block programming that shall be part of delivered system.

C. Project Management

1. The vendor shall provide a detailed project design and installation schedule with time markings and details for hardware items and software development phases. Schedule shall show all the target dates for transmission of project information and documents, and shall indicate timing and dates for system installation, debugging, and commissioning.

1.10 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.
- C. Warrant work as follows:
 1. Control system failures during warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to Owner.
 2. Warrant all actuators for a period of five (5) years.
 3. Respond during normal business hours within 24 hours of Owner's warranty service request.
 4. Work shall have a single warranty date, even if Owner receives beneficial use due to early system start-up. If specified work is split into multiple contracts or a multi-phase contract, each contract or phase shall have a separate warranty start date and period.

5. If Owner's Representative determines that equipment and systems operate satisfactorily at the end of final start-up, testing, and commissioning phase, Owner's Representative will certify in writing that control system operation has been tested and accepted in accordance with the terms of this specification. Date of acceptance shall begin warranty period.
6. Provide updates to operator workstation software, project-specific software, graphic software, database software, and firmware that resolve Contractor-identified software deficiencies at no charge during warranty period. If available, Owner can purchase in-warranty service agreement to receive upgrades for functional enhancements associated with above-mentioned items. Do not install updates or upgrades without Owner's written authorization.
7. Exception: Contractor shall not be required to warrant reused devices except those that have been rebuilt or repaired. Installation labor and materials shall be warranted. Demonstrate operable condition of reused devices at time of Engineer's acceptance.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable BAS Manufacturers include:
 1. ALC (LAVC campus only)
 2. ABB
 3. Honeywell Cipher
 4. Johnson Controls FX

2.02 OPERATOR'S WORKSTATION

- A. Where virtual servers are not utilized, the general structure of workstation interaction shall be a standard client/server relationship. Server shall be used to archive data and store system database. Clients shall access server for all archived data. Each client shall include flexibility to access graphics from server or local drive. Server shall support a minimum of 50 simultaneous clients. Where a virtual server is utilized, the operator for each campus shall access the virtual server via VPN.
- B. Primary Operator Workstation Hardware
- C. All workstations shall be general purpose microcomputer systems serving as an operator station in a cooperative processing server/client relationship with other connected work stations. The workstation shall consist of a high-speed central processing unit (CPU) with data storage facilities, high-resolution, 24", LCD monitor. Components shall be capable of operating in environments of 60°F to 105°F and relative humidity of 30% to 90%.
 1. CPU: Intel Xeon CPU E5-2640 x64, or better, and compatible with dual & quad core processors.
 2. Memory: 8 GB (minimum).
 3. Hard Drive: 1 TB (minimum) for the BAS operating software.
 4. Hard Drive: 4 TB (minimum) to be used for trend log archiving of annual data.
 5. Display: Video card and monitor capable of displaying 1920x1080 pixel resolution or better.

6. Network Support: Ethernet adapter (10/100 Mb with RJ-45 connector, or greater).
7. Keyboard: The keyboards shall be the enhanced with 101 keys and quiet.

D. Displays

1. In general, the operator's workstation shall display all data associated with project as called out on drawings and/or object type list supplied. Graphic files shall be created using digital, full color photographs of system installation, AutoCAD drawing files of field installation drawings and wiring diagrams from as-built drawings. Operator's workstation shall display all data using three-dimensional graphic representations of all mechanical equipment.
2. A customized menu label (push-button) shall be used for display selection. Menu items on a display shall allow penetration to lower level displays or additional menus. Dynamic point information and menu label pushbuttons may be mixed on the same display to allow sub-displays to exist for each item. Each display may be protected from viewing unless operator has appropriate security level. A security level may be assigned to each display and system object. The menu label shall not appear on the graphic if the operator does not have the appropriate security level.
3. The BAS displays shall have the ability to link to content outside of the BAS system. Such content shall include but is not limited to: Launching external files in their native applications (for example, a Microsoft Word document) and launching a Web browser resolving to a specified Web address.
4. The BAS system shall have the ability to run multiple, concurrent displays windows showing continuously updated data.

E. Password Protection

1. Provide security system that prevents unauthorized use unless operator is logged on. Access shall be limited to operator's assigned functions when user is logged on. This includes displays as outlined above.
2. Each operator's terminal shall provide security for a minimum of 200 users. Each user shall have an individual User ID, User Name, and Password. Entries are alphanumeric characters only and are case sensitive (except for User ID). User ID shall be capable of accepting 8 characters or more, User Name shall be 0–29 characters, and Passwords must accept a minimum of 4 characters and be capable of accepting 8 characters or more.

F. System shall include an Auto Logout Feature that shall automatically logout user when there has been no keyboard or mouse activity for a set period of time. Time period shall be adjustable by system administrator. Auto Logout may be enabled and disabled by system administrator. Operator terminal shall display message on screen that user is logged out after Auto Logout occurs.

1. The system shall permit the assignment of an effective date range, as well as an effective time of day, that the User IDs are permitted to authenticate.

G. Operator Activity Log

1. Operator Activity Log that tracks all operator changes and activities shall be included with system. System shall track what is changed in the system, who performed this change, date and time of system activity, and value of the change before and after operator activity. Operator shall be able to display all activity, sort the changes by user and also by operation. Operator shall be able to print the Operator Activity log display.

2. Log shall be gathered and archived to hard drive on operator's workstation as needed. Operator shall be able to export data for display and sorting in a spreadsheet.

H. Scheduling

1. Operator's workstation shall show all information in easy-to-read daily format including calendar of this month and next. All schedules shall show actual ON/OFF times for day based on scheduling priority. Priority for scheduling shall be events, holidays and daily, with events being the highest.
2. Holiday and special event schedules shall display data in calendar format. Operator shall be able to schedule holidays and special events directly from these calendars.
3. Operator shall be able to change all information for a given weekly or exception schedule if logged on with the appropriate security access.
4. Scheduling shall include optimum start based on outside air temperature, current heating/cooling setpoints, indoor temperature and history of previous starts. Each and every individual zone shall have optimum start time independently calculated based on all parameters listed. User shall input schedules to set time that occupied setpoint is to be attained. Optimum start feature shall calculate the startup time needed to match zone temperature to setpoint. User shall be able to set a limit for the maximum startup time allowed.

I. Alarm Indication and Handling.

1. Operator's workstation shall provide audible, visual, printed, email or test means of alarm indication. The alarm dialog box shall always become the top dialog box regardless of the application(s) currently running. Printout of alarms shall be sent to the assigned terminal and port. Alarm notification can be filtered based on the User ID's authorization level.
2. System shall provide log of alarm messages. Alarm log shall be archived to the hard disk of the system operator's terminal. Each entry shall include a description of the event-initiating object generating the alarm. Description shall be an alarm message of at least 256 characters in length. Entry shall include time and date of alarm occurrence, time and date of object state return to normal, time and date of alarm acknowledgment, and identification of operator acknowledging alarm.
3. Alarm messages shall be in user-definable text (English or other specified language) and shall be delivered either to the operator's terminal, client or through remote communication using email (Authenticated SMTP supported).

J. Trendlog Information

1. System server shall periodically gather historically recorded data stored in the building controllers and store the information in the system database. Stored records shall be appended with new sample data, allowing records to be accumulated. Systems that write over stored records shall not be allowed unless limited file size is specified. Samples may be viewed at the operator's workstation. Operator shall be able to view all trended records, both stored and archived. All trend log records shall be displayed in standard engineering units. Annual trend log data shall be archived by year for future analysis.
2. Software that is capable of graphing the trend logged object data shall be included. Software shall be capable of creating two-axis (X, Y) graphs that display up to 10 object types at the same time in different colors. Graphs shall show object values relative to time. Each trend log shall support a custom scale setting for the graph view that is to be stored continuously.

3. Operator shall be able to change trend log setup information. This includes the information to be logged as well as the interval at which it is to be logged. All input, output, and value object types in the system may be logged. All operations shall be password protected. Setup and viewing may be accessed directly from any and all graphics on which object is displayed.
4. System shall be capable of using Microsoft SQL as the system database.

K. Energy Log Information

1. System server shall be capable of periodically gathering energy log data stored in the field equipment and archive the information. Archive files shall be appended with new data, allowing data to be accumulated. Systems that write over archived data shall not be allowed unless limited file size is specified. Display all energy log information in standard engineering units.
2. All data shall be stored in database file format for direct use by third-party programs. Operation of system shall stay completely online during all graphing operations.
3. Operator shall be able to change the energy log setup information as well. This includes the meters to be logged, meter pulse value, and the type of energy units to be logged. All meters monitored by the system may be logged. System shall support using flow and temperature sensors for BTU monitoring.
4. System shall display archived data in tabular format form for both consumption and peak values. Data shall be shown in hourly, daily, weekly, monthly and yearly formats. In each format, the user shall be able to select a specific period of data to view.

L. Demand Limiting

1. System shall include demand limiting program that includes two types of load shedding. One type of load shedding shall shed/restore equipment in binary fashion based on energy usage when compared to shed and restore settings. The other type of shedding shall adjust operator selected control setpoints in an analog fashion based on energy usage when compared to shed and restore settings. Shedding may be implemented independently on each and every zone or piece of equipment connected to system.
2. Binary shedding shall include minimum of five (5) priority levels of equipment shedding. All loads in a given priority level shall be shed before any loads in a higher priority level are shed. Load shedding within a given priority level shall include two methods. In one, the loads shall be shed/restored in a "first off-first on" mode, and in the other the loads are just shed/restored in a "first off-last on" (linear) fashion.
3. Analog shed program shall generate a ramp that is independently used by each individual zone or individual control algorithm to raise the appropriate cooling setting and lower appropriate heating setting to reduce energy usage.
4. Status of each and every load shed program shall be capable of being displayed on every operator terminal connected to system. Status of each load assigned to an individual shed program shall be displayed along with English description of each load.

M. Tenant Activity

1. System shall include program that monitors after-hours overrides by tenants, logs that data, and generates a bill based on usage and rate charged for each tenant space. Tenant Activity program shall be able to assign multiple zones, from a list of every zone connected to system, to a particular tenant. Every zone is monitored for after-hour override usage and that data logged in server. Operator may then generate a bill based on the usage for each tenant and the rate charged for any overtime use.
2. Configuration shall include entry of the following information for use in logging and billing:

- a. Tenant's contact name and address.
 - b. One or multiple tenant zones that make up a total tenant space, including a separate billing rate for each separate zone.
 - c. Minimum and maximum values an event duration and event limit.
 - d. Property management information.
 - e. Overall billing rate.
 - f. Seasonal adjustments or surcharge to billing rate.
 - g. Billing notification type such including, but not limited to printer, file and email.
 - h. Billing form template.
 - i. Logging shall include recording the following information for each and every tenant event.
 - j. Zone description.
 - k. Time the event begins.
 - l. Total override time.
 - m. Limits shall be applied to override time.
3. A tenant bill shall be generated for a specific period using all the entered configuration data and the logged data. User with appropriate security level shall be able to view and override billing information. User shall be able to select a billing period to view and be able to delete events from billing and edit a selected tenant activity event's override time.

N. Reports

1. System server shall be capable of periodically producing reports of trend logs, alarm history, tenant activities, device summary, energy logs, and override points. The frequency, content, and delivery are to be user adjustable.
2. All reports shall be capable of being delivered in multiple formats including text- and comma-separated value (CSV) files. The files can be printed, emailed, or saved to a folder, either on the server hard drive or on any network drive location.

O. Configuration/Setup

1. Provide means for operator to display and change system configuration. This shall include, but not be limited to, system time, day of the week, date of daylight savings set forward/set back, printer termination, port addresses, modem port and speed, etc. Items shall be modified using understandable terminology with simple mouse/cursor key movements.

P. Field Engineering Tools

1. Operator's workstation software shall include field engineering tools for programming all controllers supplied. All controllers shall be programmed using graphical tools that allow the user to connect function blocks on screen that provide sequencing of all control logic. Function blocks shall be represented by graphical displays that are easily identified and distinct from other types of blocks. User shall be able to select a graphical function block from menu and place on screen. Provide zoom in and zoom out capabilities. Function blocks shall be downloaded to controller without any reentry of data.

2. Programming tools shall include a real-time operation mode. Function blocks shall display real-time data and be animated to show status of data inputs and outputs when in real-time operation. Animation shall show change of status on logic devices and countdown of timer devices in graphical format.
3. System shall automatically notify the user when a device that is not in the database is added to the network.
4. System shall include backup/restore function that will back up entire system to selected medium and then restore system from that media. The system shall be capable of creating a backup for the purpose of instantiating a new client PC.
5. The system shall provide a means to scan, detect, interrogate, and edit third-party BACnet devices and BACnet objects within those devices.

Q. Workstation Hardware

1. Workstation/server computer minimum requirements
 - a. Enterprise Server (supports heavy trending and/or alarm handling at very large sites using SQL Server)
 - b. 64-bit Windows 8.1 Enterprise, Windows Server 2012 Standard, 2012 R2 Standard, or better,
 - c. Browser/client requirements: Most current versions of the following: Internet Explorer, Firefox, Chrome, Safari (Mac OS X).

R. Software

1. At the conclusion of project, contractor shall provide to the Owner's Representative a portable memory device or DVD ROM that includes the complete software operation system and project graphics, setpoints, system parameters, etc. This backup shall allow the Owner to completely restore the system in the case of a computer malfunction.

2.03 WEB INTERFACE

A. General

1. BAS supplier shall provide Web-based access to the system as part of standard installation. User must be able to access all displays of real-time data that are part of the BAS using a standard Web browser. Web browser shall tie into the network through Owner-supplied Ethernet network connection. Web page host may be a separate device that resides on the BAS BACnet network, but is not the BAS server for the control system. BAS server may be a separate computer from the Web page host device. The Web page software shall not require a per-user licensing fee or annual fees. The Web page host must be able to support simultaneous users with the ability to expand the system to accommodate an unlimited number of users.

B. Browser Technology

1. No special vendor-supplied software shall be needed on computers running browser. All displays shall be viewable and the webpage host shall directly access real-time data from the BAS BACnet network. Data shall be displayed in real-time and update automatically without user interaction. User shall be able to change data on displays if logged in with the appropriate user name and password.

C. Communications

1. Web page host shall support Ethernet network connections. A network connection shall be used to gather real-time data from all the BACnet devices that form the BAS. This network shall communicate using BACnet, allowing the Web page host to gather data directly from units on the local LAN or from other projects connected over a WAN. This network shall also provide the connection to the BAS server for Web page generation.
2. An Ethernet connection shall provide the physical connection to the Internet or an IP-based WAN. It shall be the port that is used for the browser to receive Web pages and data from the Web page host. The Web page host shall act as a physical barrier between the BAS network and the WAN or Internet connection that allows the browser to receive Web pages and data. The two separate network connections provide for a physical barrier to prevent raw BACnet traffic being exposed on the IP network.
3. The Web page host shall provide for complete isolation of the IP and BACnet networks by not routing networking packets between the two networks.

D. Display of Data

1. Web page graphics shown on browser shall be replicas of the BAS displays. User shall need no additional training to understand information presented on Web pages when compared to what is shown on BAS displays. Web page displays shall include animation just as BAS displays. Fans shall turn, pilot lights shall blink, coils shall change colors, and so on.
2. Real-time data shall be shown on all browser Web pages. This data must be directly gathered using the BACnet network and automatically updated on browser Web page displays without any user action. Data on the browser shall automatically refresh as changes are detected without re-drawing the complete display.
3. It shall be possible for user from browser Web page to change data if the user is logged on with the appropriate password. Clicking on a button or typing in a new value shall change digital data. Using pull-down menus or typing in a new value shall change analog data.
4. Data displays shall be navigated using pushbuttons on the displays that are simply clicked on with the mouse to select a new display. Alternatively, the standard back and forward buttons of the browser can be used for display navigation.

E. Time Schedule Adjustment

1. Web access shall allow user to view and edit all schedules in the system. This includes three types of schedules: standard, holiday and event. Display of schedules shall show interaction of all schedules on a single display so user sees an overview of how all work together. User shall be able to edit schedules from this display.
2. Display of all three schedule types must show all ON times for standard, holiday and event schedules in different colors on a given day. In addition, OFF times for each must also be shown in additional colors. User shall be able to select from standard calendar what days are to be scheduled and same display shall show all points and zones affected. User shall be able to set time for one day and select all days of the week that shall be affected as a recurrence of that same schedule for that given day.
3. Schedule list shall show all schedules currently defined. This list shall include all standard, holiday and event schedules. In addition, user shall be able to select a list that shows all scheduled points and zones.

F. Logging of Information

1. User shall use standard browser technology to view all trendlogs in system. User shall be able to view logged data in tabular form or graphical format. User shall be able to adjust time interval of logged data viewed and shall be able to adjust Y axis of data viewed in graphical format. User shall also be able to download data through the Web interface to local computer. Data shall be in CSV format.

G. Alarm Handling

1. Web interface shall display alarms as they occur. User shall be able to acknowledge alarms using browser technology. In addition, user shall be able to view history of alarm occurrence over a user-selected time frame. In addition, those alarms may be filtered for viewing per user-selected options. A single selection shall display all alarms that have not been acknowledged.

H. Web Page Generation

1. Web pages shall be automatically generated from the BAS displays that reside on the BAS server. User shall access Web page host through the network and shall initiate a Web page generation utility that automatically takes the BAS displays and turns them into Web pages. The Web pages generated are automatically installed on the Web page host for access using any computer's standard browser. Any system that requires use of an HTML editor for generation of Web pages shall not be considered.

I. Password Security and Activity Log

1. Access through Web browser shall utilize the same hierarchical security scheme as BAS system. User shall be asked to log on once the browser makes connection to Web page host. Once the user logs in, any and all changes that are made shall be tracked by the BAS system. The user shall be able to change only those items he or she has authority to change. A user activity report shall show any and all activity of the users who have logged in to the system, regardless of whether those changes were made using a browser or through the BAS workstation.

J. BACnet Communication

1. Web server shall directly communicate to all devices on the BAS network using BACnet protocol. No intermediate devices shall be necessary for BACnet communication.

2.04 BUILDING NETWORK CONTROLLER

A. Building Network Controller

1. BACnet Conformance
 - a. Building Network Controller shall be approved by the BACnet Testing Laboratories as meeting the BACnet Building Controller requirements.

B. Building network controller modules shall provide normal 7-day scheduling, holiday scheduling and event scheduling.

1. Logging Capabilities
 - a. Logs shall be supported in the building network controller. Any object in the system (real or calculated) may be logged. Sample time interval shall be adjustable at the operator's workstation.
 - b. Logs may be viewed both on-site or off-site using WAN or remote communication.
 - c. Building network controller shall periodically upload trended data to networked operator's workstation for long-term archiving if desired.

- d. Archived data stored in database format shall be available for use in third-party spreadsheet or database programs.
2. Alarm Generation
 - a. Alarms may be generated within the system for any object change of value or state (either real or calculated). This includes things such as analog object value changes, binary object state changes, and various controller communication failures.
 - b. Each alarm may be dialed out as noted elsewhere.
 - c. Alarm log shall be provided for alarm viewing. Log may be viewed on-site at the operator's terminal or off-site using remote communications.
 - d. Controller must be store alarms as BACnet event enrollment objects, with system destination and actions individually configurable.
 3. Demand Limiting
 - a. Demand limiting of energy shall be a built-in, user-configurable function. Each controller module shall support shedding of up to 200 loads using a minimum of two types of shed programs.
 - b. Load shedding programs in building controller modules shall operate as coordinated with local utility.
 4. Tenant Activity Logging
 - a. Tenant activity logging shall be supported by building network controller module.
- C. Ethernet – MS/TP Module
1. Ethernet – MS/TP Module shall support every function as listed under paragraph A, General Requirements, of this section and the following.
 2. All communication with operator's workstation and all application controllers shall be through BACnet. Building controller Ethernet – MS/TP module shall incorporate as a minimum, the functions of a 2-way BACnet router. Controller shall route BACnet messages between the high-speed LAN (Ethernet 10/100MHz) and MS/TP LAN. Ethernet – MS/TP module shall also route messages from all other building controller modules onto the BACnet Ethernet network.
 - a. MS/TP LAN must be software-configurable from 9.6 to 76.8Kbps.
 - b. The RJ-45 Ethernet connection must accept either 10Base-T or 100Base-TX BACnet over twisted pair cable (UTP).
- D. MS/TP Module
1. MS/TP module shall support every listed function in this specification and the following.
 2. Building controller MS/TP module communications shall be through BACnet MS/TP LAN to all advanced application and application-specific controllers. MS/TP module shall also route messages to Ethernet – MS/TP module for communication over WAN.
 - a. MS/TP LAN must be software configurable from 9.6 to 76.8Kbps.
 - b. Configuration shall be through RS-232 connection.
- E. Power Supply Module
1. Input for power shall accept between 17–30VAC, 47–65Hz.

2. Power supply module shall include rechargeable battery for orderly shutdown of controller modules including storage of all data in flash memory and for continuous operation of real-time clocks for minimum of 20 days.

F. Modbus Module

1. Modbus Module shall support every function as listed in this specification.
2. Building Controller Modbus module communications shall be via one of three types of ports: EIA-485, EIA-422 or RS-232 connection. Modbus module shall convert Modbus data into BACnet objects. Modbus module shall also route messages to Ethernet-MS/TP module for BACnet Ethernet communication over WAN.
 - a. Modbus Module shall support ASCII or RTU Modbus communication at 9600 or 4800 baud.
 - b. EIA-422 and EIA-232 connection shall support one connection of Modbus unit.
 - c. EIA-485 connection shall support connection of up to 247 Modbus units.
 - d. Configuration shall be via RS-232 connection.
3. BACnet Translation
 - a. All Modbus data shall be translated into BACnet objects by the Modbus module. All configuration tools shall be supplied to assure data is translated as necessary to the correct format and value.
 - b. Standard BACnet object types supported shall include as a minimum: Analog Value, Binary Value, Calendar, Device, File, Group, Notification Class, Program and Schedule object types. All proprietary object types, if used in the system, shall be thoroughly documented and provided as part of the submittal data. All necessary tools shall be supplied for working with proprietary information.

2.05 TRIDIUM NETWORK INTEGRATION

- A. The Building Automation System (BAS) specified herein is an “integrated” system that utilizes a Tridium Niagara (N4) front end with BAS contractor’s native BACnet controllers. The BAS contractor shall furnish and install all Tridium Niagara (N4) based front end, hardware systems, and equipment to access and interface with a BACnet control system that utilizes unitary controllers to control all mechanical equipment, including all unitary equipment such as VAV boxes, fan-coils, etc., and all air handlers, boilers, chillers, and any other listed equipment.
- B. The BAS contractor shall develop, test, and commission all Tridium Niagara (N4) and GUI (Graphic User Interface) software applications for the HVAC control system. Additionally, the BAS contractor shall configure and commission the Ethernet communication network for the HVAC system.
- C. Only BAS contractors that are Factory Authorized to sell and install the Niagara (N4) hardware and software are authorized to bid. The Niagara (N4) Authorized Contractor will have a minimum of three factory trained programmers. The programmers will have completed the Niagara (N4) Certification Program and work as full time employees, not sub-contractors.

- D. It is the owner's express goal to implement an open system that will allow products from various suppliers to be integrated into unified systems in order to provide flexibility for expansion, maintenance, and service of the system. The owner shall be the named license holder of all software associated with any and all incremental work on the project(s). All Niagara (N4) software licenses shall have the 'accept.station.in="*"'; accept.station.out="*"', accept.wb.in="*" and 'accept.wb.out="*" section of the software licenses. The intent is to insure that the installed Niagara (N4) products may be completely open for integrations. The Owner shall be free to direct the modifications of the any software license, regardless of supplier. In addition, the Owner shall receive ownership of all job specific software configurations documentation, data files, and application-level software developed for the project. This shall include all custom job specific software code and documentation for all configuration and programming that is generated for a given project and/or configured for use within Niagara (N4) Framework (Niagara (N4)) based controllers and/or servers and any related LAN/ WAN Intranet and Internet connected routers and devices. Any and all required Ids and passwords for access to any component or software program shall be provided to the Owner.
- E. Furnish a distributed logic BACnet-based control system, compatible operator's workstation. The operator's workstation, all building controllers, application controllers, and all input/output devices shall communicate using the protocols and network standards as defined by ANSI/ASHRAE Standard 135-2012, BACnet. Provide all necessary BACnet-compliant hardware and software to meet the system's functional specifications. Provide Protocol Implementation Conformance Statement (PICS) for Windows-based control software and every controller in system, including unitary controllers.
- F. The Web Server is a flexible network server for multiple connected Niagara controllers. The Web Supervisor is designed to harness the power of the Internet and provide efficient integration and aggregation of the information from multiple controllers. In effect, the Web Supervisor creates a single view of these multiple devices, while providing a powerful network environment with comprehensive database management, alarm management, and messaging services. In addition, the Web Supervisor provides the engineering environment used to set up and manage the systems and the graphical user interface. The software is designed to run on 64-bit Windows 8.1 Enterprise, Windows Server 2012 Standard, 2012 R2 Standard, or better. The browser interface utilizes HTML5. JAVA is not required for the system and graphics to operate. The workstation shall include the following minimal features:
1. Processor: Intel Xeon CPU E5-2640 x64, or better, and is compatible with dual and quad core processors.
 2. RAM: 4 Gb of memory minimum.
 3. Hard disk: minimum 4 TB hard drive and additional space for archiving purposes.
- G. Java Application Control Engine JACE (9000 or latest model at the time of construction)
1. The Tridium JACE Controllers shall provide the interface between the LAN or WAN and the field control devices, and provide global supervisory control functions over the control devices connected to the JACE. It shall be capable of executing application control programs to provide:
 - a. Calendar functions
 - b. Scheduling
 - c. Trending
 - d. Alarm monitoring and routing
 - e. Time synchronization by means of an Atomic Clock Internet site including automatic synchronization
 - f. Integration of LonWorks controller data and BACnet controller data

- g. Network Management functions for all LonWorks and BACnet based devices
2. The JACE (9000) must provide the following hardware features as a minimum:
 - a. Two Ethernet Port -10/100 Mbps
 - b. Two Isolated RS-485 and, if needed, RS -232 ports
 - c. One LonWorks Interface Port - 78KB FTT-10A with Weidmuller connector.
 - d. Two BACnet MS/TP interface Ports
 - e. Power supply 120 VAC
 - f. Battery Backup
 - g. Real-time clock
 - h. Processor: TI AM3352, 1GHz, or greater
 - i. 1 GB Ram, or greater
 - j. 4 GB flash memory.
 - k. 2 GB user storage
 - l. USB flash drive
 - m. Wi-Fi (Client or WAP)
 - n. Operating temperature: -20°C to 60°C
 3. The JACE shall provide multiple user access to the system and support for ODBC or SQL. A database resident on the Tridium JACE shall be an ODBC compliant database or must provide an ODBC data access mechanism to read and write data stored within it.
 4. The JACE shall support standard Web browser access via the Intranet/Internet. It shall support a minimum of 64 simultaneous users.
 5. Event Alarm Notification and actions
 - a. The JACE shall provide alarm recognition, storage; routing, management, and analysis to supplement distributed capabilities of equipment or application specific controllers.
 - b. The JACE shall be able to route any alarm condition to any defined user location whether connected to a local network or remote via dial-up telephone connection, or wide-area network.
 - c. Provide for the creation of a minimum of eight of alarm classes for the purpose of routing types and or classes of alarms, i.e.: security, HVAC, Fire, etc.
 - d. Provide timed (schedule) routing of alarms by class, object, group, or node.
 - e. Provide alarm generation from binary object "runtime" and log event counts for equipment maintenance. The user shall be able to reset runtime or event count values with appropriate password control.
 - f. Control equipment and network failures shall be treated as alarms and annunciated.
 - g. Graphic with flashing alarm object(s)
 - h. The following shall be recorded by the Tridium JACE for each alarm (at a minimum):
 - 1) Time and date
 - 2) Location (building, floor, zone, office number, etc.)

- 3) Equipment (air handler #, accessway, etc.)
 - 4) Acknowledge time, date, and user who issued acknowledgement.
 - 5) Number of occurrences since last acknowledgement.
 - i. Alarm actions may be initiated by user defined programmable objects created for that purpose.
 - j. Defined users shall be given proper access to acknowledge any alarm, or specific types or classes of alarms defined by the user.
 - k. A log of all alarms shall be maintained by the JACE and/or a server (if configured in the system) and shall be available for review by the user.
 - l. Provide a "query" feature to allow review of specific alarms by user defined parameters.
 - m. A separate log for system alerts (controller failures, network failures, etc.) shall be provided and available for review by the user.
 - n. An Error Log to record invalid property changes or commands shall be provided and available for review by the user.
6. Data Collection and Storage
- a. The JACE shall have the ability to collect data for any property of any object and store this data for future use.
 - b. The data collection shall be performed by log objects, resident in the Tridium JACE that shall have, at a minimum, the following configurable properties:
 - 1) Designating the log as interval or deviation.
 - 2) For interval logs, the object shall be configured for time of day, day of week and the sample collection interval.
 - 3) For deviation logs, the object shall be configured for the deviation of a variable to a fixed value. This value, when reached, will initiate logging of the object.
 - 4) For all logs, provide the ability to set the maximum number of data stores for the log and to set whether the log will stop collecting when full, or rollover the data on a first-in, first-out basis.
 - 5) Each log shall have the ability to have its data cleared on a time-based event or by a user-defined event or action.
7. All log data shall be stored in a relational database in the Tridium JACE and the data shall be accessed from a server (if the system is so configured) or a standard Web Browser.
8. All log data, when accessed from a server, shall be capable of being manipulated using standard SQL statements.
9. All log data shall be available to the user in the following data formats:
- a. HTML
 - b. XML
 - c. Plain Text
 - d. Comma or tab separated values

10. Systems that do not provide log data in HTML and XML formats at a minimum shall provide as an alternative Microsoft SQL Server, Oracle Si or Expressa, Hyperion Solutions™ SQL Server.
 11. The Tridium JACE shall have the ability to archive it's log data either locally (to itself), or remotely to a server or other Tridium JACE on the network. Provide the ability to configure the following archiving properties, at a minimum:
 - a. Archive on time of day
 - b. Archive on user-defined number of data stores in the log (buffer size)
 - c. Archive when log has reached its user-defined capacity of data stores
 - d. Provide ability to clear logs once archived
 12. Audit Log
 - a. Provide and maintain an Audit Log that tracks all activities performed on the Tridium JACE. Provide the ability to specify a buffer size for the log and the ability to archive log based on time or when the log has reached the user-defined buffer size. Provide the ability to archive the log locally (to the Tridium JACE), to another Tridium JACE on the network, or to a server. For each log entry, provide the following data:
 - 1) Time and date
 - 2) User ID
 - 3) Change or activity: i.e., Change setpoint, add or delete objects, commands, etc.
 13. Database Backup and Storage
 - a. The Tridium JACE shall have the ability to automatically backup its database. The database shall be backed up based on a user defined time interval.
 - b. Copies of the current database and, at the most recently saved database shall be stored in the Tridium JACE. An onboard micro SD card contains a real-time back up of the system software, database, graphics, license and ability to be relocated to a replacement controller in the event the original controller fails.
 - c. The Tridium JACE database shall be stored, at a minimum, in XML format to allow for user viewing and editing, if desired. Other formats are acceptable as well, as long as XML format is supported.
 14. A JACE with I/O boards shall not be used for the control of any equipment such as fan coil units, boilers, pumps, etc. A single Unitary or Programmable controller shall manage the control functions for a specific mechanical system.
- H. Ethernet – MS/TP Module
1. Ethernet – MS/TP Module shall support every function as listed under paragraph A, General Requirements, of this section and the following.
 2. All communication with operator's workstation and all application controllers shall be through BACnet. Building controller Ethernet – MS/TP module shall incorporate as a minimum, the functions of a 2-way BACnet router. Controller shall route BACnet messages between the high-speed LAN (Ethernet 10/100MHz) and MS/TP LAN. Ethernet – MS/TP module shall also route messages from all other building controller modules onto the BACnet Ethernet network.
 - a. MS/TP LAN must be software-configurable from 9.6 to 76.8Kbps.

- b. The RJ-45 Ethernet connection must accept either 10Base-T or 100Base-TX BACnet over twisted pair cable (UTP).
- I. MS/TP Module
 1. MS/TP module shall support every listed function in this specification and the following.
 2. Building controller MS/TP module communications shall be through BACnet MS/TP LAN to all advanced application and application-specific controllers. MS/TP module shall also route messages to Ethernet – MS/TP module for communication over WAN.
 - a. MS/TP LAN must be software configurable from 9.6 to 76.8Kbps.
 - b. Configuration shall be through RS-232 connection.
- J. Wireless Module
 1. Integrated IEEE 802.11 a/b/g/n
 2. The wireless function comes from the factory disabled and can be turned on or off from a selector switch and can also be turned off through software. It should be turned off when wireless is not being used. Both Client mode and Access Point mode are supported, but cannot be run simultaneously. Broadcasting of the SSID can be turned off. For those using wireless please read the JACE 9000 WiFi document for proper configuration. It supports only WPA-PSK & WPA2-SPK security protocols. It has a single dual band antenna supporting 2.4 Ghz channels 1-11 & 5.8Ghz channels 36, 40, 44, 48, 149, 153, 157, 161, & 165.
 3. Several wireless protocols can be used including: WiFi, Zigbee, Z Wave, EnOcean, 3G, 4G LTE.
- K. Power Supply:
 1. Provide UPS for power supply-backup for each new building global controller (i.e. JACE 9000).
- L. Modbus Module
 1. Modbus Module shall support every function as listed in this specification
 2. Building Controller Modbus module communications shall be via one of three types of ports: EIA-485, EIA-422 or RS-232 connection. Modbus module shall convert Modbus data into BACnet objects. Modbus module shall also route messages to Ethernet-MS/TP module for BACnet Ethernet communication over WAN.
 - a. Modbus Module shall support ASCII or RTU Modbus communication at 9600 or 4800 baud.
 - b. EIA-422 and EIA-232 connection shall support one connection of Modbus unit.
 - c. EIA-485 connection shall support connection of up to 247 Modbus units.
 - d. Configuration shall be via RS-232 connection.
 3. BACnet Translation
 - a. All Modbus data shall be translated into BACnet objects by the Modbus module. All configuration tools shall be supplied to assure data is translated as necessary to the correct format and value.

- b. Standard BACnet object types supported shall include as a minimum: Analog Value, Binary Value, Calendar, Device, File, Group, Notification Class, Program and Schedule object types. All proprietary object types, if used in the system, shall be thoroughly documented and provided as part of the submittal data. All necessary tools shall be supplied for working with proprietary information.

2.06 APPLICATION CONTROLLERS – GENERAL

- A. All application controllers shall include universal inputs with 10-bit resolution that can accept 3K and 10K thermistors, 0–5VDC, 4–20mA, dry contact signals and a minimum of 3 pulse inputs. Any input on controller may be either analog or digital. Controller shall also include support and modifiable programming for interface to intelligent room sensor. Controller shall include binary outputs on board with analog outputs as needed.
- B. All program sequences shall be stored on board controller in memory. No batteries shall be needed to retain logic program. All program sequences shall be executed by controller ten(10) times per second and shall be capable of multiple PID loops for control of multiple devices. Programming of application controller shall be completely modifiable in the field over installed BACnet LANs or remotely through modem interface. Operator shall program logic sequences by graphically moving function blocks on screen and tying blocks together on screen. Application controller shall be programmed using same programming tools as building controller and as described in operator workstation section. All programming tools shall be provided and installed as part of system.
- C. Provide all application controllers with a minimum of 10% spare points for analog input, analog output, digital input and digital output signals.

2.07 APPLICATION CONTROLLERS –AIR HANDLER OR CENTRAL PLANT

- A. Provide one or more native BACnet application controllers to adequately cover all objects listed in object list. All controllers shall interface to building controller through MS/TP LAN using BACnet protocol. No gateways shall be used. Controllers shall include input, output and self-contained logic program as needed for complete control of units. Controllers shall be fully programmable using graphical programming blocks. Programming tool shall be resident on operator workstation and be the same tool as used for the building controller. No auxiliary or non-BACnet controllers shall be used.
- B. Programming of application controller shall be completely modifiable in the field over installed BACnet LANs or remotely using modem interface. Operator shall program logic sequences by graphically moving function blocks on screen and tying blocks together on screen. Application controller shall be programmed using programming tools as described in operator's terminal section.
- C. Application controller shall include support for intelligent room sensor. Display on intelligent room sensor shall be programmable at application controller and include an operating mode and a field service mode. All button functions and display data shall be programmable to show specific controller data in each mode, based on which button is pressed on the sensor. See sequence of operation for specific display requirements at intelligent room sensor.
- D. Schedules
 1. The controller shall support a minimum of three (3) BACnet Schedule Objects and have a real-time clock on board with battery backup to maintain time through a power loss.
- E. Logging Capabilities

1. Controller shall support a minimum of 50 trend logs. Any object in the controller (real or calculated) may be logged. Sample time interval shall be adjustable at the operator's workstation.
2. Controller shall periodically upload trended data to system server for long-term archiving if desired. Archived data stored in (MS Jet Database or SQL) database form and shall be available for use in third-party spreadsheet or database programs.

F. Alarm Generation

1. Alarms may be generated within the controller for any object change of value or state (either real or calculated). This includes things such as analog object value changes, and binary object state changes.
2. Alarm log shall be provided for alarm viewing. Log may be viewed on-site at the operator's terminal or off-site using remote communications.
3. Controller must be able to handle up to 25 alarm setups stored as BACnet event enrollment objects, with system destination and actions individually configurable.

- G. The packaging of the controller shall provide operable doors to cover the terminals once installation is complete. The housing of the controller shall provide for DIN rail mounting and also fully enclose circuit board.

2.08 APPLICATION CONTROLLER – UNITARY MECHANICAL EQUIPMENT

- A. Provide one native BACnet application controller for each piece of unitary mechanical equipment that adequately covers all objects listed in object list for unit. All controllers shall interface to building controller through MS/TP LAN using BACnet protocol. No gateways shall be used. Controllers shall include input, output and self-contained logic program as needed for complete control of unit.

2.09 APPLICATION CONTROLLER – VAV BOX SINGLE DUCT

- A. Provide one native BACnet application controller for each VAV box that adequately covers all objects listed in object list for unit. All controllers shall interface to building controller through MS/TP LAN using BACnet protocol. No gateways shall be used. Controllers shall include on board CFM flow sensor, inputs, outputs and programmable, self-contained logic program as needed for control of units.
- B. On board flow sensor shall be microprocessor-driven and pre-calibrated at the factory. All factory calibration data shall be stored in non-volatile memory. Calibration data shall be field adjustable to compensate for variations in VAV box type and installation. All calibration parameters shall be adjustable through intelligent room sensor. Operator's workstation, portable computers, and special hand-held field tools shall not be needed for field calibration.
- C. Provide duct temperature sensor at discharge of each VAV box that is connected to controller for reporting back to operator's workstation.

2.10 APPLICATION CONTROLLER – VAV BOX DUAL DUCT

- A. Provide one BACnet application controller for each dual-duct VAV box that adequately covers all objects listed in object list for unit. Systems that use two or more controllers for control of a single dual-duct box shall be rejected. All controllers shall interface to building controller via MS/TP LAN using BACnet protocol. No gateways shall be used. Controllers shall include two (2) on-board flow sensors, inputs, outputs and self-contained logic program as needed for control of units.

- B. On-board flow sensor shall be microprocessor driven and pre-calibrated at the factory. Pre-calibration shall be at 16 flow points as a minimum. All factory calibration data shall be stored in memory. Calibration data shall be field adjustable to compensate for variations in VAV box type and installation. All calibration parameters shall be adjustable through intelligent room sensor. Operator workstation, portable computers and special hand-held field tools shall not be needed for field calibration.
- C. Provide duct temperature sensors at discharge of cold duct and hot duct for report of data at operator workstation.

2.11 AUXILIARY CONTROL DEVICES

A. Temperature Sensors (TS)

1. Duct air temperature (duct mounted, indoor location)
 - a. Thermistor type with 1/4" stainless steel probe and junction box. 10K ohm, type II, or as required for controller interface. Two-wire, loop powered 4-20 mA. Probe length as required to extend 25% (minimum) to 50% (maximum) into the width of duct. Manufacturer: Veris #TF Series, Dwyer Instruments #TE-DFG Series, Kele (Minco) #TT Series, or equal.
 2. Duct air temperature (duct mounted, outdoor location)
 - a. Thermistor type with 1/4" stainless steel probe and weather-tight junction box. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA. Probe length as required to extend 25% (minimum) to 50% (maximum) into the width of duct. Manufacturer: Veris #TG Series, Dwyer Instruments #TE-DFW Series, Kele (Minco) #TT Series, or equal.
 3. Outside air temperature (wall mounted location)
 - a. Thermistor type with stainless steel or platinum probe and weather-proof aluminum junction box. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA. Probe encased in durable radiation shield with radiation solar shield. Manufacturer: Veris #TO Series, Dwyer Instruments #TE Series, or equal.
 4. Pipe or tank fluid temperature (immersion probe)
 - a. Immersion probe type temperature sensor encased in a corrosion-resistant stainless steel thermowell. Thermistor type with metallic housing. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA. Manufacturer: Veris #TIG Series, Dwyer Instruments #TE Series, or equal.
 5. Temperature averaging (coil mounting)
 - a. Thermistor type with bendable copper tubing element water-resistant junction box. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA. Probe length as required to extend across coil face at least twice to cover two corners and one midpoint. Mounting of tubing shall utilize Veris #AA64 mounting clips, or equal. Manufacturer: Veris #TA Series, Kele #ACI Series, or equal.
- B. Intelligent Room Temperature Sensor (TS) with LCD Readout
1. Sensor shall contain a backlit LCD digital display and user function keys along with temperature sensor. Controller shall function as room control unit and allow occupant to raise and lower setpoint, and activate terminal unit for override use-all within limits as programmed by building operator. Sensor shall also allow service technician access to hidden functions as described in sequence of operation.

2. The intelligent room sensor shall simultaneously display room setpoint, room temperature, outside temperature, and fan status (if applicable) at each controller. This unit shall be programmable, allowing site developers the flexibility to configure the display to match their application. The site developer should be able to program the unit to display time-of-day, room humidity and outdoor humidity. Unit must have the capability to show temperatures in degrees Fahrenheit or Centigrade.
3. Override time may be set and viewed in half-hour increments. Override time countdown shall be automatic, but may be reset to zero by occupant from the sensor. Time remaining shall be displayed. Display shall show the word "OFF" in unoccupied mode unless a function button is pressed.
4. See sequence of operation for specific operation of LCD displays and function keys in field service mode and in normal occupant mode. Provide intelligent room sensors as specified in point list. Field service mode shall be customizable to fit different applications. If intelligent room sensor is connected to VAV controller, VAV box shall be balanced and all air flow parameters shall be viewed and set from the intelligent room sensor with no computer or other field service tool needed.

C. Humidity Sensors

1. Indoor space humidity (wall mounted inside):
 - a. 1% accuracy thin film capacitive replaceable sensor element, LED display. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
 - b. Manufacturers: Veris #HW Series, Dwyer Instruments #RHP-W Series or equal.
2. Outside air humidity (wall mounted outdoors):
 - a. 2% accuracy thin film capacitive replaceable sensor element, with weatherproof housing. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
 - b. Manufacturers: Veris #HO Series, Dwyer Instruments #RHP-W Series, or equal.
3. Duct air humidity (duct mounted indoor application):
 - a. Humidity sensor, 2% accuracy thin film capacitive replaceable sensor element, with die cast metal housing. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
 - b. Manufacturers: Veris #HD Series, Dwyer Instruments #RHP-W Series, or equal.
4. Indoor space humidity with temperature (wall mounted inside):
 - a. Combination humidity and temperature sensor, 2% accuracy thin film capacitive replaceable sensor element, LED display, push button override and setpoint slider. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
 - b. Manufacturers: Veris #HW Series, Dwyer Instruments #RHP-W Series, Vaisala #HMW Series, or equal.
5. Outside air humidity with temperature (wall mounted outside):
 - a. Combination humidity and temperature sensor, 2% accuracy thin film capacitive replaceable sensor element, with weatherproof housing. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
 - b. Manufacturers: Veris #HO Series, Dwyer Instruments #RHP Series, Vaisala #HMS Series, or equal.

6. Duct air humidity and temperature (duct mounted indoor application):
 - a. Combination humidity and temperature sensor, 2% accuracy thin film capacitive replaceable sensor element, with die cast metal housing. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
 - b. Manufacturers: Veris #HD Series, Dwyer Instruments #RHP Series, Vaisala, #HMT Series, or equal.
7. Duct high limit humidity switch (duct mounted indoor application):
 - a. Single-stage duct hygrostat with insertion probe to monitor humidity level with NO and NC contacts. Adjustable relative humidity setpoint range of 35 to 100% RH. SPDT 250 Vac/ 15 amp.
 - b. Manufacturers: Honeywell #H6045A1002, or equal.
- D. Dew Point Sensor (Wall Mounted Indoors):
 1. Dew point transmitter with non-dispersive dual beam infrared sensor in high impact ABS plastic enclosure. Measurement range from 0°F to 80°F (-18°C to 26°C) dew point with altitude correction. 24 VAC input with 0-10 VDC or 4 to 20 mA output as required by controller interface. Accuracy +/- 3.6°F (2°C).
 2. Manufacturers: GE (Telaire) #Vaporstat 9002 or equal.
- E. Dew Point Sensor (Pipe Strap Mounted Indoors):
 1. Early-warning dew point switch to monitor chilled water pipes. Strap on mounting, status light, NO and NC alarm terminals, 24 VAC/0.3 VA.
 2. Manufacturers: Honeywell #HSS-DPS or equal.
- F. CO2 Sensors
 1. Indoor space measurement (wall mounted):
 - a. Non-dispersive infrared sensor in high impact white ABS plastic enclosure. Input power 20 to 30 VDC/24 AC, 100 mA. Analog output 4-20 mA. Operating range 32°F to 122°F (0°C to 50°C). Measurement range of 0-2000 ppm with accuracy of +/- 30 ppm.
 - b. Manufacturers: Veris #CWE Series, Dwyer #CDT Series, or equal.
 2. Outdoor air measurement (indoor duct mounted location):
 - a. Non-dispersive infrared sensor in high impact white ABS plastic enclosure. Input power 20 to 30 VDC/24 AC, 100 mA. Analog output 4-20 mA. Operating range 32°F to 122°F (0°C to 50°C). Measurement range of 0-2000 ppm with accuracy of +/- 30 ppm.
 - b. Manufacturers: Veris #CDE Series, Dwyer #CDT Series, or equal.
- G. CO2, Humidity, Temperature Combined Sensor (Indoor Wall and Duct Mounted)
 1. High impact white ABS plastic enclosure with digital LCD display and adjustable setpoints.
 2. Input power 20 to 30 VDC/24 AC, 100 mA.
 3. Analog output 4-20 mA.
 4. Operating range 32°F to 122°F (0°C to 50°C).

5. CO2 Sensor: Non-dispersive infrared sensor in. Measurement range of 0-5000 ppm with accuracy of +/- 30 ppm.
6. Humidity Sensor: Digitally profiled thin-film capacitive, plus or minus 2% RH. 2% accuracy thin film capacitive replaceable sensor element, with weatherproof housing. 10K ohm, Type 2, or as required for controller interface. Two-wire, loop powered 4-20 mA.
7. Temperature Sensor: Thermistor. 2% accuracy thin film capacitive replaceable sensor element.
8. Manufacturers: Veris #CWLP Series or equal.

H. Leak Detector

1. Water leak detector connected to BAS to alarm on detecting the presence of water in the following locations:
 - a. Secondary condensate drip pan below air conditioning air handling units and fan coils located above spaces with electrical and/or electronic equipment.
 - b. Below raised access floors with one sensor per 5,000 square feet (maximum) where water pipes are located below access floor. Or, one sensor per 10,000 square feet (maximum) where no water pipes are located below access floor.
 - c. On the floor adjacent to sump pump(s).
 - d. On the floor of mechanical rooms adjacent to electrical equipment and/or data/electronics equipment rooms. Single point leak detector for locating in condensate drip pan below air conditioning air handling units, under raised floors, in secondary drain pans, on the floor near a sump pump, and in other critical drain locations. Sensing of water shall provide an alarm and send a signal to the BAS or thermostat to shut down operation of the air conditioning compressors.
2. Features:
 - a. Mounting: Base mounted.
 - b. Service: water of conductive fluids.
 - c. Sensing gap: Minimum 1/8" (3 mm) to maximum 1/4" (6 mm).
 - d. Switch type: DPDT relay.
 - e. External power: 1 A @ 24 VAC/DC.
 - f. Audible alarm: 85 dB @ 1' distance (0.3 m).
 - g. Visual indicators:
 - 1) Green to indicate power is supplied.
 - 2) Red to indicate water is detected.
 - h. Temperature limits: 32 to 122°F (0 to 50°C).
 - i. Flammability: plenum rated electrical cable with length as required and UL-94 compliant housing.
 - j. Attached with 1/16" thick double sided adhesive urethane foam tape.
3. Manufacturers: Dwyer #WD3-LP-D2-A, Kele, Veris or equal.

I. Condensate Sensor (Pipe):

1. Solid state condensate detector for locating condensate on chilled water piping. Sensing of water shall provide a signal to the BAS system for control sequence adjustment to raise chilled water temperature.
 2. Features:
 - a. Service: mounted on metallic pipe from 1/2" to 3" in diameter.
 - b. Sensing: 80% to 90% RH (adjustable) surface moisture.
 - c. Switch type: SPST open/close.
 - d. External power: 40 mA at 24 VAC or 20 mA at 12 to 30 VDC.
 - e. Temperature limits: 149°F (65°C).
 - f. Flammability: plenum rated electrical cable with length as required and UL-94 compliant housing.
 - g. Mounting bracket with stainless steel worm gear clamp for attachment.
 3. Manufacturers: Consense #CG-ICM-P or equal.
- J. Differential Pressure Transmitters:
1. Duct Static Pressure Transmitter:
 - a. Differential pressure transducer with selectable range, +/- 1% accuracy, with push button auto-zero, LCD display.
 - b. Manufacturers: Veris #PX Series, Dwyer Instruments #MS2, Kele #DPA Series, or equal.
 2. Building Static Pressure Transmitter:
 - a. Differential pressure transducer with selectable range, +/- 1% accuracy, with push button auto-zero. Provide with AA05 ceiling mount static pressure pick up, LCD display.
 - b. Manufacturers: Veris #PX Series, Dwyer Instruments #MS2, Kele #DPA Series, or equal.
 3. Water differential pressure transmitter:
 - a. Differential pressure transmitter, wet/wet, switch selectable pressure ranges, jumper selectable port swap, LCD display and NEMA 4 enclosure.
 - b. Manufacturers: Veris #PW Series, Dwyer Instruments #MS2, or equal.
- K. Differential Pressure Switches:
1. Filter differential pressure switch for status:
 - a. Adjustable differential pressure switch, dual scale adjustable knob, silicone diaphragm, single-pole double-throw type, 1/4" tubing diameter, setting range from 0.08 in. w.c. (20 Pa) up to 20 in. w.c. (5000 Pa), and NEMA-3 enclosure.
 - b. Manufacturers: Dwyer #ADPS Series or equal.
 2. Duct static manual reset high pressure safety switch for supply fan shut down:
 - a. Adjustable trip and manual reset, single-pole double-throw, 120-480 VAC. Maximum operating range of -30°F to 180°F (-34°C to 82.2°C) and humidity limit of 80% RH non-condensing. Provide weatherproof housing where mounted outdoors. Adjustable setpoint between 3.0 to 11.75 in. w.c.
 - b. Manufacturers: Dwyer #1900-10-MR Series or equal.

3. Duct static manual reset high pressure safety switch for return fan shut down:
 - a. Adjustable trip and manual reset, single-pole double-throw, 120-480 VAC. Maximum operating range of -30°F to 180°F (-34°C to 82.2°C) and humidity limit of 80% RH non-condensing. Provide weatherproof housing where mounted outdoors. Adjustable setpoint between 1.40 to 5.5 in. w.c.
 - b. Manufacturers: Dwyer #1900-5-MR Series or equal.

- L. Air Filter Differential Pressure Gauges: (where not supplied by air handling equipment manufacturer):
 1. Dial type, diaphragm-actuated with external zero adjustment and 3-7/8-inch diameter dial.
 2. With two (2) static pressure taps, 2-way valves, tubing and mounting plate (and adjustable signal flag).
 3. Range as recommended by filter manufacturer.
 4. One gauge per filter bank for direct field verification independent of BAS monitoring.
 5. Manufacturers: Dwyer 2000 Series Magnehelic or equal.

- M. Current Sensors
 1. Current sensing switch for constant speed fans and pumps to detect belt loss, coupling shear and mechanical failure:
 - a. Current switch with split core, adjustable trip, pilot light, self-gripping split core housing and mounting bracket.
 - b. Manufacturers: Veris #HX08 Series or equal.
 2. Current sensing switch for VFD controlling multiple fans and pumps:
 - a. VFD current switch split core, self-learning adjustable trip, pilot light, self-gripping split core housing and mounting bracket.
 - b. Manufacturers: Veris #H614 or equal.
 3. Current sensing switch with fixed trip point for monitoring constant speed direct-drive fans, recirculating pumps or other fixed loads:
 - a. Current switch with split core, fixed trip, self-gripping split core housing and mounting bracket.
 - b. Manufacturers: Veris #HX00 Series or equal.
 4. Current sensing transmitter for load trending with proportional 4 to 20 mA output signal:
 - a. Current sensing transmitter with self-gripping split core, preset slide switches, and removable mounting bracket.
 - b. Manufacturers: Veris #H921 or equal.
 5. Current sensing transmitter with relay for fan start/stop control and status monitoring of motors:
 - a. Current sensing transmitter with integral relay, slide switches, self-gripping split core, and removable mounting bracket.
 - b. Manufacturers: Veris #H931 or equal.

- N. Flow Meters – Liquid:

1. Electromagnetic inline flow meter for high accuracy flow measurement of clean fluid in a closed loop:
 - a. Accuracy: +/- 0.25% with bidirectional flow capability. Maintain minimum of three (3X) straight pipe diameters upstream and two (2X) pipe diameters downstream when installed greater than seven (7X) pipe diameters downstream of a pump.
 - b. Electrodes: Two electrodes for flow measurement, one electrode for empty pipe detection, and one electrode for grounding as required by piping system. Constructed of Hastelloy C22, 316 stainless steel, gold, platinum or tantalum.
 - c. Pipe spool: 316 stainless steel.
 - d. Flanges: ANSI B16.5 carbon steel, 304 or 316 stainless steel.
 - e. Housing: NEMA 4X weather tight aluminum enclosure, or carbon steel or stainless steel. Powder coated.
 - f. Power: 120 VAC or 24 VDC.
 - g. Connections: Four programmable digital outputs (minimum), one analog programmable and scalable output, and one digital input.
 - h. Totalizing display: Backlit with minimum four rows of text with BACnet interface.
 - i. Ambient operating temperature range: -4°F to 140°F (-20°C to 60°C).
 - j. Fluid temperature to maximum of 212°F (100°C).
 - k. Manufacturers: Badger Meter #ModMAG M2000, Onicon #FT-3000.

- O. Flow Meters – Steam:
 1. Vortex flow meter, integral 1,000 Ohm platinum RTD for precise temperature measurement, pressure transducer for instantaneous pressure measurement, flow straightener, ANSI class 300 flanges.
 2. Manufacturers: Onicon #F-2600 Series, Preso (Badger Meter) #CV Series or equal.

- P. BTU Meters:
 1. BTU meter with BACnet interface with matched temperature sensors and thermo-wells, NEMA 13 wall mount enclosure, 316 stainless steel, weather tight aluminum enclosure, and standard or copper installation kit including 1" full port bronze ball valve, close nipple, and branch outlet.
 2. Manufacturers: Onicon #F-3500 electromagnetic flow meter, or equal by E-Mon D-Mon or Badger.

- Q. Airflow Measuring Arrays
 1. Provide one thermal dispersion airflow/temperature measurement device (ATMD) at each location indicated on the plans, schedules and/or control schematics.
 2. Each ATMD shall consist of one to four sensor probes and a single, remote transmitter. Each sensor probe shall consist of one to eight independent sensor nodes in a gold anodized, aluminum 6063 alloy tube with 304 stainless steel mounting brackets.
 3. Each sensor node shall consist of two hermetically sealed bead-in-glass thermistors. Chip thermistors of any type or packaging are not acceptable.
 4. The velocity-weighted average temperature output performance of the ATMD is preferred to that of the specified temperature measuring device (TMD), when the location of the ATMD and TMD are effectively the same.
 5. Outside Air Measurement:

- a. Provide a minimum outside airflow measuring station in a straight duct section upstream from the minimum outside air dampers and interfacing control for providing an electronic signal for use by the control contractor in controlling a minimum outside airflow. On outdoor mounted air handling units, outside airflow measurement station is to be factory mounted on the intake side of the outside air intake (upstream of the damper).
 6. Sensor Performance:
 - a. Fan Installation:
 - 1) Installed airflow accuracy: +/- 3% to 10% of reading with +/- 0.25% repeatability.
 - 2) Sensor probe performance: +/- 2% of reading, 0-5000 fpm, +/- 0.15°F temperature accuracy.
 - b. Outside Air/duct Installation:
 - 1) Installed airflow accuracy: +/- 2% of reading with +/- 0.25% repeatability.
 - 2) Sensor probe performance: +/- 2% of reading, 0-5000 fpm, +/- 0.15°F temperature accuracy.
 7. Transmitter:
 - a. Flow measuring array to include a transmitter for flow and temperature analog output signal for the building energy management system to be user selectable in either 4-20 mA or 0-10VDC. Coordinate signal output with controls installer.
 - b. Transmitter to include an analog airflow gauge to provide direct analog readout in cfm. Mount on the outside of the air handler if air handler is located in a mechanical room. Mount in a NEMA 3R control cabinet if located outside.
 - c. Device to provide switch selectable Modbus or Johnson N2 outputs.
 - d. Device to be UL listed.
 - e. The transmitter shall be powered by 24 VAC, shall include over-voltage and over-current protection, and shall include watchdog circuitry to ensure continuous operation following power failures and/or brown-outs.
 - f. The transmitter shall determine the airflow rate and temperature of each sensing node prior to averaging.
 - g. The transmitter shall include self-diagnostics and other features to ensure reliability and continued operation despite a limited failure. The transmitter shall automatically detect sensor damage and correctly calculate the average using the remaining functional sensor nodes, while reporting a system fault over the network and by local visual indication.
 - h. All integrated circuits shall be industrial rated for operation down to -40°F (-40°C).
 - i. The environmental operating temperature limits for the transmitter shall be -20°F to 120°F (-28.8°C to 48.8°C).
 - j. The system shall be factory tested prior to shipment and not require calibration or adjustment over the life of the equipment when installed in accordance to manufacturer's guidelines.
 - k. The Sensors shall be calibrated to NIST traceable standards.
 8. Manufacturers: Ebtron, Paragon Controls, Dynasonics, or equal.
- R. LED Pilot Lights

1. Provide wall mounted pilot lights to indicate when operable windows may be opened or closed based on outdoor weather conditions as determined by BAS. Mount adjacent to main access door serving space with operable windows or adjacent to light switch, as shown on Architectural or Mechanical drawings. Coordinate final placement of pilot lights and color of cover plate with Owner's Representative.
2. Polycarbonate or steel wall box.
3. Wall plate color to match wall color. Color options to include: ivory, white, black or stainless steel.
4. Continuous color indication. LED lights, 20-25 mm diameter. One green light located above one red light.
5. Voltage as selected by BAS installer, 12-volt or 24-volt, 20 mA, maximum.
6. Manufacturers: Signaworks #WP22 Series or equal.

S. Flow Switch

1. Paddle type vane flow switch for insertion into pipe sizes 1" to 8". Forged brass body, stainless steel vane, and tin-bronze bellows. Maximum operating temperature to 230°F (110°C) and maximum operating pressure to 145 psig (10 bar). NEMA 4 enclosure, SPDT snap switch, 250 VAC (max). Connection using 1" male NPT or BSPT. Switch must be installed vertically on a horizontal pipe run.
2. Manufacturers: Dwyer #FS-2, or equal.

2.12 ACTUATORS

A. Electronic Actuators:

1. Size for torque required for damper seal at load conditions.
2. Coupling: V-bolt dual nut clamp with a V-shaped, toothed cradle.
3. Mounting: Actuators shall be capable of being mechanically and electrically paralleled to increase torque if required.
4. Overload protected electronically throughout rotation.
5. Fail-Safe Operation: Mechanical, spring-return mechanism
6. Electronic Fail-Safe Operation: Incorporate a visual indication of the fail safe status on the face of the actuator. The power fail position shall be field adjustable between 0 to 100% in 10% increments. The electronic fail safe shall have a 2-10 second adjustable operational delay.
7. Power Requirements (Spring Return): 24-V ac, maximum 10 VA at 24-V ac or 8 W at 24-V dc (running). Maximum 1 VA at 24-V ac or 1 W at 24-V dc (holding).
8. Proportional Actuators shall be fully programmable through an onboard EEPROM by using an external cable and software interface.
9. Temperature Rating: -22 to +122°F.
10. Housing: Minimum requirement NEMA type 2 mounted in any orientation.
11. Agency Listings: ISO 9001, cULus, CE or CSA
12. The manufacturer shall warrant all components for a period of 5 years from the date of production, with the first two years unconditional.
13. Manufacturers: Belimo, Siemens, Honeywell, Keystone #777, or equal.

- B. Actuators with torque requirements exceeding 360 inch-pounds:
1. The combination of valve and actuator shall meet the close-off requirements as specified in Section 2.16.H – Butterfly Valves.
 2. Coupling: ISO 5211 mounting standards.
 3. Overload Protection: A self-resetting thermal switch embedded in the motor.
 4. Manual Override: Actuator shall be equipped with a hand wheel or shaft for manual override to permit operation of the actuator in the event of an electrical power failure
 5. Power Requirements: 24VAC, 120VAC, or 230VAC single phase.
 6. Auxiliary Switches: 2 SPDT rated 3A at 250 VAC.
 7. Temperature Rating: -22 to +122°F.
 8. Duty Cycle Rated 75% minimum.
 9. Housing: Minimum requirement NEMA type 4X/ IP67 with an industrial quality coating. Actuator shall have an internal heater to prevent condensation within the housing. A visual indication beacon shall indicate position status of the device.
 10. Agency Listing: ISO, CE, CSA
 11. The manufacturer shall warrant for 2 years from the date of production.
 12. Manufacturers: Belimo, Siemens, Honeywell, or equal.

2.13 CONTROL VALVES

- A. Manufacturer: Belimo, Siemens, Honeywell, or equal.
- B. The manufacturer shall warrant all components for a period of 5 years from the date of production, with the first two years unconditional (except as noted).
- C. Control Valve Actuators:
1. Size for valve close off at 150 percent of total system (head) pressure for two-way valves; and 100 percent of pressure differential across the valve or 100 percent of total system (pump) head differential pressure for three-way valves.
 2. Coupling: directly couple and mount to valve stem, shaft ISO-style direct-coupled mounting pad.
 3. Non-spring return actuators shall have manual override
 4. Spring return actuators of 90 inch-pounds or above shall have manual override.
- D. Control Valves:
1. Factory fabricated of type, body material, and pressure class based on maximum pressure and temperature rating of piping system, unless otherwise indicated.
 2. Sizing (Water):
 - a. Two-Position: Line size or size using a pressure differential of 1 psi.
 - b. Two-Way Modulating: Size for a pressure differential across the valve of 4 psi at design flow, or twice the load pressure drop at design flow.
 - c. Three-Way Modulating: Size for a pressure differential across the valve of not more than 4 psi at design flow
 3. Sizing (Steam):

- a. Two-Position: Line size or sized using 10% of inlet gauge pressure.
 - b. Modulating: 15 psig or less inlet steam pressure, the pressure drop shall be 80% of inlet gauge pressure. Higher than 15 psig inlet steam pressure the pressure drop shall be 42% of the inlet absolute pressure.
4. Close-Off Pressure Rating: Combination of actuator and trim shall provide minimum close-off pressure rating of 150 percent of total system head pressure for two-way valves and 150 percent of the design pressure differential across the three-way valves.
 5. The control valve assembly shall be provided and delivered from a single manufacturer as a complete assembly.
- E. Pressure Independent Control Valves:
1. NPS 2 and Smaller: Forged brass body rated at no less than 400 PSI, chrome plated brass ball and stem, female NPT ends, dual EPDM lubricated O-rings and a brass or TEFZEL characterizing disc for equal percentage characteristic.
 2. NPS 2-1/2 through 6: GG25 cast iron body according to ANSI Class 125, standard class B, stainless steel ball and blowout proof stem, flange to match ANSI 125 with a dual EPDM O-ring packing design, PTFE seats, and a stainless steel flow characterizing disc.
 3. The control valve assembly shall have an integral magnetic flow meter Magnetic flow meter to accurately control the flow from 0 to 100% full rated flow with an operating pressure differential range of 5 to 50 PSID across the valve with a valve body accuracy of +/- 5% variance due to differential pressure fluctuation or +/- 10% total assembly error incorporating differential pressure fluctuation, manufacturing tolerances and valve hysteresis.
 4. Flow Characteristics: NPS 1/2" through 2" Equal percentage characteristic. NPS 2-1/2" through 6" capable of Equal percentage or Linear characteristic (field programmable).
 5. All proportional actuators shall be capable of being electronically programmed in the field by use of external computer software or a dedicated handheld tool for the adjustment of flow. Programming using actuator mounted switches or multi-turn actuators are not acceptable.
 6. Actuators for 3-wire floating (tri-state) and on 2 position (on/off) on 1/2" to 1" pressure independent control valves shall fail in place.
 7. Water Coil optimization 2-1/2" through 6" shall be accomplished by utilizing an energy meter (a pressure independent control valve assembly) with two integral temperature sensors providing feedback of coil inlet and coil outlet water temperature; and integral magnetic flow meter for control and to provide actual analog flow feedback. Valve assembly to have built in intelligence to control pressure independently and a Delta T Manager mode to mitigate low delta T syndrome by referencing an internally programmed design delta T setpoint. Valve assembly shall be capable of communicating data by means of BACnet MS/TP, BACnet I/P and TCP IP. Data to include, but not be limited to, inlet and outlet coil water temperatures, valve position, absolute flow, absolute valve position, absolute power and heating/cooling energy in BTU/hr. Valve assembly shall be capable of trending and storing up to 13 months of data on the actuator. Trended data on actuator to be retrievable via TCP IP or direct connect and download to *.csv file format.
 8. The manufacturer shall provide a published commissioning procedure following the guidelines of the National Environmental Balancing Bureau (NEBB) or Associated Air Balance Council (AABC).
 9. The control valve shall require no maintenance and shall not include replaceable cartridges.

10. NPS 2" and smaller pressure independent control valves for individual coil control shall be provided as part of a pipe package supplied by the valve manufacturer. The supply side of the coil shall contain an integrated isolation ball valve/manual air vent with strainer/shut-off valve/drain with pressure/temperature test ports. The return side shall contain a union fitting with a pressure/temperature test port, pressure independent control valve, and integrated isolation ball valve/manual air vent with a pressure/temperature test port. Shut-off valves as an integrated part of the pressure independent control valve are prohibited. A braided stainless flexible hose shall be provided for each coil supply and return connection for all pipe packages.
- F. Characterized Control Valves:
1. NPS 1/2" and smaller for Terminal Units: Nickel plated forged brass body rated at no less than 600 psi WOG Water oil gas, chrome plated brass Stainless steel stem is an option ball and blowout proof stem, female NPT end fittings, with a dual EPDM O-Ring packing design, fiberglass reinforced Teflon seats, and a TEFZEL flow characterizing disc.
 2. NPS 1" through 2": Nickel-plated forged brass body rated at no less than 400 psi, stainless steel ball and blowout proof stem, female NPT end fittings, with a dual EPDM O-ring packing design, fiberglass reinforced Teflon seats, and a TEFZEL flow characterizing disc.
 3. NPS 2-1/2" through 6": GG25 cast iron body according to ANSI Class 125, standard class B, stainless steel ball, stainless steel blowout proof stem, flange to match ANSI 125 with a dual EPDM O-ring package design, PTFE seats, and a stainless steel flow characterizing disc.
 4. Flow Characteristics: Equal percentage characteristics.
 5. Six-way control valve used for chilled beam applications shall have the following characteristics:
 - a. NPS 1/2" and 3/4": Nickel plated forged brass body rated at no less than 600 psi, dual chrome plated brass ball and blowout proof stems, and female NPT end fittings. Each three-way portion of the 6-way valve body shall have EPDM O-Ring packing design, fiberglass reinforced Teflon seats, and a TEFZEL flow characterizing disc.
 - b. The six-way control valve shall be controlled by a rotary actuator for managing two media in a modulating application. The valve shall be closed to all flow at mid-rotation.
- G. Butterfly Valves – Resilient Seat:
1. NPS 2 to 12: Valve body shall be full lugged cast iron 200 psig body with a 304 stainless steel disc, EPDM seat, extended neck and shall meet ANSI Class 125/150 flange standards. The shaft shall be supported at four locations by RPTFE bushings.
 2. NPS 14 and Larger: Valve body shall be full lugged cast or ductile iron, 150 psig body with a 304 stainless steel disc, EPDM seat, extended neck and shall meet ANSI Class 125/150 flange standards. Disc-to-stem connection shall utilize a dual-pin method to prevent the disc from settling onto the liner. The shaft shall be supported at four locations by RPTFE bushings.
 3. Sizing:
 - a. Two-Position: Line size or size using a pressure differential of 1 psi.
 - b. Modulating: 4 psig or twice the load pressure drop, whichever is more. Size for the design flow with the disc in a 60-degree-open-position and a design velocity not to exceed 12 feet per second.

4. Close-Off Pressure Rating: NPS 2-12" 200 psi bubble tight shut-off. NPS 14 and larger, 150 psi bubble tight shut-off.

H. Butterfly Valves – High Performance:

1. Valve body shall be full lugged carbon steel ANSI Class 150 [300] body with a 316 stainless steel disc without a nylon coating, RTFE seat, and be ANSI Class 150300 flange standards. Blowout-proof shaft shall be 17-4ph stainless steel and shall be supported at four locations by glass-backed TFE bushings. Valve packing shall be Chevron TFE and shall include fully adjustable packing flange and separable packing gland. Valve body shall have long stem design to allow for 2" insulation (minimum). Valve face-to-face dimensions shall comply with API 609 and MSS-SP-68. Valve assembly shall be completely assembled and tested, ready for installation.
2. Sizing:
 - a. Two-Position: Line size or size using a pressure differential of 1 psi.
 - b. Modulating: 4 psig, or twice the load pressure drop, whichever is more. Size for the design flow with the disc in a 60-degree-open-position with the design velocity less than 32 feet per second.
3. Flow Characteristics: Modified equal percentage, unidirectional.
4. Close-Off Pressure Rating: 150 psi bubble tight shut-off.
5. Media Temperature Range: ANSI Class 150 limitations.
6. Max Differential Pressure: 285 psi @ 100°F for ANSI 150 (725 psi @ 100°F for ANSI 300).

I. Equipment Isolation Valves:

1. Slow Closing/Quick Opening Solenoid Valve (2-Way/2-Position), 1/2" to 2-1/2":
 - a. Class 125, brass body, stainless steel core, snubber slows disc closing to protect system against water hammer, minimum operating pressure differential 5 psi, 120 VAC input, normally closed (closed when deenergized). Lead-free construction and UL/NSF compliant. Valve shall full stroke close in 4 to 10 seconds and open immediately when energized. Manufacturers: Asco Redhat #8221 or equal.
2. Butterfly Valves, 2-1/2" and larger:
 - a. Valve body shall be full lugged cast iron 200 psig body with a 304 stainless steel disc, EPDM seat, extended neck and shall meet ANSI Class 125/150 flange standards. The shaft shall be supported at four locations by RPTFE bushings.
 - b. Valve actuator with integrated linkage for 90° degree rotation and visual position indicator. Power supply with input voltage from 24 to 240 VAC. Power consumption in operation 20 watts and resting power consumption of 6 watts maximum. Adjustable running time of 30 to 120 seconds for full stroke. Ambient humidity to 95% RH non-condensing and operating temperature from -22°F to 122°F (-30°C to 50°C). Die cast aluminum Type 4X enclosure. Open/close or floating point operation as required by system operation. Manufacturer: Belimo #PR Series or equal.

2.14 ENERGY VALVE

1. NPS 1/2" through 2":

- a. 2-way characterized control valve with tight close-off. Nickel-plated forged brass body rated at no less than 360 psi, stainless steel ball and blowout proof stem, female NPT end fittings, with a dual EPDM O-ring packing design, fiberglass reinforced Teflon seats, and flow characterizing disc.
 - b. Non-spring return or electronic fail-safe actuator with analog input and output
 - c. Ultrasonic flow meter with temperature and glycol compensation.
 - d. Supply and return temperature sensors with thermowells and pipe fittings.
2. NPS 2-1/2" through 6":
- a. 2-way characterized control valve with tight close-off. GG25 cast iron body according to ANSI Class 125 or Class 250 per system pressure class, standard class B, stainless steel ball, stainless steel blowout proof stem, flange to match ANSI 125/250 with a dual EPDM O-ring package design, PTFE seats, and a stainless steel flow characterizing disc.
 - b. Non-spring return or electronic fail-safe actuator with analog input and output
 - c. Magnetic flow sensor.
 - d. Supply temperature sensor with thermowell.
 - e. Return temperature sensor embedded.

B. Manufacturer: Belimo.

2.15 DOMESTIC WATER SECURITY VALVES

- A. Scope: connect to BAS for automatic opening and closing of domestic cold water supply to building.
- B. Control Valve Actuator:
1. High torque actuator, fast opening and closing to control incoming domestic cold water service.
 2. NEMA 6P waterproof enclosure.
 3. UL listed.
 4. Power supply input: 100–240 volts, 60 Hz, 1 amp maximum. Output 18 volts, 2.22 amps.
 5. BAS feedback signals for valve open or closed.
 6. 12 VDC trigger contact to open valve.
- C. Control Valve:
1. 316 stainless steel, 3-piece construction for body, ball and stem.
 2. Equipped with a manual handle for emergency override.
 3. Pressure rated to 600 psi, minimum.
 4. Full port ball valve.
 5. Threaded for sizes 1/2" to 2".
- D. Low lead and certified for potable water use per UPC and NSF/ANSI 61.
- E. Manufacturer: Automatic Security Valves, or equal.

2.16 WIRELESS SYSTEM

A. Architecture and Communications:

1. Wireless equipment controllers and control devices shall conform to IEEE 802.15.4 standard for low-power, low duty-cycle RF transmitting systems. Equipment shall also comply with the following standards:
 - 1) UL 916: Energy Management Equipment
 - 2) UL 94: The Standard for Flammability of Plastic Materials for Parts in Devices and Appliances: 5 VA flammability rating
 - 3) UL 873: Temperature regulating and indicating equipment
 - 4) ZigBee Building Automation
 - 5) BACnet Tunneling
2. Communication between equipment controllers shall conform to ZigBee Building Automation (ZBA) standard as BACnet tunneling devices to ensure future integration of other ZBA certified devices.
3. Operating range shall be a minimum of 200 feet; open range shall be 2,500 ft. (762 m) with less than 2% packet error rate to ensure reliable operation.
4. To maintain robust communication, mesh networking and two-way communications shall be used to optimize the wireless network health.
5. Wireless communication shall be capable of many-to-one sensors per controller to support averaging, monitoring, and multiple zone applications.
6. Certifications shall include FCC CFR47 - RADIO FREQUENCY DEVICES - Section 15.247 & Subpart E.
7. The system devices shall use direct sequence spread spectrum RF technology.
8. The system devices shall operate on the 2.4 GHZ ISM Band.
9. The system devices shall be FCC compliant to CFR Part 15 subpart B Class A.

B. Service Tools:

1. To support network setup and troubleshooting, service tools shall display link quality and hop quantities for each wireless device.
2. Wireless service tool access to communication link shall be provided to minimize installation and troubleshooting labor.

C. Construction:

1. Devices such as sensors, receivers and signal coordinators, intended to be installed in a return air plenum, shall be assembled in a plenum rated plastic housing with flammability rated to UL94-5VB. Wall mounted devices may be assembled in NEMA-1 plastic enclosures.

D. Wireless Field Bus System:

1. The system shall employ ZigBee technology to create a wireless mesh network to provide wireless connectivity for BACnet devices at multiple system levels. This includes communications from field controllers to sensors and from sensors to field controllers. Wireless devices shall co-exist on the same network with hardwired devices. Hardwired controllers shall be capable of retrofit to wireless devices with no special software.

2. The field bus coordinator shall provide a wireless interface between supported field controllers and an NAE35/45/55 or NCE25 supervisory controller via the BACnet MS/TP field bus. Each wireless mesh network shall be provided with a coordinator for initiation and formation of the network
 - a. The coordinator shall operate as a bidirectional transceiver with the sensors and routers to confirm and synchronize data transmission.
 - b. The coordinator shall be capable of communication with sensors and routers up to a maximum distance of 250 Feet (line of sight).
 - c. The coordinator shall have LED indicators to provide diagnostic information required for efficient operation and commissioning.
3. A wireless field bus router shall be used with any controller and field device to provide a wireless interface to supervisory devices and associated wireless mesh room temperature sensors.
 - a. The router shall operate as a bidirectional transceiver with other mesh network devices to ensure network integrity.
 - b. The router shall be capable of communication with other mesh network devices at a maximum distance of 250 feet (line of sight).
 - c. The router shall provide LED indication for use in commissioning and troubleshooting that can be disabled.

E. Wireless Room Temperature Sensors:

1. Wireless space sensors shall be capable of continuous operation in the following conditions:
 - a. Ambient operating temperature range shall be 32°F to 122°F (0 to 50°C).
 - b. Ambient operating and storage humidity range shall be 5 to 95%, non-condensing.
2. Wireless room temperature sensors shall sense and transmit room temperatures, room set point, room occupancy notification low battery condition to an associated router.
 - a. The sensors shall be available with:
 - 1) Warmer/cooler setpoint adjustment or no setpoint adjustment.
 - 2) Setpoint adjustment scale: 55°F to 85° F (minimum range).
 - b. Wireless sensors shall be provided with display of room temperature, signal strength, fan mode, occupancy and network status as required by application and indicated on plans or in the schedules.
3. Features:
 - a. The wireless space sensor battery life shall provide at least 15 years life under normal operating conditions and must be readily available size AA, 1.5V.
 - b. To check for proper operation, wireless space temperature sensors shall include signal strength on the space sensor display.
 - c. To support use by the physically impaired, the wireless space sensor shall be a minimum font size of 12 points, and the LCD model shall be readable in low light conditions.
 - d. An optional 2% relative humidity sensors module shall be available for humidity control applications to minimize the need for wired sensors, and shall not shorten typical battery life to less than 15 years.

- e. Wireless space sensors shall be available as: temperature only, field configurable model with digital display, and optional 2% humidity module for use in either model above. The field configurable models shall all allow field configuration without a field service tool. Configuration options include: setpoint, override pushbuttons, fan speed, and system mode switches. System mode, fan speed and setpoint shall include a lock option. The digital display shall also be field configurable to display in Fahrenheit or Celsius units of measure, and can also be configured to display setpoint only.
 - f. The wireless space sensor addresses shall be held in non-volatile memory to ensure operation through system voltage disturbances and to minimize the risk of incorrect association.
 - g. The wireless space sensor shall be addressed using pushbuttons and display with numerical indication to simplify and reduce installation time and minimize risk of incorrect addressing.
 - h. The wireless space sensor shall include security screws to protect against theft.
4. Accuracy:
- a. To ensure proper system performance, the wireless space sensors shall automatically determine when the space temperature is rapidly changing. When the space temperature is rapidly changing, the space temperature shall be transmitted at least once each 30 seconds. The maximum time between transmissions shall be 15 minutes. Space temperature sensing accuracy shall be +/- 0.5°F (+/- 0.28°C).
- F. Wireless Communications Interface:
- 1. Wireless communication devices and receivers shall be capable of continuous operation in the following conditions:
 - a. Ambient operating temperature range shall be 32°F to 122°F (0 to 50°C).
 - b. Ambient operating and storage humidity range shall be 5 to 95%, non-condensing.
 - 2. Features:
 - a. Wireless communications interface shall be addressed using rotary switches with numerical indication to simplify and reduce installation time and minimize risk of incorrect addressing.
- G. Many-To-One Wireless Receiver:
- 1. The Many-To-One System Receiver shall receive wireless Radio Frequency (RF) signals containing temperature data from multiple wireless room temperature sensors.
 - 2. The receiver shall operate as a bidirectional transceiver with the sensors to confirm and synchronize data transmission.
 - 3. The receiver shall be capable of communication with sensors up to a distance of 200 Feet.
 - 4. The receiver shall be assembled in a plenum rated plastic housing with flammability rated to UL94-5VB.
 - 5. The receiver shall have LED indicators to provide information regarding the following conditions:
 - a. Power: on/off.
 - b. Ethernet: receiver activity/no activity.

- c. Wireless Normal Mode: transmission from sensors/no transmission.
- d. Wireless Rapid Transmit Mode: no transmission/weak signal/adequate signal/excellent signal.
- e. Ethernet Connection: No connection/10Mbps connection/100Mbps connection
- f. Network Activity: No network activity/half-duplex communication/full-duplex communication.

H. One-to-One Wireless Receiver:

- 1. The One-To-One Wireless Receiver shall receive wireless radio frequency (RF) signals containing temperature data from multiple wireless room temperature sensors and communicate this information to field controllers via the communication bus.
- 2. The receiver shall operate as a bidirectional transceiver with the sensors to confirm and synchronize data transmission.
- 3. The receiver shall be capable of communication with from one to five sensors up to a distance of 200 Feet.
- 4. The receiver shall have LED indicators to provide information regarding the following conditions:
 - a. Power.
 - b. Communication Bus: Receiver activity/no activity.
 - c. Wireless RF: Transmission from sensors/no transmission.
 - d. Wireless Rapid Transmit Mode: No transmission/weak signal/adequate signal/excellent signal.

I. System Tools:

- 1. Wireless Space Sensor Installation and Configuration Tools
 - a. To enable installation and servicing when specialized tools are required, site survey and installation tools as well as software shall be provided to the contractor use for system installation and commissioning for the duration of the warranty period.
 - b. To enable installation and servicing when specialized tools are required, site survey and installation tools as well as software shall be provided to the Owner for permanent possession for ongoing system maintenance and trouble shooting.

2.17 ENCLOSURES

- A. All controllers, power supplies and relays shall be mounted in enclosures.
- B. Enclosures may be NEMA 1 when located in a clean, dry, indoor environment.
- C. Indoor enclosures shall be NEMA 12 when installed in other than a clean environment.
- D. Outdoor enclosures shall be NEMA 3R or NEMA 4X, as necessary for the site.
- E. Enclosures shall have hinged, locking doors.
- F. Provide laminated plastic nameplates for all enclosures in any mechanical room or electrical room. Include location and unit served on nameplate. Laminated plastic shall be 0.125 inches thick and appropriately sized to make label easy to read.

2.18 PROGRAMMABLE THERMOSTAT

- A. Thermostat with 365 day programmability that allows the building occupants to program the temperature setpoints for at least four periods within 24 hours. A minimum of 5 holidays shall be programmable for up to 5 years. Daylight savings shall be provided as a standard feature in the programming calendar.
 - 1. Manufacturers: shall match the manufacturer of the specified BAS system.
- B. Minimum thermostat features shall include, but not limited to, the following:
 - 1. The thermostat shall have a touch screen and shall display both room temperature and cooling and heating setpoints simultaneously, and shall indicate when cooling or heating and what stage is energized on the main screen.
 - 2. Programming may be accomplished at the thermostat, or via free software. The program shall have an override mode to provide comfort on demand while in an unoccupied period. The unoccupied override shall be adjustable by pushing an override button and selecting thirty minute increments, up to four hours.
 - 3. The setback override shall be activated by a single button, and deactivated on demand.
 - 4. Setpoints shall be adjustable from 35°F to 99°F, with a minimum 5°F adjustable deadband available.
 - 5. Dual setpoints shall be provided with the ability to individually set heating and cooling temperatures with adjustable heating and cooling setpoint limits. Initial occupied mode cooling setpoint of 75°F and heating setpoint of 70°F. Initial unoccupied mode cooling setpoint of 85°F and heating setpoint of 55°F.
- C. The thermostat shall be capable of independently controlling an individual system, with up to three stages of heating and two stages of cooling, fan, and reversing valve.
 - 1. For heat pumps an adjustable auxiliary heat lockout temperature based on outdoor temperatures shall be provided.
 - 2. Emergency Heat switch will be provided on the touch screen when set in heat pump mode.
- D. The fan shall be programmable to operate continuously during occupied periods and in auto mode during unoccupied periods.
- E. Controls shall be capable of alternating compressor starting sequence with a built-in lead-lag operating logic.
 - 1. Equipment protection options shall be provided to prevent compressor short-cycling, and to limit the number of cycles per hour. These options shall be overridden for use with zoning systems.
- F. Pre-Occupancy purge cycle that energizes the fan before the programmed occupancy time, adjustable up to three (3) hours in 15-minute increments.
 - 1. Configurable terminals shall be provided for remote indoor, remote outdoor or remote supply air temperature sensing.
- G. Multiple security levels to limit access to programming and configuration and will allow for a custom passcode. The various security levels will allow controlled access to programming, unoccupied override, and thermostat mode.

- H. All programming information, except time of day, shall reside in nonvolatile memory. During a power failure, the thermostat shall maintain its program indefinitely without the use of batteries. Wi-Fi capable and controlled through local wireless internet routers. The thermostat shall be capable of receiving an automated demand response signal from the local electrical utility, and automatically reset the cooling and heating setpoints during the demand event. When the demand event is terminated by the local electrical power utility, the thermostat will reset to normal occupied and unoccupied setpoints.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Prior to starting work, carefully inspect installed work of other trades and verify that such work is complete to the point where work of this Section may properly commence.
- B. Notify the Owner's Representative in writing of conditions detrimental to the proper and timely completion of the work.
- C. Do not begin work until all unsatisfactory conditions are resolved.

3.02 INSTALLATION (GENERAL)

- A. Install in accordance with manufacturer's instructions.
- B. Provide all miscellaneous devices, hardware, software, interconnections, installation, and programming required to ensure a complete operating system in accordance with the sequences of operation and point schedules.

3.03 LOCATION AND INSTALLATION OF COMPONENTS

- A. Locate and install components for easy accessibility; in general, mount 48 inches above floor with minimum three (3) feet of clear access space in front of units. Obtain approval on locations from Owner's Representative prior to installation.
- B. Wall mounted temperature sensors will typically be mounted directly above or below light switches and comply with ADA height requirements. Coordinate with Owner, Architect and other trades to assure proper mounted locations prior to installation.
- C. All instruments, switches, transmitters, etc., shall be suitably wired and mounted to protect them from vibration, moisture, and high or low temperatures.
- D. Identify all equipment and panels. Provide permanently mounted tags for all panels.
- E. Provide stainless steel or brass thermowells suitable for respective application and for installation under other sections, and sized to suit pipe diameter without restricting flow.

3.04 CONDUIT

- A. Conduit Requirements: all conduit shall with comply with minimum requirements of local authority having jurisdiction.
 - 1. Low voltage wiring in concealed areas may be plenum rated. Low voltage wiring in exposed areas shall be enclosed in conduit.
 - a. All low voltage wiring exposed to weather shall be installed in conduit.

- b. Low voltage wiring in exposed areas, such as in mechanical, electrical, or service rooms, shall be installed in EMT conduit up to 10 feet above finished floor.
 - 2. All low voltage control wiring in critical facilities and critical locations shall be enclosed in conduit.
- B. Provide rigid conduit for low voltage wiring in walls for all wall mounted sensors, CO2 sensors, humidity sensors, etc. Conduit shall be run to 6" (minimum) above the ceiling and shall terminate with a bushing installed on the conduit end. Flexible conduit shall not be used.
- C. Provide conduit for low voltage wiring above inaccessible ceilings.
- D. Conceal all conduits, except within mechanical, electrical, or service rooms. Install conduit to maintain a minimum clearance of 12 inches (30 cm) from high-temperature equipment (i.e.-such as flues or high temperature pipes).
- E. Conduit must be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Conduit sections shall be joined with couplings (according to code). Terminations must be made with fittings at boxes, and ends not terminating in boxes shall have bushings installed.
- F. Secure conduits with conduit clamps fastened to the structure and spaced according to code requirements. Conduits and pull boxes may not be hung on flexible duct strap or tie rods. Conduits may not be run on or attached to ductwork.
- G. Size of conduit and size and type of wire type shall be the responsibility of the contractor in keeping with the manufacturer's recommendations and NEC requirements, except as noted elsewhere.

3.05 LOW VOLTAGE INTERLOCKING AND CONTROL WIRING

- A. All control and interlock wiring shall comply with national and local electrical codes, and Division 26 of this specification, Where the requirements of this section differ from Division 26, the requirements of this section shall take precedence.
- B. All low-voltage wiring shall meet NFPA-70 (NEC) Article 725 Class 2 requirements. Low-voltage power circuits shall be subfused when required to meet Class 2 current limit.
- C. Do not install Class 2 wiring (greater than 100 volts and protected by overcurrent device not over 20 amperes) in conduits containing Class 1 wiring (not exceeding 30 volts and 1000 volt-amperes). Boxes and panels containing line voltage wiring and equipment may not be used for low-voltage wiring except for the purpose of interfacing the two (e.g. relays and transformers).
- D. Unless otherwise noted, power wiring for all valve and damper actuators is Class 2. If the BAS contractor desires to substitute 120-volt actuators, the BAS contractor shall coordinate directly with the General Contractor and Electrical Contractor to provide all 120-volt wiring and conduit at no additional cost to the Owner.
- E. Contractor shall provide step-down transformers as necessary.
- F. Install insulated bushings on all conduit ends and openings to enclosures. Seal top end of vertical conduits.
- G. All wire-to-device connections shall be made at a terminal block or terminal strip. All wire-to-wire connections shall be at a terminal block. Wire nuts are not acceptable.

- H. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.
- I. All wiring shall be installed as continuous lengths, with no splices permitted between termination points.
- J. Use color-coded conductors throughout with conductors of different colors.
- K. Control and status relays are to be located in designated enclosures only. These enclosures include packaged equipment control panel enclosures unless they also contain Class 1 starters.
- L. The contractor shall terminate all communications, control and/or interlock wiring and shall maintain updated (as-built) wiring diagrams with terminations identified at the job site.

3.06 COMMUNICATION WIRING

- A. The contractor shall adhere to the wiring requirement previously listed.
- B. All cabling shall be installed in a neat and workmanlike manner. Follow manufacturer's installation recommendations for all communication cabling
- C. Do not install communication wiring in conduits and enclosures containing Class 1 or other Class 2 wiring.
- D. Maximum pulling, tension, and bend radius for the cable installation, as specified by the cable manufacturer, shall not be exceeded during installation.
- E. Contractor shall verify the integrity of the entire network following cable installation. Use appropriate test measures for each particular cable.
- F. When a cable enters or exits a building, a lightning arrestor must be installed between the lines and ground. The lightning arrestor shall be installed according to manufacturer's instructions.
- G. All runs of communication wiring shall be unspliced length when that length is commercially available.
- H. All communication wiring shall be labeled to indicate origination and destination data.
- I. Grounding of coaxial cable shall be in accordance with NEC regulations article on "Communications Circuits, Cable, and Protector Grounding."
- J. BACnet MS/TP communications wiring shall be installed in accordance with ASHRAE/ANSI Standard 135. This includes but is not limited to:
 - 1. The network shall use shielded, twisted-pair or stranded cable with characteristic impedance between 100 and 120 ohms. Distributed capacitance between conductors shall be less than 100 pF per meter (30 pF per foot). Wire gauge and wire type shall be sized and coordinated with manufacturer load requirements and lengths of runs.
 - 2. The maximum length of an MS/TP segment is 1200 meters (4000 ft) with AWG 18 cable. The use of greater distances and/or different wire gauges shall comply with the electrical specifications of EIA-485.
 - 3. The maximum number of nodes per segment shall be 32, as specified in the EIA 485 standard. Additional nodes may be accommodated by the use of repeaters.
 - 4. An MS/TP EIA-485 network shall have no T connections.

- K. All Ethernet cabling, routers, hubs and switches for connecting 230900 furnished and installed control panels, servers and clients to the building Owner's Ethernet network are the responsibility of the BAS contractor.

3.07 MOTORIZED DAMPERS

- A. Where ducts penetrate an exterior surface install a Class I motorized damper at each outdoor air supply opening, return air opening, exhaust opening, relief outlet, shaft vent and stairway vent, as required to comply with minimum requirements of the local Energy Code.
 - 1. Dampers shall be installed with automatic controls configured to close when the systems or spaces served are not in use or during unoccupied period warm-up and setback operation, unless the system served requires outdoor air or exhaust air or operates continuously or the dampers are opened to provide intentional economizer cooling.
 - 2. Stairway and shaft vent dampers shall be installed with automatic controls configured to open upon the activation of any fire alarm initiating device of the building's fire alarm system or the interruption of power to the damper.

3.08 FIELD SERVICES

- A. Prepare and start logic control system under provisions of this section.
- B. Start up and commission systems. Allow sufficient time for startup and commissioning prior to placing control systems in permanent operation. Provide all labor and services as necessary to support testing and verification by third party commissioning authority.
- C. Provide the capability for off-site monitoring at control contractor's local or main office. At a minimum, off-site facility shall be capable of system diagnostics and software download. Owner shall provide phone line for this service for one year or as specified.
- D. Provide Owner's Representative with spare parts list. Identify equipment critical to maintaining the integrity of the operating system.

3.09 PROJECT RECORD DOCUMENTS

- A. Project Record Documents: Upon completion of installation, submit three copies of record (as-built) documents. The documents shall be submitted for approval prior to final completion and shall include:
 - 1. Project Record Drawings. As-built versions of the submittal shop drawings provided as AutoCAD 2006 (or newer) compatible files on optical media and as 11" x 17" prints.
 - 2. Testing and Commissioning Reports and Checklists. Completed versions of reports, checklists, and trend logs used to meet requirements of Part 3: "Control System Demonstration and Acceptance."
 - 3. Operation and Maintenance (O & M) Manual.
 - 4. As-built versions of submittal product data.
 - 5. Names, addresses, and 24-hour telephone numbers of installing contractors and service representatives for equipment and control systems.
 - 6. Operator's manual with procedures for operating control systems: logging on and off, handling alarms, producing point reports, trending data, overriding computer control, and changing setpoints and variables.

7. Programming manual or set of manuals with description of programming language and syntax, of statements for algorithms and calculations used, of point database creation and modification, of program creation and modification, and of editor use.
8. Engineering, installation, and maintenance manual or set of manuals that explains how to design and install new points, panels, and other hardware; how to perform preventive maintenance and calibration; how to debug hardware problems; and how to repair or replace hardware.
9. Documentation of all programs created using custom programming language including setpoints, tuning parameters, and object database.
10. Graphic files, programs, and database on magnetic or optical media.
11. List of recommended parts with part numbers and suppliers.
12. Complete original-issue documentation, installation, and maintenance information for furnished third-party hardware including computer equipment and sensors.
13. Complete original-issue copies of furnished software, including operating systems, custom programming language, operator workstation software, and graphics software.
14. Licenses, guarantees, and warranty documents for equipment and systems.
15. Recommended preventive maintenance procedures for system components, including schedule of tasks such as inspection, cleaning, and calibration; time between tasks; and task descriptions.

3.10 TRAINING

- A. Provide application engineer to instruct Owner in operation of systems and equipment.
- B. Provide system operator's training to include (but not be limited to) such items as the following: modification of data displays, alarm and status descriptors, requesting data, execution of commands and request of logs. Provide this training to a minimum of three persons.
- C. Provide on-site training above as required, up to 16 hours as part of this contract.
- D. Provide tuition for at least one individual to attend for a one-week factory training class. If applicable, costs for travel, lodging and meals will be the responsibility of the Owner.

3.11 DEMONSTRATION

- A. Demonstrate complete operating system to Owner's Representative.
- B. Provide certificate stating that control system has been tested and adjusted for proper operation.

END OF SECTION

SECTION 23 21 13

HYDRONIC PIPING, VALVES AND SPECIALTIES

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this section shall include, but not necessarily be limited to, the following:
1. Pipe and Fittings:
 - a. Chilled water piping aboveground
 - b. Condenser water piping aboveground
 - c. Heating water piping aboveground
 - d. Temperature and Pressure relief
 - e. Radiant heating piping
 - f. Refrigerant piping
 - g. Boiler feed
 - h. Cold condensate drainage piping (also reference Division 22 for plumbing piping)
 2. Valves:
 - a. HVAC Service Valves (125 psig max. working pressure)
 - b. HVAC Service Valves (250 psig max. working pressure)
 - c. Check Valves
 - d. Balancing Valves (125 psig working pressure)
 - e. Combination HVAC terminal unit valve line sets
 - f. Hydronic Service Pressure Reducing Valves
 - g. Hydronic Service Pressure Relief Valves
 3. Expansion tanks
 4. Air separators
 5. Chemical pot feeder
 6. Hydronic water buffer tank
 7. Piping specialties:
 - a. Thermometers

- b. Pressure gauges
- c. Expansion Compensators
- d. Pipe escutcheons
- e. Strainers
- f. Drip pans
- g. Air vent
- h. Air elimination valves
- i. Dielectric unions and flanges
- j. Unions
- k. Flanges
- l. Pipe sleeves
- m. Sleeve seals
- n. Valve boxes
- o. Pipe coating

B. In addition, provide the following:

- 1. Furnish accessories and labor for flushing and cleaning HVAC piping.
- 2. Install water treatment systems.
- 3. Furnish material, accessories and labor for glycol antifreeze charging of new HVAC piping.

1.03 RELATED WORK SPECIFIED ELSEWHERE

A. Division 01: General Requirements.

B. Division 22: Plumbing.

C. Division 23: Mechanical.

- 1. Section 23 05 00 - Basic HVAC Materials and Methods.
- 2. Section 23 05 48 - Vibration Isolation for Piping Ductwork and Equipment.
- 3. Section 23 05 49 - Seismic Restraint for Piping Ductwork and Equipment.
- 4. Section 23 05 93 - Testing, Adjusting and Balancing.
- 5. Section 23 07 19 - HVAC Piping Insulation.
- 6. Section 23 21 14 - Hydronic Underground Piping.
- 7. Section 23 21 23 - Hydronic Pumps.
- 8. Section 23 25 00 - HVAC Water Treatment.
- 9. Section 23 52 00 - Non-Condensing HW Boilers.
- 10. Section 23 52 16 - Condensing Boilers.

1.04 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Manufactured items furnished shall be the current, cataloged product of the manufacturer.
2. Replacement parts shall be readily available and stocked in the USA.

B. Codes and Standards:

1. All work shall be in full accordance with all applicable codes, ordinances and code rulings.
2. The Contractor shall furnish without any extra charge the labor and material required for compliance of codes.
3. Perform all tests required by governing authorities and as required under all Division 23 Sections. Provide written reports on all tests.
4. Electrical devices and wiring shall confirm to the latest standards of NEC; all devices shall be UL listed and so identified.
5. All HVAC work shall comply with the Americans with Disabilities Act (ADA).
6. All excavation work must comply with all provisions of state laws including notification to all owners of underground utilities at least 48 business day hours, but not more than 10 business days, before commencing an excavation.

C. Product Control

1. Protection: Use all means necessary to protect materials before, during, and after installation and to protect the installed work and materials of all other trades.
2. The general arrangement and locations of piping are shown on the Drawings. Changes may be necessary to accommodate work. If project conditions require deviations from arrangement or location indicated to meet existing conditions or due to interference with work of other trades, such deviations as offsets, rises and drops in piping that may be necessary, whether shown or not, shall be made without extra expense. Accuracy of data given herein and on the Drawings is not guaranteed. The Drawings and Specifications are for assistance and guidance, and exact locations, distances, and elevations will be governed by actual site conditions.
3. All work shall be in accordance with the applicable codes listed in Division 01. No extra charge will be paid for furnishing items required by the regulations but not specified herein or shown on the Drawings. Should there be any direct conflict between the Drawings and/or Specifications and the above rules and regulations, the rules and regulations shall take precedence.
4. All work shall be completely coordinated, and all lines, grades, slopes and vertical and horizontal locations of pipes shall be exactly determined in the field and cleared with the Owner's Representative before the installation of these items is begun. No extra compensation shall be made for failure to observe this clause.
5. The Drawings and Specifications do not undertake to list every item that will be installed. When an item is necessary for the satisfactory operation of the system, it shall be furnished without extra cost. Work called for in the Specifications, but not on the Drawings, or vice versa, shall be done as though required by both. Lack of specific mention of any work necessary for proper completion of the work in the Specifications and/or Drawings, shall not lessen the Contractor's responsibility.
6. Obtain Owner's Representative's approval prior to rerouting of existing services. Refer to Division 01 sections for alterations, shutdown and temporary construction for existing services.

7. Pipe spaces provided in the design shall be utilized and the work shall be kept within the spaces established on the Drawings.
 8. Manufacturers' directions shall be followed in all cases where manufacturers of articles used in this Contract furnish directions covering points not shown on the Drawings or specified herein. Manufacturers' directions do not take precedence over the Drawings and Specifications. Where manufacturers' directions conflict with the Drawings and Specifications, submit these conflicts to the Owner's Representative and receive clarification before installing the work.
 9. Do not permit or cause any work to be covered or enclosed until it has been inspected, tested, and approved. Should any of the work be enclosed or covered before inspection and test, Contractor shall, at his/her own expense, uncover the work; and, after it has been inspected, tested and approved, make all repairs with such materials as may be required. Restore all work to its original and proper condition.
 10. Be responsible for damage to any of this work before acceptance. Securely cover all openings, both before and after setting into place, to prevent obstructions in the pipes and breakage.
 11. Repair all damage to the premises occasioned by the work. All damage to any part of the premises caused by leaks or breaks in the pipe installed under this Section of the work for a period of one (1) year after date of final acceptance of the work, shall be repaired.
- D. All materials (such as insulation, ductwork, piping, wiring, controls, etc.) located within air plenum spaces, air shafts, and occupied spaces shall have a flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E84 (NFPA 255) Method. In addition, the products, when tested, shall not drip flame particles, and flame shall not be progressive. Provide Underwriters Laboratories, Inc., label or listing, or satisfactory certified test report from an approved testing laboratory to prove the fire hazard ratings for materials proposed for use do not exceed those specified.
- E. Welding Standards:
1. Welding Qualifications:
 - a. Certification: Each welder shall have a current AWS QC7 welding certification with successful completion of written test and welding samples in compliance with AWS D1.1. The welder must maintain their certification to show qualified welding experience every six months. The Owner's Representative reserves the right to request sample coupon test welds of each welder to validate quality of welding work.
 2. Welding Procedures:
 - a. Steel Support Welding: All work shall be performed in compliance with American Welding Society AWS D1.1/D1.1M-Structural Welding Code-Steel.
 - b. Pipe Welding: All work shall be performed to meet or exceed the requirements of the American Welding Society AWS B2.1 Specification for Welding Procedure and Performance Qualification and ASME Boiler & Pressure Vessel Code: Section IX "Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators."
- F. Pressure Piping Standards
- a. Comply with ASME B31.1 Power Piping, ASME B31.3-Process Piping and ASME B31.9-Building Services Piping standards for materials, products, and installation per pressure and temperature operating class.

- b. Comply with ASME B31.9 Building Services Piping standard for the following services:
 - 1) Conveying fluid between 0°F (-18°C) to 250°F (121°C).
 - 2) Fluid pressure less than 350 psig.
- c. Comply with ASME B31.3 Process Piping standard for the following services:
 - 1) Conveying fluid above 250°F (121°C).
 - 2) Toxic or flammable fluids.

1.05 DEFINITIONS

- A. ECM: Electronically commutated motor.
- B. EPDM: Ethylene propylene diene monomer.
- C. EPR: Ethylene propylene rubber.
- D. FKM: Fluoroelastomer polymer.
- E. HI: Hydraulic Institute.
- F. NBR: Nitrile rubber or Buna-N.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for all piping, valves and specialties indicating dimensions, valve CV, flow capacity, pressure setting, tolerances etc.
- B. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, valve replacement, and spare parts lists. Include this data, product data, and shop drawings in operating and maintenance manuals.
- C. Grooved joint couplings and fittings shall be shown on drawings and product submittals and be specifically identified with the applicable mechanical coupling style number.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect equipment and products against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.
- C. Provide the following additional extended warranty requirements that apply to piping with mechanical type joints and fittings, such as grooved or pressed/compression type fittings.

1. The warranties and corrective obligations provided under this section: (i) are in addition to, and not in lieu of, any other warranty, representation, covenant, duty or other obligation (including any corrective obligation) of the Contractor or Manufacturer; (ii) have no relationship to the time when any warranty, representation, duty, covenant or other obligation of Contractor or Manufacturer may be enforced or any dispute resolution proceeding commenced; and (iii) are made by the Manufacturer to both the Contractor and the Owner and by the Contractor to Owner.
2. Contractor and Manufacturer warrant that, for a period of ten (10) years from the date of Substantial Completion, the entire system, including but not limited to the fittings and joints, will conform to the requirements of the Contract Documents, will be free from defects, and will not leak.
3. Nothing in any separate warranty or other document provided by Contractor or Manufacturer, or both, will apply to limit their liability or responsibility for damages arising out of or related to a breach of any warranty or corrective obligation.

PART 2 PRODUCTS

2.01 GENERAL

- A. Furnish and install all new material, equipment, and apparatus hereinafter specified unless specifically noted otherwise. All material, equipment, and apparatus shall be identified by the manufacturer's name, nameplate, and pertinent data.
 1. All pipe, pipe fittings and valves shall be manufactured in North America. Alternatives may be acceptable, but must be submitted and approved by the Owner's Representative prior to bidding.

OR
 2. Upon request, the Owner's Representative shall be furnished certification by the manufacturer, stating samples representing each lot have been tested and inspected as indicated in governing ASTM specifications have been met. Certification shall be accompanied by test reports as prepared in accordance with relevant ASTM sections governing Test Methods and Inspection. Tension Tests reports shall include breaking load, machined diameter of the test bars, and calculated tensile strength. Certification shall include the legal name and address of the manufacturer.
- B. Type M copper piping is not acceptable for any pressure water piping unless specifically noted otherwise.
- C. All materials, equipment, and apparatus are mentioned as standards unless noted otherwise. The words "or approved equal" shall be considered to be subsequent to all manufacturers' names used herein, unless specifically noted that substitutes are not allowed.
- D. Hydronic Piping Pressure Classifications:
 1. Chilled Water, Condenser Water, Heating Water and Condensate:
 - a. "Normal Pressure" shall be working fluid pressure up to 125 psig.
 - b. "High Pressure" shall be working fluid pressure up to 250 psig.

2.02 PIPE AND FITTINGS

- A. Chilled Water Piping: (Aboveground)
 1. Steel Pipe:

- a. Pipe Material: ASTM A53 Grade B, Schedule 40 black steel up to 10" diameter. Standard weight black steel for 12" and larger.
 - b. Fittings:
 - 1) Steel normal pressure application: 150 lb. rating. ANSI B16.3, malleable iron threaded for pipe 2-inch and under; ANSI B16.5, flanged; ANSI B16.9, steel bevel welding
 - 2) Steel high pressure application: 300 lb. rating. ANSI B16.3, malleable iron threaded; ANSI B16.5, flanges; ANSI B16.9, steel bevel welding.
 - c. Grooved Fittings – Alternate for use in mechanical rooms, exterior to the building and routing in non-critical areas. Not allowable for placement above or in electrical, computer or low-voltage equipment areas or rooms.
 - 1) Steel grooved end system: Painted, grooved end system, for applications to 300 psi.
 - a) Grooved joint couplings shall be ASTM A395 and A536 ductile iron. Manufacturers: Victaulic rigid Style 107N ("Installation Ready" stab-on design 2" to 12") and 07 (standard coupling 1" to 12"), or flexible Style 177N ("Installation Ready" stab-on design 2" to 8") and 77 (standard coupling 3/4" to 24") or rigid style P07 coupling or P10 elbow (QuickVic Installation-Ready 1/2" to 1"), Tyco-Grinnell rigid Fig. 772 or flexible Fig 705 and 707, or Anvil-Gruvlok FIG 7001 flexible or FIG 7401 rigid. Other types of fittings may be submitted for review for use in mechanical rooms or exterior to the building on a case-by-case basis.
 - b) Rigid Type: Coupling housings shall be used to provide system rigidity and support and hanging in accordance with ANSI B31.1 and B31.9. Manufacturers: Victaulic Style 107 or 07, Tyco-Grinnell Fig 772, or Anvil-Gruvlok FIG 7401.
 - c) Flexible Type: Use in locations where vibration attenuation and stress relief are required. Flexible couplings may be used in lieu of flexible connectors at equipment connections. Three couplings shall be placed in close proximity to the vibration source. Manufacturers: Victaulic Style 177, 077, or W77, Tyco-Grinnell 705 and 707, or Anvil-Gruvlok FIG 7001.
 - d) Gasket as recommended for the intended service by the manufacturer. Gaskets shall be EPDM pressure responsive synthetic rubber rated for service from -30°F to +230°F (-34°C to +110°C). Manufacturers: Victaulic Grade "EHP" or better.
 - e) Grooved fittings shall be ASTM A395 and A536 ductile iron; ASTM A234 forged steel; or fabricated from carbon steel pipe conforming to ASTM A53.
 - f) All grooved couplings, fittings, valves and specialties used on project shall be the products of a single manufacturer.
 - g) Grooved manufacturer must be ISO 9001 certified.
2. Copper Tubing:

- a. Pipe Material: ASTM B88, Type K or Type L hard drawn copper water tube for normal pressure aboveground.
- b. Fittings:
 - 1) ASME B16.23 cast brass or ANSI/ASME B16.22 wrought copper with the following connection methods.
 - 2) Soldered or brazed: ASTM B32, solder, Grade 95TA.
 - h) 2" and smaller: Make connections using 95%-5% tin-antimony solder joints aboveground or sil-fos brazing.
 - i) 2-1/2" and larger: Sil-Fos brazing or flanged.
- c. Grooved Fittings – Alternate for use in mechanical rooms, exterior to the building and routing in non-critical interior areas. Not allowable for placement above or in electrical, computer or low-voltage equipment areas or rooms.
 - 1) Grooved copper tubing connection system. Manufacturers: Victaulic CTS, Tyco-Grinnell, or Gruvlok for aboveground joints.
 - 2) Grooved couplings. Manufacturers: Victaulic Style 607 (Quick Vic), Tyco-Grinnell Fig. 672, Gruvlok FIG 6400. Other types of fittings may be submitted for review for use in mechanical rooms or exterior to the building on a case-by-case basis.
 - 3) Gasket as recommended for the intended service by the manufacturer. Gaskets shall be EPDM pressure responsive synthetic rubber rated for service from -30°F to +230°F (-34°C to +110°C). Manufacturers: Victaulic Grade "EHP" or better.
 - 4) Fittings shall be wrought copper per ANSI B16.22, or bronze sand castings per ANSI B16.18.
 - 5) Grooved manufacturer must be ISO 9001 certified.
 - 6) Flaring of copper tube to IPS dimensions is unacceptable.
- d. Pressfit Fittings – Alternate for use in mechanical rooms, exterior to the building and routing in non-critical interior areas. Not allowable for placement above or in electrical, computer or low-voltage equipment areas or rooms.
 - 1) Pressed copper tubing connection system as an alternate for 2-1/2" and smaller chilled water piping system for normal pressure systems. Systems shall be rated for maximum pressure to 200 psi and operating temperature range from 0°F to 230°F continuous.
 - j) Manufacturers: Victaulic Vic Press 304™ pipe, couplings, and fittings. Pipe shall be ASTM A312, Schedule 10S, Type 304/304L, certified for use with Vic Press 304™ products. Couplings and fittings shall be manufactured of precision cold drawn austenitic stainless steel, with EPDM O-ring seals or better.
 - k) Manufacturers: Viega ProPress with Smart Connect fittings and couplings. Copper tubing shall conform to ASTM B75 or ASTM B88. Copper and copper alloy press fittings shall conform to material requirements of ASME B16.18 or ASME B16.22 and performance criteria of IAPMO PS 117. Sealing elements shall be EPDM or better.

B. Condenser Water Piping (Aboveground)

1. Steel Pipe:

- a. Pipe Material: ASTM A53 Grade B, Schedule 40 black steel up to 10" diameter. Standard weight black steel for 12" and larger.
 - b. Fittings:
 - 1) Steel normal pressure application: 150 lb. rating. ANSI B16.3, malleable iron threaded for pipe 2-inch and under; ANSI B16.5, flanged; ANSI B16.9, steel bevel welding high pressure application: 300 lb. rating. ANSI B16.3, malleable iron threaded; ANSI B16.5, flanges; ANSI B16.9, steel bevel welding.
 - c. Grooved Fittings – Alternate for use in mechanical rooms, exterior to the building and routing in non-critical areas. Not allowable for placement above or in electrical, computer or low-voltage equipment areas or rooms.
 - 1) Steel grooved end system: Painted, grooved end system, for applications to 300 psi.
 - i) Grooved joint couplings shall be ASTM A395 and A536 ductile iron. Manufacturers: Victaulic rigid Style 107N ("Installation Ready" stab-on design 2" to 12") and 07 (standard coupling 1" to 12"), or flexible Style 177N ("Installation Ready" stab-on design 2" to 8") and 77 (standard coupling 3/4" to 24") or rigid style P07 coupling or P10 elbow (QuickVic Installation-Ready 1/2" to 1"), Tyco-Grinnell rigid Fig. 772 or flexible Fig 705 and 707, or Anvil-Gruvlok FIG 7001 flexible or FIG 7401 rigid. Other types of fittings may be submitted for review for use in mechanical rooms or exterior to the building on a case-by-case basis.
 - m) Rigid Type: Coupling housings shall be used to provide system rigidity and support and hanging in accordance with ASME B31.1 and B31.9. Manufacturers: Victaulic Style 107 or 07, Grinnell Fig 772, or Gruvlok FIG 7401.
 - n) Flexible Type: Use in locations where vibration attenuation and stress relief are required. Flexible couplings may be used in lieu of flexible connectors at equipment connections. Three couplings shall be placed in close proximity to the vibration source. Manufacturers: Victaulic Style 177, 077, or W77 Grinnell 705 and 707, or Gruvlok FIG 7001.
 - o) Gasket as recommended for the intended service by the manufacturer. Gaskets shall be EPDM pressure responsive synthetic rubber rated for service from -30°F to +250°F (-34°C to +110°C). Manufacturers: Victaulic Grade "EHP" or better.
 - p) Grooved fittings shall be ASTM A395 and A536 ductile iron; ASTM A234 forged steel; or fabricated from carbon steel pipe conforming to ASTM A53.
 - q) All grooved couplings, fittings, valves and specialties used on project shall be the products of a single manufacturer.
 - r) Grooved manufacturer must be ISO 9001 certified.
2. Copper Tubing:
 - a. Pipe Material: ASTM B88, Type K or Type L hard drawn copper water tube for normal pressure aboveground.

- b. Fittings:
- 1) ASME B16.23 cast brass or ANSI/ASME B16.22 wrought copper with the following connection methods.
 - 2) Soldered or brazed: ASTM B32, solder, Grade 95TA.
 - s) 2" and smaller: Make connections using 95%-5% tin-antimony solder joints aboveground or sil-fos brazing.
 - t) 2-1/2" and larger: Sil-Fos brazing or flanged.
- c. Grooved Fittings – Alternate for use in mechanical rooms, exterior to the building and routing in non-critical interior areas. Not allowable for placement above or in electrical, computer or low-voltage equipment areas or rooms.
- 1) Grooved copper tubing connection system for aboveground joints. Manufacturers: Victaulic CTS, Tyco-Grinnell, or Gruvlok.
 - 2) Grooved couplings. Manufacturers: Victaulic Style 607 (Quick Vic), Grinnell Fig. 672, or Gruvlok FIG 6400.
 - 3) Gasket as recommended for the intended service by the manufacturer. Gaskets shall be EPDM pressure responsive synthetic rubber rated for service from -30°F to +250°F (-34°C to +110°C). Manufacturers: Victaulic Grade "EHP" or better.
 - 4) Fittings shall be wrought copper per ANSI B16.22, or bronze sand castings per ANSI B16.18.
 - 5) Grooved manufacturer must be ISO 9001 certified.
 - 6) Flaring of copper tube to IPS dimensions is unacceptable.
- d. Pressfit Fittings – Alternate for use in mechanical rooms, exterior to the building and routing in non-critical interior areas. Not allowable for placement above or in electrical, computer or low-voltage equipment areas or rooms. Pressed copper tubing connection system as an alternate for 2-1/2" and smaller condenser water piping system for normal pressure systems. Systems shall be rated for maximum pressure to 200 psi and operating temperature range from 0°F to 230°F continuous.
- (a) Manufacturers: Victaulic Vic Press 304™ pipe, couplings, and fittings. Pipe shall be ASTM A312, Schedule 10S, Type 304/304L, certified for use with Vic Press 304™ products. Couplings and fittings shall be manufactured of precision cold drawn austenitic stainless steel, with EPDM O-ring seals or better.
 - (b) Manufacturers: Viega ProPress with Smart Connect fittings and couplings. Copper tubing shall conform to ASTM B75 or ASTM B88. Copper and copper alloy press fittings shall conform to material requirements of ASME B16.18 or ASME B16.22 and performance criteria of IAPMO PS 117. Sealing elements shall be EPDM or better. eating Water Piping (Aboveground): Steel Pipe: ASTM A53 Grade B, Schedule 40 black steel up to 10" diameter, and Std. Wt. Black steel for 12" diameter and greater.
- e. Fittings:
- 1) Steel normal pressure application: 150 lb. rating. ANSI B16.3, malleable iron threaded; ANSI B16.5, flanged; ANSI B16.9, steel bevel welding

- 2) Steel high-pressure application: 300 lb. rating. ANSI B16.3, malleable iron threaded; ANSI B16.5, flanges; ANSI B16.9, steel bevel welding.
 - f. Grooved Fittings – Alternate for use in mechanical rooms and exterior to the building. Steel grooved end system: Painted, grooved end system, for applications to 300 psi.
 - 1) Grooved joint couplings shall be ASTM A395 and A536 ductile iron. Manufacturers: Victaulic rigid Style 107 (“Installation Ready” stab-on design) and 07 (standard coupling), or flexible Style 177 (“Installation Ready” stab-on design and 77 (standard coupling), or equal.
 - 2) Rigid Type: Coupling housings shall be used to provide system rigidity and support and hanging in accordance with ANSI B31.1 an. Manufacturers: Victaulic Style 107 or 07, or equal.
 - 3) Flexible Type: Use in locations where vibration attenuation and stress relief are required. Flexible couplings may be used in lieu of flexible connectors at equipment connections. Three couplings shall be placed in close proximity to the vibration source. Manufacturers: Victaulic Style 177, 077, or W77, or equal.
 - 4) Gasket as recommended for the intended service by the manufacturer. Gaskets shall be EPDM pressure responsive synthetic rubber rated for service from -30°F to +250°F (-34°C to +110°C). Manufacturers: Victaulic Grade “EHP” or better.
 - 5) Grooved fittings shall be ASTM A395 and A536 ductile iron; ASTM A234 forged steel; or fabricated from carbon steel pipe conforming to ASTM A53.
 - 6) All grooved couplings, fittings, valves and specialties for this project shall be the products of a single manufacturer.
 - 7) Grooved manufacturer must be ISO 9001 certified.
 3. Copper: ASTM B88, Type K or Type L hard drawn copper water tube for normal pressure aboveground.
 - a. Fittings:
 - 1) Copper system: ANSI B16.22, wrought copper with the following connection methods.
 - a) 2” and smaller: Make connections using 95%-5% tin-antimony solder joints or sil-fos brazing.
 - b) 2-1/2” and larger: Sil-Fos brazing or flanged.
- C. Boiler Feed Piping:
 1. Steel (normal pressure application of 100 psig or less working pressure): Pipe: ASTM A53 Grade B, Schedule 80 black steel.
 2. Fittings: Steel normal pressure application of 150 lb. rating (minimum). ANSI B16.3, malleable iron threaded; ANSI B16.5, flanged; ANSI B16.9, steel bevel welding
 3. Joints: 2” and smaller, threaded (except in the case of piping located in shafts which must be welded); 2-1/2” and larger, ANSI B16.25 bevel weld, ANSI B16.5 flanges, or ANSI B16.11 socket weld.
- D. Temperature and Pressure Relief Valve Discharge Piping:
 1. Hydronic Water System (150 psig and 212 deg. F. maximum):

- a. Pipe: Type M or L copper ASTM B88
- b. Pipe: Schedule 40 black steel, ASTM A53 Grade B.
- c. Fittings: ANSI B16.22, wrought copper.
- d. Fittings: 150 lb. rating. ANSI B16.3, malleable iron threaded.
- e. Joints: ANSI B16.22, wrought copper, with 95%-5% tin-antimony solder joints.
- f. Joints: 2" and smaller, threaded (except in the case of piping located in shafts which must be welded); 2-1/2" and larger, ANSI B16.25 bevel weld, ANSI B16.5 flanges, or ANSI B16.11 socket weld.

2.03 VALVES-GENERAL

- A. General: Valve ratings shall exceed respective system operating pressures by 50% (minimum). All valves shall be line size unless otherwise noted.
- B. Product Data: Submit manufacturer's technical product data, including installation instructions for each type of valve. Include pressure drop curve or chart for each type and size of balancing valve or circuit setter. Submit valve schedule showing manufacturer's figure number, size, location, and valve features for each required valve.
- C. Shop Drawings: Submit manufacturer's assembly-type (exploded view) shop drawings for each type of valve, indicating dimensions, weights, materials, and methods of assembly of components.
- D. Acceptable Manufacturers (manufacturer and model number listed for individual valves indicates minimum acceptable by all manufacturers):
 1. Gate or Butterfly: Crane, Bray, Hammond, Anvil-Gruvlok, Milwaukee, Victaulic, Tyco-Grinnell, Keckley, Keystone, Bray, Keystone K-Lok, Nibco, or equal.
 2. Ball and Drain Valves: Apollo, Hammond, Milwaukee, Nibco, Victaulic, Tyco-Grinnell, Bray, Anvil-Gruvlok, Bray, Keystone K-ball, Watts, or equal.
 3. Check: US Valve, Metraflex, DeZurik, Victaulic, Milwaukee, Mueller, Nibco, Apco, Cla-Val, Prince, American Wheatley Products, or equal.
 4. Hydronic System Pressure Reducing Valves: Cash-Acme, Cla-Val, Watts, or Wilkins.
 5. Hydronic Pressure Relief Valves: Cash-Acme, Cla-Val, Watts, Wilkins, or equal.
 6. Hydronic Balancing Valves and Circuit Setters: Pro Hydronic Specialties, Griswold (Venturi with characterized ball valve only), Wheatley (Y-globe type only), Armstrong, Nibco (globe style), Victaulic/Tour & Anderson, Bray, Anvil-Gruvlok, Oventrop, Tyco-Grinnell, or equal.
- E. Valve Identification: Provide valves with manufacturer's name (or trademark) and pressure rating clearly marked on the valve body.
- F. Operators:
 1. Provide 90-degree lever operator for ball valves.
 2. Provide 90-degree locking lever operator for butterfly valves up through 5" size. For 6" size and greater, provide gear operator and handwheel.
 3. Provide insulated valve stem extension for lever-operated valves on insulated piping, so handle will clear insulation and jacket. Provide valve manufacturer's plastic insulated housing where available as valve option.

4. Provide chain operated sheaves on valves sizes 2-1/2" and larger, located more than ten (10) feet from floor in equipment room areas. Provide chain and extend down to five (5) feet above floor and hook clips on chain arranged to clear walking aisles.

G. Valve Features:

1. General: Provide valves with features indicated and, where not otherwise indicated, provide proper valve features. Comply with ASME B31.9 for building services piping and ASME B31.1 for power piping.
2. Bypass: On valves 6" and larger comply with MSS SP-45, and except as otherwise indicated, provide manufacturer's standard bypass piping and valving. Provide a 3-valve bypass, minimum 1" size, to consist of two threaded shut-off valves and a plugged drain valve.
3. Drain: Comply with MSS SP-45 and provide 3/4" threaded pipe end with cap and chain.
4. Flanged: Valve flanges complying with ANSI B16.1 (cast iron), ANSI B16.5 (steel), or ANSI B16.24 (bronze).
5. Grooved: Valves shall be joined using grooved joint couplings of the same manufacturer. Copper tubing valve grooved ends shall be copper tubing sized.
6. Vic Press 304™: Valves complete with Vic Press 304™ ends.
7. Threaded: Valve ends complying with ANSI B2.1.
8. Solder-Joint: Valve ends complying with ANSI B16.18.
9. Flangeless: Valve bodies manufactured to fit between flanges complying with ANSI B16.1 (cast iron), ANSI B16.5 (steel), or ANSI B16.24 (bronze).

Valve Comparison			
Item	Soft Seated Ball Valve	Resilient Seated Butterfly Valve	Iron or Bronze Gate Valves
Sealing	Positive "Bubble tight" per MSS standards	Positive "Bubble tight" per MSS standards	Allowable leakage rate per MSS
Weight	Lighter than gate - could lead to lower overall piping costs	Lighter than gate - could lead to lower overall piping costs	Heavy vs Lug BFV
Size	Lower profile for better clearance (approx 1/6 space vs gate)	Lower profile for better clearance (approx 1/6 space vs gate)	Need for room especially considering rising stem
Application	On-off or throttling capabilities(except steam)	On-off or throttling capabilities	On-Off only
Operation	1/4 turn/90 degree operation	1/4 turn/90 degree operation	Multi-turn/many revolutions needed
Maintenance	Virtually maintenance free	Virtually maintenance free	Requires routine maintenance (packing adjustment, etc)
Position Indication	Easy to read via handle position (or via standard gear operator)	Easy to read via handle position (or via standard gear operator)	Difficult to know without a special indicator

2.04 HVAC SERVICE VALVES (MAXIMUM 125 PSIG SYSTEM WORKING PRESSURE)

A. Ball Valves, 2" and Smaller:

1. 2-piece bronze body, 600 psi rating, stainless steel or chrome plated brass ball, Teflon seat, brass or stainless steel stem, steel handle, full port. Threaded steel ends for iron pipe and soldered ends for copper pipe. Threaded steel pipe: Milwaukee #BA-400 or equal. Soldered copper pipe: Milwaukee #BA-450 or equal.
 2. 2-piece stainless steel body, 300 psi maximum operating pressure, ASTM A-312 compliant, Vic-Press Schedule 10S ends for Type 304 stainless steel pipe, brass body, chrome plated brass ball, brass stem, PTFE seats, steel handle, full port. Manufacturers: Victaulic #Series 589 or equal.

B. Butterfly Valves, 2-1/2" and Larger:

1. 2-1/2" through 12", lug type, MSS SP-67 compliant, 200 psig non-shock, cast or ductile iron body, stainless steel stem, EPDM seat, memory stop control, lever handle thru 5" size and worm gear operator for 6" and larger. Disc may be stainless steel, bronze, nickel-plated ductile iron or aluminum bronze. Mount stem in horizontal position. Molded in seat acceptable in this size range. Manufacturers: Milwaukee #ML223E (up to 5"), Milwaukee #ML323E (6" and larger), Keystone (Emerson) #222 or equal.

2. 14" through 48", lug type, MSS SP-67 compliant, 150 psig non-shock, ductile iron body, stainless steel stem, EPDM seat, memory stop control, worm gear operator. Disc may be stainless steel, bronze, nickel-plated ductile iron or aluminum bronze. Mount stem in horizontal position. Manufacturers: Milwaukee #ML333E, Keystone #GRL, or equal.
3. 2-1/2" through 12" grooved end type, MSS SP-67 compliant, 300 psig working pressure, ASTM A395 and A536 compliant, ductile iron body, EPDM seal, stainless steel stem, and memory stop control. Lever handle thru 5" size and worm gear operator for 6" and larger. Disc may be nickel coated ductile iron, aluminum bronze or stainless steel. Mount stem in horizontal position. Manufacturers: Victaulic #Series 761 Vic@-300 MasterSeal, Tyco-Grinnell #B302, Gruvlok #FIG 7700 Series, or equal.
4. 14" through 24" grooved end type, MSS SP-67 compliant, 300 psig working pressure, ASTM A395 and A536 compliant, ductile iron body, EPDM seal, stainless steel stem, with gear operator. Disc may be nickel coated ductile iron, aluminum bronze or stainless steel. Mount stem in horizontal position. Manufacturers: Victaulic #Series 761 Vic@-300 AGS (300 psi maximum pressure.), Tyco-Grinnell # FIG 7700 series, or equal.
5. 2-1/2" through 6" copper tube dimensioned grooved end type, cast brass body, EPDM seal, 300 psig working pressure, stainless steel stem, memory stop control, lever handle thru 5" size and worm gear operator for 6". Disc may be nickel coated ductile iron, aluminum bronze or stainless steel. Mount stem in horizontal position. Manufacturers: Victaulic #Series 608N, Tyco-Grinnell #B680, Gruvlok #BFV, or equal.

C. Check Valves:

1. Bronze Silent Check Valves – Up to 2" for mounting in close proximity to pumps:
 - a. Class 125, MSS SP-80, ASTM B62, ASTM B16, bronze body, threaded ends, bronze or stainless steel spring, PTFE or Buna disk ring, and silent closing. Manufacturers: Milwaukee #548B (Buna)/548T (PTFE) or equal.
2. Bronze T-Pattern Swing Check Valves – Up to 3" for horizontal mounting adjacent to air handling units and fan coils:
 - a. Class 125, MSS SP-80, ASTM B62, ASTM B16, bronze body, threaded ends, horizontal swing. Manufacturers: Milwaukee #509/509T or equal.
3. Globe Style Silent Check Valves – 2-1/2" and Larger:
 - a. Class 125, MSS SP-125, ASTM A126 class B cast iron body, SS seat and plug, stainless steel spring, SS bushing, stainless screw. ANSI B16.1 flange rating to 190 psi up to 12" and 135 psi above 12". Manufacturers: Milwaukee #1800, Cla-Val #Series 581, Apco #Series 600, Metraflex #Series CVO900 or equal.
4. Wafer Style Silent Check Valves – 2" and Larger:
 - a. Class 125, MSS SP-125, ASTM A126 class B cast iron body, stainless steel seat and disc, stainless steel spring, SS bushing, stainless screw. ANSI B16.1 flange rating to 190 psi up to 12" and 135 psi above 12". Manufacturers: Milwaukee #1400 single disk, Milwaukee #8800 dual disk, Prince #Fig. 810, US Valve #Series 09, or equal.
5. Grooved Style Silent Check Valves – 2" to 12":
 - a. ASTM A536 ductile iron body, single stainless steel disc, EPDM disc coating, brass or stainless steel shaft, stainless steel spring, stainless steel plug. Sizes 2" to 3" rated for 365 psi working pressure and sizes 4" to 12" rated for 300 psi working pressure. Manufacturers: Victaulic #Series 716H/716, Anvil-Gruvlok #Series 7800, Tyco-Grinnell #Series 590 or equal.

- b. Venturi style check valve with flow measuring taps across the valve. ASTM A536 ductile iron body, single stainless steel disc, EPDM disc coating, brass or stainless steel shaft, stainless steel spring, stainless steel plug. Sizes 2" to 3" rated for 365 psi working pressure and sizes 4" to 12" rated for 300 psi working pressure. Manufacturers: Victaulic #Series 779 or equal.

D. Drain Valves:

1. Threaded or soldered ends, Class 125, ASSE 1005, bronze body, screw-in bonnet, rising stem, composition disc, 3/4" hose outlet.
2. Threaded or soldered ends, Class 600, bronze body, 2-piece ball valve, 3/4" hose outlet with cap and chain. Manufacturers: Milwaukee #BA-100H/150H or equal.

E. Globe Valves:

1. 2" and Smaller: Class 150, MSS SP-80 and ASTM B62 compliant cast bronze body, bronze union bonnet, PTFE disc, rising stem, brass packing gland, non-asbestos packing and aluminum or malleable iron hand-wheel. Manufacturers: Milwaukee #590T or equal for threaded steel pipe. Milwaukee #1590T or equal for soldered copper pipe
2. 2-1/2" and Larger: Class 125, MSS SP-70, ASTM A126 Grade B cast iron body, flanged ends, bolted bonnet and disc, bronze trim, OS & Y, brass packing gland, non-asbestos packing and cast iron hand-wheel. Manufacturers: Milwaukee #F-2981-M or equal.

2.05 HVAC SERVICE VALVES (MAXIMUM 250 PSIG SYSTEM WORKING PRESSURE)

A. Ball Valves, 2" and smaller:

1. 3-piece carbon steel body, 1000 psig WOG rating up to 300°F, MSS SP-110 compliant, threaded ends, stainless steel ball, stainless steel stem, reinforced PTFE seat, stainless steel lever handle, full port. Manufacturers: Milwaukee #30CSOF02, Keystone #K-ball Figure 120, or equal.
2. 3-piece stainless steel body, 400 psi maximum operating pressure, ASTM A-351 compliant, Vic-Press Schedule 10S ends or grooved for Type 304 stainless steel pipe, stainless steel ball, stainless steel stem, PTFE seats, stainless steel handle, full port. Manufacturers: Victaulic #Series P569 or equal.

B. Butterfly Valves, 2-1/2" through 18":

1. One-piece carbon steel body, wafer or lug type, MSS SP-68 compliant, Class 300 carbon steel body, stainless steel stem, stainless steel disc, RTFE or reinforced PTFE seat, memory stop control, lever handle thru 5" size and worm gear operator for 6" and larger. Mount stem in horizontal position. Manufacturers: Milwaukee #HP3LCS4212 (up to 5"), Milwaukee #HP3LCS4213 (for 6" and larger), Keystone #K-Lok Figure 37, or equal.

C. Check Valves:

1. Bronze Silent Check Valves – Up to 2":
 - a. 250 psi rating, ASTM B-584 cast bronze body, threaded ends, bronze spring, PTFE disk ring, and silent closing. Manufacturers: Milwaukee #548B (Buna)/548T (PTFE), or equal.
2. Globe Style Silent Check Valves – 2-1/2" and Larger:

- a. Class 250, MSS SP-125, ASTM A126 class B cast iron body, ASTM B584 bronze seat and plug, stainless steel spring, bronze bushing, stainless screw. ANSI B16.1 flange rating to 370 psi up to 12" and 280 psi above 12". Manufacturers: Milwaukee #1850, Cla-Val #Series 581, Apco #Series 600, Metraflex #Series CVO900 or equal.
- 3. Wafer Style Silent Check Valves – 2" to 6":
 - a. Class 250, MSS SP-125, ASTM A126 class B cast iron body, ASTM B584 bronze seat and plug, stainless steel spring, bronze bushing, stainless screw. ANSI B16.1 flange rating to 370 psi up to 12" and 280 psi above 12". Manufacturers: Cla-Val #Series 580, Metraflex #Series CVO700, Milwaukee #Series 1400, Hammond #Series IR9253 or equal.

D. Globe Valves:

- 1. 2" and Smaller: Class 200, MSS SP-80, ASTM B62 cast bronze body, bronze union bonnet, bronze disc, rising stem, brass packing gland, non-asbestos packing and aluminum or malleable iron hand-wheel. Manufacturers: Milwaukee #570 or equal for threaded steel pipe.
- 2. 2-1/2" and Larger: Class 250, MSS SP-70, ASTM A126 Grade B cast iron body, flanged ends, bolted bonnet and disc, bronze trim, OS & Y, brass packing gland, non-asbestos packing and cast iron hand-wheel. Manufacturers: Milwaukee #F-2983-M or equal.

2.06 BALANCING VALVES (MAXIMUM 125 PSIG SYSTEM WORKING PRESSURE)

A. Pressure Independent Water Flow in Variable Flow Systems:

- 1. 1/2" and Larger: Construction and attachment style as required by piping system. Body shall be brass, bronze, steel or ductile iron as required by valve size. Internal working parts and removable flow cartridge shall be stainless steel. Valves shall be factory set and shall automatically limit the flow to specified capacities with 10% +/- accuracy over the entire operating pressure differential. Pressure and temperature ports shall be extended to outside of insulation. The permanent pressure lost added to the pump head shall not exceed three (3) psi.
- 2. Manufacturers: Pro Hydronic Specialties, Griswold, Victaulic, Danfoss, IMI Flow Design AutoFlow, Oventrop, Hays Fluid Controls, Nexus Valve, or equal.

B. Pressure Dependent Water Flow in Constant Flow Systems:

- 1. 1/2" and Larger: Construction and attachment style as required by piping system. Body shall be brass, bronze, steel or ductile iron as required by valve size. Characterized ball valve or Y-type globe valve design with memory stop. Valves shall be field adjustable. Pressure and temperature ports shall be extended to outside of insulation. Install in pipe with minimum length of unrestricted straight pipe equivalent to five pipe diameters upstream and two pipe diameters downstream.
- 2. Manufacturers: Pro Hydronic Specialties #CBV, Hays Fluid Controls Venturi (insert/ball valve style), Preso Venturi #B-Plus series, Oventrop Hydrocontrol #R,F, and G, Griswold (Venturi with characterized ball valve only), IMI Flow Design #FlowSet, Wheatley (Y-globe type only), Armstrong, Nibco (Globe style), Tyco-Grinnell, Oventrop, or Victaulic/Tour & Anderson or Gruvlok(Y-globe type only), #Series 786 (soldered), #Series 787 (threaded), #Series 788 (flanged) or #Series 789 (grooved), Nexus Valve, or equal.

2.07 TERMINAL UNIT ASSEMBLIES – COIL KITS

- A. General: As an alternative to built-up valve and connection assemblies for terminal units, a complete kit consisting of valves, strainer, balancing, and flexible hose connection may be provided. Refer to Section 230548 Vibration Isolation for Piping, Ductwork and Equipment specification for additional requirements for flexible hose. Manufacturers: Victaulic #Koil Kit Series 799 or 79V, Pro Hydronic Specialties, Hays Fluid Controls, IMI #Versaflo, or equal.

2.08 BRANCH CIRCUIT DIFFERENTIAL PRESSURE CONTROL VALVES

- A. Self-powered control valves designed to maintain constant differential pressure for branch circuits and consisting of a differential control, single pressure temperature port, and dead end service shutoff. Shall be capable of stabilizing pressure ranges of 1.5 to 8.7 psi in 3/4" to 1" valves, 2.9 to 11.6 psi in 1-1/4" -2" valves, or 51 psi for 2-1/2" through 4" valves.
- B. Bonnet shall be manufactured of copper alloy, O-rings, seat seal, and membrane to be EPDM.
- C. Manufacturers: Tour & Anderson #793/794 used in conjunction with Victaulic/Tour&Anderson balancing valves, or equal.

2.09 PRESSURE INDEPENDENT TEMPERATURE CONTROL VALVES (COIL CONTROL VALVES)

- A. Modulating control valves shall be pressure independent characterized two-way actuated flow control valves. The flow rate through the valve shall not vary more than + or - 15% due to system pressure fluctuations across the valve in the selected operating range.
- B. Electronic valves at all variable air volume terminals, constant volume terminals, fan powered terminals, and zone reheat coils with valve connections of 1" (18 gpm) or less in size may utilize floating point control. All air handler coils shall utilize proportional control electronic valves.
- C. The rangeability of the valve shall be 90:1 (minimum).
- D. The valve bodies shall be of cast brass and rated for 200 PSI working pressure (minimum). All internal parts shall be stainless steel, teflon, brass, bronze, or polyphenylsufone orifice with an elastomeric diaphragm. The valves shall be serviceable without removing them from the piping system. Valve flow characteristics shall be able to be changed without removing the valve from the piping system.
- E. Balancing valves shall not be required where these control valves are installed. Flow performance curves shall be provided with each valve
- F. The actuator shall modulate the control valve from 0 to 100% design flow. The actuator shall be directly coupled to the valve at the factory.
- G. Pressure/temperature ports (Pete's Plugs) shall be installed at the factory in each valve larger than 1" or be integral to the valve. Two ports shall be used to measure inlet and outlet pressure to the valve.
- H. Manufacturers: Honeywell #VRN, Belimo #PICCV, Hays #Fluid Controls, Victaulic #TCP Series, Danfoss #AB-QM, Griswold #PIC-V/MVP/PIM models, Oventrop #Cocon Q, Flow Control Industries #Delta P Valve, or equal. Valves shall be provided by controls provider and installed by piping.

2.10 HYDRONIC SYSTEM PRESSURE REDUCING VALVES

- A. Single seated, direct operated type; high capacity, having bronze body with strainer, by-pass feature, pressure gauge tappings and complying with requirements of ASSE Standard 1003. Select proper size for maximum flow rate and fall-off at inlet and outlet pressure indicated.
 - 1. 25-75 psig range. Manufacturers: Watts #LFU5B-Z3, Zurn #600XL or equal.
 - 2. For applications where reducing valve is used in hot water systems provide with asbestos-free insulating cover, with silicone treated fiberglass cover, 1" insulation, and Velcro fasteners. Suitable for temperatures up to 550°F. Manufacturers: Spence #Series E or equal.

2.11 HYDRONIC SYSTEM PRESSURE RELIEF VALVES

- A. Pressure Relief Valves: Constructed in accordance with ASME, 125-pound setting, and so stamped. Size as required. Manufacturers: Watts #740 Series or equal.
- B. Temperature and Pressure Relief Valve: Constructed in accordance with ASME, 125-pound setting (or pressure setting as indicated on construction documents), and so stamped. Size as required. Manufacturers: Watts #100XL, 40XL, 140, N240, or 340 Series, or equal.

2.12 HYDRONIC SYSTEM REDUCED PRESSURE BACKFLOW PREVENTION VALVES

- A. General: All backflow prevention valves shall be State approved. Coordinate with plumbing system for provision of domestic water to reduced pressure backflow prevention to protect domestic water system from connection to hydronic piping systems.
- B. Reduced Pressure Backflow Preventer
 - 1. 2" and Smaller: Assembly shall consist of shutoff ball valves in inlet and outlet, and strainer on inlet. Assemblies shall include test cocks and pressure-differential relief valve located between two positive seating check valves and shall comply with requirements of ASSE Standard 1013 and AWWA C506. Bronze construction, threaded ends, stainless steel internal parts, and air gap fitting. Route pipe from air gap fitting to approved waste receptor. Manufacturers: Watts #909-QT-S-HW valve with #909AG air gap fitting, or equal.
 - 2. 2-1/2" and Larger: Assembly shall consist of shutoff OS&Y gate valves in inlet and outlet, and strainer on inlet. Assemblies shall include test cocks and pressure-differential relief valve located between two positive seating check valves and shall comply with requirements of ASSE Standard 1015 and AWWA C506. Epoxy coated cast iron body construction, flanged ends, stainless steel internal parts, bronze seats, and air gap fitting. Route pipe from air gap fitting to approved waste receptor. Manufacturers: Watts #909-S-OSY valve with #909AG air gap fitting, or equal.

2.13 THERMOMETERS AND GAUGES

- A. General:
 - 1. Certification: Provide meters and gauges whose accuracies, under specified operating conditions, are certified by manufacturer.
 - 2. No mercury shall be used in thermometers due to hazardous material classification.
 - 3. Manufacturers: Weklser, Ashcroft, Winters, Terice, Marshalltown, Wika, US Gauge, or equal.
- B. Thermometers:

1. Bi-Metal Type: Provide bi-metal glass thermometers of materials, capacities, and ranges indicated, designed and constructed in service indicated. Accuracy shall be 1% +/- full scale with adjustable recalibration.
 - a. Case: Type 300 series stainless steel, hermetically sealed, glass window, 3" diameter dial, with adjustable angle.
 - b. Adjustable Joint: Die cast aluminum, finished to match case, 180° adjustment in vertical plane, 360° adjustment in horizontal plane, with locking device.
 - c. Scale: Satin faced, non-reflective aluminum, permanently etched markings.
 - d. Stem: Stainless steel, adjustable angle socket, length to suit installation.
 2. Glass Thermometer: Provide adjustable angle 9" thermometer of materials, capacities and ranges as appropriate to medium being measured and designed and constructed for service indicated. Accuracy to be 1% +/- of full scale.
 - a. Case: Aluminum or Valox.
 - b. Temperature Sensitive Gage Liquid: Organic non-toxic. No mercury permitted.
 - c. Scale: Aluminum painted white with black markings.
 - d. Connection: 1/2" NPT with thermowell, 1-1/4" UNF swivel nut without thermowell.
 3. Photovoltaic Cell Powered LCD Thermometer
 - a. Case: ABS Plastic.
 - b. Accuracy: 1% of full scale.
 - c. Display: 16 LUX rating LCD display. Switchable Fahrenheit and Celsius.
 - d. Connection: 3/4" NPT with thermowell 1-1/4" UNF swivel nut without thermowell.
 4. Range: Conform to the following:
 - a. Cold Water: -40°F - 160°F with 2°F scale divisions.
- C. Sensor Test Wells:
1. Provide control device test wells as indicated and as required by the BAS. Constructed of brass or stainless steel, pressure rated to match piping system design pressure. Provide 3" extension for insulated piping. Provide shutoff valves to isolate sensor for maintenance and removal.
- D. Thermometer Test Wells:
1. Provide 1/4" thermometer test wells as indicated and as required by the BAS. Constructed of brass or stainless steel, pressure rated to match piping system design pressure. Provide 3" extension for insulated piping. Provide cap nut with chain fastened permanently to thermometer well.
- E. Temperature/Pressure Gauge Connector Test Plugs (Pete's Plugs):
1. Provide temperature gauge connector plugs pressure rated for 500 psi and 200° F (93° C). Construct of brass or stainless steel, equip with 1/2" NPT fitting, with self-sealing valve core type neoprene gasketed orifice suitable for inserting 1/8" O.D. probe assembly from dial type insertion thermometer or pressure gauge. Equip orifice with gasketed screw cap and chain. Provide extension, length equal to insulation thickness, for insulated piping.
- F. Pressure Gauges:

1. General: Provide pressure gauges of materials, capacities, and ranges indicated, designed and constructed for use in service indicated.
2. Type: General use, 1% accuracy ANSI B40.1 grade A, phosphor bronze bourbon type, bottom connection.
3. Case: Drawn steel or brass, glass lens, 4-1/2" diameter.
4. Connector: Brass with 1/4" male NPT.
5. Scale: White coated aluminum, with permanently etched markings.
6. Pressure differential range shall be 100 psig minimum for the appropriate application with maximum 1 psig divisions.

G. Pressure Gauge Cocks:

1. General: Provide pressure gauge cocks/valves between pressure gauges and gauge tees on piping systems. Two-piece bronze body ball valve with threaded ends. Manufacturers: Milwaukee #BA-100 or equal.
2. Snubber: 1/4" brass or stainless steel bushing with corrosion resistant porous metal disc, through which pressure fluid is filtered. Select disc material for fluid served and pressure rating. Manufacturers: Wika #910.12, Ashcroft #1112, or equal.

2.14 PIPING SPECIALTIES

A. General:

1. Provide factory fabricated piping specialties recommended by manufacturer for use in service indicated. Provide piping specialties of types and pressure ratings indicated for each service, or provide proper selection to comply with installation requirements. Provide sizes as indicated, and connections, which properly mate with pipe, tube, and equipment connections. Where more than one type is indicated, selection is installer's option.

B. Strainers - Low Pressure Y-Type Pipeline Style:

1. Provide strainers full line size of connecting piping, with ends matching piping system materials. Select strainers for 150% (minimum) of the working pressure of piping system.
2. Threaded Ends, 2" and Smaller: Cast-iron body, conforming to ASTM A126, screwed screen retainer with centered blowdown fitted with hose bibb. Manufacturers: Spirax Sarco, Keckley, Wheatley, Mueller, or equal.
3. Flanged Ends, 2-1/2" and Larger: Cast-iron body, conforming to ASTM A126, bolted screen retainer with off-center blowdown fitted with 3/4" drain valve. Manufacturers: Spirax Sarco, Metraflex #LPD, Keckley, Wheatley, Mueller, or equal.
4. Grooved Ends, 2-1/2" and Larger: Ductile iron body, conforming to ASTM A395 and ASTM A536, bolted screen strainer with off center blowdown fitted with 3/4" drain valve. Manufacturers: Victaulic #Style 730/731/732, Tyco-Grinnell #Fig. S853 and S55, Gruvlok #FIG 7260/758G, or equal.
5. Strainer screen or basket, Type 304 stainless steel or better.
 - a. Start-up screen for first month of operation shall be a 40 mesh with 0.016" openings and 41% open area. For applications with piping connected to existing piping systems the start-up screen shall be 60 mesh with 0.010" openings and 38% open area.

- b. Start-up screen shall be removed and replaced with normal operation screen after one month of pump operation, or as directed by the water treatment company, and prior to final water balance.
- c. Normal operation screens or baskets, shall be installed prior to final water balance.
 - 1) Strainer sizes up to 2" shall be provided with 20 mesh screens, with 0.035" openings and 49% open area (minimum).
 - 2) Strainer sizes 2-1/2" and larger shall be provided with perforated baskets with 3/64" diameter perforations with 36% open area (minimum).

C. Unions:

- 1. Unions shall be of type specified in following schedule:
 - a. Black Steel, 2" and smaller: 250 lb. screwed malleable iron, ground joint, brass to iron seat.
 - b. Black Steel, 2-1/2" and larger: 150 lb. cast iron screwed flanged, flat faced, full faced gasket.
 - c. Stainless Steel, 2" and smaller: 300 psi maximum operating pressure, threaded union, with Vic Press 304™ ends.
 - d. Soldered Copper or Brass Pipe, 2" and smaller: 150 lb. cast bronze or copper, ground joint, non-ferrous seat with soldered ends.
 - e. Screwed Copper or Brass Pipe, 2" and smaller: 150 lb. cast brass, ground joint, brass to brass seat, with threaded ends.
 - f. Flanged Copper or Brass Pipe, 2-1/2" and larger: two (2) 150 lb. cast bronze flanges.
 - g. Where grooved joint piping systems are utilized, unions are not required. Grooved joint couplings shall serve as unions.
 - h. Manufacturers: EPCO, Mueller, Stanley G. Flagg, Victaulic, Tyco-Grinnell, Watts, or equal.
- 2. Dielectric Unions:
 - a. Provide standard products recommended by manufacturer for use in service indicated to effectively isolate ferrous (galvanized steel, black steel, zine coated steel) from non-ferrous piping to prevent galvanic action and related corrosion.
 - b. Manufacturers: Watts #LF3000 Series, Zurn #DUX Series, or equal.

D. Dielectric Waterways:

- 1. To effectively isolate ferrous from non-ferrous piping (electrical conductance), prevent galvanic action, and stop corrosion.
- 2. Steel to copper, with thermoplastic dielectric lining.
- 3. 250 psig rated pressure at 210°F.
- 4. Connection: screwed, grooved, sweat, or flanged to match pipe.
- 5. Manufacturers: Victaulic #Style 647, Gruvlok #FIG 7088/7089/7090 or equal.

E. Dielectric Flanges: Provide dielectric flanges and dielectric bolt sleeves for flanged transitions between dissimilar metal piping. Manufacturers: Watts Series 3100 or approved equal.

F. Flanges:

1. Provide flanges at flanged connections to equipment, tanks and valves. Faces of flanges being connected shall be alike in all cases. Connection of raised-face flange to flat-faced flange not permitted.
2. Use ASTM A307, Grade B, bolts and nuts for cast iron flanges and ASTM A193 for steel flanges. Regular square head unfinished bolts with heavy semi-finished hex nuts ASTM A194. Cadmium plated where exposed to weather. Rating: 150 lb. or 300 lb. in high pressure portions.
3. Type of pipe and corresponding flanges as follows:
 - a. Screwed Black Steel Pipelines: 125 lb. black cast iron screwed flange, flat faces.
 - b. Stainless Steel Pipe, Class 150 stainless steel flange adapter with carbon steel back-up flange and Vic Press 304™ end.
 - c. Welded Steel Pipe, 150 lb. black forged steel welding flanges, 1/16" raised face ASTM A181 Grade I. Use flat face when connected to flat faced companion flange.
 - d. Grooved Steel Pipe, Class 150, ASTM A395 and A536 ductile iron flange adapter, with pressure responsive synthetic rubber gasket. Manufacturers: Victaulic #Style 741, Tyco-Grinnell #Fig. 71, Gruvlok #FIG 7401, or equal.

G. Flange Gaskets:

1. Type: full faced or flat ring to suit flange facings.
2. Shall conform to ASTM F-104
3. Minimum thickness: 1/16"
4. Manufacturers: Garlock style 3200 or equal.

H. Pipe Sleeves:

1. Provide fire proof sleeve assemblies utilizing UL rated sealant systems at all fire rated penetrations. For non-rated sleeve penetrations pack the annular space between the pipe and sleeve with fiberglass and/or mastic.
2. Sleeves shall provide a minimum 1/2-inch annular clearance around pipe.
3. Sheet metal: Fabricate from galvanized sheet metal; round tube closed with snaplock joint, welded spiral seams, or welded longitudinal joint. Fabricate from the following gauges: 3" and smaller, 20-gauge; 4" to 6", 16-gauge; over 6", 14-gauge.
4. Steel pipe: Fabricate from Schedule 40 galvanized steel pipe; remove burrs.
5. Iron pipe: Fabricate from cast iron or ductile-iron pipe; remove burrs.
6. Plastic and copper pipe: Fabricate from Schedule 80 PVC plastic pipe; remove burrs.
7. Sleeves through interior concrete walls and floors. Floor sleeves to extend a minimum of 1" above finished floor. Telescopic, submerged, or adjustable sleeves. Manufacturers: Adjust-to-Crete, AMI, Shamrock, or equal.
8. Through exterior walls and floor on grade: 150-pound class cast-iron pipe sleeve. Where waterproof membranes are used, provide membrane clamps. For insulated piping, sleeve diameter shall not be less than diameter of insulated pipe.
9. Cast-in-place watertight device for protecting penetrating objects from expansion and contraction of concrete. Factory-assembled for use in cast-in-place concrete floors and walls and consisting of two outer sleeves and a one-piece radial extended-flange waterstop gasket, with mid-body seal for embedment and sealing to concrete slab and continuous water seal extending to the penetrating pipe.

- a. Outer Sleeves: EPDM or NBR attached to the mid-body seal forming an area with which to attach the device to the structural reinforcing rod determining the position of sleeve in the wall.
 - b. Water Stop Mid-Body Seal: Flexible polymer seal with radial extended flange consisting of one to three concentric raised rings which lock into concrete, maintaining seal over time as concrete contracts from sleeve
 - c. Manufacturers: Hubbard Enterprises/HOLDRITE, Hydro Preseal, or equal.
- I. Sleeve Seals:
1. All sleeves shall be sealed to prevent intrusion of moisture, dust or insects.
 2. Underground: For sleeves passing through exterior or foundation walls, provide mechanical link seal assembly.
 3. Aboveground: For sleeves passing through walls or floors provide a non-toxic 3-hour rated fire resistant silicone foam sealant with a Flame Spread Rating of 20. Sealant to be tested and approved under UL 263, ASTM E119, and NFPA 251 Standards. All fire rated penetrations shall be sealed with approved UL System.
 4. Local Approvals: All seals to be provided shall be in accordance with the regulations of all governing agencies of the city, county, and State Fire Marshal's Office.
- J. Watertight Sleeve-Seal Systems:
1. Wood Decking Description: Cast-in-place, factory-assembled, one-piece watertight firestop device for use in concrete floors formed with wood decking to protect penetrating objects from expansion and contraction of concrete, thermal and seismic movement, and the passage of air, smoke, fire, and hot gasses.
 - a. Consists of an outer sleeve lined with an intumescent strip, and a radial extended flange attached to one end of the sleeve for fastening to concrete formwork.
 - b. Include a waterstop gasket and mid-body seal consisting of one to three concentric raised rings for embedment and sealing to the concrete slab.
 - c. Retain subparagraph below if fire resistance rating is required.
 - d. Provide a one-hour, two-hour, or three-hour fire-resistance rated assembly as required at penetration when tested according to ASTM E 814 or ANSI/UL 1479.
 - e. Manufacturers: Hubbard Enterprises/HOLDRITE, Hydroflame Sleeve, or equal.
 2. Metal Decking Description: Cast-in-place, factory-assembled, one-piece watertight firestop device for use in floors formed with steel decking to protect penetrating objects from expansion and contraction of concrete, thermal and seismic movement, and the passage of air, smoke, hot gasses and fire.
 - a. Consists of an outer sleeve lined with an intumescent strip, and wide outside wings attached to one end of the sleeve for fastening to metal deck concrete formwork and span deck corrugations.
 - b. Includes a cone attached to the base for extending the device through the metal deck and a waterstop gasket and mid-body seal consisting of one to three concentric raised rings for embedment and sealing to the concrete slab.
 - c. Provide a one-hour, two-hour, or three-hour fire-resistance rated assembly as required at penetration when tested according to ASTM E 814 or ANSI/UL 1479.
 - d. Manufacturers: Hubbard Enterprises/HOLDRITE, Hydroflame CMD Metal Deck Device, or equal.

K. Pipe Escutcheons:

1. Provide pipe escutcheons as specified herein with inside diameter closely fitting pipe outside diameter, or outside of pipe insulation where pipe is insulated. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, walls, or ceilings; and pipe sleeve extension, if any. Furnish pipe escutcheons with nickel or chrome finish for occupied areas, prime zinc base paint finish for unoccupied areas.
2. Pipe Escutcheons for Moist Areas: For waterproof floors and walls, and areas where water and condensation can be expected to accumulate, provide stainless steel, cast brass or sheet brass escutcheons, solid or split hinged.
3. Pipe Escutcheons for Dry Areas: Provide stainless steel escutcheons, solid or split hinged.

L. Drip Pans:

1. Provide drip pans fabricated from 20-gauge galvanized sheet metal with watertight joints, and with edges turned up 2-1/2". Reinforce top by structural angles. Provide hole, gasket, and flange at low point for watertight joint and 1" copper drain line connection.

2.15 EXPANSION COMPENSATORS AND FLEXIBLE PIPING CONNECTIONS

- A. General: Pipe expansion, in general, is to be absorbed in bends, swing joints, expansion loops, and offsets. All piping mains, branches and runouts shall be installed to allow for free expansion and contraction without developing leaks or undue stressing of pipe. Stresses shall be within allowable limits of ANSI B31.1 for pressure piping. Vertical piping for chilled water, heating water, and condenser water shall be provided with system flexibility to allow expansion compensation at each floor level without inducing stresses on branch piping. Expansion products to conform to the standards of the Expansion Joint Manufacturer's Association. Expansion joints shall not require packing. Installer shall select materials and pressure/temperature ratings to suit intended service. Select packless expansion joints to provide 150% absorption capacity of calculated maximum piping expansion between anchors. All connections shall have ends to match piping system application.
- B. Expansion Compensators (Pipe Compression and Extension): Multiple stainless steel bellows, hose, braid, shroud and flange end fittings. Manufacturers: Keflex #311 series, Metraflex #GIL04F series, or equal.
- C. Flexible Expansion Joint/Seismic Connector for Steel Pipe: Stainless steel hose and braid, 180° return, CSA approved, and end fittings. Manufacturers: Metraflex #Metraloop, Unisource #V-SF21 Style, Mason Industries #VEE Assembly, or equal.
- D. Flexible Connection for Steel Pipe (piping and equipment located outside the building): Stainless steel hose and braid, with threaded, grooved or flanged ends. Provide steel supports to prevent sagging as required. Manufacturers: Metraflex #SST, Mason Mercer, or equal.
- E. Three grooved joint flexible type, not rigid, couplings may be used in lieu of flexible connectors on steel pipe for vibration attenuation and stress relief. Grooved joint couplings shall be placed in close proximity to the vibration source. For services up to 250°F. Manufacturers: Victaulic #Style 177 or 77, Tyco Grinnell #Fig. 705 and 707 couplings, or Gruvlok #FIG 7401.
- F. Flexible Connection for Copper Pipe: Bronze hose and braid, copper tube ends. Provide steel supports to prevent sagging is required. Manufacturers: Metraflex #BBS, Unisource #V-BF11 Style, Mason Industries or approved equal.

- G. Flexible Rubber Connectors (Pump Connections): Concentric spool type expansion joint, single or double arch. Chlorobutyl tube and cover, meeting ASTM specification D2000 Grade 2AA610AB, L13. The body shall be reinforced with rectangular body rings and a minimum of six bias plies of polyester fabric. A hypolon coating shall be applied completely and uniformly to the cover. All expansion joints shall be rated 190 psi/26-inch vacuum at 250° F for sizes up to and including 12 inches.
1. For chilled water, condenser water, and non-critical pump connections. Furnish with fluorelastomer tube and cover to ASTM D2000 Grade 1HK710. The body shall be reinforced with rectangular body rings and six bias plies of fiberglass/kevlar fabric rated 190#/26-inch vacuum at 250° F. Provide galvanized flat (not L shaped) back up rings and control rods to limit maximum axial extension. Manufacturers: Garlock #206 EZ-FLO or equal.
 2. Three grooved joint flexible type couplings may be used in lieu of flexible connectors on steel pipe for vibration attenuation and stress relief. Grooved joint couplings shall be placed in close proximity to the vibration source. For services up to 250°F. Manufacturers: Victaulic #Style 177 or 77 or Gruvlok #FIG 7401.
- H. Expansion Joints for Grooved Piping: For piping systems fabricated from grooved pipe and couplings, use one of the following methods for expansion compensation:
1. Combination Couplings and Nipples: Provide expansion joints constructed of grooved short pipe nipples and flexible couplings, designed by manufacturer to suit intended service. Provide removable ties to hold joint compressed or expanded during piping fabrication, depending on application. Total joint end movement is dependent on the number of couplings/nipples in the joint. Select couplings and gasket materials to match balance of piping system. Manufacturers: Victaulic #Series 155 or Gruvlok #FIG 7240.
 2. Slip-Type Expansion Joints: Provide slip-type expansion joints constructed of carbon steel pipe and couplings, designed by manufacturer to suit intended service. Joint shall be gasketed expansion joint, with grooved ends. Slide section coated with PTFE modified PPS (Polyphenylene Sulfide) coating. Joint suitable for axial end movement up to 3". Select couplings and gasket material to match balance of piping system. Manufacturer: Victaulic #Style 150 or equal.
 3. Three flexible couplings: Use three flexible couplings for the first three connections in close proximity to a pump or chiller to eliminate flexible rubber connectors. Manufacturers: Victaulic #177, 75 or 77, Tyco-Grinnell #Fig. 705 and 707, or Gruvlok #FIG 7401.
- I. Pipe Alignment Guides: Provide pipe alignment guides on both sides of expansion joints, and elsewhere as indicated on drawings. Guide shall be of carbon steel construction with split guiding cylinder and integral anchor base and internal four finger two-piece spider. Cylinder wall thickness shall be equal to schedule 40 wall thickness of pipe being guided. Spider shall be capable of clamping directly to pipe and moving only in an axial direction while inside cylinder. Anchoring directly to building substrate. Manufacturers: Metraflex #Style IV or equal.
- J. Expansion Loops: Provide field fabricated pipe expansion loops as an alternate to mechanical expansion joints. Expansion loops in IPS steel and roll grooved copper tubing systems shall be accommodated with loops or bends consisting of eight (8) mechanical groove-type couplings, four (4) 90-degree elbows, and three (3) grooved end pipe spools provided in water systems up to 250°F in accordance with recommendations for expansion compensation.
- 2.16 EXPANSION TANKS
- A. Bladder Type Pre-Pressurized:

1. The pressurization system shall include a bladder-type expansion tank which will accommodate the expanded water of the system generated within the normal operating temperature range, limiting this pressure increase at all components in the system to the maximum allowable pressure at those components. It shall maintain minimum operating pressure necessary to eliminate entrained air. The system's expanded water shall be contained in the acceptance volume heavy-duty butyl bladder. Maximum acceptance volume for any tank shall not exceed 65% of the tank volume for purposes of tank selection. Bladder shall be removable and replaceable.
2. The expansion tank shall be welded steel, constructed, tested and stamped in accordance with Section VIII Division 1 of the ASME Boiler and Pressure Vessel Code for working pressures to 300 psi, maximum operating design temperature of 240°F, and pre-charged to the 12 psi (minimum). Adjust pressure charge after installation based on system requirements.
3. The tank shall have a minimum 3/4" NPT system water connection and a 0.302"-32 air charging valve connection (standard tire valve) to facilitate on-site charging by system installer to meet system operating requirements.
4. Provide integrity monitor or sight glass to allow for maintenance observations.
5. Provide with base mounting clips for attachment to floor or pad.
 6. Manufacturers: Amtrol #L Series, Wessels #NLA Series, Taco #CA Series, Bell and Gossett #B Series or equal.

2.17 AIR ELIMINATION

A. Manual Air Vent

1. To be located at the high points in all closed and open hydronic piping systems for manual air venting, including high points at coil connections, and where shown on the drawings.
2. Body: Bronze or brass.
3. Internal Parts: Nonferrous.
4. Operator: Screwdriver or thumbscrew. Knurled thumbwheel with blowout-proof actuating stem.
5. Inlet Connection: Minimum 1/4" NPT. Extended stem, minimum 2" long, to terminate above insulation/jacket surface.
6. Maximum operating pressure: 250 psig.
7. Maximum operating temperature: 300°F.
8. Manufacturers: Nexus #MV-025L or equal.

B. Automatic Air Vent – Low Capacity Pipe Connections

1. For automatic air venting at all high points in all closed and open hydronic piping systems to be located at the top floor of each pipe riser (supply and return), other high points in piping where air binding may occur, and other locations shown on drawing and as required for complete air venting of piping system. Air vents shall be tightly sealed against loss of system water and prevent entrance of air in negative pressure situations.
2. Body: Bronze, brass, steel or cast iron.
3. Float: Stainless steel.
4. Seat: Stainless steel or brass.

5. Inlet Connection: Minimum 1/4" NPT. Extended stem, minimum 2" long, to terminate above insulation/jacket surface.
 6. Outlet Connection: Minimum 1/4" discharge pipe routed to nearest floor drain or floor sink or other approved drainage location.
 7. Maximum operating pressure: 150 psig.
 8. Maximum operating temperature: 250°F.
 9. Manufacturers: Hoffman (Xylem) #78, Nexus #AV-025, or equal.
- C. Automatic Air Vent – High Capacity Equipment Connections
1. For high capacity air venting in all closed hydronic piping systems to be located on the top of air separators, boilers, chillers, pump skid high points, heat exchangers and other locations shown on drawing and as required for complete air venting of piping system. Air vents shall be tightly sealed against loss of system water and prevent entrance of air in negative pressure situations.
 2. Body: Bronze, brass, steel or cast iron.
 3. Float: Stainless steel.
 4. Seat: Stainless steel or brass.
 5. Inlet Connection: Minimum 1/2" NPT. Extended stem, minimum 2" long, to terminate above insulation/jacket surface.
 6. Outlet Connection: Minimum 3/8" with discharge pipe routed to nearest floor drain or floor sink or other approved drainage location.
 7. Maximum operating pressure: 150 psig.
 8. Maximum operating temperature: 250°F.
 9. Manufacturers: Metraflex #MVC-15, Spirotherm #Spirotop, Hoffman (Xylem) #792 or #107A, Amtrol #747, or equal.
- D. Air and Dirt Separators - Tangential and Coalescing Media Type
1. All free air originally contained in the system, and all entrained air bubbles carried by system water shall be eliminated at all system points as indicated on the drawings.
 2. The air separator shall be welded steel, constructed, tested and stamped in accordance with Section VIII of the ASME Code for a working pressure of 125 psi.
 3. Air separators shall be sized as indicated on Drawings.
 4. Provide with strainer unless otherwise noted.
 5. All fittings shall be fabricated steel, rated for 150 psig design pressure and be selected for less than 1 foot of water pressure drop and entering velocity not to exceed 4 feet per second at specified GPM.
 6. Units shall eliminate 99.6% of system air (including entrained air and microbubbles). Performance curves from the unit manufacturer shall be furnished as part of the submittal for each unit. Units may include internal copper coalescing medium to facilitate maximum air elimination and suppress turbulence or be furnished with galvanized steel strainer and stainless steel collector tube for a similar purpose.
 7. Provide integral high capacity float actuated air vent at top fitting of tank or cast iron float actuated air vent rated at 150 psig which shall be threaded to the top of the separator. Unit shall have bottom blow down connection.

8. Manufacturers: Amtrol #ADS Series, Spirovent, Xylem Bell & Gossett, TACO, Patterson, Wheatley, Armstrong, Spirovent or equal.

2.18 CHEMICAL POT (BYPASS) FEEDER

- A. Provide a pot (bypass) feeder with removable cover, bottom drain valve, and shut-off valves. Provide balancing valve and check valves as shown on Drawings.
- B. The size of the pot feeder is to be five (5) gallons for piping systems under 15,000 gallons (total) and 10-12 gallons for systems over 15,000 gallons. The feeder is to have the ability to have a removable top without tools needed, inlet port, outlet port, drain port and meet pressure rating requirements of the system.
- C. Steel body, rated at 125 psig and 250°F. Tank shall have 3-1/2 inch (minimum) neck opening.
- D. Mount on support stand, with integral legs, or attached to the wall and pipe between the supply and return piping as shown on Drawings. Provide clearance under the pot feeder for gravity draining to approved sanitary sewer location.
- E. Manufacturers: Dearborn, Garrett-Callahan, J.L Wingert, Neptune, or equal.

2.19 HYDRONIC WATER BUFFER TANK

- A. Provide vertical buffer tank with features indicated herein and per the drawings. If chilled water system total volume is less than 6 gallons per ton of capacity (10 gallons for low temperature/ice storage systems) or less than a 3 minute total system changeover flow, install a buffer tank sized as needed to achieve the minimum total system water volume.
- B. Fabricate base, frame, and attachment to tank components strong enough to resist tank movement during a seismic event when tank base is anchored to concrete base slab.
- C. The buffer tank shall be welded carbon steel, constructed, tested and stamped in accordance with Section VIII of the ASME Code for a maximum working pressure of 125 psig/200 psig/250 psig as required.
- D. The tank shall be epoxy lined to extend service life.
- E. Tank connections shall include:
1. 3/4" NPT top air vent connection with automatic air vent and drain line routed to approved receptacle.
 2. 1" NPT bottom drain outlet connection with hose bibb valve.
 3. Flanged or grooved chilled water inlet and outlet sized to match system piping.
- F. Manufacturer: Wessels #CBT Series, A.O. Smith, Hanson Tank, or equal.

2.20 SUPPORTS AND ANCHORS (SEE SECTIONS 23 05 00 AND 23 05 49)

2.21 WATER TREATMENT SYSTEMS (SEE SECTION 23 25 00)

PART 3 EXECUTION

3.01 GENERAL

- A. Workmanship shall be performed by licensed journeymen or master mechanics and shall result in an installation consistent with the best practices of trades.
- B. Install work uniform, level and plumb, in relationship to lines of building. Do not install any diagonal or otherwise irregular work unless so indicated on Drawings or approved by the Owner's Representative.
- C. Coordinate mounting and attachment of piping and tanks with Structural Engineering design.
- D. Coordinate the work between the various Mechanical Sections and with the work specified under other Divisions of the work or contracts toward rapid completion of the entire project. If any cooperative work must be altered due to lack of proper supervision or failure to make proper provisions in time, then the work hereunder shall include all expenses of such changes as are necessary in the work under other contracts, and such changes shall be directly supervised by and made to the satisfaction of the Owner's Representative.
- E. The cooperative work not included in the Mechanical Division related to the general construction work is as follows:
 - 1. All formed concrete work
 - 2. Framed openings in masonry and other Architectural and Structural elements
 - 3. Wood grounds and nailing strips in masonry and concrete
- F. Inspect all material, equipment, and apparatus upon delivery and do not install any that may be subject to rejection as a result of damage or other defects. Provide tarps and waterproof material cover to protect equipment and piping delivered to and stored at the site.

3.02 MANUFACTURER'S DIRECTIONS

- A. Follow manufacturer's directions and recommendations in all cases where the manufacturers of articles used on this Contract furnish directions covering points not shown on the Drawings or covered in these Specifications. Provide additional valves, strainers, unions, etc. as required by manufacturer installation instructions.

3.03 WORKING PRESSURES

- A. All fittings, valves, pipe, specialties equipment shall be rated for the working pressure subjected in the installed locations.
- B. Drawings indicate working pressure in each system. The rating of the equipment and material shall not be less than that of the system pressures.

3.04 PIPE SIZES TO EQUIPMENT

- A. General: Pipe sizes indicated on drawings shall be carried full size to equipment served. Any change of size to match equipment connection shall be made within one foot of equipment.
- B. At temperature control valves with sizes smaller than connected lines, reduction shall be made immediately adjacent to valve.

3.05 PIPING INSTALLATION

- A. General: Install pipes and pipe fittings in accordance with recognized industry practices which will achieve permanently leakproof piping systems, capable of performing each indicated service without piping failure. Install each run with minimum joints or couplings, but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes (where indicated) by use of reducing fittings. Align piping accurately at connections, within 1/16-inch misalignment tolerance. Comply with ASME B31 Code for Pressure Piping.
- B. Locate piping runs, except as otherwise indicated, vertically and horizontally (pitched to drain) and avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. Locate runs as shown or described by diagrams, details, and notations or, if not otherwise indicated, run piping in shortest route which does not obstruct space or block access for servicing building and its equipment. Hold piping close to walls, overhead construction, and other structural and permanent-enclosure elements of building. Limit clearance to 1/2 inch where furring is shown for enclosure or concealment of piping, but allow for insulation thickness, if any. Where possible, locate insulated piping for 1-inch clearance outside insulation. Whenever possible in finished and occupied spaces, conceal piping from view, by locating in column enclosures, in hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as indicated.
- C. Install expansion joints, expansion loops, expansion bends, and similar units to accommodate project seismic movement across building expansion joints and in vertical risers to accommodate drift between vertical buildings levels.
- D. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- E. Install lateral bracing with pipe hangers and supports to prevent swaying.
- F. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, and changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
- G. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.
- H. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.
- I. Check Valves: All check valves should be installed in a location that has smooth and laminar flow conditions. Use the following general rules for check valve installations:
1. Downstream of a reciprocating pump or other turbulence inducing device (elbow, tee, etc.)
 - a. Swing Type: Locate valve a minimum of 10-12 diameters downstream of the device.
 - b. Silent Type: Locate valve a minimum of 4-5 diameters downstream of the device.
 2. Pipe fittings, elbows, reductions, etc. downstream of the valve:
 - a. Swing Type: Locate elbow a minimum of 5-7 diameters downstream of the valve.
 - b. Silent Type: Locate elbow a minimum of 2-3 diameters downstream of the valve.

J. Strainers

1. Install strainers in piping and locate upstream of control valves, coils, and heat exchangers where shown on drawings and as required by equipment and controls manufacturers.
2. Strainer screen or basket shall be Type 304 or 316 stainless steel.
 - a. Start-up screen for first month of operation shall be a 40 mesh with 0.016" openings and 41% open area. For applications with piping connected to existing piping systems the start-up screen shall be 60 mesh with 0.010" openings and 38% open area.
 - b. Start-up screen shall be removed and replaced with normal operation screen after one month of pump operation, or as directed by the water treatment company, and prior to final water balance.
 - c. Normal operation filter screens or baskets shall be installed prior to final water balance.
 - 1) Strainer sizes up to 2" shall be provided with 20 mesh screens, with 0.035" openings and 49% open area (minimum).
 - 2) Strainer sizes 2-1/2" and larger shall be provided with perforated baskets with 3/64" diameter perforations with 36% open area (minimum).

K. Elevator Machine Rooms, Switchgear, Generator, Telecommunications, Telephone Rooms, and Electrical Equipment Spaces: Do not run piping through transformer vaults and other electrical or electronic equipment spaces and enclosures unless unavoidable. Install drip pan under piping that must be run through electrical spaces.

L. Cleaning: Clean exterior surfaces of installed piping systems of superfluous materials and prepare for application of specified coatings (if any).

3.06 SLOPING, AIR VENTING, AND DRAINING

- A. Provide hose bibb valve, with threaded brass cap, at all low points in piping for maintenance drainage. Provide drains on each side of air handling coils and heat transfer devices. Provide drains at each low point in the piping on each floor level.
- B. Connect all branch piping to the bottom or side of their respective hydronic mains. Where connections must be made to the top of the main piping, make provision for venting of air.
- C. Provide drain discharge pipe from each temperature relief valve and/or pressure relief valve as required by mechanical code. Discharge pipes shall and discharge independently by gravity through an air gap into the drainage system or outside of the building with the end of the pipe not exceeding 2 feet (610 mm) and not less than 6 inches (152 mm) above the ground and pointing downwards, or indirectly terminated above an approved location such as a floor sink or floor drain.
- D. Provide manual or automatic vents at all high points in water piping, at high points in the piping and adjacent to each coil, and where shown on the drawings.
 1. Manual air vents shall be located at the high points in all closed and open hydronic piping systems for manual air venting, including high points at coil connections, and where shown on the drawings. Provide at high points in piping system on each floor.

2. Automatic air vents shall be provided in all closed hydronic piping systems and located on the top of air separators, boilers, chillers, pump skid high points, heat exchangers and other locations shown on drawing and as required for complete air venting of piping system. Air vents shall be tightly sealed against loss of system water and prevent entrance of air in negative pressure situations. Route drain pipe to nearest floor drain or floor sink or other approved drainage location.

3.07 PIPING SYSTEM JOINTS

- A. All piping shall be cut squarely, free of rough edges and reamed to full bore. Piping shall be mechanically cleaned prior to make-up of joints and fully inserted into fittings.
- B. Provide joints of type indicated in each piping system.
- C. Piping shall be capped during construction to prevent entry of foreign material.
- D. Thread pipe in accordance with ANSI B2.1. Cut threads full and clean using sharp dies. Ream threaded ends to remove burrs and restore full inside diameter. Remove excess cutting oil from piping prior to assembly. Apply pipe joint compound, or pipe joint tape (Teflon) where recommended by pipe/fitting manufacturer, on male threads at each joint and tighten joint to leave not more than 3 threads exposed.
- E. Solder copper tube and fitting joints with lead free nickel/silver bearing solder meeting ASTM B-32, in accordance with IAPMO IS 3-93, ASTM B-828 and Copper Development Association recommended procedures. Joints shall be cleaned by other than chemical means prior to assembly. "Shock" cooling is prohibited. Fluxes shall be applied liberally to the outside of the pipe and the solder cup of the fitting. Fluxes shall be water soluble for copper and brass potable water applications and shall meet CDA standard test method 1.0 and ASTM B813-91. Solder shall be applied until a full fillet is present around the joint. Solder and flux shall not be applied in such excessive quantities as to run down interior of pipe. Lead solder or corrosive flux shall not be present at the jobsite.
 1. Manufacturers:
 - a. Solder: JW Harris "Bridgit" or Englehard "Silvabrite 100".
 - b. Flux: Laco "Flux-Rite 90", MW Dunton "Nokorode CDA Flux", Hercules "Fluid Action Solder Flux".
 - F. Mechanically Formed Extruded Tee Fittings: Form tee in copper tube according to ASTM F2014. Forming procedures shall be in accordance with the tool manufacturer's recommendations. Use tool designed for copper tube; drill pilot hole, form collar for outlet, dimple tube to form seating stop, and braze branch tube into collar. Formed tee fitting shall not be greater than 50% of the diameter of the main run tube/pipe. Soldered joints are not allowed.
 1. Mechanically formed extruded outlets shall be perpendicular to the axis of the run tube (main pipe). Holes shall be formed by drilling a pilot hole and drawing out the tube surface to form a collar having a height of not less than three times the thickness of the branch wall.
 2. Branch tubes shall not restrict the flow in the run tube. A dimple (depth stop) shall be formed in the branch tube to ensure that penetration into the collar is of the correct depth. For inspection purposes, a second dimple shall be placed 0.25 inch above the first dimple. Dimples shall be aligned with the tube run.
 3. Manufacturer: T-Drill or equal.

- G. Braze copper tube and fitting socket or mechanically formed tee fittings with BCUP series filler metal without flux. Listed brazing flux shall be used for joining of copper tube to brass or bronze fittings and shall meet AWS FB3A or FB3C. "Shock" cooling is prohibited. A continuous fillet shall be visible around the completed joint. After cooling, flux residue shall be thoroughly removed with warm water and a brush prior to testing. Do not use BCUP filler on copper alloys containing over 10% nickel.
1. Brazing fittings may use a mechanically limited depth that is not less than the minimum cup depth (overlap) specified by ANSI/ASME B16.50 for Wrought Copper and Copper Alloy Braze-Joint Pressure Fittings. Manufacturer of mechanical dimpler: Brazing Dimpler Corp or equal.
- H. Depth of solder joint and braze joint fitting:

Depth of Solder Joint and Braze Joint Fittings		
Pipe Size (inches)	ASME 16.22 Solder Joint Socket Depth (inches)	ASME B16.50 Brazed Joint Socket Depth (inches)
1/2	0.50	0.22
3/4	0.62	0.25
1	0.75	0.28
1-1/4	0.97	0.31
1-1/2	1.09	0.34
2	1.34	0.40
2-1/2	1.47	0.47
3	1.66	0.53
4	2.16	0.64
5	2.66	0.73
6	3.09	0.83
8	4.09	1.28

- I. Weld pipe joints in accordance with recognized industry practice and as follows:

1. Weld pipe joints only when ambient temperature is above 0°F.
 2. Bevel pipe ends at a 37.5° angle where possible, smooth rough cuts, and clean to remove slag, metal particles, and dirt.
 3. Use pipe clamps or tack-weld joints with 1" long welds, 4 welds for pipe sizes to 10", 8 welds for pipe sizes 12" to 20".
 4. Build up welds with stringer-bead pass, followed by hot pass, followed by cover or filler pass. Eliminate valleys at center and at edges of each weld. Weld by procedures which will ensure elimination of unsound or un-fused metal, cracks, oxidation, blow-holes, and non-metallic inclusions.
 5. Do not weld out piping system imperfections by tack-welding procedures. Re-fabricate to comply with requirements.
 6. With engineering pre-approval stub-in saddle taps may be acceptable for aboveground branch connections, in non-critical areas, where the branch size is less than 50% of the main size and where branch sizes are 3", or smaller, in diameter. Pipe main must be larger than 8" diameter in a renovation project for consideration.
- J. Flanged Joints: Match flanges within piping system, and at connections with valves and equipment. Clean flange faces and install gaskets. Tighten bolts to provide uniform compression of gaskets.
- K. Grooved Joints:
1. All grooved couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall meet AWWA C-606 requirements.
 2. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Gaskets shall be molded and produced by the grooved coupling manufacturer.
 3. Grooved ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove.
 4. Grooved coupling manufacturer's factory trained field representative shall provide on-site training for contractor's field personnel in the proper use of grooving tools, application of groove, and installation of grooved piping products. Factory trained representative shall periodically inspect the product installation. Contractor shall remove and replace any improperly installed products.
- L. Dielectric Fittings:
1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing such as copper to zinc plated equipment fittings or copper to galvanized steel or black steel equipment:
 - a. Dielectric Fittings for NPS 2" (DN 50)] and Smaller: Use dielectric couplings, nipples, unions.
 - b. Dielectric Fittings for NPS 2-1/2" to NPS 4" (DN 65 to DN 100): Use dielectric flange kits or threaded nipples.
 - c. Dielectric Fittings for NPS 5" (DN 125) and Larger: Use dielectric flange kits.
 2. Dielectric couplings are not required in the following locations:
 - a. Unions in a copper piping system with connections to brass/bronze valves and devices.

- b. Unions in a copper piping system with connections to stainless steel valves and devices.
- M. Adhesive Bonded Joints: All joints installed or constructed in the field shall be assembled by employees of the contractor who have been trained and certified to the bonding procedure specification provided by the pipe manufacturer. This specification shall meet or exceed the requirements of ASME B31.3, Section A328.2.1. The pipe manufacturer or their authorized representative shall train the contractor's employees in the proper joining and assembly procedures required for the project including hand-on participation by the contractor's employees in accordance with the manufacturer's specification.
- N. Vic-Press 304™ Joints: Pipe shall be certified for use with the Vic Press 304™ system. Pipe shall be square cut, +/- 0.030", properly deburred and cleaned. Pipe ends shall be marked at the required location, using a manufacturer-supplied gauge, to ensure full insertion into the coupling or fitting during assembly. Use a Victaulic 'PFT' series tool with the proper sized jaw for pressing.

3.08 VALVES

- A. General: Except as otherwise indicated, comply with the following requirements.
1. Install valves where required for proper operation of piping and equipment, including valves in branch lines where necessary to isolate sections of piping, strainers and other equipment. Locate valves so as to be accessible and so that separate support can be provided as necessary.
 2. Install valves, except butterfly valves, with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane without prior written approval. Install valve drains with hose-end adapter for each valve that must be installed with stem below horizontal plane.
 3. Install butterfly valves with stems mounted horizontally.
 4. All valves mounted higher than 10 feet above floor in mechanical rooms and where indicated shall be installed with stem horizontal and equipped with chain wheels and chains extending to 5 feet above floor.
- B. Insulation: Where insulation is indicated, install extended-stem valves, arranged in proper manner to receive insulation.
- C. Selection of Valve Ends (Pipe Connections): Except as otherwise indicated, select and install valves with the following ends of types of pipe/tube connections:
1. Copper Pipe, 2-1/2" and Smaller:
 - a. Soldered-joint valves.
 - b. Grooved-joint valves.
 2. Copper Pipe, 2-1/2" and Larger: Grooved-joint valves.
 3. Stainless Steel Pipe, 2" and Smaller: Vic Press 304™ joint valves.
 4. Steel Pipe, 2" and Smaller: Threaded joint valves.
 5. Steel Pipe, sizes 2-1/2" and larger: One of the following, at installer's option:
 - a. Flanged valves.
 - b. Lug valves.
 - c. Grooved-end valves.

- D. Non-Metallic Disc: Limit selection and installation of valves with non-metallic discs to locations indicated and where foreign material in piping system can be expected to prevent tight shutoff of metal seated valves.
- E. Renewable Seats: Select and install valves with renewable seats, except where otherwise indicated.
- F. Fluid Control: Except as otherwise indicated, install gate, globe, ball, plug, circuit setter, glove, and butterfly valves to comply with ASME B31.9.
- G. Check Valves: Install in vertical or horizontal a minimum of three (3) pipe diameters downstream of pump outlet.
- H. Wafer Style Silent Check Valve: Install between two (2) flanges and use full size bolts to assure center alignment.
- I. Ball Valve: Ball valve used on gas systems shall be UL listed, CSA approved for pressure of system, no exception
- J. Valve Adjustment: After piping systems have been tested and put into service, but before final testing, adjusting, and balancing, inspect each valve for possible leaks. Adjust or replace packing to stop leaks, replace valve if leak persists.
- K. Valve Identification: Tag each valve in accordance with "Mechanical Identification" section.
- L. Cleaning: Clean factory-finished surfaces. Repair marred or scratched surfaces with manufacturer's touch-up paint.
- M. Install so handles are readily available. Locate valves and valve handles for appropriate maintenance access.
- N. Gasket and O Ring Material: Valve manufacturer is responsible for submittals. Provide gasket and O ring material best suited for the both piping systems.

3.09 TEMPERATURE GAUGES AND THERMOMETERS

- A. General: Install temperature gauges/thermometers in vertical upright position and tilted so as to be easily read by observer standing on floor without supplemental illumination.
- B. Install in the following locations and elsewhere as indicated:
 - 1. At inlet and outlet of chillers.
 - 2. At inlet and outlet of fluid coolers.
 - 3. At inlet and outlet of heat exchangers.
 - 4. At inlet and outlets of boilers.

3.10 PRESSURE GAUGES

- A. General: Install pressure gauges in vertical upright position and tilted so as to be easily read by observer standing on floor without supplemental illumination. All gauges to be installed with snubbers to absorb system shock.
- B. Install in the following locations and elsewhere as indicated:
 - 1. At inlet and outlet of pumps.

2. At inlet and outlet of chillers.
3. At inlet and outlet of heat exchangers.
4. At inlet and outlet of boilers.

3.11 IDENTIFICATION MARKERS (SEE SECTION 23 05 00)

3.12 SLEEVE INSTALLATION

- A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.
- B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1" minimum annular clear space between piping/insulated piping and concrete slabs and walls.
 1. Retain subparagraph below when cast-in-place watertight sleeve seals are required.
 2. When cast-in-place watertight sleeve seals are required, select sleeve size to match the size and type of pipe to be installed.
 3. Retain subparagraph below if applicable.
 4. Sleeves are not required for core-drilled holes.
- C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
 1. Cut sleeves to length for mounting flush with both surfaces.
 - a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2" above finished floor level.
 2. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
- D. Install sleeves for pipes passing through interior partitions.
 1. Cut sleeves to length for mounting flush with both surfaces.
 2. Install sleeves that are large enough to provide 1/4" (6.4 mm) annular clear space between sleeve and pipe or pipe insulation.
 3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Division 07 Section "Joint Sealants."
 4. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Division 07 Section "Penetration Firestopping." Exception: When fire-resistance-rated cast-in-place watertight sleeve seals are required for floor penetrations, additional firestopping is not necessary.

3.13 SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.

- B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.
- C. Aboveground, Cast-in-Place Watertight Sleeves. Select sleeve size based on pipe size and material to be inserted, and thicken;
- D. ss of wall.
 - 1. Install cast-in-place watertight sleeves for pipes NPS 6 (DN 150) and smaller in diameter.
 - 2. Position cast-in-place water tight sleeve in wall space securing sleeve to reinforcing steel using tie wire.
- E. Fire-Resistance Rated, Cast-in-Place Sleeve Installation: Select sleeve size based on size and type of pipe and thickness of the floor. Position and secure sleeve to concrete form using nails or staples.

3.14 EXPANSION COMPENSATION

- A. Expansion Loops/Connectors at Expansion Joints:
 - 1. Provide flexible hose expansion loop(s) or connectors as indicated on the contract drawings or as required to accommodate any thermal expansion, contraction, building settlement, or seismic movement of the piping system.
 - 2. Flexible hose expansion loops shall be manufactured complete with two parallel sections of corrugated metal house, compatible braid, 180 deg return bend, with inlet and outlet connections. Field fabricated loops shall not be acceptable.
 - 3. Flexible loops shall be capable of movement in the $\pm X$, $\pm Y$, and $\pm Z$ planes to meet or exceed the limits identified in the structural design.
 - 4. Flexible hose expansion loops and connectors shall impart no thrust loads to system support, anchors or building structure.
 - 5. Provide pipe anchors and pipe alignment guides as indicated, and elsewhere as determined by installer to properly anchor piping in relationship to expansion loops.
 - 6. Where plans do not indicate spacing of guides or other pertinent information, install per manufacturer's recommendations.
- B. Expansion Compensation for Risers and Terminals:
 - 1. Install connection between horizontal piping mains and vertical piping risers with at least five pipe fittings including tee in main. Install connections between piping risers and terminal units with at least four pipe fittings including tee in riser.
- C. Thermal Expansion Compensation:
 - 1. Provide piping U-Bend, Z-Bend, L-Bend or flexible devices to accommodate thermal expansion and contraction in piping system where shown on drawings and as required to impart minimal stress in piping and building structure.

3.15 PIPE INSPECTIONS

- A. It is the intent of the Contract Documents that systems be inspected at completion of each phase while under tests required for administrative authorities, and prior to concealment, i.e. "Rough-in" "Top-out" and final.
- B. Inspection - Belowground: All piping installed underground shall be inspected prior to burial by the Owner's Representative. Provide photographs of underground piping in Operation and Maintenance Manuals including location and depth of pipes. Contractor must notify the Owner's Representative no less than 24 working hours prior to inspection time. Should the piping be buried without approval the contractor may be requested to uncover the piping at no delay to the project and at no additional cost to the Owner.
- C. Inspection - Aboveground: All piping installed aboveground shall be inspected upon completion and prior to finish of walls and ceilings by the Owner's Representative. Contractor must notify the Owner's Representative no less than 24 working hours prior to inspection time. Should the piping be hidden within the structure prior to inspection approval the contractor may be requested to uncover the piping at no delay to the project and at no additional cost to the Owner.

3.16 TESTING

- A. Provide all tests specified hereinafter and as otherwise required. Provide all test equipment, including test pumps, gauges, instruments, and other equipment required. Test all rotational equipment for proper direction of rotation. Testing shall be witnessed by an independent third party inspector. Upon completion of testing, certify to the Owner's Representative, in writing, that the specified tests have been performed and that the installation complies with the specified requirements and provide a report of the test observations signed by third party inspector.
- B. Piping: Remove from the system, during testing, all equipment which would be damaged by test pressure. Replace removed equipment when testing has been accomplished. The systems may be tested in sections as the work progresses; however, any previously tested portion shall become a part of any latter test of a composite system. Correct leaks by remaking joints with new material.
 - C. Test time for final pressure test and report will be accrued only while full test pressure is on the entire piping system. Pressure tests shall be witnessed by the Owner's Representative. Provide minimum 48-hour notice prior to start to each test. "Tolerance" shall be no perceptible pressure drop, except that due to temperature change in a 24-hour test period (minimum). Inspect and test all work prior to burying or concealing. Test pressure shall be 100 psig or 1.5 times the system operating pressure, whichever is greater. If approved by the local Authority Having Jurisdiction, the maximum test pressure may be limited to 50 psi greater than the operating pressure, but in no case less than 100 psig. Final test medium shall be water and pressure shall be applied and measured at the lowest floor level of the piping system. Confirm maximum pressure testing requirements with pipe manufacturer and do not exceed the maximum pressure rating of the piping.
- D. Valves: Test all valve bonnets for tightness. Test operate all valves at least once from closed-to-open-to-closed position while valve is under test pressure. Test all automatic valves, including solenoid valves, and temperature and pressure relief valves, safety valves, and temperature and pressure relief valves not less than three (3) times.
- E. Piping Specialties: Test all thermometers, pressure gauges, and water meters for accurate indication; automatic water feeders, and air vents for proper performance. Test all air vent points to ensure that all air has been vented.

3.17 WATER TREATMENT EQUIPMENT AND SYSTEMS

- A. Install water treatment equipment and provide water treatment for systems as designated in Section 23 25 00 HVAC Water Treatment and other Division 23 sections.
- B. Close, fill system and provide chemical treatment as soon as possible after final flushing to minimize corrosion.

3.18 FLUSHING AND CLEANING PIPING SYSTEMS

- A. Clean systems with chemicals specified in Section 23 25 00 HVAC Water Treatment. Follow the method provided below or a method recommended by the suppliers of the chemicals specified in Section 23 25 00.
 - 1. General Initial flushing:
 - a. Remove loose dirt, mill scale, metal chips, weld beads, rust, and similar deleterious substances without damage to any system component.
 - b. Provide temporary piping or hoses to bypass coils, control valves, exchangers and other factory cleaned equipment unless acceptable means of protection are provided and subsequent inspection of hide-out areas takes place.
 - c. Isolate or protect clean system components, including pumps and pressure vessels, and remove any components which may be damaged.
 - d. Open all valves, drains, vents and strainers at all system levels. Remove plugs, caps, spool pieces, and components to facilitate early debris discharge from system. Sectionalize system to obtain debris-carrying velocity of 3 to 6 feet per second, if possible.
 - e. Connect dead-end supply and return headers as necessary. Flush bottoms of risers.
 - f. Install temporary strainers where necessary to protect down-stream equipment.
 - g. Supply and remove flushing water and drainage by various type hose, temporary and permanent piping and contractor's booster pumps.
 - h. Flush until clean as approved by the Owner's Representative.
 - 2. Closed Circulating Water Systems:
 - a. Fill system with local utility water; start circulation pump and vent high points manually until all air is released from the system.
 - b. Flush the system with fresh water, drain a second time and refill. After final filling, the pH of the water must not exceed the pH of the fresh incoming water by more than 0.5 pH.
 - c. Introduce the chemical cleaning solution into the system gradually by injecting into the suction side of the circulating pump, or by means of a pot (bypass) chemical feeder. If it is a chilled water system, do not turn on the compressor. If it is a glycol system, use softened makeup water.)
 - d. While the water is being circulated, check to make sure that all passages are open and adequate flow velocity is present throughout the system.
 - e. During circulation, open each drain connection for a short flow. Repeat at hourly intervals. Replace water drained during blowdown with chemical solution as required until air is eliminated from the system. The chemical cleanout procedure shall be continuous in this manner for two full 8-hour periods.

- f. Propylene glycol-base industrial coolant shall be added to closed system to prevent freezing of water based systems exposed to sub-freezing conditions. Glycol must be thoroughly mixed before the solution is entered into the system. Provide percentage of glycol as recommended by manufacturer to meet local design conditions. Turn over an additional 20 gallons (minimum) of glycol at completion of construction to Owner. Manufacturers: Dow, Union Carbide or equal.

3. Open Condenser Water Systems:

- a. Fill system completely
 - b. Use an oxidizing disinfectant surfactant cleaner for cooling towers with non-metallic internal coatings. Use chemically neutral cleaner for cooling towers with galvanized coating. Use alkaline low foaming surfactant for stainless steel cooling tower systems.
 - c. For packaged unit systems bypass the systems as necessary with temporary piping. For central chiller plants, protect heat exchangers with 150 mesh screens at heat exchanger inlets.
 - d. Circulate water with high levels of cleaner for 4 to 8 hours.
 - e. Test system pH at 60-minute intervals, pH should be above 10.0 while cleaning is taking place, unless water is flowing through a galvanized tower then pH remains between 7.0-8.0. Add more chemicals, to keep pH level. Have anti-foam on-site to prevent pump cavitation.
 - f. Flush entire system with fresh water to reduce pH within 0.5 pH of incoming water and test system pH, conductivity, alkalinity.
 - g. Clean and flush circulators mud legs and strainers.
 - h. Isolate and drain cooling tower.
 - i. Clean/vacuum tower sump and distribution pan.
 - j. Treat with water treatment chemicals at elevated dosage as necessary.
4. Final Flushing: Return systems to conditions required by initial flushing after all cleaning solution has been displaced by clean make-up. Flush all dead ends and isolated clean equipment. Gently operate all valves to dislodge any debris in valve body using the velocity of this throttling action. Flush for not less than one hour. Fill entire system with clean water and vent all air.

3.19 WATER ANALYSIS AND TREATMENT

- A. Upon completion of systems installation, cleaning, and filling, engage a qualified water treatment firm, acceptable to the Owner's Representative. Treat systems with chemicals and procedures specified in Section 23 25 00 HVAC Water Treatment. The water treatment firm shall perform a chemical analysis on each system listed hereinafter, and shall submit to the Owner's Representative a report, including the following:
 - 1. Analysis of each water system.
 - 2. Initial treatment of each system.
 - 3. Recommendations regarding subsequent, periodic, or continuous treatment on each system.
- B. Contractor is to furnish and install initial treatment.

- C. For all systems the contractor is to provide for periodic testing after startup and shall provide all recommended treatment for first year of building occupancy.

END OF SECTION

This page intentionally left blank

SECTION 23 21 14

HYDRONIC UNDERGROUND PIPING

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this Section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, and Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. Provide all labor, materials and equipment required to complete the mechanical site utility work of the Contract Documents. Verify all existing utilities and exact locations prior to installation of new piping and provide all necessary trim and fittings for required connections. All work to be furnished and installed under this Section shall include, but not necessarily be limited to, providing the following:
 - 1. Chilled water piping.
 - 2. Condenser water piping.
 - 3. Heating hot water piping.
 - 4. Piping accessories.
 - 5. Valves and valve boxes.
 - 6. Expansion compensation.
 - 7. Thrust blocks.
 - 8. Excavation, trenching and backfill.
 - 9. Cathodic protection for buried carbon steel piping.
 - 10. Cleaning and testing of piping.
 - 11. Connection of site utility services to building piping system of buildings, to existing site utilities and to site utilities specified under other divisions.
- B. Provide complete design, hardware, installation, maintenance, and repair requirements for the direct bury piping system.
- C. A complete, underground piping system including carrier piping, pipe supports, insulation, air/water-tight outer protective casing, anchors, corrosion protection, casing drain-connections, casing vent connections, and accessories to a point at least 6 inches inside the buildings.
- D. Piping dimensions, as identified on drawings and in specifications, refer to the interior free dimensions. Adjust selected pipe sizes and work as necessary to account for larger outside dimensions to account for material wall thickness.

- E. Performance of each piping systems shall be based on heat transfer calculation for the longest underground path at full design capacity. Heat transfer calculations shall be provided by pipe system manufacturer for each service starting with the point of supply where the pipe enters the underground system to the most remote location where the pipes transitions into a building. Calculations shall be based on fluid flows at full design capacity. Heat transfer calculations for above grade piping are not included in the section. Insulation thickness shall be based on maximum allowable heat transfer. Return water insulation thickness shall match supply water thickness. For each system the maximum allowable temperature rise or drop shall be limited to the following:
1. Chilled water supply: 2°F rise from design based on 70°F ground temperature.
 2. Heating water supply: 2°F drop from design based on 40°F ground temperature.

1.03 RELATED WORK IN OTHER SECTIONS

- A. Coordinate with site work and civil engineering design for trench excavation and backfill, paving and cast-in-place concrete.
- B. Section 23 05 00: Basic HVAC Materials and Methods
- C. Section 23 21 13: Hydronic Piping, Valves and Specialties
- D. Section 23 21 23: Hydronic Pumps
- E. Section 23 07 19: HVAC Piping Insulation
- F. Section 26 42 00: Cathodic Protection

1.04 TRENCHING, BACKFILLING, AND COMPACTION

- A. Provide trenching, backfilling, and compaction for the Work of this Section.
- B. Trenching, backfilling, and compaction shall comply with requirements referenced in Section 23 05 00 and relevant Architectural specifications, in addition to requirements specified in this Section.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of piping system, boxes and accessories.
- B. Shop Drawings: Submit shop drawings indicating underground piping installation showing all fittings with inverts. Indicate all footings and grade beams
1. Complete descriptions and drawings of design of system and materials of construction including sizes, types, locations, component parts, assembly, carrier pipes, casing, anchors, pipe guides, pipe supports, expansion loops, and building wall and floor penetrations, end seals, leak plates, field installation instructions, design of the transition points to aboveground systems.
 2. Manufacturer's data sheets on coatings, carrier pipe and insulation.
 3. Expansion Bends:
 - a. Locations, sizes, types, movements.
 - b. Anchor locations, design, forces and moments.

4. Calculations approved and stamped by Professional Engineer demonstrating that allowable stress of piping will not be exceeded due to thermal expansion and that anchor forces and moments are not excessive. Calculations shall be performed by a finite-element, three-dimensional analysis computer program.
 5. Calculations and drawings for thrust blocks.
 6. Drawings and calculations shall have professional engineer's stamp.
 7. Heat transfer calculations to validate insulation thickness per system.
 8. Type and details of the cathodic protection system including dielectric gaskets. Design life calculations for cathodic protection system. Coordinate with Div 26.
- C. Maintenance Data: Submit maintenance data and replacement material lists. Include this data in maintenance manual.
- D. Product Samples: Provide one 12" long sample of each proposed type of pipe.
- 1.06 DELIVERY, STORAGE, AND HANDLING
- A. Deliver products to the site in containers with manufacturer's stamp or label affixed.
 - B. Store and protect products against dirt, water, chemical, and mechanical damage. Do not install damaged components - remove from project site.
- 1.07 QUALITY ASSURANCE
- A. Manufacturer Qualifications:
 1. Manufactured items furnished shall be current and cataloged products of the manufacturer.
 2. Replacement parts, piping and fittings shall be readily available and stocked in the USA.
 3. The piping systems shall conform to specification requirements and shall be manufactured by a company which specializes in these systems, and which has been in the business in excess of five years.
 4. The installation of each direct-buried system shall be performed by a contracting firm with documented experience in excess of five years.
 - B. Manufacturer Engineered Piping Systems: (Note to Editor-Revise as necessary if underground piping system must be engineered to accommodate expansion/contraction, heat lose/gain, thrust blocking, insulation thickness, cathodic protection, etc. Coordinate with site conditions and manufacturer to determine necessary scope of work.)
 1. For all Grade B (ASTM A53 carbon steel piping specified below grade provide a mill report with production identification numbers for piping submitted to permit tracking of pipe by mill and production lot.
 2. Manufacturers of assemblies of products, which include components made by others, shall assume complete responsibility for final assembled unit.
 3. Certification that system manufacturer regularly and currently manufactures direct-buried systems, and that the designs of the system and equipment to be provided for this project conform to specification requirements. This certification shall be an original signed by a principal officer of the manufacturer.

4. Manufacturer's quality assurance plan for fabrication, delivery, storage, installation and testing of system. Certificate of Qualification from system manufacturer that his field representative regularly performs the specified duties in relation to monitoring the installation of the system, that he is technically qualified and experienced in the installation of the system and is authorized by the supplier to make and sign the daily reports specified herein.
 5. A proposed schedule of activities indicating when various items of work and tests are to be carried out and when quality control inspectors of the supplier will be present at the job site.
 6. A written report from the manufacturer's representative, at the job site, during critical stages of material delivery and construction.
 7. Upon completion of the work, Certificate of Compliance, signed by the manufacturer and the contractor, certifying that the system has been installed in accordance with contract requirements.
- C. Codes and Standards:
1. All work shall be in full accordance with all applicable codes, ordinances and code rulings.
 2. The Contractor shall furnish without any extra charge the labor and material required for compliance of codes.
 3. Perform all tests required by governing authorities and as required under all Division 23 Sections. Provide written reports on all tests.
 4. All excavation work must comply with all provisions of state laws including notification to all owners of underground utilities at least 48 business day hours, but not more than 10 business days, before commencing an excavation.
- D. Product Delivery, Storage and Handling
1. Deliver products to the site in containers with manufacturer's stamp or label affixed.
 2. Protection: Use all means necessary to protect materials before, during, and after installation and to protect the installed work and materials of all other trades.
 3. Store and protect products against dirt, water, chemical, and mechanical damage. Do not install damaged components - remove from project site.
 4. The general arrangement and locations of piping are shown on the Drawings. Changes may be necessary to accommodate work. Should it be necessary to deviate from arrangement or location indicated in order to meet existing conditions or due to interference with work of other trades, such deviations as offsets, rises and drops in piping that may be necessary, whether shown or not, shall be made without extra expense. Accuracy of data given herein and on the Drawings is not guaranteed. The Drawings and Specifications are for assistance and guidance, and exact locations, distances, and elevations will be governed by actual site conditions.
 5. All work shall be in accordance with the applicable codes listed in Division 01. No extra charge will be paid for furnishing items required by the regulations but not specified herein or shown on the Drawings. Should there be any direct conflict between the Drawings and/or Specifications and the above rules and regulations, the rules and regulations shall take precedence.
 6. All work shall be completely coordinated, and all lines, grades, slopes and vertical and horizontal locations of pipes shall be exactly determined in the field and cleared with the Owner's Representative before the installation of these items is begun. No extra compensation shall be made for failure to observe this clause.

7. The Drawings and Specifications do not undertake to list every item that will be installed. When an item is necessary for the satisfactory operation of the system, it shall be furnished without extra cost. Work called for in the Specifications, but not on the Drawings, or vice versa, shall be done as though required by both. Lack of specific mention of any work necessary for proper completion of the work in the Specifications and/or Drawings, shall not lessen the Contractor's responsibility.
8. Pipe spaces provided in the design shall be utilized and the work shall be kept within the spaces established on the Drawings.
9. Manufacturers' directions shall be followed in all cases where manufacturers of articles used in this Contract furnish directions covering points not shown on the Drawings or specified herein. Manufacturers' directions do not take precedence over the Drawings and Specifications. Where manufacturers' directions are in conflict with the Drawings and Specifications, submit these conflicts to the Engineer and receive clarification before installing the work.
10. Do not permit or cause any work to be covered or enclosed until it has been inspected, tested, and approved. Should any of the work be enclosed or covered before inspection and test, Contractor shall, at his/her own expense, uncover the work; and, after it has been inspected, tested and approved, make all repairs with such materials as may be required. Restore all work to its original and proper condition.
11. Be responsible for damage to any of this work before acceptance. Securely cover all openings, both before and after setting into place, to prevent obstructions in the pipes and breakage.
12. Repair all damage to the premises occasioned by the work. All damage to any part of the premises caused by leaks or breaks in the pipe installed under this Section of the work for a period of one (1) year after date of final acceptance of the work, shall be repaired
13. Obtain Owner's Representative's approval prior to rerouting of existing services. Refer to Division 01 sections for alterations, shutdown and temporary construction for existing services.

E. Welding Qualifications:

1. Steel Support Welding: Qualify procedures and personnel according to American Welding Society AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX "Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators."
 - a. Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation per pressure and temperature operating class.
 - b. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 DIRECT BURIED PIPING

A. Chilled Water Piping

1. Polyvinylchloride (PVC) Schedule 80 Pipe: Pre-insulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Chill-Therm, Perma-Pipe, Rovanco or equal.
 - a. Carrier Pipe and Fittings: All PVC Schedule 80 pipe shall be manufactured in conformance to ASTM D1785 and ASTM D2267. Maintain minimum interior dimension as identified on drawings.
 - b. Fittings and joints joined using solvent weld glue and are manufactured from PVC material which meets or exceeds requirements of ASTM D1785, cell classification 12454B, Type 1, Grade 1. Fittings and couplings shall be field insulated per manufacturer requirements.
 - c. Casing: Polyurethane insulation with jacket and mastic end seals.
 - d. Insulation: Polyurethane foam with K-factor = 0.165 (maximum), density = 2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat gain in distribution system.
 - e. Jacketing Material: Seamless Polyvinylchloride (PVC) meeting the specifications of ASTM D1784 or high density polyethylene (HDPE), conforming to ASTM D1248. Minimum wall thickness of 0.06 inches for the PVC jacketing material and 100 mils for the HDPE jacketing material.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.
2. High Density Polyethylene (HDPE): Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor #Polycor HDPE, Perma-Pipe, Rovanco, or equal.
 - a. Carrier pipe: Pipe shall be manufactured from a high density polyethylene (HDPE) conforming to ASTM D3350 and D2837 with SDR wall thickness based on design temperature and pressure requirements ranging up to 255 psi and maximum operating temperature of 140°F. Select wall thickness and diameters for minimum pressure drop and maximize service life based on manufacturer selection criteria. Maintain minimum interior dimension as identified on drawings.
 - b. Fittings and joints using butt-fusion as applicable for the fitting or joint type. Fusion-weld tooling, welding machines, and electrofusion devices shall be specified by the pipe and fittings manufacturer.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing (minimum). Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248 and D3350, Type III, Category 5, Class C and Grade P23/P34. Minimum thickness of 100 mils for small pipe diameters.
 - e. Warranty: Minimum 2 years.

- f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.
3. Plastic (Polypropylene) Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Rovanco or approved equal.
 - a. Carrier pipe: Pipe shall be manufactured from a PP-R resin meeting the short-term properties and long-term strength requirements of ASTM F 2389. All pipes shall be made in a three-layer extrusion process. Piping shall contain a fiber layer (faser) to restrict thermal expansion. All pipes shall comply with the rated pressure requirements of ASTM F 2389 or CSA B137.11. Select wall thickness and diameters for minimum pressure drop and maximize service life based on manufacturer selection criteria. Maintain minimum interior dimension as identified on drawings. Carrier pipe manufactured by Aquatherm Greenpipe/Climatherm or approved equal.
 - b. Fittings and joints using socket-fusion, electrofusion, or butt-fusion as applicable for the fitting or joint type. Fusion-weld tooling, welding machines, and electrofusion devices shall be specified by the pipe and fittings manufacturer.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248 and D3350, Type III, Category 5, Class C and Grade P23/P34. Minimum thickness of 100 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - e. Fittings and joint closures shall consist of polyurethane foam with PE cover or sleeve and pressure sensitive tape.
 - f. Warranty: Minimum 2 years.
 - g. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.
4. Copper Pipe: Preinsulated pipe with jacket. Engineering by the manufacturer shall include a review and recommendation of piping layout, including expansion compensation and anchoring. A stress analysis of the piping system shall be completed at the conclusion of the installation to incorporate any and all changes that may have occurred during the installation. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Copper-Therm, Perma-Pipe, Rovanco or equal.
 - a. Carrier pipe. Copper ASTM B88, Type K or Type L hard drawn copper water tube for normal pressure.
 - b. Fittings: Factory fabricated and insulated with polyurethane foam and one-piece molded Polyethylene cover.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils. No FRP overwrap or sprayed jacketing will be allowed.

- e. Joint closures shall consist of polyurethane foam, HDPE sleeve and heat shrink sleeve.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
5. Fiberglass Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Fiber-Therm 250, Perma-Pipe, Rovanco, or equal.
- a. Fiberglass pipe: conforming to MIL-SPEC P28584A and P22245A. Minimum wall thickness 0.180 inches. Series 2000 Bondstrand, Smith Red Thread II filament wound fiberglass or approved equal.
 - b. Fittings: Bell and spigot type joined by thermosetting epoxy resin. Connection to steel pipe with flanged fittings.
 - c. Casing: Polyurethane insulation with jacket and heat shrink sleeves.
 - d. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf, closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - e. Jacketing Material: Seamless polyvinylchloride (PVC) conforming to ASTM 1784 or high density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 100 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - f. Joint closures shall consist of polyurethane foam and heat shrink sleeve.
 - g. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.
6. Carbon steel pipe: Preinsulated pipe with jacket. The preinsulated piping manufacturer shall provide a pre-engineered and prefabricated piping system. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Ferro-Therm, Perma-Pipe, Rovanco, or equal.
- a. Pipe and Fitting Material: ASTM A53 Grade B, Schedule 40 or Schedule 80 black steel. Elbows shall be long radius. Normal pressure application: 150 lb. rating. High pressure application: 300 lb. rating.
 - b. Joints: Butt-weld for sizes 2-1/2" and larger. Socket-welded or butt-welded for 2" and smaller. Comply with Power Piping Code ASME/ANSI B31.1.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils.
 - e. Joint closures shall consist of polyurethane foam and heat shrink sleeve.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.

7. Stainless Steel Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Ferro-Therm, Perma-Pipe, Rovanco, or equal.
 - a. Carrier pipe: Stainless steel 316/316L Alloy, ASTM A312, Schedule 40 or Schedule 80. Elbows shall be long radius. Normal pressure application: 150 lb. rating. High pressure application: 300 lb. rating.
 - b. Fittings: ASTM A403. Shall be factory preinsulated.
 - c. Joints: Butt-weld for sizes 2-1/2" and larger. Socket-welded or butt-welded for 2" and smaller. Comply with Power Piping Code ASME/ANSI B31.1.
 - d. Casing: Polyurethane insulation with jacket and heat shrink sleeves.
 - e. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - f. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils.
 - g. Joint closures shall consist of polyurethane foam and heat shrink sleeve.
 - h. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.

- B. Condenser Water Piping
 1. Ductile iron pipe as manufactured by US Pipe and Foundry or equal.
 - a. Pipe: Restrained joint ductile iron pipe manufactured in accordance with ANSI/AWWA C151/A21.51. Pipe thickness shall be in accordance with ANSI/AWWA C150/A21.50.
 - b. Joints:
 - 1) Ductile Iron Push-On Joint Type: 250-lb. working pressure, ductile iron, ANSI/AWWA C110/A21.10 and C111/A21.11, Tyton type push-on joints with SBR rubber ring gaskets.
 - 2) Ductile Iron Mechanical Joint Type: 250-lb. working pressure, ductile iron, ANSI/AWWA C110 and C111, mechanical joints with SBR rubber ring gaskets. Flanged outlets shall conform to ANSI B16.1, 125 lb.
 - c. Pipe coating: all underground exposed ferrous pipe and fittings in corrosive soil conditions shall be covered with one of the following methods:
 - 1) Twice Wrap 20 Mill Scotch Wrap PVC No. 51, 50% overlap.
 - 2) Prefabricated extruded plastic cover with joints sealed with two coats of 20 Mill Scotch Wrap No. 51.
 2. Polyvinylchloride (PVC) Schedule 80 Pipe: Pre-insulated pipe with jacket. Pipe system shall be manufactured by Thermacor #Chill-Therm, Perma-Pipe, Insul-Pipe Systems, Rovanco or equal.
 - a. Carrier Pipe: All PVC Schedule 80 pipe shall be manufactured in conformance to ASTM D1785 or ASTM D2241. Maintain minimum interior dimension as identified on drawings.

- b. Fittings and joints joined using solvent weld glue and are manufactured from PVC material which meets or exceeds requirements of ASTM D1784, cell classification 12454B, Type 1, Grade 1. Fittings and couplings shall be field insulated per manufacturer requirements.
 - c. Insulation: Polyurethane foam with K-factor = 0.13, density = 2 pcf, closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1 inch.
 - d. Jacketing Material: Seamless Polyvinylchloride (PVC) meeting the specifications of ASTM D1784 or high density polyethylene (HDPE), conforming to ASTM D1248. Minimum wall thickness of 0.06 inches for the PVC jacketing material and 80 mils for the HDPE jacketing material.
3. High Density Polyethylene (HDPE): Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Polycor, Perma-Pipe, Rovanco or equal.
- a. Carrier pipe: Pipe shall be manufactured from a high density polyethylene (HDPE) conforming to ASTM D3350 and D2837 with SDR wall thickness based on design temperature and pressure requirements ranging up to 255 psi and maximum operating temperature of 140°F. Select wall thickness and diameters for minimum pressure drop and maximize service life based on manufacturer selection criteria. Maintain minimum interior dimension as identified on drawings.
 - b. Fittings and joints using butt-fusion as applicable for the fitting or joint type. Fusion-weld tooling, welding machines, and electrofusion devices shall be specified by the pipe and fittings manufacturer.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing (minimum). Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248 and D3350, Type III, Category 5, Class C and Grade P23/P34. Minimum thickness of 100 mils for small pipe diameters up to 150 mils for large diameters.
 - e. Joint closures shall consist of polyurethane foam, Zeston or PE cover or sleeve and pressure sensitive tape.
 - f. Warranty: Minimum 2 years.
 - g. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.
4. Plastic (Polypropylene) Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Rovanco or approved equal.
- a. Carrier pipe: Pipe shall be manufactured from a PP-R resin meeting the short-term properties and long-term strength requirements of ASTM F 2389. All pipes shall be made in a three-layer extrusion process. Piping shall contain a fiber layer (faser) to restrict thermal expansion. All pipes shall comply with the rated pressure requirements of ASTM F 2389 or CSA B137.11. Select wall thickness and diameters for minimum pressure drop and maximize service life based on manufacturer selection criteria. Maintain minimum interior dimension as identified on drawings. Carrier pipe manufactured by Aquatherm Greenpipe/Climatherm or approved equal.

- b. Fittings and joints using socket-fusion, electrofusion, or butt-fusion as applicable for the fitting or joint type. Fusion-weld tooling, welding machines, and electrofusion devices shall be specified by the pipe and fittings manufacturer.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248 and D3350, Type III, Category 5, Class C and Grade P23/P34. Minimum thickness of 150 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - e. Fitting and joint closures shall consist of polyurethane foam, Zeston or PE cover or sleeve and pressure sensitive tape.
 - f. Joint closures shall consist of polyurethane foam, Zeston or PE cover or sleeve and pressure sensitive tape.
 - g. Warranty: Minimum 2 years.
 - h. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.
5. Copper Pipe: Preinsulated pipe with jacket. Engineering by the manufacturer shall include a review and recommendation of piping layout, including expansion compensation and anchoring. A stress analysis of the piping system shall be completed at the conclusion of the installation to incorporate any and all changes that may have occurred during the installation. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Copper-Therm, Perma-Pipe, Rovanco or equal.
- a. Carrier pipe. Copper ASTM B88, Type K or Type L hard drawn copper water tube for normal pressure.
 - b. Fittings: Factory fabricated and insulated with polyurethane foam and one piece molded Polyethylene cover.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - e. Joint closures shall consist of polyurethane foam, HDPE sleeve and heat shrink sleeve.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
6. Fiberglass Pipe. Pipe system shall be manufactured by Thermacor Fiber-Therm, Perma-Pipe, Rovanco or equal. On-site training and inspection of joint closures and installation shall be provided by factory certified representative.
- a. Fiberglass pipe: conforming to MIL-SPEC P28584A and P22245A. Minimum wall thickness 0.180 inches. Series 2000 Bondstrand, Smith Red Thread II filament wound fiberglass or approved equal. Maintain minimum interior dimension as identified on drawings.

- b. Fittings: Bell and spigot type joined by thermosetting resin. Connection to steel pipe with flanged fittings.
7. Carbon Steel Pipe: Preinsulated pipe with jacket. The preinsulated piping manufacturer shall provide a pre-engineered and prefabricated piping system. Engineering by the manufacturer shall include a review and recommendation of piping layout, including expansion compensation and anchoring. A stress analysis of the piping system shall be completed at the conclusion of the installation to incorporate any and all changes that may have occurred during the installation. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Ferro-Therm, Perma-Pipe, Rovanco or equal.
- a. Pipe and Fitting Material: ASTM A53 Grade B, Schedule 40 or Schedule 80 black steel. Elbows shall be long radius. Normal pressure application: 150 lb. rating. High pressure application: 300 lb. rating.
 - b. Joints: Butt-weld for sizes 2-1/2" and larger. Socket-welded or butt-welded for 2" and smaller. Comply with Power Piping Code ASME/ANSI B31.1.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils.
 - e. Joint closures shall consist of polyurethane foam and heat shrink sleeve.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
8. Stainless Steel Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Ferro-Therm, Perma-Pipe, Rovanco or equal.
- a. Carrier pipe: Stainless steel 316/316L Alloy, ASTM A312, Schedule 40 or Schedule 80. Elbows shall be long radius. Normal pressure application: 150 lb. rating. High pressure application: 300 lb. rating.
 - b. Fittings: ASTM A403. Shall be factory preinsulated.
 - c. Joints: Butt-weld for sizes 2-1/2" and larger. Socket-welded or butt-welded for 2" and smaller. Comply with Power Piping Code ASME/ANSI B31.1.
 - d. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - e. Jacketing Material: Seamless polyvinylchloride (PVC) conforming to ASTM 1784 or high density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - f. Joint closures shall consist of polyurethane foam, Zeston or PE cover or sleeve and heat shrink sleeve.
 - g. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
- C. Heating Water Piping (Maximum operation temperature of 250°F)

1. Copper Pipe: Preinsulated pipe with jacket. Engineering by the manufacturer shall include a review and recommendation of piping layout, including expansion compensation and anchoring. A stress analysis of the piping system shall be completed at the conclusion of the installation to incorporate any and all changes that may have occurred during the installation. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Copper-Therm, Perma-Pipe, Rovanco or equal.
 - a. Carrier pipe. Copper ASTM B88, Type K or Type L hard drawn copper water tube for normal pressure.
 - b. Fittings: Factory fabricated and insulated with polyurethane foam and one piece molded Polyethylene cover.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - e. Joint closures shall consist of polyurethane foam, HDPE sleeve and heat shrink sleeve.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
2. Carbon Steel Pipe: Preinsulated pipe with jacket. The preinsulated piping manufacturer shall provide a pre-engineered and prefabricated piping system. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Ferro-Therm, Perma-Pipe, Rovanco or equal.
 - a. Pipe and Fitting Material: ASTM A53 Grade B, Schedule 40 or Schedule 80 black steel. Elbows shall be long radius. Normal pressure application: 150 lb. rating. High pressure application: 300 lb. rating.
 - b. Joints: Butt-weld for sizes 2-1/2" and larger. Socket-welded or butt-welded for 2" and smaller. Comply with Power Piping Code ASME/ANSI B31.1.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: High density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils.
 - e. Joint closures shall consist of polyurethane foam and heat shrink sleeve.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
3. Stainless Steel Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Ferro-Therm, Perma-Pipe, Rovanco or approved equal.
 - a. Carrier pipe: Stainless steel 316/316L Alloy, ASTM A312, Schedule 40 or Schedule 80. Elbows shall be long radius. Normal pressure application: 150 lb. rating. High pressure application: 300 lb. rating.

- b. Fittings: ASTM A403. Shall be factory preinsulated.
 - c. Joints: Butt-weld for sizes 2-1/2" and larger. Socket-welded or butt-welded for 2" and smaller. Comply with Power Piping Code ASME/ANSI B31.1.
 - d. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf, closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - e. Jacketing Material: Seamless polyvinylchloride (PVC) conforming to ASTM 1784 or high density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - f. Joint closures shall consist of polyurethane foam, Zeston or PE cover or sleeve and heat shrink sleeve.
 - g. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings.
4. Fiberglass Pipe: Preinsulated pipe with jacket. On-site training and inspection of joint closures and installation shall be provided by factory certified representative. Pipe system shall be manufactured by Thermacor Fiber-Therm 250, Perma-Pipe, Rovanco or equal.
- a. Fiberglass pipe: Conforming to MIL-SPEC P28584A and P22245A. Minimum wall thickness 0.180 inches. Series 2000 Bondstrand, Smith Red Thread II filament wound fiberglass or approved equal. Maintain minimum interior dimension as identified on drawings.
 - b. Fittings: Bell and spigot type joined by thermosetting epoxy resin. Connection to steel pipe with flanged fittings.
 - c. Insulation: Polyurethane foam with K-factor=0.165 (maximum), density=2 pcf (minimum), closed cell, filling space between carrier pipe and jacketing. Minimum thickness shall be 1-1/2 inches, or larger as required to minimize heat loss in distribution system.
 - d. Jacketing Material: Seamless polyvinylchloride (PVC) conforming to ASTM 1784 or high density polyethylene (HDPE) conforming to ASTM D1248. Minimum thickness of 80 mils. No FRP overwrap or sprayed jacketing will be allowed.
 - e. Joint closures shall consist of polyurethane foam, Zeston or PE cover or sleeve and pressure sensitive tape.
 - f. Leak detection system shall consist of copper wire embedded in the foam of each piece of pre-insulated pipe and fittings and one copper wire mounted adjacent to the non-conductive pipe carrier.

2.02 VALVES

- A. All valves shall be designed for Class 150 pipe systems and shall open by turning the stem counterclockwise.
- B. Buried Butterfly Valves (2" and larger): Valves shall be mechanical joint, rubber-seated butterfly valves conforming to AWWA Standard C504 Class 150B. Buried valves shall be equipped with a 2" square operating nut. Buried valves shall be bituminous coated and shall be provided with an extension stem equipped with a 2" square operating nut. Extension stem shall extend to within 18" of top of valve box.
- C. Manufacturers: Henry Pratt (Mueller) #Groundhog, Milwaukee #Ultra Pure CL series, or equal.

2.03 TAPPING SLEEVE AND TAPPING VALVE

- A. Cast iron mechanical joint type sleeve, sized specifically for actual O.D. and piping material, Koppel, Mueller, Clow or equal.

2.04 VALVE BOXES

- A. Cast iron valve boxes for shutoff valves buried in ground shall be complete with bell bottoms, extension piece, top and cover. Boxes shall be suitable for the types of valves with which they are used. All valve boxes shall have a concrete collar flush with grade.
- B. Lids shall have the applicable letters embossed upon the top surface. Tagging shall match existing lids.
- C. Manufacturer: Tyler, ITT Grinnell, Mueller or Kennedy.

2.05 PIPE LOCATING WIRE AND MARKER

- A. Pipe Locating Wire: Bare AWG No. 10, soft drawn, single strand copper wire.
- B. Provide at least six mil PVC electrical tape insulation around wire where adjacent to metal pipe, valves, and in all valve boxes.
- C. Pipe marker shall be internal with locating wire color coded for use with different utility pipe systems, and marked with the utility tape every 24 inches. Provide 4 mil thick, 4"inch wide polyethylene marker.

2.06 THRUST BLOCKS

- A. Provide 2,000 psi concrete thrust blocks at changes in pipe direction, changes in pipe sizes, dead-end stops and at valves.
- B. Calculate area of undisturbed earth of thrust block based on 2000 psi soil and 150 psi water test pressure.
- C. Concrete and reinforcing steel shall be as specified in Divisions 03 and 05. All concrete shall be Class A, unless specified otherwise.
- D. Miscellaneous nuts and bolts shall be stainless steel.

2.07 ANCHORS

- A. Pre-fabricated anchors shall be furnished and installed in pipe systems as required by piping system manufacturer. Anchors shall consist of steel pipe welded to pipe and conduit. The steel anchor plate shall be 1/2" thick and extend a minimum of 1-1/2" beyond the outside jacket.

2.08 RODS AND CLAMPS

- A. Socket clamps shall be stainless steel, four bolt type, equipped with stainless steel socket clamp washers and nuts. Anvil Fig. 595 and 594, B-Line B3134, or equal.
- B. Rods shall be stainless steel.

2.09 MECHANICAL SLEEVE SEALS

- A. General: Modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.
- B. Sleeve: To be furnished by same manufacturer of seals; schedule 40 galvanized steel pipe or Century line sleeves, with integral anchor and waterstop collar.
- C. Manufacturer: Metraflex #Metraseal, Advance Products & Systems #Innerlynx, GPT #Link-Seal, or equal.

2.10 TEST CONNECTIONS

- A. Saddles shall be of malleable or ductile iron, with neoprene gasket and 3/4" N.P.T. female pipe connection, Smith Blair No. 311, Rockwell International No. 331.
- B. Valves shall be 3/4" - 300# bronze globe with composition disc. NOTE: When all tests have been completed, valve and pipe nipple shall be removed from the saddle and a forged steel pipe plug shall be inserted.

2.11 DIRECT-BURIED CONTROLLED DENSITY THERMAL INSULATION

- A. Extent of underground piping insulation is indicated on drawings. Insulation is inorganic engineered granular mix. Product must consist of insulating minerals (sodium potassium aluminum silicate) and dielectric mineral filler (coated calcium carbonate). Material shall be dry, free-flowing, inert, inorganic, non-toxic, non-flammable, and completely free of asbestos and fibers. Material to be chemically treated to render it hydrophobic. Product is NOT to rely upon polyethylene barrier to prevent: foreign object/soil intrusion, material protection or direct contact of water. Underground fill product must consist of well-graded, multi-sized and shaped particles and raw material must be dimensionally stable. Insulation material must be able to be mechanically compacted.
- B. Applicable Codes and Standards:
 - 1. ASTM C-177-04 Steady-State Heat Flux Measurement and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.
 - 2. ASTM D-1895 Apparent Density, Bulk Factor and Pourability of Plastic Materials.
- C. Manufacturer:
 - 1. Gilsulate #500XR, Gilsulate, Santa Clarita, CA 91350, 800-833-3881, www.gilsulate.com, or equal.
- D. Physical Properties:
 - 1. ASTM C177-04 Thermal Conductivity (tested @ use density):
 - a. $K = 0.53 \text{ Btu/hr.ft}^2 \text{ }^\circ\text{F/in. @ } 100^\circ\text{F Mean Temp}$
 - b. $K = 0.60 \text{ Btu/hr.ft}^2 \text{ }^\circ\text{F/in. @ } 175^\circ\text{F Mean Temp}$
 - 2. ASTM D1895A – Bulk Density: 30-34 lbs./ft³.
 - a. ASTM D1895C (400 lbs.) – Consolidated Cubic Foot Installed/Use Density (CFUD): 40-42 lbs./ft³ CFUD.
 - 3. ASTM D1895C (400 lbs.) – Percent of compaction of installed density under static load
 - a. Shall not exceed more than 1% compaction

4. ASTM D1895C – Material Bearing Under Applied Static Loading: 12,000 PSF.
5. Particle Sizing Range: “Well-graded” diameter ranging from 1 mm to sub-micron sizes.
6. Material Stability: Material for direct-buried application must support weight of a man prior to backfill placement.
7. Temperature Range: 35°F to 800°F
8. Electrical Resistivity: Greater than 10 to the 12th Ohm-cm.

E. ACCESSORIES

1. Protective Coatings: provide a bitumastic self-priming, heavy duty, cold-applied, waterproof coating made from pitch derived from tar and solvents. Approved product: Carbolite “Bitumastic 50” or equal.
2. Structural Steel Components: provide steel anchors and guides as required by the contract documents and insulation manufacturer's drawings and Design and Installation Manual.
3. Expansion Cushions: provide 3 to 5 pound density mineral fiber cushion to accommodate thermal expansion at expansion loops and elbows as required by the contract documents and insulation manufacturer's drawings and Design and Installation Manual.

PART 3 EXECUTION

3.01 GENERAL INSTALLATION

- A. Have on hand all installation manuals, brochures, and procedures for the equipment and materials concerned.
 1. Follow manufacturer's instructions, where such are provided, in all cases that cover points not shown on the Drawings or specified herein.
 2. Manufacturer's instructions do not take precedence over the Drawings and Specifications.
 3. Where manufacturer's instructions are in conflict with the Drawings and Specifications; submit the conflicting instructions to the Owner's Representative for clarification before performing the work.
 4. Use fittings to make all changes in direction and size unless otherwise shown on the Drawings.
 5. Maintain factory plastic end covers on the pipe during storage. Caps shall be removed upon installation of pipe to insure cleanliness.
 6. Manufacturer piping drawings for expansion and contraction.
- B. Representative of System Manufacturer: This shall be a person who regularly performs the duties listed below, is certified in writing by the system manufacturer to be technically qualified and experienced in the installation of the system, and shall be authorized by the manufacturer to make and sign the daily reports specified herein. The representative shall be responsible for training and supervision of the installing workers. This is to include the following services and/or training.
 1. Inspection of material delivered to site.
 2. Inspection of concrete anchors.
 3. Field joint closure work.

4. Repair of any coatings.
 5. Holiday test of steel piping systems.
 6. Installation and testing of cathodic protection systems. Coordinate with Div 26 installer and Section 26 42 00 Cathodic Protection.
 7. The slope of the system. Elevation readings shall be witnessed and recorded.
- C. Protect casing coating from damage during rigging, storage and installation. Protect casing and carrier pipe ends from water intrusion during rigging and installation. Protect casing coatings from ultraviolet light (sunlight).
- D. Defective Material: The Representative shall take prompt action to return to the factory damaged or defective material and shall order prompt replacement of such material.
- E. Cleaning of Piping: Remove dirt, scale, and other foreign matter from inside the piping by use of a pipe swab or pipe "pig" before connecting pipe sections.
- F. Wet Insulation: Sections of system, which have been fully or partially submerged in water, must be replaced. Moisture content of insulation shall not exceed five percent by weight.
- G. Vents and Drains at Ends of System: At each casing termination (end plate) in building, plug the casing drain openings with brass plugs and extend one-inch pipe size vent pipes from the casing vents to one foot above the conduit in buildings.

3.02 CATHODIC PROTECTION OF METAL PIPE

- A. Cathodic Protection: Provide cathodic protection for steel piping/casing systems and buried exposed metal to minimize corrosion potential. Assume that 25 percent of the exterior of the steel casing is exposed metal. Cathodic protection systems shall have a minimum design life of 25 years and shall be designed in accordance with recommendations of NACE SP0169 (latest edition). Provide all anodes, wiring, dielectric pipe flange kits, and any additional required isolation devices, at points necessary within vaults or at building terminations. Provide test stations at grade on each section of the piping system. Isolation flanges and unions shall be rated for the carrier pipe service temperature and pressure. Coordinate with electrical design per Section 264200 Cathodic Protection.

3.03 MECHANICAL SLEEVE SEALS

- A. Install mechanical link seal(s) where piping penetrates an exterior walls or floors. Loosely assemble rubber links around pipe with bolts and pressure plates located under each bolt head and nut. Push into sleeve and center. Tighten bolts until links have expanded to form a watertight seal.

3.04 TRENCH, EXCAVATION AND BACKFILL

- A. Conform to requirements of Division 02.
- B. Install all utilities with a minimum 36" cover over the crown of the pipe.
- C. Provide all necessary shoring, sheeting, pumping as part of work of this division.
- D. Dig trenches straight, true to line and grade with bottoms smoothed of any rock points. Excavate 3" below grade of pipe, fittings, hubs, couplings, etc., using templates to fit outside periphery of lower third of piping.

- E. Excavations for trench may be by machine or by hand with special care used around buried utilities and trees shown on Contract Drawings.
- F. All excavations shall be carefully done to avoid "over-digging" and backfilling the bottom of trench before pipe is installed in the trench.
- G. Piping shall be properly bedded and backfilled over stable trench bottom to a level of at least 12" above the pipe crown where located outside the building footprint, and not less than 2" above pipe crown where pipes are located within the building footprint. Use thin layers of unwashed sand, dampened but not puddle, and free of organic or corrosive materials and excessive moisture. Backfill shall be placed in thin layers not to exceed 6" and tamped by mechanical tampers to a minimum 90% Modified Proctor Density, in accordance with ASTM D-1557-58T or greater as defined by elsewhere in construction documents. Alternate backfill material may be Class I or II SE-30+ fill with minimum 30 percent sand and maximum 1/2" diameter particle size.
- H. Trench width and special instructions necessary to correctly install pipe and fittings shall be as recommended by the pipe manufacturer.
- I. Special preparation shall be taken to keep the inside of the piping clean of all debris, especially sand and dirt, during installation and testing. Maintain factory covers on open ends of pipe until lowered into trench.
- J. After testing and acceptance, the trench shall be backfilled with native backfill for the first 12" depth, then wetted and hand tamped, refilled with the native backfill to approximately 12" over top of pipe, wetted again and hand tamped firm. Mechanical tamping of rock-free soil shall be carefully done to achieve a minimum of 90% compaction at depth of 12" and below, and to 95% for top 12" depth.
- K. Provide precast monument set flush with surface in paved area to locate branch connection.

3.05 UNDERGROUND PIPING INSTALLATION

- A. Remove loose rock, clods, and debris from the trench before placing bedding sand, and before laying any pipe.
- B. Before placement of pipe, a sand bed shall be prepared in the following manner:
 - 1. Trench shall be backfilled with sand to a minimum depth of 6".
 - 2. Sand shall be compacted sufficiently to prevent settlement of pipe.
 - 3. The pipe shall be made up with the pipe barrel bearing evenly along its full length on the sand bed on the bottom of the trench.
 - 4. In the case of steel or other rigid joint piping, excavate holes under joints and connections for access for making up, welding, testing, and wrapping joints.
- C. Thoroughly clean each section of pipe and fitting before lowering into the trench. Clean each pipe or fitting by swabbing-out, brushing-out, blowing-out with compressed air, washing-out with water, or by any combination of these methods necessary to remove all foreign matter.
- D. If cleaned pipe sections and fittings cannot be placed in the trench without getting dirt into the open ends, tie tightly woven canvas or other type of approved cover over the ends of the pipes and fittings until they have been lowered into position in the trench. After removal of the covers in the trench, completely remove foreign matter from the pipe ends and fittings.

- E. Do not lower any pipe or fitting into a trench that contains water.
 - 1. Pump water from wet trenches, and keep the trenches dry until the joints have been completed and the open ends of the pipes have been closed with watertight plugs or bulkheads.
 - 2. Whenever pipe installation is discontinued on any job for short periods or whenever work is stopped at the end of the day, close the open ends of the pipe with watertight plugs or bulkheads. Do not remove the plug or bulkhead unless the trench is dry.
 - 3. Keep the trench dry at all times.
- F. Assemble lengths of pipe such that centerline of two pipes being joined do not form an angle exceeding 2 degrees in any plane. In addition, the angle formed in the vertical plane shall not exceed 1-1/2 degrees.
- G. Weld pipe joints in accordance with recognized industry practice and as follows:
 - 1. Weld pipe joints only when ambient temperature is above 0°F.
 - 2. Bevel pipe ends at a 37.5° angle where possible, smooth rough cuts, and clean to remove slag, metal particles, and dirt.
 - 3. Use pipe clamps or tack-weld joints with 1" long welds and four (4) welds for pipe sizes to 10".
 - 4. Build up welds with stringer-bead pass, followed by hot pass, followed by cover or filler pass. Eliminate valleys at center and at edges of each weld. Weld by procedures which will ensure elimination of unsound or un-fused metal, cracks, oxidation, blow-holes, and non-metallic inclusions.
 - 5. Do not weld out piping system imperfections by tack-welding procedures. Re-fabricate to comply with requirements.
 - 6. With engineering pre-approval stub-in saddle taps may be acceptable for branch connections where the branch size is less than 50% of the main size and where branch sizes are 2", or smaller, in diameter.

3.06 SLOPING, AIR VENTING, AND DRAINING

- A. Slope all piping mains to allow for drainage at low points. Slope shall not exceed 1%. Provide drain valves and hose adapters at all low points in piping inside the building or exterior concrete vaults.
- B. Connect all water branch piping to the top or side of their respective mains. All branch piping shall slope upwards towards the building riser at a maximum slope not exceeding 1%.
- C. Provide manual or automatic vents at all high points in water piping as specified elsewhere in the specifications.

3.07 LOCATING WIRE AND MARKER TAPE

- A. Pipe locating wire shall be provided for the entire length of all pressure pipelines except for metallic piping.
- B. Install locating wire by strapping to the pipe or tubing with PVC tape, polyethylene backed tape, or tie locks. Test pipe locating wire with pipe locator equipment prior to final acceptance of pipeline.

- C. Stub the locating wire up inside each valve box. Sufficient excess length shall be provided at terminal connections to allow continuation of locating wire to the terminal connection.
- D. Wire splices shall be made with compression fittings or soldering; wrapped with Tac-Tape, Aqua-Seal; and wrapped with electrical tape. Prevent bare copper wire from contacting metallic appurtenances including, but not limited to, pipe, buried valves, or fittings.

3.08 LEAK DETECTION MONITORING WIRE FOR BURIED PIPE

- A. The piping system shall be provided with leak detection monitoring wire by means of installing a bare copper wire between the carrier pipe and the jacket. The piping system manufacturer shall install the wire in a manner that has the wire embedded in the foam insulation and incorporated into each piece of pre-insulated pipe and fittings. Installer shall check continuity and electrical isolation of each piece of insulated pipe and fittings with a standard ohmmeter as it arrives at the jobsite. Installer shall connect the copper wires together at each field joint with the insulated jumper cables and recommended crimping tool as per manufacturer's instructions.
- B. Wire leads shall be looped, minimum 12" exposed, and tagged at each end of the buried piping system for connection to alarm monitoring panel(s) and future maintenance monitoring by the Owner using portable resistance metering.
- C. Installer shall then check for continuity and electrical isolation using a standard ohmmeter over the length of the installed piping system before insulating straight run joint kits. When required contractor will have to make provisions for running the wire in and out of vaults. The reading on the ohmmeter should be close to infinity for any single piece, and not less than 1 Million Ohms for an entire run.
- D. After the piping system is installed, the owner at any time may check the system for a leak by using a standard analog volt ohmmeter. One ERM (electric resistance monitoring) panel shall be installed for each piping system to monitor up to 2000' of piping length. The ERM alarm single shall have output contacts for connection to the BAS with connection by the controls installer. Coordinate with the BAS installer for location of alarm panel(s) and contact connections. If the ERM panel alarms, indicating a leak has been detected, the Owner should contact the system manufacturer for a technician to come to the site to determine the location of the leak with a TDR (time domain reflectometer) instrument.

3.09 CONNECTIONS TO EXISTING UTILITY MAINS

- A. Install tapping sleeve and tapping valve with flanged designed outlet for existing pipe connection. Follow manufacturer's installation recommendations. The use of pipe freezing technology may be utilized for hot tapping existing line with prior Owner approval.
- B. Under no circumstances shall existing lines or utilities be interrupted without prior approval of the Owner's Representative. Submit the request for this approval to the Owner's Representative in accordance with Division 01, and also state the maximum duration of shutdown.
- C. Schedule all outages for utility tie-in work well in advance and give written notice to the Owner's Representative in accordance with Division 01.

- D. In preparation for tie-ins to existing on-site utility systems, the Owner will drain and/or blow the existing piping prior to start of tie-in work by the Contractor. In all cases, the Owner will close the appropriate valves to isolate the area of work. The Contractor shall be responsible for refilling the system including all approved chemical treatment. The Contractor shall be responsible for venting the isolated portion of the existing chilled water mains affected by the work of this project.

3.10 CONCRETE

- A. Conform to requirements of Division 03.
- B. Install thrust blocks and anchors as per pipe manufacturer's recommendations.
- C. Provide concrete thrust blocks for piping. Concrete thrust blocks shall be poured and set before pressure testing.
- D. Concrete thrust blocks shall be installed at all fittings and at all changes of direction whether shown on drawing or not.
- E. Thrust blocks shall be formed on the sides to establish a definite shape and limit on height and width subject to approval before ordering concrete. Make-shift and ill-fitting forms will not be accepted. Forms shall be removed before backfilling.
- F. Thrust blocks shall be allowed to cure a minimum of 3 days before water pressure is applied to any part of the system and before forms are removed.

3.11 FLUSHING

- A. The entire new piping system shall be thoroughly flushed out until reasonably clean in the opinion of the Owner's Representative.
- B. All tests shall be conducted at such times as directed by and in the presence of the Owner's Representative.

3.12 PIPE TESTING

- A. Chilled water, condenser water, and heating water piping shall be hydrostatically tested to prove watertight prior to backfilling. Provide all instruments, facilities, and labor to conduct testing and placing in operation. In addition, piping systems with integral airtight external casings shall have the casing air tested to 15 psig with no leaks for two hours.
- B. Piping shall be tested in whole or in sections. Testing under this section of the work shall be done before final connections to building piping and existing utility piping is made, with the provision that subsequent leaks, if developed, at these conditions shall be corrected under this section of the work.
- C. Any part of any piping system, including all accessories, that shows failure during testing shall immediately be repaired or replaced with new materials. The system shall be completely retested after repair or replacement. This procedure shall be repeated, if necessary, until all parts of all systems withstand the specified tests. All retesting costs shall be part of the Contract.

- D. Holiday testing of direct-buried steel piping and casing systems: Test entire surface of piping and casings for faults in coating, after installation in trench, and prior to backfilling. Use test method and voltage recommended by coating manufacturer. Repair any holidays found and retest. System shall not be backfilled until holidays are eliminated.
- E. Test time for final pressure test will be accrued only while full test pressure is on the entire piping system. Pressure tests shall be witnessed by the Owner's Representative. Provide minimum 48-hour notice prior to start to each test. "Tolerance" shall be no perceptible pressure drop, except that due to temperature change in a 24-hour test period (minimum). Inspect and test all work prior to burying or concealing. Test pressure shall be 100 psig or 1.5 times the system operating pressure, whichever is greater. If approved by the local Authority Having Jurisdiction, the maximum test pressure may be limited to 50 psi greater than the operating pressure, but in no case less than 100 psig. Test pressure shall be applied and measured at the lowest floor level of the piping system. Confirm maximum pressure testing requirements with pipe manufacturer and do not exceed the maximum pressure rating of the piping.

3.13 CLOSING OF UNINSPECTED WORK

- A. No work shall be covered up or enclosed until the opportunity to inspect and test same has been afforded to the Owner's Representative and the Owner's Representative has authorized the Contractor to cover or enclose the work.
- B. Any work enclosed or covered in the absence of the Owner's Representative's authorization shall be uncovered. All expense to comply shall be borne by the Contractor.

3.14 INSTALLATION OF DIRECT-BURIED CONTROLLED DENSITY THERMAL INSULATION

- A. Install and test carrier pipe: Install and test prior to installing insulation. Inspect welds and pressure test pipe as required by other sections of this specification. Clean pipe of all dirt, scale and foreign materials.
- B. Installation of temporary pipe supports: Provide temporary pipe support wires suspended from lumber bridging the trench. Temporary wood blocks located under the pipe may also be used. These supports must be removed as the insulation is poured and consolidated. No object should be allowed to bridge the gap between the soil and the pipe except the insulation.
- C. Installation of expansion cushions: Wrap mineral fiber cushions around pipe elbows on expansion elbows and expansion loops as indicated on the contract documents. Insure there is sufficient space or flexibility between cushions to allow insulation to pour and be consolidated under piping. Secure cushion to pipe with fiber reinforced tape. Specified Insulation thicknesses need to be maintained around fiber cushion areas.
- D. Installation of forms: Provide gypsum board forms with support posts as shown in Gilsulate International, Inc.'s Design and Installation Manual. Posts must be located on the outside of the forms and spaced to prevent bowing of the gypsum board. After forms are in place, partially backfill outside of form to height of pipe.
- E. Pouring of insulation: Pour insulation in short sections along the pipe axis. Apply bitumastic to structural steel surfaces and fill trench to centerline of pipe. Consolidate insulation using a rod-type concrete vibrator pulled along the sides and between the pipes. Pour and consolidate additional layers of insulation until the design coverage has been achieved. Proper consolidation is achieved when the insulation can be walked on with footprints less than 1" deep. No wood is to remain in contact with pipes or left in insulation envelope. This could affect overall system efficiency (heat gain/loss) of non-metallic pipe(s) and/or cause corrosion to metallic pipes.

- F. Inspector must physically be capable of confirming specified installed/compacted insulation thicknesses prior to placement of any backfill.
- G. Backfill first 6" of soil (no stones) by hand. Complete backfilling and mechanically compact in uniform layers with suitable excavated soil to grade level.
- H. Refer to Gilsulate International Inc. "Design & Installation Manual for Installation Procedures.

END OF SECTION

SECTION 23 21 23

HYDRONIC PUMPS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, and Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. In-line close coupled pumps.
 - 2. Suction diffusers.
 - 3. Basket strainers.
 - 4. Electronically commutated motors.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00 - Basic HVAC Materials and Methods.
- B. Section 23 05 93 - Testing, Adjusting and Balancing.
- C. Section 23 09 00 - Building Automation System (BAS) Controls.
- D. Section 23 09 02 - Variable Frequency Drives (VFD).
- E. Section 23 21 13 - Hydronic Piping, Valves and Specialties.
- F. Section 23 31 13 - Air Distribution.
- G. Section 23 52 00 - Non-Condensing Boilers.
- H. Section 23 52 16 - Condensing Boilers.
- I. Section 23 52 20 - Steam Boilers.
- J. Section 23 57 00 - Heat Exchangers for HVAC.
- K. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide systems that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products.
- B. Codes and Standards: Provide pumps which conform to the requirements of the following standards.
 - 1. Hydraulic Institute (HI): Manufacturer pumps in accordance with "Standards for Centrifugal Rotary and Reciprocating Pumps."
 - 2. National Electrical Manufacturers Association (NEMA): Provide electrical components which comply with NEMA Standards.
 - 3. National Fire Protection Association (NFPA)-70: National Electrical Code.
 - 4. Underwriters Laboratories (UL) UL-778: Motor Operated Water Pumps.
 - 5. Code or Federal Regulations 431.465: Pumps energy conservation standards effective January 27, 2020.

1.05 DEFINITIONS

- A. ECM: Electronically commutated motor.
- B. EPDM: Ethylene propylene diene monomer.
- C. EPR: Ethylene propylene rubber.
- D. FKM: Fluoroelastomer polymer.
- E. HI: Hydraulic Institute.
- F. NBR: Nitrile rubber or Buna-N.

1.06 PUMP ENERGY CONSERVATION STANDARDS

- A. Each pump manufactured after January 27, 2020 shall not exceed the maximum PEI of 1.00 as defined by Section §431.465 of the Code of Federal Regulations.
- B. Definitions:
 - 1. PEI_{CL}: The constant load pump energy index.
 - 2. PEI_{VL}: The variable load pump energy index.
 - 3. BEP: The best efficiency point as determined in accordance with the test procedure in §431.464 of the Code of Federal Regulations.
- C. Pump Applications:
 - 1. ESCC: End suction close-coupled.
 - 2. ESFM: End suction frame mounted/own bearings.
 - 3. IL: In-line close coupled or split coupled.
 - 4. RSV: Radially split, vertical, multi-stage, in-line diffuser casing.
 - 5. ST: Submersible vertical turbine with 6 inch or smaller bowl diameter.
 - 6. Exception for the following type of pumps:
 - a. Fire pumps.

- b. Self-priming pumps.
- c. Split-case pumps.
- d. Prime-assist pumps.
- e. Magnet driven pumps.
- f. Pool pumps.

D. Pump Operating Conditions:

1. Flow rate: 25 gpm or greater at BEP and full impeller diameter.
2. Maximum head: 459 feet at BEP and full impeller diameter.
3. Design temperature: 14 to 248°F (-10°C to 120°C).
4. Pole: 2- or 4-pole induction motors.
5. Nominal speed of rotation: 1800 rpm or 3600 rpm.
6. Operating mode : CL = constant load or VL = variable load.

E. Pump Labeling Requirements:

1. In addition to manufacturer performance data each pump shall be permanently labeled with the following energy efficiency data:
 - a. Rated pump energy index: PEI_{CL} or PEI_{VL} .
 - b. Impeller diameter.

1.07 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, and installation instructions.
1. Parallel pump plots: For all parallel and series pump applications submit a combined pump curve showing parallel pump operation and single pump non-overloaded operation verifying that the pump selections operate non-overloading on curve in a single pump operation.
 2. Submittal information to verify all scheduled characteristics are met including efficiency.
- B. Shop Drawings: Submit manufacturer's shop drawings indicating dimensions, weight (shipping, operating), required clearances, methods of assembly of components, and location and size of each field connection.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, tube replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.
- D. Wiring Diagrams: Submit manufacturer's ladder-type wiring diagrams for power and control wiring required. Differentiate between factory-installed and field-installed wiring.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver units to the site in containers with manufacturer's stamp or label affixed.

- B. Store and protect products and units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.
- C. Rigging: Comply with the manufacturer's rigging and installation instructions.

1.09 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 IN-LINE CLOSE COUPLED PUMPS

- A. Furnish and install pumps with capacities as shown on plans on a factory installed skid manufactured. Pumps shall be in-line type, close coupled, single stage design, for installation in vertical or horizontal position, and capable of being serviced without disturbing piping connections.
- B. Pump casing shall be ductile iron, and impeller shall be of stainless steel enclosed type, dynamically balanced, keyed to the shaft and secured by a locking capscrew. Impeller trim shall be optimized for best efficiency safety factor..
- C. The liquid cavity shall be sealed off at the motor shaft by an internally flushed mechanical seal with ceramic seal seat and carbon seal ring, suitable for continuous operation at 225°F. A bronze shaft sleeve shall completely cover the wetted area under the seal.
- D. Pumps shall be rated for minimum of 175 psi working pressure. The pump case shall have gauge tappings at the suction and discharge nozzles and will include vent and drain ports.
- E. Motor shall be IE5 ECM TEFC and shall be of the size, voltage and enclosure called for on the plans. It shall have heavy duty grease lubricated ball bearings, completely adequate for the maximum load for which the motor is designed.
- F. Each pump shall be factory tested. It shall then be thoroughly cleaned and painted with at least one coat of high grade machinery enamel prior to shipment.
- G. Manufacturer: Armstrong, Xylem Bell & Gossett #80 Series, Grundfos, or equal.

2.02 SUCTION DIFFUSERS

- A. Provide suction diffuser at inlet to pump unless otherwise shown on plans. Suction diffuser shall have an angle pattern flow straightening fitting equipped with a combination diffuser-strainer-orifice cylinder, flow straightening vanes, start-up strainer, permanent magnet and adjustable support foot. The combination diffuser-strainer-orifice cylinder shall be designed to withstand pressure differential equal to the system pump shutoff head and shall have a free area equal to five times the cross section area of the pump suction opening. The length of the flow straightening vanes shall be no less than 2-1/2 times the diameter of the system suction connection.
- B. Suction Diffuser shall include the following features:
 - 1. Suction diffuser body shall be made of either cast iron or ductile iron.

2. Include a full-length, 4-plane, removable straightening vane.
 3. Straightening vane shall be made of either carbon steel or 304 stainless steel.
 4. Orifice cylinder shall be made of 304 stainless steel, or better.
 5. Flanged end connections or grooved end connections.
 6. Flange end connections should be designed according to ANSI Class 150 Standards.
 7. Strainers shall be rated for 150% (minimum) of the working pressure of piping system
 8. Strainer orifice cylinder (basket) shall be full length and removable.
 - a. Start-up screen for first month of operation shall be a 40 mesh with 0.016" openings and 41% open area.
 - b. Start-up screen shall be removed and replaced with normal operation cylinder after one month of pump operation, or as directed by the water treatment company, and prior to final water balance.
 - c. Normal operation orifice cylinder shall include 3/64" diameter perforations with 51% open area (minimum).
- C. Manufacturer: Xylem Bell & Gossett, TACO, Patterson, Wheatley, Victaulic or equal.

2.03 BASKET STRAINERS:

- A. Provide strainers full line size of connecting piping, with flanged ends to match piping system.
- B. Provide strainers full line size of connecting piping, with ends matching piping system materials. Select strainers for 150% (minimum) of the working pressure of piping system
- C. Body with bolted cover and bottom drain connection: ASTM A126, Class 125, high-tensile cast iron. Or, ASTM A216, Class 150, cast carbon steel. Or, ASTM A351, stainless steel.
- D. Cover with O-ring seal and quick release knob fasteners up to 8" size and bolted cover for 10" and larger.
- E. Strainer screen or basket, Type 304 stainless steel or better.
 1. Start-up screen for first month of operation shall be a 40 mesh with 0.016" openings and 41% open area.
 2. Start-up screen shall be removed and replaced with normal operation basket after one month of pump operation, or as directed by the water treatment company, and prior to final water balance.
 3. Normal operation perforated basket, shall be installed prior to final water balance, shall be provided with 3/64" diameter perforations with 36% open area (minimum).
- F. Manufacturer: Spirax Sarco, Keckley, Wheatley, Mueller, or equal.

2.04 ELECTRONICALLY COMMUTATED MOTOR (ECM)

- A. Provide pumps so they are specified or scheduled with ECM.
 1. Synchronous, constant torque, ECM with permanent magnet rotor. Rotor magnets to be time-stable, nontoxic ceramic magnets (Sr-Fe).
 2. Driven by a frequency converter with an integrated power factor correction filter. Conventional induction motors will not be acceptable.

3. Each motor with an integrated variable-frequency drive, tested as one unit by manufacturer.
4. Motor speed adjustable over full range from 0 rpm to maximum scheduled speed.
5. Variable motor speed to be controlled by a 0 to 10 Vdc or 4 to 20 mA input.
6. Integrated motor protection verified by UL to protect the pump against over-/undervoltage, overtemperature of motor and/or electronics, overcurrent, locked rotor, and dry run (no-load condition).

PART 3 EXECUTION

3.01 INSTALLATION

- A. All equipment, unless otherwise shown or noted on the Drawings, is to be installed in accordance with industry standards and manufacturer's recommended installation instructions.
- B. Grouting Pump Base: For all base mounted flexibly coupled pumps fill the pump base frame with grout after completing pump/motor alignment.
- C. Provide vibration isolation, inertia bases, seismic snubber, flexible pipe connections, etc., as specified in related specification sections. Refer to Section 230548 for additional requirements.
- D. For variable flow pumping applications refer to Section 230902 for additional requirements.
- E. Mechanical contractor to assist testing and balancing contractor in verifying correct pump rotation and system operation.
- F. Flush and clean equipment, in accordance with manufacturer's start-up instructions, and in presence of manufacturer's representative. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls.
- G. Isolation for Service: Provide pump installations with a discrete isolation valve on both the supply and intake side of the pump to permit service of the pump and any related strainer, check or balancing valves. Triple duty valves are not equivalent for this shut-off service.
- H. Balancing Coordination and Impeller Trimming: Coordinate final pump flow with test and balance contractor. For pumps larger than 5 horsepower, if the system tests and balance indicate that flow exceeds the specified flow by greater than 20%, it is not acceptable to reduce flow merely by adjusting balance valves to create additional head or reducing VFD peak flows. Excess system flow must be reduced by replacing the impeller to match the load.

3.02 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify pump systems mounting, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four-hours travel from the jobsite.

END OF SECTION

SECTION 23 23 00
REFRIGERANT PIPING SYSTEMS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. Includes, but not limited to:
 1. Furnish and install piping and piping specialties for refrigeration systems serving split system air conditioning units.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00 - Basic HVAC Materials and Methods.
- B. Section 23 07 19 - HVAC Piping Insulation.
- C. Section 23 81 30 - Split Air Conditioning Units.
- D. Division 26 - Electrical.

1.04 QUALITY ASSURANCE

- A. Codes and Standards: Comply with the requirements of the latest addition of the following:
 1. Welding Qualifications: Qualify procedures and personnel according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications" latest edition.
 2. ASHRAE 15: Safety Code for Refrigeration Systems.
 3. ASME B31.5: Refrigeration Piping and Heat Transfer Components.
 4. ASTM B 280: Specification for Seamless Copper Tube for Air Conditioning & Refrigeration Field Service.

Internal Working Pressure of Copper ACR Tube per ASTM B280			
Nominal Or Standard Size (Inches)	Annealed	Annealed Lengths Lengths	Hard Lengths Lengths
1/8	2459	NA	NA
3/16	1548	NA	NA

1/4	1102	NA	NA
5/16	957	NA	NA
3/8	787	731	1569
1/2	581	625	1341

- B. Contractor Qualifications: A refrigeration contractor licensed by the State shall install refrigerant piping.
- C. Manufacturer Qualifications:
1. Manufactured items furnished shall be the current, cataloged product of the manufacturer.
 2. Replacement parts shall be readily available and stocked in the USA.
 3. Manufacturer shall have a minimum of five years of manufacturing products related to refrigerant piping and/or fittings.
 4. Products shall have an installation history of no less than five years of field operation with reliable maintenance track record.
 5. Alternate system and material must be submitted with historical supporting documentation and reliability report before approval is allowed.
- D. Codes and Standards:
1. All work shall be in full accordance with all applicable codes, ordinances and code rulings.
 2. The Contractor shall furnish without any extra charge the labor and material required for compliance of codes for work required, but not specifically shown in Drawings.
 3. Perform all tests required by governing authorities and as required under all Division 23 Sections. Provide written reports on all tests.
 4. Electrical devices and wiring shall conform to the latest standards of NEC; all devices shall be UL listed and so identified.
- E. Product Control
1. Protection: Use all means necessary to protect materials before, during, and after installation and to protect the installed work and materials of all other trades.
 2. The general arrangement and locations of piping are shown on the Drawings. Changes may be necessary to accommodate work. Should it be necessary to deviate from arrangement or location indicated in order to meet existing conditions or due to interference with work of other trades, such deviations as offsets, pipe sizes, fittings sizes, rises and drops in piping that may be necessary, whether shown or not, shall be

made without extra expense. Accuracy of data given herein and on the Drawings is not guaranteed. The Drawings and Specifications are for assistance and guidance, and exact locations, distances, and elevations will be governed by actual site conditions.

3. All work shall be in accordance with the applicable codes listed in Division 01. No extra charge will be paid for furnishing items required by the regulations but not specified herein or shown on the Drawings. Should there be any direct conflict between the Drawings and/or Specifications and the above rules and regulations, the rules and regulations shall take precedence.
 4. All work shall be completely coordinated, and all lines, grades, slopes and vertical and horizontal locations of pipes shall be exactly determined in the field and cleared with the Owner's Representative before the installation of these items is begun. No extra compensation shall be made for failure to observe this clause.
 5. The Drawings and Specifications do not undertake to list every item that will be installed. When an item is necessary for the satisfactory operation of the system, it shall be furnished without extra cost. Work called for in the Specifications, but not on the Drawings, or vice versa, shall be done as though required by both. Lack of specific mention of any work necessary for proper completion of the work in the Specifications and/or Drawings, shall not lessen the Contractor's responsibility.
 6. Obtain Owner's Representative's approval prior to rerouting of existing services. Refer to Division 01 sections for alterations, shutdown and temporary construction for existing services.
 7. Pipe spaces provided in the design shall be utilized and the work shall be kept within the spaces established on the Drawings.
 8. Manufacturers' directions shall be followed in all cases where manufacturers of articles used in this Contract furnish directions covering points not shown on the Drawings or specified herein. Manufacturers' directions do not take precedence over the Drawings and Specifications. Where manufacturers' directions are in conflict with the Drawings and Specifications, submit these conflicts to the Owner's Representative and receive clarification before installing the work.
 9. Do not permit or cause any work to be covered or enclosed until it has been inspected, tested, and approved. Should any of the work be enclosed or covered before inspection and test, Contractor shall, at his/her own expense, uncover the work; and, after it has been inspected, tested and approved, make all repairs with such materials as may be required. Restore all work to its original and proper condition.
 10. Be responsible for damage to any of this work before acceptance. Securely cover all openings, both before and after setting into place, to prevent obstructions in the pipes and breakage.
 11. Repair all damage to the premises occasioned by the work. All damage to any part of the premises caused by leaks or breaks in the pipe installed under this Section of the work for a period of one (1) year after date of final acceptance of the work, shall be repaired.
- F. All materials (such as insulation, ductwork, piping, wiring, controls, etc.) located within air plenum spaces, air shafts, and occupied spaces shall have a flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E84 (NFPA 255) Method. In addition, the products, when tested, shall not drip flame particles, and flame shall not be progressive. Provide Underwriters Laboratories, Inc., label or listing, or satisfactory certified test

report from an approved testing laboratory to prove the fire hazard ratings for materials proposed for use do not exceed those specified.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for all refrigerant piping, valves and specialties indicating dimensions, flow capacity, pressure setting, tolerances etc.
- B. Shop Drawings:
 - 1. Submit shop drawings including plans, schematics, and riser diagrams of refrigerant piping, including dimensions of all piping.
 - 2. Reference to associated insulation systems submitted in compliance with Section 23 07 19 HVAC Piping Insulation.
 - 3. Provide all details of suspension and support for ceiling hung equipment.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, valve replacement, and spare parts lists. Include this data, product data, and shop drawings in operating and maintenance manuals.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect equipment and products against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.07 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.
- C. Provide the following additional extended warranty requirements that apply to piping with mechanical type joints and fittings, such as grooved or pressed/compression type fittings.
 - 1. The warranties and corrective obligations provided under this section (i) are in addition to, and not in lieu of, any other warranty, representation, covenant, duty or other obligation (including any corrective obligation) of the Contractor or Manufacturer, (ii) have no relationship to the time when any warranty, representation, duty, covenant or other obligation of Contractor or Manufacturer may be enforced or any dispute resolution proceeding commenced and (iii) are made by the Manufacturer to both the Contractor and the Owner and by the Contractor to Owner.
 - 2. Contractor and Manufacturer warrant that, for a period of ten (10) years from the date of Substantial Completion, the entire system, including but not limited to the fittings and

joints, will conform to the requirements of the Contract Documents, will be free from defects, and will not leak.

3. Nothing in any separate warranty or other document provided by Contractor or Manufacturer, or both, will apply to limit their liability or responsibility for damages arising out of or related to a breach of any warranty or corrective obligation.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Line Test Pressure for Refrigerant R-134a:
 1. Suction Lines for Air-Conditioning Applications: 115 psig (793 kPa).
 2. Suction Lines for Heat-Pump Applications: 225 psig (1551 kPa).
 3. Hot-Gas and Liquid Lines: 225 psig (1551 kPa).
- B. Line Test Pressure for Refrigerant R-407C:
 1. Suction Lines for Air-Conditioning Applications: 230 psig (1586 kPa).
 2. Suction Lines for Heat-Pump Applications: 380 psig (2620 kPa).
 3. Hot-Gas and Liquid Lines: 380 psig (2620 kPa).
- C. Line Test Pressure for Refrigerant R-410A:
 1. Suction Lines for Air-Conditioning Applications: 300 psig (2068 kPa).
 2. Suction Lines for Heat-Pump Applications: 535 psig (3689 kPa).
 3. Hot-Gas and Liquid Lines: 535 psig (3689 kPa).
- D. Do not use pre-charged refrigerant lines more than 50 feet in length.

2.02 COPPER TUBE AND FITTINGS

- A. Copper Tube: ASTM B88, Type K or L; or ASTM B280, Type ACR.
- B. Wrought-Copper Fittings and Unions: ASME B16.22.
- C. Solder Filler Metals: ASTM B32. Use 95-5 tin antimony or alloy HB solder to join copper socket fittings on copper pipe.
- D. Flux: Stay-Silv white brazing flux by J.W. Harris Co or silver solder flux by Handy & Harmon.
- E. Brazing Filler Metals: AWS A5.8.
 1. Copper to Copper Connections:
 - a. AWS Classification BCuP-4 Copper Phosphorus (6% silver).
 - b. AWS Classification BCuP-5 Copper Phosphorus (15% silver).
 2. Copper to Brass or Copper to Steel Connections
 - a. AWS Classification BAg-5 Silver (45% silver)
 3. Do not use rods containing Cadmium.

- F. Manufacturers: Mueller Streamline, Nibco, Grinnell, Elkhart, or equal.

2.03 FLEXIBLE CONNECTORS

- A. Body: Tin-bronze bellows with woven, flexible, tinned-bronze-wire-reinforced protective jacket.
- B. End Connections: Socket ends.
- C. Offset Performance: Capable of minimum 3/4 inch (20 mm) misalignment in minimum 7 inch (180 mm) long assembly.
- D. Working Pressure Rating: Factory test at minimum 450 psig (3100 kPa).
- E. Maximum Operating Temperature: 250°F (121°C).
- F. Manufacturers: Metraflex #RAF or equal.

2.04 COPPER PRESS-CONNECT TYPE FITTINGS AND JOINTS – IN JURISDICTIONS WHERE 2018 MECHANICAL CODE IS ADOPTED **THE UMC ANSWERS & ANALYSIS COMMITTEE ANSWERED AS FOLLOWS:** THESE FITTINGS DO NOT MEET THE CRITERIA SET FORTH IN CHAPTER 11 SECTION 1109.2 OF THE 2015 UNIFORM MECHANICAL CODE FOR USE WITH APPROVED REFRIGERANTS. ZOOMLOCK FITTINGS ARE NOT OF THE FLARED OR SWAGELOK TYPE, THEY ARE CLASSIFIED AS PRESSED FITTINGS WHICH ARE NOT LISTED AS AN APPROVED JOINING METHOD FOR REFRIGERATION PIPING IN THE UMC AND IMC UP THROUGH 2015 CODE CYCLE. THE FITTINGS ARE LISTED BY AN APPROVED LISTING AGENCY TO THE UL 207 STANDARD, WHICH IS A STANDARD FOR REFRIGERANT-CONTAINING COMPONENTS AND ACCESSORIES. MOST PRESS-TYPE COPPER FITTINGS ARE LISTED TO ASME B16.51 OR IAPMO PS-117.)

- A. Flame free press fittings are allowed as a contractor option, however confirm compliance with allowable refrigerant usage, and local building codes authority having jurisdiction.
- B. Product Characteristics (minimum):
 1. Continuous Operating Temperature: 250°F (121°C).
 2. O-Ring Temperature Rating: -40 to 300°F (-40 to 149°C).
 3. Maximum Rated Pressure: 700 psi (49 bar).
 4. Minimum Burst Pressure: 2,100 psi (145 bar).
 5. Vacuum Pressure Capability: 20 micron.
 6. Maximum Leak Rate: 0.1 oz Helium per year.
 7. Vibration Resistance: Conforms to UL 109.
- C. Klauke 15 kN Compatible Jaws: Hard Drawn Copper: 1/4" to 7/8" Type ACR, M, L, Type K up to 7/8". Soft (Annealed) Copper: 1/4" to 1-1/8" Type ACR, L, Type K up to 7/8".
- D. Klauke 19 kN Jaws and RIDGID Compatible Jaws: Hard Drawn Copper: 1/4" to 1-3/8" Type ACR, M, L, K. Soft (Annealed) Copper: 1/4" to 1-3/8" Type ACR, L, K.
- E. Tubing: The installer shall confirm the copper tubing conforms to ASTM B280, ASTM B88, or EN 12735-1.
- F. Fitting Body: Conform to ASTM-B75 or ASTM-B743.

- G. Fitting Sealing O-Rings: HNBR. These shall be factory installed only.
- H. Compatible ODM Fittings: Material conform to C12200 copper per ASTM B280 or Cu-DHP CW024A per BS EN 12735-1.
- I. Threaded Schraeder Valve Access Fittings: Schraeder style valve material and threads conform to SAE J513.
- J. Threaded Fittings: Flare nuts conform to SAE J513 & SAE J533.
- K. Manufacturers: Parker Sporlan #Zoomlock or approved equal.

2.05 STEEL PIPE AND FITTINGS

- A. Steel Pipe: ASTM A53, black steel with plain ends; type, grade, and wall thickness as selected in piping application articles.
- B. Wrought-Steel Fittings: ASTM A234, for welded joints.
- C. Steel Flanges and Flanged Fittings: ASME B16.5, steel, including bolts, nuts, and gaskets, bevel-welded end connection, and raised face.
- D. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- E. Flanged Unions:
 - 1. Body: Forged-steel flanges for NPS 1" to NPS 1-1/2" (DN 25 to DN 40) and ductile iron for NPS 2" to NPS 3" (DN 50 to DN 80). Apply rust-resistant finish at factory.
 - 2. Gasket: Fiber asbestos free.
 - 3. Fasteners: Four plated-steel bolts, with silicon bronze nuts. Apply rust-resistant finish at factory.
 - 4. End Connections: Brass tailpiece adapters for solder-end connections to copper tubing.
 - 5. Offset Performance: Capable of minimum 3/4-inch (20-mm) misalignment in minimum 7-inch (180-mm) long assembly.
 - 6. Pressure Rating: Factory test at minimum 400 psig (2760 kPa).
 - 7. Maximum Operating Temperature: 330°F (165 C).
- F. Flexible Connectors:
 - 1. Body: Stainless-steel bellows with woven, flexible, stainless-steel-wire-reinforced protective jacket.
 - 2. End Connections:
 - a. NPS 2" (DN 50) and Smaller: With threaded-end connections.
 - b. NPS 2-1/2" (DN 65) and Larger: With flanged-end connections.
 - 3. Offset Performance: Capable of minimum 3/4-inch (20-mm) misalignment in minimum 7-inch (180-mm) long assembly.
 - 4. Pressure Rating: Factory test at minimum 500 psig (3450 kPa).
 - 5. Maximum Operating Temperature: 250°F (121°C).

G. Manufacturers:

1. Anaconda "Vibration Eliminators" by Anamet.
2. Vibration Absorber Model VAF by Packless Industries.
3. Vibration Absorbers by Superior Valve Co.
4. Style "BF" Spring-flex refrigerant connectors by Vibration Mountings.
5. Or equal.

2.06 VALVES AND SPECIALTIES

A. Diaphragm Packless Valves:

1. Body and Bonnet: Forged brass or cast bronze; globe design with straight-through or angle pattern.
2. Diaphragm: Phosphor bronze and stainless steel with stainless-steel spring.
3. Operator: Rising stem and hand wheel.
4. Seat: Nylon.
5. End Connections: Socket, union, or flanged.
6. Working Pressure Rating: 500 psig (3450 kPa).
7. Maximum Operating Temperature: 275 F (135 C).

B. Packed-Angle Valves:

1. Body and Bonnet: Forged brass or cast bronze.
2. Packing: Molded stem, back seating, and replaceable under pressure.
3. Operator: Rising stem.
4. Seat: Nonrotating, self-aligning polytetrafluoroethylene.
5. Seal Cap: Forged-brass or valox hex cap.
6. End Connections: Socket, union, threaded, or flanged.
7. Working Pressure Rating: 500 psig (3450 kPa).
8. Maximum Operating Temperature: 275 F (135 C).

C. Check Valves:

1. Body: Ductile iron, forged brass, or cast bronze; globe pattern.
2. Bonnet: Bolted ductile iron, forged brass, or cast bronze; or brass hex plug.
3. Piston: Removable polytetrafluoroethylene seat.
4. Closing Spring: Stainless steel.
5. Manual Opening Stem: Seal cap, plated-steel stem, and graphite seal.
6. End Connections: Socket, union, threaded, or flanged.
7. Maximum Opening Pressure: 0.50 psig (3.4 kPa).
8. Working Pressure Rating: 500 psig (3450 kPa).
9. Maximum Operating Temperature: 275 F (135 C).

D. Service Valves:

1. Body: Forged brass with brass cap including key end to remove core.
 2. Core: Removable ball-type check valve with stainless-steel spring.
 3. Seat: Polytetrafluoroethylene.
 4. End Connections: Copper spring.
 5. Working Pressure Rating: 500 psig (3450 kPa).
 6. Manufacturers: Apollo Valves (Conbraco), Henry, Mueller, Superior, Virginia, or equal.
- E. Solenoid Valves: Comply with AHRI 760 and UL 429; listed and labeled by a National Recognized Testing Laboratory (NRTL).
1. Body and Bonnet: Plated steel.
 2. Solenoid Tube, Plunger, Closing Spring, and Seat Orifice: Stainless steel.
 3. Seat: Polytetrafluoroethylene.
 4. End Connections: Threaded.
 5. Electrical: Molded, watertight coil in NEMA 250 enclosure of type required by location with 1/2-inch (16-GRC) conduit adapter, and 24/115/208-volt ac coil as required.
 6. Working Pressure Rating: 400 psig (2760 kPa).
 7. Maximum Operating Temperature: 240 F (116 C).
- F. Safety Relief Valves: Comply with 2010 ASME Boiler and Pressure Vessel Code; listed and labeled by an NRTL.
1. Body and Bonnet: Ductile iron and steel, with neoprene O-ring seal.
 2. Piston, Closing Spring, and Seat Insert: Stainless steel.
 3. Seat: Polytetrafluoroethylene.
 4. End Connections: Threaded.
 5. Working Pressure Rating: 400 psig (2760 kPa).
 6. Maximum Operating Temperature: 240 F (116 C).
- G. Thermostatic Expansion Valves: Comply with AHRI 750.
1. Body, Bonnet, and Seal Cap: Forged brass or steel.
 2. Diaphragm, Piston, Closing Spring, and Seat Insert: Stainless steel.
 3. Packing and Gaskets: Non-asbestos.
 4. Capillary and Bulb: Copper tubing filled with refrigerant charge.
 5. Reverse-flow option (for heat-pump applications).
 6. End Connections: Socket, flare, or threaded union.
 7. Manufacturers: Alco, Henry, Mueller, Parker, Singer, Sporlan, or equal.
- H. Hot-Gas Bypass Valves: Comply with UL 429; listed and labeled by an NRTL.
1. Body, Bonnet, and Seal Cap: Ductile iron or steel.
 2. Diaphragm, Piston, Closing Spring, and Seat Insert: Stainless steel.
 3. Packing and Gaskets: Non-asbestos.
 4. Solenoid Tube, Plunger, Closing Spring, and Seat Orifice: Stainless steel.

5. Seat: Polytetrafluoroethylene.
 6. Electrical: Molded, watertight coil in NEMA 250 enclosure of type required by location with 1/2-inch (16-GRC) conduit adapter and 24/115/208-volt AC coil as required.
 7. End Connections: Socket.
 8. Throttling Range: Maximum 5 psig (34 kPa).
 9. Working Pressure Rating: 500 psig (3450 kPa).
 10. Maximum Operating Temperature: 240 F (116 C).
- I. Straight-Type Strainers:
1. Body: Welded steel with corrosion-resistant coating.
 2. Screen: 100-mesh stainless steel.
 3. End Connections: Socket or flare.
 4. Working Pressure Rating: 500 psig (3450 kPa).
 5. Maximum Operating Temperature: 275 F (135 C).
- J. Angle-Type Strainers:
1. Body: Forged brass or cast bronze.
 2. Drain Plug: Brass hex plug.
 3. Screen: 100-mesh monel.
 4. End Connections: Socket or flare.
 5. Working Pressure Rating: 500 psig (3450 kPa).
 6. Maximum Operating Temperature: 275 F (135 C).
- K. Moisture/Liquid Indicators:
1. Body: Forged brass.
 2. Window: Replaceable, clear, fused glass window with indicating element protected by filter screen.
 3. Indicator: Color coded to show moisture content in parts per million (ppm).
 4. Minimum Moisture Indicator Sensitivity: Indicate moisture above 60 ppm.
 5. End Connections: Socket or flare.
 6. Working Pressure Rating: 500 psig (3450 kPa).
 7. Maximum Operating Temperature: 240 F (116 C).
- L. Replaceable-Core Filter Dryers: Comply with AHRI 730.
1. Body and Cover: Painted-steel shell with ductile-iron cover, stainless-steel screws, and neoprene gaskets.
 2. Filter Media: 10-micron, pleated with integral end rings; stainless-steel support.
 3. Desiccant Media: Activated alumina or charcoal.
 4. End Connections: Socket.
 5. Access Ports: NPS 1/4 (DN 8) connections at entering and leaving sides for pressure differential measurement for suction-line filter dryers.

6. Maximum Pressure Loss: **2 psig (14 kPa)**.
 7. Working Pressure Rating: 500 psig (3450 kPa).
 8. Maximum Operating Temperature: 240 F (116 C).
- M. Permanent Filter Dryers: Comply with AHRI 730.
1. Body and Cover: Painted-steel shell.
 2. Filter Media: 10-micron, pleated with integral end rings; stainless-steel support.
 3. Desiccant Media: Activated alumina or charcoal.
 4. End Connections: Socket.
 5. Access Ports: NPS 1/4 (DN 8) connections at entering and leaving sides for pressure differential measurement.
 6. Maximum Pressure Loss: **2 psig (14 kPa)**.
 7. Working Pressure Rating: 500 psig (3450 kPa).
 8. Maximum Operating Temperature: 240 F (116 C).
 9. Manufacturers: Alco, Mueller, Parker, Sporlan, Virginia, or equal.
- N. Mufflers:
1. Body: Welded steel with corrosion-resistant coating.
 2. End Connections: Socket or flare.
 3. Working Pressure Rating: 500 psig (3450 kPa).
 4. Maximum Operating Temperature: 275 F (135 C).
- O. Receivers: Comply with AHRI 495.
1. Comply with 2010 ASME Boiler and Pressure Vessel Code; listed and labeled by an NRTL for receivers larger than 6 inches (150 mm).
 2. Comply with UL 207; listed and labeled by an NRTL.
 3. Body: Welded steel with corrosion-resistant coating.
 4. Tappings: Inlet, outlet, liquid level indicator, and safety relief valve.
 5. End Connections: Socket or threaded.
 6. Working Pressure Rating: 500 psig (3450 kPa).
 7. Maximum Operating Temperature: 275 F (135 C).
- P. Liquid Accumulators: Comply with AHRI 495.
1. Body: Welded steel with corrosion-resistant coating.
 2. End Connections: Socket or threaded.
 3. Working Pressure Rating: 500 psig (3450 kPa).
 4. Maximum Operating Temperature: 275 F (135 C).
- Q. Sight Glass
1. Combination moisture and liquid indicator with protection cap.
 2. Sight glass shall be full line size.

3. Sight glass connections shall be solid copper or brass, no copper-coated steel sight glasses allowed.
4. Manufacturers: Alco, Asco, Mueller, Parker, Sporlan, or equal.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Provide and install refrigerant piping, fittings, valves and devices as required by equipment manufacturer and as shown on the Drawings.
- B. Refrigeration system connections shall be copper-to-copper, copper-to-brass, or copper-to-steel type properly cleaned and brazed with specified rods. Use flux only where necessary.
 1. No soft solder (tin, lead, antimony) connections will be allowed in system.
 2. Braze valve, sight glass, and flexible connections.
 3. Circulate dry nitrogen through tubes being brazed to eliminate formation of copper oxide during brazing operation.
- C. Insulate all suction and hot gas lines. Insulate liquid lines where pipe may be in close contact to humans.

3.02 VALVE AND SPECIALTY APPLICATIONS

- A. Install diaphragm packless or packed-angle valves in suction and discharge lines of compressor.
- B. Install service valves for gage taps at inlet and outlet of hot-gas bypass valves and strainers if they are not an integral part of valves and strainers.
- C. Install a check valve at the compressor discharge and a liquid accumulator at the compressor suction connection.
- D. Install diaphragm packless or packed-angle valves on inlet and outlet side of filter dryers.
- E. Install a full-size, three-valve bypass around filter dryers.
- F. Install solenoid valves upstream from each expansion valve and hot-gas bypass valve. Install solenoid valves in horizontal lines with coil at top.
- G. Install thermostatic expansion valves as close as possible to distributors on evaporators.
 1. Install valve so diaphragm case is warmer than bulb.
 2. Secure bulb to clean, straight, horizontal section of suction line using two bulb straps. Do not mount bulb in a trap or at bottom of the line.
 3. If external equalizer lines are required, make connection where it will reflect suction-line pressure at bulb location.
- H. Install safety relief valves where required by ASME Boiler and Pressure Vessel Code. Pipe safety-relief-valve discharge line to outside according to ASHRAE 15.
- I. Install moisture/liquid indicators in liquid line at the inlet of the thermostatic expansion valve or at the inlet of the evaporator coil capillary tube.

- J. Install strainers upstream from and adjacent to the following unless they are furnished as an integral assembly for the device being protected:
 - 1. Solenoid valves.
 - 2. Thermostatic expansion valves.
 - 3. Hot-gas bypass valves.
 - 4. Compressor.
- K. Install filter dryers in liquid line between compressor and thermostatic expansion valve.
- L. Install receivers sized to accommodate pump-down charge.
- M. Install flexible connectors at refrigerant piping connection to all equipment (coils, condensers, and/or compressors) as required by the manufacturer and where necessary to prevent vibration from transferring into the building structure and to minimize vibration and audible noise in occupied spaces.

3.03 PIPING INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems; indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop Drawings.
- B. Install refrigerant piping according to ASHRAE 15.
- C. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
- D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- F. Install piping adjacent to machines to allow service and maintenance.
- G. Install piping free of sags and bends.
- H. Install fittings for changes in direction and branch connections.
- I. Select system components with pressure rating equal to or greater than system operating pressure.
- J. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.
- K. Arrange piping to allow inspection and service of refrigeration equipment. Install valves and specialties in accessible locations to allow for service and inspection. Install access doors or panels if valves or equipment requiring maintenance is concealed behind finished surfaces.
- L. Install refrigerant piping in protective chaseway where installed belowground.

- M. Install refrigerant piping in rigid or flexible conduit in locations where exposed to mechanical injury.
- N. Slope refrigerant piping as follows:
 - 1. Install horizontal hot-gas discharge piping with a uniform slope downward away from compressor.
 - 2. Install horizontal suction lines with a uniform slope downward to compressor.
 - 3. Install traps and double risers to entrain oil in vertical runs.
 - 4. Liquid lines may be installed level.
- O. When brazing or soldering, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion-valve bulb.
- P. Before installation of steel refrigerant piping, clean pipe and fittings using the following procedures:
 - 1. Shot blast the interior of piping.
 - 2. Remove coarse particles of dirt and dust by drawing a clean, lintless cloth through tubing by means of a wire or electrician's tape.
 - 3. Draw a clean, lintless cloth saturated with trichloroethylene through the tube or pipe. Continue this procedure until cloth is not discolored by dirt.
 - 4. Draw a clean, lintless cloth, saturated with compressor oil, squeezed dry, through the tube or pipe to remove remaining lint. Inspect tube or pipe visually for remaining dirt and lint.
 - 5. Finally, draw a clean, dry, lintless cloth through the tube or pipe.
 - 6. Safety-relief-valve discharge piping is not required to be cleaned but is required to be open to allow unrestricted flow.
- Q. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation.
- R. Install sleeves and escutcheons for piping penetrations of walls, ceilings, and floors.

3.04 PIPE JOINT CONSTRUCTION

- A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- C. Steel pipe: Fill pipe and fittings with an inert gas (nitrogen or carbon dioxide), during brazing or welding, to prevent scale formation.
- D. Soldered Joints: Construct joints according to ASTM B828 or CDA's "Copper Tube Handbook."
- E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube."
 - 1. Use Type BCuP (copper-phosphorus) alloy for joining copper socket fittings with copper pipe.

2. Use Type BAg (cadmium-free silver) alloy for joining copper with bronze or steel.
- F. Threaded Joints: Thread steel pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and to restore full ID. Join pipe fittings and valves as follows:
 1. Apply appropriate tape or thread compound to external pipe threads unless dry-seal threading is specified.
 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
 - G. Steel pipe can be threaded, but threaded joints must be seal brazed or seal welded.
 - H. Welded Joints: Construct joints according to AWS D10.12M/D10.12.
 - I. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
- 3.05 PRESS-FIT PIPING INSTALLATION-ZOOMLOCK (CONTRACTOR OPTION)
- A. Installers shall follow all installation steps per the Sporlan #Zoomlock installation instructions. This covers examination, preparation and installation.
 - B. Upon delivery to the jobsite, the installing contractor shall examine the copper tubing and fittings for debris, defects, incise marks (manufacturer's engraving on tube), holes or cracks.
 - C. If any brazing is required, the installer shall follow the manufacturer guidelines.
 - D. Wrapping electrical tape over the end of a flare fitting can be used when placing foam insulation of a pipe to prevent tearing.
 - E. The installer shall not crimp Sporlan #Zoomlock fittings over flared style tubing (ODF). The installer can cut off the flare and crimp the Sporlan #Zoomlock fitting to the tube as long as there is a minimum of two inches of tube remaining.
 - F. Installer shall ensure piping is spaced such that the crimp gauge can be fit around the pipes to check for proper crimp.
 - G. The installer shall place Sporlan #Zoomlock fittings no closer than 1" apart.
 - H. The installer shall locate the copper tubing such that the crimp tool and jaws can fit around the fittings.
- 3.06 HANGERS AND SUPPORTS
- A. Install the following pipe attachments:
 1. Adjustable steel clevis hangers for individual horizontal runs less than 20 feet (6 m) long.
 2. Spring hangers to support vertical runs.
 3. Copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.
 - B. Install hangers for copper tubing with the following maximum spacing and minimum rod diameters:

1. Up to NPS 5/8" (DN 18): Maximum span, 60" (1500 mm); minimum rod, 3/8" (9.5 mm).
 2. Greater than 5/8" up to NPS 1-1/8" (DN 25): Maximum span, 72" (1800 mm); minimum rod, 3/8" (9.5 mm).
 3. Greater than 1-1/8" up to NPS 2" (DN50): Maximum span, 96" (2400 mm); minimum rod, 3/8" (9.5 mm).
 4. NPS 2-1/2" (DN 65): Maximum span, 108" (2700 mm); minimum rod, 3/8" (9.5 mm).
 5. NPS 3" (DN 80): Maximum span, 10 feet (3 m); minimum rod, 3/8" (9.5 mm).
 6. NPS 4" (DN 100): Maximum span, 12 feet (3.7 m); minimum rod, 1/2" (13 mm).
- C. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 2" (DN 50): Maximum span, 10 feet (3 m); minimum rod, 3/8 inch (9.5 mm).
 2. NPS 2-1/2" (DN 65): Maximum span, 11 feet (3.4 m); minimum rod, 3/8 inch (9.5 mm).
 3. NPS 3" (DN 80): Maximum span, 12 feet (3.7 m); minimum rod, 3/8 inch (9.5 mm).
 4. NPS 4" (DN 100): Maximum span, 14 feet (4.3 m); minimum rod, 1/2 inch (13 mm).
- D. Support multifloor vertical runs at each floor.

3.07 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
1. Comply with ASME B31.5, Chapter VI.
 2. Test refrigerant piping, specialties, and receivers. Isolate compressor, condenser, evaporator, and safety devices from test pressure if they are not rated above the test pressure.
 3. Test high- and low-pressure side piping of each system separately at not less than the pressures indicated in "Performance Requirements" Article.
 - a. Fill system with nitrogen to the required test pressure.
 - b. System shall maintain test pressure at the manifold gage throughout duration of test.
 - c. Test joints and fittings with electronic leak detector or by brushing a small amount of soap and glycerin solution over joints.
 - d. Remake leaking joints using new materials, and retest until satisfactory results are achieved.
 4. Prepare test and inspection reports.

3.08 SYSTEM CHARGING

- A. Charge system using the following procedures:
1. Install core in filter dryers after leak test but before evacuation.
 2. Evacuate entire refrigerant system with a vacuum pump to 500 micrometers (67 Pa). If vacuum holds for 12 hours, system is ready for charging.
 3. Break vacuum with refrigerant gas, allowing pressure to build up to 2 psig (14 kPa).
 4. Charge system with a new filter-dryer core in charging line.

3.09 ADJUSTING

- A. Adjust thermostatic expansion valve to obtain proper evaporator superheat.
- B. Adjust high- and low-pressure switch settings to avoid short cycling in response to fluctuating suction pressure.
- C. Adjust set-point temperature of air-conditioning or chilled-water controllers to the system design temperature.
- D. Perform the following adjustments before operating the refrigeration system, according to manufacturer's written instructions:
 - 1. Open shutoff valves in condenser water circuit.
 - 2. Verify that compressor oil level is correct.
 - 3. Open compressor suction and discharge valves.
 - 4. Open refrigerant valves except bypass valves that are used for other purposes.
 - 5. Check open compressor-motor alignment and verify lubrication for motors and bearings.
- E. Replace core of replaceable filter dryer after system has been adjusted and after design flow rates and pressures are established.

SECTION 23 25 00

HVAC WATER TREATMENT

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 DESCRIPTION OF SCOPE

- A. Provide complete water treatment work required by this section as indicated on drawings and schedules and by requirements of this section, and includes necessary equipment, chemicals, and service for the following systems:
1. Cleaning solution for HVAC Piping Systems.
 2. Treatment of cooling tower condenser water systems-startup only.
 3. Treatment of cooling tower condenser water systems.
 4. Treatment of chilled water systems.
 5. Treatment of heating water systems.
 6. Treatment for steam systems.
 7. Treatment of process cooling water systems.
 8. Treatment of heat recovery loop piping systems.
 9. Treatment of solar water heating systems.
 10. Closed loop glycol solution charging and maintenance systems.
- B. Provide chemicals and service program for a period of one year from start-up date of equipment, including the following:
1. Initial water analysis and recommendations.
 2. Systems start-up assistance and supporting documentation.
 3. Training of operating personnel.
 4. Periodic field service and consultation for first year of operation.
 5. Customer report charts and log sheets.
 6. Laboratory technical assistance.

1.03 GENERAL PERFORMANCE REQUIREMENTS

- A. Water treatment systems for closed loop and open loop piping systems, including condenser water, chilled water, heating water and steam systems shall inhibit corrosion and scale to maximize efficiency and operating life of HVAC equipment.

- B. Water treatment systems for cooling towers shall also inhibit microbiological fouling.
- C. Water treatment shall be based on existing water quality, HVAC system materials and performance, and any local jurisdictional requirements.
- D. Water treatment services shall include water analysis; water quality goal definition; solid or liquid chemical products designed to treat specific water conditions; effective dosage calculations; equipment adjustment and maintenance. Services shall be provided by qualified water treatment professionals trained in solid chemical application.
- E. Water treatment equipment for delivery of solid or liquid chemicals shall deliver accurate dosages per professional water treatment service recommendations, and use equivalent or less energy than liquid chemical systems.

1.04 QUALITY ASSURANCE

- A. **Manufacturers and Representative Qualifications.** Firms regularly engaged in manufacture of water treatment equipment, chemical and service shall have been active in the field of industrial water treatment and whose products have been in satisfactory use in similar service for not less than 5 years, and shall have full-time service personnel located within 150 miles of the project site.
- B. **Codes and Standards:**
 - 1. **ASME Compliance:** Construct pressure service tanks in accordance with ASME Boiler and Pressure Vessel Code, Section VIII, provide stamp and certification.
 - 2. **UL Labels:** Provide water conditioners ancillary electrical components that have been listed and labeled by UL.
 - 3. **NEMA Standards:** Provide electrical controls and enclosures conforming to applicable standards of NEMA for environment where water conditioners are indicated.
 - 4. **Chemical Standards:** Provide only chemical products that are acceptable under state and local public health and pollution control regulations. All products shall have the necessary registrations and approvals. All biocides shall be registered with the company performing the service in the State where the project is located and the company shall have all necessary licenses.

1.05 SUBMITTALS

- A. **Product Data:** Submit manufacturer's technical product including rated capacities of selected equipment clearly indicating water pressure drops, weights, installation and start-up instructions, and furnished specialties and accessories.
- B. **Shop Drawings:** Submit manufacturer's assembly-type shop drawings indicating dimensions, weight loadings, required clearances, and methods of assembly of components.
- C. **Wiring Diagrams:** Submit manufacturer's electrical requirements for power supply wiring to water treatment equipment. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
- D. **Record Drawings:** At project closeout, submit record drawings of installed systems and products.

- E. Maintenance Data: Submit maintenance data and parts list for each item of equipment, control, and accessory; including “trouble-shooting” maintenance guide. Include this data, product data, shop drawings, and wiring diagrams in maintenance manual.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Handle water treatment materials and components carefully to prevent damage, breaking, denting and scoring to materials and equipment. Deliver packaged units in original crates. Do not install damaged water treatment materials and components; remove from site and replace with new.
- B. Store water treatment materials and components in an environment satisfactory to prevent their damage by the elements.

1.07 EXTENDED MAINTENANCE SERVICES

- A. Agreement to Maintain: Prior to time of final acceptance, submit four copies of “Agreement for Continued Service and Maintenance” for water treatment system, for Owner’s possible acceptance. Offer terms and conditions for furnishing chemicals and providing continued testing and servicing, and including replacement of materials and equipment, for one-year period with option for renewal of Agreement by Owner. For the purposes of this section, the date of substantial completion shall begin on the date regular chemical treatment has commenced for the water systems.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or to the environment.
- B. Base HVAC water treatment on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.
- C. Closed hydronic systems, including hot-water heating, chilled water, condenser water, dual-temperature water and glycol cooling, shall have the following water qualities:
 1. pH: Maintain a value within 9.0 to 10.5, or as required by equipment manufacturer.
 2. "P" Alkalinity: Maintain a value within 100 to 500 ppm, or as required by equipment manufacturer.
 3. Boron: Maintain a value within 100 to 200 ppm, or as required by equipment manufacturer.
 4. Chemical Oxygen Demand (non-glycol systems): Maintain a maximum value of 100 ppm, or as required by equipment manufacturer.

5. Soluble Copper: Maintain a maximum value of 0.20 ppm, or as required by equipment manufacturer.
6. TSS: Maintain a maximum value of 10 ppm, or as required by equipment manufacturer.
7. Ammonia: Maintain a maximum value of 20 ppm, or as required by equipment manufacturer.
8. Free Caustic Alkalinity: Maintain a maximum value of 20 ppm, or as required by equipment manufacturer.
9. Microbiological Limits:
 - a. Total Aerobic Plate Count: Maintain a maximum value of 1000 organisms/mL.
 - b. Total Anaerobic Plate Count: Maintain a maximum value of 100 organisms/mL.
 - c. Nitrate Reducers: Maintain a maximum value of 100 organisms/mL.
 - d. Sulfate Reducers: Maintain a maximum value of 0 organisms/mL.
 - e. Iron Bacteria: Maintain a maximum value of 0 organisms/mL.

2.02 CHEMICALS

- A. Chemicals shall be as recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment and that can attain water quality specified in "Performance Requirements" Article.
- B. Chemicals to be FDA approved and safe for use with direct steam injection humidification and for steam used in direct contact with food.

2.03 CHEMICAL POT (BYPASS) FEEDER FOR CLOSED LOOP SYSTEMS

- A. Refer to Section 23 21 13 Hydronic Piping, Valves and Specialties for bypass feeder requirements.

2.04 AUTOMATIC CHEMICAL-FEED EQUIPMENT

- A. Water Meter:
 1. AWWA C700, oscillating-piston, magnetic-drive, totalization meter.
 2. Body: Bronze.
 3. Minimum Working-Pressure Rating: 150 psig.
 4. Maximum Pressure Loss at Design Flow: 3 psig.
 5. End Connections: Threaded.
 6. Controls: Flow-control switch with normally open contacts; rated for maximum 10 A, 250 Vac; and that will close at adjustable increments of total flow.
 7. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Water Meter:
 1. AWWA C701, turbine-type, totalization meter.
 2. Body: Bronze.
 3. Minimum Working-Pressure Rating: 100 psig.

4. Maximum Pressure Loss at Design Flow: 3 psig.
5. End Connections: Threaded.
6. Control: Low-voltage signal capable of transmitting 1000 feet.
7. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Water Meter:

1. AWWA C701, turbine-type, totalization meter.
2. Body: Bronze or Epoxy-coated cast iron.
3. Minimum Working-Pressure Rating: 150 psig.
4. Maximum Pressure Loss at Design Flow: 3 psig.
5. End Connections: Flanged.
6. Controls: Flow-control switch with normally open contacts; rated for maximum 10 A, 250 Vac; and that will close at adjustable increments of total flow.
7. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Inhibitor Injection Timers:

1. Microprocessor-based controller with digital display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
2. Programmable timers with infinite adjustment over full range, and mounted in cabinet with hand-off-auto switches and status lights.
3. Test switch.
4. Hand-off-auto switch for chemical pump.
5. Illuminated legend to indicate feed when pump is activated.
6. Programmable lockout timer with indicator light. Lockout timer to deactivate the pump and activate alarm circuits.
7. Digital display makeup totalizer to measure amount of makeup and bleed-off water from two water meter inputs.
8. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

E. TSS Controller:

1. Microprocessor-based controller, 1 percent accuracy in a range from zero to 5000 micromhos. Incorporate solid-state integrated circuits and digital display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
2. Digital display and touch pad for input.
3. Sensor probe adaptable to sample stream manifold.
4. High, low, and normal conductance indication.
5. High- or low-conductance-alarm-light trip points, field adjustable; with silence switch.
6. Hand-off-auto switch for solenoid bleed-off valve.
7. Bleed-off valve activated indication.

8. Internal adjustable hysteresis or deadband.
 9. Bleed Valves:
 - a. Cooling Systems: Forged-brass body, globe pattern, general-purpose solenoid with continuous-duty coil, or motorized valve.
 - b. Steam Boilers: Motorized ball valve, steel body, and TFE seats and seals.
- F. Biocide Feeder Timer:
1. Microprocessor-based controller with digital display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
 2. 24-hour timer with 14-day skip feature to permit activation any hour of day.
 3. Precision, solid-state, bleed-off lockout timer and clock-controlled biocide pump timer. Pre-bleed and bleed lockout timers.
 4. Solid-state alternator to enable use of two different formulations.
 5. 24-hour display of time of day.
 6. 14-day display of day of week.
 7. Battery backup so clock is not disturbed by power outages.
 8. Hand-off-auto switches for biocide pumps.
 9. Biocide A and Biocide B pump running indication.
- G. Chemical Solution Tanks:
1. Chemical-resistant reservoirs fabricated from high-density opaque polyethylene with minimum 110 percent containment vessel.
 2. Molded cover with recess for mounting pump.
 3. Capacity: 30-gallon, minimum. Upsized as required by system volume.
- H. Chemical Solution Injection Pumps:
1. Self-priming, positive displacement; rated for intended chemical with minimum 25 percent safety factor for design pressure and temperature.
 2. Adjustable flow rate.
 3. Metal and thermoplastic construction.
 4. Built-in relief valve.
 5. Fully enclosed, continuous-duty, single-phase motor.
 6. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- I. Chemical Solution Tubing: Polyethylene tubing with compression fittings and joints except ASTM A269, Type 304. Stainless steel for steam boiler injection assemblies.
- J. Injection Assembly:
1. Quill: Minimum NPS 1/2" with insertion length sufficient to discharge into at least 25 percent of pipe diameter.
 2. Ball Valve: Three or two-piece, stainless steel; selected to fit quill.

3. Packing Gland: Mechanical seal on quill of sufficient length to allow quill removal during system operation.
4. Assembly Pressure/Temperature Rating: Minimum 600 psig at 200°F.

2.05 SYSTEMS FOR TREATMENT OF CLOSED LOOPS

A. Antifreeze Protection of Closed Loops.

1. Systems requiring an antifreeze solution are to be charged with propylene glycol.
 - a. Condenser or chilled water systems are to be charged with Dow Chemical Dowfrost propylene glycol or equal. The fluid is to be colorless and must be easily capable of being analyzed for concentration and inhibitor level. Solutions up to 80% to be non-flammable. Operating range to be -50F to 250 F.
 - b. Heating water systems requiring treatment are to use Dow Chemical Dowfrost HD propylene glycol with industrial corrosion inhibitors. Fluid to be dyed bright yellow to facilitate leak detection.
2. The water treatment company to provide an auto glycol feed unit for maintenance of charge subsequent to initial fill. The feed unit shall be mounted on a pre-painted steel stand with 50 gallon tank capacity. Unit shall be capable of discharge pressure of above systems design operational pressure. Discharge pump will be fit to unit in a prefabricated method delivering 1.5-3.5 GPM discharge rate.
3. The unit shall come with a pressure sensor, controller and remote alarm output which triggers feed in the event of pressure loss indicating water loss.
4. Manufacturers Advantage Controls, Neptune, JL Wingert. No acceptations.

B. Leak Alarm for Closed Loop:

1. Closed loop systems are to be equipped with a water meter on the makeup water connection. The meter supplied by the water treatment company will have the ability to send dry closure contact signals to the energy management system. Connections are to be coordinated between the mechanical contractor and the control contractor. Alarm outputs will be programmed by the control contractor and mechanical joint work for water leak detection. Manufacturers: SeaMetrics #M Series or equal.

2.06 NON-CHEMICAL TREATMENT FOR COOLING TOWER AND FLUID COOLER SYSTEMS:

- A. Non-chemical device technology shall be considered where the make-up water supply contains less than 25 ppm SiO₂ and Ca levels are less than 25 ppm. The non-chemical system shall include all necessary components to provide a fully functional system to control scale, corrosion, and biological contamination.
- B. Refer to Section 23 25 01 Non-Chemical HVAC Water Treatment for options.

2.07 ANTIFREEZE SYSTEMS FOR TREATMENT OF CLOSED LOOPS IN FREEZING ENVIRONMENTS

A. Antifreeze Protection of Closed Loops.

1. Systems requiring an antifreeze solution are to be charged with propylene glycol.
 - a. Condenser or chilled water systems are to be charged with Dow Chemical Dowfrost propylene glycol or equal. The fluid is to be colorless and must be easily capable of being analyzed for concentration and inhibitor level. Solutions up to 80% to be non-flammable. Operating range to be -50F to 250 F.

- b. Heating water systems requiring treatment are to use Dow Chemical Dowfrost HD propylene glycol with industrial corrosion inhibitors. Fluid to be dyed bright yellow to facilitate leak detection.
 2. The water treatment company to provide an auto glycol feed unit for maintenance of charge subsequent to initial fill. The feed unit shall be mounted on a pre-painted steel stand with 50 gallon tank capacity. Unit shall be capable of discharge pressure of above systems design operational pressure. Discharge pump will be fit to unit in a prefabricated method delivering 1.5-3.5 GPM discharge rate.
 3. The unit shall come with a pressure sensor, controller and remote alarm output which triggers feed in the event of pressure loss indicating water loss.
 4. Manufacturers Advantage Controls, Neptune, JL Wingert, or equal.
 - B. Leak Alarm for Closed Loop:
 1. Closed loop systems are to be equipped with a water meter on the makeup water connection. The meter supplied by the water treatment company will have the ability to send dry closure contact signals to the energy management system. Connections are to be coordinated between the mechanical contractor and the control contractor. Alarm outputs will be programmed by the control contractor and mechanical joint work for water leak detection. Manufacturers: SeaMetrics #M Series or equal.
- 2.08 CHEMICAL TREATMENT FOR OPEN CONDENSING WATER/COOLING TOWER SYSTEM
(NOTE TO EDITOR: DELETE IF USING NON-CHEMICAL WATER TREATMENT SYSTEM)
- A. Subject to compliance with requirements, provide products by US Water Services, Chem Pro Lab, San Joaquin Chemicals, Garratt-Callahan, Chemcoa Nalco, ITOH2 Industrial Treatment of Water, or equal.
 - B. General: Provide a prefabricated automatic control system to monitor and control cooling bleed by conductivity and feed of inhibitor based on impulse water meter signals. If pH and alkalinity of the makeup water source requires adjustment, a pH control system will be supplied.
 - C. Controller: The controller shall include all necessary control features in a single easily removable panel housed in a NEMA 12 enclosure. The system shall include all chemical injection fittings, chemical feed pumps, solution line injector or corporation stops, solenoid bleed assembly of appropriate size and alternating biocide with bleed lock out feature. Controller to be UL approved. Manufacturers: Pulsafeeder, LMI, Lakewood Instruments, Hydro Systems Company, Accepta, Advantage Control or approved equal.
 1. Biocide Program Timers and Pumps: An internal program within the controller shall provide "day, hour and minute trip" to periodically feed biocide. During the feeding of the biocide, the bleed cycle shall be automatically locked out to permit retention of the biocide. A suitable chemical pump constructed of materials resistant to the biocides to be used shall be provided to inject the biocide into the third chemical injection tee. Pump must have sufficient capacity to inject the necessary dosage of biocide for 24 hours operation within a one-hour time span. All oxidizing biocide feed pumps shall be of the peristaltic type. All oxidizing biocide injection feed locations shall be either directly into the cooling tower basin with a bulk-head fitting extending into and below the water line, or into the condenser water header with a corporation stop injection assembly to insure dissemination of material without causing damage to the pipe injection site. If Halogen chemistry is used, an ORP or Chlorine controller shall be supplied with all necessary sensors, pumps, and fittings.

2. Sensor shall be constructed of "O" ring sealed PVC with carbon electrodes. Temperature compensation over 32°F to 140°F shall be automatic to compensate for condenser water temperature changes. Sensor shall be easily removed from the flow cell via pin fasteners to facilitate cleaning.
3. Pressure rating shall be 150 psig. Conductivity calibration range shall cover 0.0 to 3,000 mmhos full scale. Front panel adjustable. Accuracy and repeatability 1%. Deadband 0.5% of full scale.
4. Auto-Off-Manual switch to be provided on front panel.
5. An alarm timer shall be provided to limit the time an inhibitor pump may be activated per bleed cycle when chemical inhibitor is fed proportional to bleed-off. The alarm timer range shall be 5 to 90 minutes and be front panel adjustable. The alarm timer shall:
 6. Disconnect the inhibitor feed pump.
 7. Activate an alarm light.
 8. Have no effect on the bleed cycle solenoid valve.
 9. Automatically reset after the conductivity is satisfied.
10. pH Control: Sensors shall be constructed of or enclosed in "O" ring sealed PVC housings and shall be easily removable from the flow cell for cleaning
 - a. Pressure rating shall be 150 psig.
 - b. The pH sensor shall be of the glass type in order to provide a linear display of pH.
 - c. The reference electrode shall be refillable and feature a visible KCL reservoir to permit easy viewing of the excess KCL level. A ceramic junction shall be used to ensure long electrode life.
 - d. pH calibration shall be front panel adjustable and have a fixed span of 4-9 pH for control and display.
 - 1) Control Accuracy: 0.0 pH units
 - 2) Deadband: 0.05 pH units
 - 3) Drift less than: 0.1 pH/month
 - e. An alarm timer shall be provided to limit the time an acid pump may pump continuously whether activated manually or automatically. The alarm timer range shall be 5 to 90 minutes and be front panel adjustable. In the alarm condition:
 - 1) The acid pump shall be disconnected.
 - 2) Activate the alarm light.
 - 3) Switch 115 VAC to a terminal for an external alarm.
 - 4) Automatically reset after the pH is satisfied or the output switched off.
 - f. "Low pH alarm timer override" shall function if the pH should drop to 6.5 (adjustable) or below within the system. In the alarm condition:
 - 1) The acid pump shall be disconnected.
 - 2) Activate the alarm light.
 - 3) Switch 115 VAC to a terminal for an external alarm.
 - 4) A combination flow switch, flow sight and back check valve shall be provided which will:
 - (a) Disconnect all outputs during a "no flow" condition.

- (b) Be magnetically operated and not utilize "through the pipe wall" levers or paddles that could be subject to fouling or sticking.
 - (c) Operate at 1.5 GPM minimum flow rate.
 - g. Display Lamps: All display lamps shall be solid state LEDs for longest life.
 - h. Display of pH and/or conductivity shall be as follows:
 - 1) Single meter readout of pH.
 - 2) Meter for pH and meter for conductivity.
 - 3) Chart recorder for pH, 60 day capacity, inkless recording type.
 - 4) Dual channel chart recorder for display of pH and conductivity, 60 day capacity, inkless recording type.
- D. Chemical Feed Pumps: Each pump shall be electronically controlled, positive displacement diaphragm type with variable stroke and speed, with the exception of the oxidizing biocide chemical feed pump. The only moving part in the drive mechanism shall be an electromagnet driven by an electronic pulsing circuit. No lubrication shall be required. The pump shall be fully adjustable with a maximum delivery of 24 GPD and a maximum working discharge pressure of 75 psig. For acid service, the pump head and fittings must be of PVC, the check balls ceramic, and the diaphragm and "O" rings of Viton. For non-acid service, the head may be Lucite and diaphragm of hypalon construction. All pumps to operate on 115 VAC. Biocide pump fittings, and head shall be polymoreslene. Diaphragm to be Teflon. A pre-plumbed chemical solution line assembly shall be PVC schedule 80 and be so constructed as to prevent excessive heat buildup due to chemical reaction with circulation water. Manufacturer: Liquid Metronics or equal. The assembly shall include:
 - 1. Acid injection tee.
 - 2. Inhibitor injection tee.
 - 3. 1/4" PVC ballcock valve installed in a tee to facilitate safe chemical pump priming and pressure relief.
 - 4. PVC double union shut-off valve 3/4".
 - 5. External chemical injection assembly with double union ball valve and brass gate valve shut-off.
- E. Solenoid Bleedoff Valve: Shall be pilot operated, cast-iron body with a brass top and rubber diaphragm to provide a slow closing action and have built in provisions for manual flow rate adjustment. Must be completely serviceable without removing it from the system line. Valve to be sized at minimum of one-half the diameter of tower makeup valve. Maximum working pressure 200 psig. Manufacturer: ASCO or equal.
- F. Water Meters: Contact pulse water meter with sealed pulse contact, sized for water makeup line and system requirements.
- G. Chemical Feed Piping: Schedule 80 PVC with solvent welded joints or polyethylene tubing with compression fittings.
- H. Chemical Tracking and Web-Based Monitoring Systems:
 - 1. Web-based monitoring interface and application for remote monitoring, documentation and optional remote control of chemical dosing. Manufacturers: Lakewood Instruments, Advantage Controls, or equal.

2. Used with solid chemicals containing a UV tracer dye. Manufacturers: APTech Group EnduroSolv brand solid chemicals with duroTrace UV additive, or equal.
3. UV probe and chemical analyzer with manual or automatic chemical feed adjustment capability.

I. Filtration

1. In applications where high cycles of concentration are being maintained, 7 to 10 cycles or more, provide a bag type, cartridge-type, or a sand filter system to remove suspended solids.
2. Refer to Section 23 26 13 Water Filtration for Open-Loop Hydronic Systems for requirements.

2.09 WATER TREATMENT EQUIPMENT – BOILERS: LOW- AND MEDIUM-TEMPERATURE BOILERS (< 350° F) OPERATING AT LOW PRESSURE (<15 PSI)

- A. All boilers shall be pre-equipped with surface blowdown line, manually controlled or automatically controlled based on water conductivity or boiler load.
- B. Chemical metering pumps
1. Positive displacement, diaphragm type pumps made of corrosion-resistant materials suitable for chemicals being used.
 2. Pumps shall have an adjustable flow rate, a minimum capacity of 1 gallon per hour (gph) and a minimum discharge rate of 1.5x line pressure at point of connection.
 3. Continuous duty totally enclosed drive. Solid-state electronic pulser fully encapsulated with quick-connect terminals. All electronics housed in chemical resistant enclosure.
 4. Automatic pressure relief when discharge pressure exceeds pump pressure by not more than 35%.
 5. Manufacturers: Pulsafeeder, LMI, Magnus, Prominent or equal.
- C. Chemical pump timers
1. Automatic reset type timers, activated by water meter, based on boiler feedwater use.
 2. 110/1/60 power connection.
- D. Water meters
1. Contact pulse water meter with sealed pulse contact, sized for feedwater line.
- E. Bleed blowdown solenoid valves
1. Boiler blowdown shall be provided by a motorized ball valve sized for blowdown requirement and specified for temperature and pressure requirement of the system and rated for use in a steam system.
 2. Brass body, actuator normally closed as required.
 3. 110/1/60 power connection.

2.10 WATER TREATMENT EQUIPMENT – BOILERS: STEAM BOILERS AND HIGH-TEMPERATURE BOILERS (< 350° F) AND ALL BOILERS OPERATING AT HIGH PRESSURE (>15 PSI)

- A. Feedwater for steam boilers high-temperature boilers operating at high-pressure (>15 psi) shall be softened. In addition, provide dealkalization and/or reverse osmosis as additional pretreatment.
 - B. All boilers shall be pre-equipped with surface blowdown line, manually controlled automatically controlled based on water conductivity boiler load.
 - C. Solid chemical dissolving units for boilers rated at under 100 HP
 - 1. One to four dissolving units for solid chemicals – sulfite or nitrite, scale inhibitor, caustic and amine- packaged in one-gallon recyclable plastic bottles, rated at 0.75 gpm at 40 psi water pressure. All-in-one solid chemical product is acceptable when recommended by the water treater.
 - 2. Electrical connections: none required.
 - 3. Manufacturers: Hydro systems company solid dissolvers, Advantage Controls SFS Series or approved equal.
 - D. Chemical metering pumps
 - 1. Positive displacement, diaphragm type pumps made of corrosion-resistant materials suitable for chemicals being used.
 - 2. Pumps shall have an adjustable flow rate, a minimum capacity of 1 gallon per hour (gph) and a minimum discharge rate of 1.5x line pressure at point of connection.
 - 3. Continuous duty totally enclosed drive. Solid-state electronic pulser fully encapsulated with quick-connect terminals. All electronics housed in chemical resistant enclosure.
 - 4. Automatic pressure relief when discharge pressure exceeds pump pressure by not more than 35%.
 - 5. Manufacturers: Pulsafeeder, Lmi, Magnus, Prominent or equal.
 - E. Chemical pump timers
 - 1. Automatic reset type timers, activated by water meter, based on boiler makeup water use.
 - 2. 110/1/60 power connection.
 - F. Water meters
 - 1. Contact pulse water meter with sealed pulse contact, sized for feedwater line.
 - G. Bleed blowdown valves rated for steam boilers.
 - 1. Valve for boiler blowdown shall be a motorized ball valve sized for blowdown requirement and specified for temperature and pressure requirement of the system.
 - 2. Brass body, actuator normally closed as required.
 - 3. 110/1/60 power connection.
- 2.11 CHEMICAL TREATMENT TEST EQUIPMENT
- A. Test Kit: Manufacturer-recommended equipment and chemicals in a wall-mounting cabinet for testing pH, TSS, inhibitor, chloride, alkalinity, and hardness; sulfite and testable polymer tests for high-pressure boilers, and oxidizing biocide test for open cooling systems.
- 2.12 CORROSION TEST COUPON RACK

- A. Corrosion Test Coupon Assembly: Constructed of corrosive-resistant material, complete with piping, valves, and mild steel and copper coupons. Locate copper coupon downstream from mild steel coupon in the test-coupon assembly.
 - 1. Two-station rack for closed-loop systems.
 - 2. Four-station rack for open-loop systems.

2.13 STAINLESS-STEEL PIPES AND FITTINGS

- A. Stainless-Steel Tubing: Comply with ASTM A269, Type 316.
- B. Stainless-Steel Fittings: Comply with ASTM A815/A815M, Type 316, Grade WP-S.
- C. Two-Piece, Full-Port, Stainless-Steel Ball Valves: ASTM A351/A351M, Type 316 stainless-steel body; ASTM A276, Type 316 stainless-steel stem and vented ball, carbon-filled TFE seats, threaded body design with adjustable stem packing, threaded ends, and 250-psig (1725-kPa) steam working-pressure rating and 600-psig (4140-kPa) cold working-pressure rating.

PART 3 EXECUTION

3.01 CHEMICAL COMPATIBILITY

- A. The Water Treatment Contractor is responsible for determining the system material content and submitting chemicals compatible with each system's content. In the case of systems equipped with aluminum heat exchangers, non-Borate Nitrite inhibitors must be submitted. For closed chilled water systems in excess of 10,000 gallons, non-Nitrate inhibitors must be submitted if aluminum heat exchangers are in use.

3.02 FLUSHING AND CLEANING

- A. The Water Treatment Contractor shall be responsible for furnishing the cleaning material and supervising the chemical cleaning of the chilled water piping, process cooling water system, condenser water piping, heating piping, and heat recovery loop piping. See 232113 for flushing and cleaning method for HVAC piping.
- B. The system to be cleaned shall be filled with a solution of 10% by weight of a heavy duty alkaline liquid cleaner. The cleaner shall be capable of wetting and penetrating heavy soil deposits of oil or grease, and keeping these products in suspension, for removal through flushing the system to drain. Alkaline cleaners shall not be used for systems with galvanized components to assure no stripping of zinc coating.
- C. The cleaning solution shall be circulated for a minimum of 8 to 24 hours depending on the system water volume. At the end of the circulation period the system shall be flushed to sanitary sewer drain for an additional 8 to 24 hours and then refilled with fresh water, taking care to remove any entrapped air from the system.
- D. At the end of the cleaning period, the system shall be chemically treated as specified. In no case shall the system being cleaned be left in an untreated condition for more than 8 hours.
- E. At the conclusion of the cleaning operation, the Water Treatment Contractor shall certify in writing that the system was cleaned as specified.

3.03 TESTING

- A. Closed Systems:
 - 1. Provide a Nitrite "Drop Test" kit or other inhibitor test kit for determining the level of Nitrite or other approved inhibitor in the closed system.
- B. Open Systems:
 - 1. Provide the following test equipment and test kits:
 - a. One conductivity meter and three ranges covering 0 to 10,000 PPM/TDS and with automatic temperature compensation.
 - b. Provide one reagent-free, fluorescent-reading meter for determining the level of inhibitor being used in the cooling tower water. Provide a Phosphonate/Molybdate test kit with systems treated without the use of fluorescent.
 - c. One "Drop Test" for determining the chlorine level of the water in the cooling tower water.

3.04 COUPON RACKS

- A. Coupon Rack for Closed Systems:
 - 1. Install two coupon holders between the low and high pressure of the circulating pump. The coupon holders shall be isolated with shut off valves for removing and inspecting the coupons. When the system is ready for startup, the Water Treatment Contractor shall install two pre-weighted coupons, one copper, and the other steel in the above coupon holders, noting time and date. At the end of each 180-day period, the coupons shall be removed, noting the time and date, re-weighed, and inspected, with a report being sent to the General Contractor/Mechanical Contractor, for distribution to the Owner's Representative, showing the condition of the system being treated. Coupon racks shall be PVC Schedule 80 composition for all chilled water closed loop systems and black iron composition for a heating water closed loop systems.
- B. Coupon Rack for Open Systems:
 - 1. Install a minimum two station coupon rack, built to ASME specifications and as shown on the drawing, made from 3/4" PVC Schedule 80 pipe. The coupon holders shall consist of nylon screw and nut for holding the coupon, PVC water inlet ball shut off valves, 3/4" PVC pipe, and the coupon rack shall be pre-mounted on a galvanized steel channel support frame. When the system is ready for startup, the Water Treatment Contractor shall install three pre-weighted copper coupons in the above coupon holders, noting time and date. Coupon will be removed at the end of each 90-day period, noting time and date, reweighed, and inspected, with a report being sent to the General Contractor/Mechanical Contractor, for distribution to the Owner's Representative showing the condition of the system being treated.

3.05 INSTALLATION

- A. Coordination where installation of Water Treatment equipment in piping systems is required with the other work (plumbing and heating piping) as necessary to interface components of water treatment equipment. Provide installation instructions to those firms providing installation.
- B. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory mounted. Furnish copy of manufacturer's wiring diagram submittal to Electrical installer.
 - 1. Verify that electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26 sections. Do not proceed with equipment start-up until wiring installation is acceptable to equipment installer.

2. Install pressure gauges, valves, and controls furnished by manufacturer, in accordance with manufacturer's instructions.

C. Closed System Treatment:

1. The Pot Feeder is to be installed between supply and return with shut off ball valves at the level of the Pot. A discharge line is to be plumbed to drain with a shutoff ball valve at the Pot. The pressure connection is to enter the bottom side orifice of the pot feeder. The suction system side will connect to the upper orifice to the pot feeder. The bottom orifice on the pot feeder shall be used for a ball valve connection as drain and piped to a sanitary drain. Observe manufacturer recommendations.
- 2.
3. Add corrosion inhibitor chemicals to each closed system. The type of inhibitor chemicals shall be as recommended by the Water Treatment Contractor for the intended system materials, operating temperatures and application. Non-Nitrate inhibitors must be used for all closed loop systems in excess of 10,000 gallons. No Nitrite borate inhibitor is allowed should aluminum be used in the heat exchanger.

D. Antifreeze Solution Treatment

1. Furnish and install a sufficient quantity of anti-freeze fluid into the piping systems, where required, to provide a 30-50 percent glycol/50 percent water solution by volume. Solution shall offer freeze protection determined by design engineer. Minimum 5 F+.
- 2.
3. Thoroughly clean the piping systems before installing glycol fluid per cleaning protocol listed in closed loop cleaning 23 25 00
- 4.
5. Water used for mixing with glycol on antifreeze treated systems: Water used for mix to have low levels (less than 25 ppm) of chloride and sulfate and have less than 50 ppm total Hardness (Ca++, Mg++). For filling systems that will contain a reservoir of the water/glycol fluid solution, either reverse osmosis treated or distilled water is recommended

E. Coordination of chemical system with service access:

1. In the event a cooling tower mechanical room is located in an area that is inaccessible for delivery of wet chemical drums, the water treatment contractor shall base their bid on a control, feed, and bleed system that uses solid chemical technology for both scale, corrosion control, and bacterial control.

- F. Provide full size shut-off ball valves and piping between tower sump filter and inlet/discharge side of pump. Tower filtration system filters shall be of the multi-media sand filter type for all open systems and closed loop systems in excess of 10,000 gallons. The multi-media sand filters shall be capable of filtering down to a minimum of 0.5 micron and shall automatically perform unit backwashes based on a programmed pressure differential set-point. Filters for closed loop systems less than 10,000 gallons in capacity shall be of the cartridge filter type and shall be capable of filtering down to a minimum of 1 micron. Cyclone or other separator type filtration systems shall not be accepted

3.06 INSPECTION

- A. Examine areas and conditions under which water treatment systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.07 FIELD QUALITY CONTROL

- A. Following start-up sample water at one-week intervals for period of three (3) weeks and provide a test report on the conditions of the water. Subsequent visits shall be at a monthly frequency.

3.08 SYSTEM START-UP

- A. The Water Treatment Supplier shall put the system into operation and adjust as necessary for proper operation.
- B. The Water Treatment Supplier shall provide a written report to the Division 23 Contractor indicating that the start-up has been completed and that all Water Treatment Equipment is operating properly.

3.09 TESTING AND CLEANING

- A. Following start-up sample all treated water systems at one-week intervals for period of three (3) weeks and prepare certified test report for each system being treated. Subsequent visits shall be at a monthly frequency.
- B. Start-up test, and adjust water conditioners in presence of manufacturer's authorized representative. Operate units including regeneration, back washing, rinsing and flushing. Adjust unit to maintain required steady state effluent water quality.
- C. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

3.10 CLOSEOUT PROCEDURES

- A. Provide services of manufacturer's technical representative to instruct Owner's personnel in operation and maintenance of water treatment systems.
 - 1. Schedule training with Owner, provide at least 7-day notice to Contractor and Engineer of training date.
 - a. The water treatment vendor shall provide scheduled owner training on all equipment supplied including but not limited to theory, function, safety, testing equipment and recommended tests and logging protocol.
 - b. The water treatment vendor must have the ability to provide a central online data base that the vendor and owners rep have access to all data from control equipment and water use.
 - 2. Submit certified test reports to Engineer.
 - 3. Provide a water treatment service program for the installation and warranty period.
 - a. The supplier shall provide from qualified service representatives, 12 service visits, complete with reports at the following times:
 - 1) Visit one: Aid on installation, identification of installation points for equipment, and outline of program with contractor as needed
 - 2) Visit two: Inspection and testing of cleaned and drained piping, scheduling tentative date for start-up.
 - 3) Visit three: Start-up of system.

- 4) Visit 4-12: Training of operators, and beginning monthly service visits to total 12 visits over one year of operation. Each call shall include testing all systems, checking chemicals and equipment and completing field test reports. Troubleshooting and training of new operators is always included.
4. Provide sufficient supply of biocide and inhibitor for the cooling tower system during the warranty period.

END OF SECTION

This page intentionally left blank

SECTION 23 31 13

AIR DISTRIBUTION

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this Section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:

1. Ductwork - Rigid, Flexible and Fabric.
2. Diffusers, Grilles, and Registers.
3. Ductwork Specialties.
4. Flexible Connections.
5. Sealants, Adhesives and Tapes.
6. Duct Access Panels and Doors.
7. Backdraft and Relief Dampers.
8. Constant Volume Regulator.
9. Variable Air Volume (VAV) Terminal Units.
10. Combination Fire and Smoke Dampers.
11. Fire Dampers.
12. Smoke Dampers.
13. Control Dampers.
14. Louvers.
15. Flashings.
16. Bird/Insect Screens.
17. Sound Traps.
18. Elevator Shaft Vents.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00 - Basic Materials and Methods.
- B. Section 23 05 93 - Testing, Adjusting and Balancing.
- C. Section 23 07 13 - Duct Insulation.

D. Section 23 09 00 - Building Automation System (BAS) Control.

E. Division 26 - Electrical.

1.04 QUALITY ASSURANCE

A. Codes and Standards: Provide products conforming to the requirements of the following:

1. ARI 885-98: Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminal and Air Outlets.
2. AMCA-210: Laboratory Methods of Testing Fans for Rating Purposes.
3. ANSI S12.23: Designation of Sound Power Emitted by Machinery and Equipment.
4. ASC-A7001: Standard for Duct Sealants.
5. ASHRAE Standard 130: Methods of Testing Air Terminal Units.
6. AHRI Standard 885: Procedures for Estimating Occupied Space Sound Levels in the Application of Air Terminals and Air Outlets.
7. NFPA 90A: Standards for the Installation of Air Conditioning and Ventilating Systems.
8. NFPA 90B: Standard for the Installation of Warm Air Heating and Air-Conditioning Systems.
9. American Society for Testing and Materials (ASTM): Manufacture and test in accordance with the ASTM Standards, including:
 - a. ASTM A167: Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip. Type 304 or 304 stainless steel.
 - b. ASTM A525: Standard Specification for General Requirements for Steel Sheet, Zinc-Coated (Galvanized) Hot-Dip Process. G60 and G90 zinc-coated.
 - c. ASTM A527/A527M: Standard Specification for Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Lock-Forming Quality.
 - d. ASTM C920: Standard Specification for Elastomeric Joint Sealants.
10. Underwriters Laboratory (UL): Manufacture and test in accordance with the UL Standards, including:
 - a. 181: Standard for Factory-Made Air Ducts and Air Connectors.
 - b. 181A: Standard for Closure Systems for Use With Rigid Air Ducts.
 - c. 181B: Standard for Closure Systems for Use With Flexible Air Ducts and Air Connectors.
 - d. 268A: Standard for Smoke Detectors for Duct Application.
 - e. 555: Standard for Fire Dampers.
 - f. 555C: Standard for Ceiling Dampers.
 - g. 555S: Standard for Smoke Dampers.
 - h. 723: Standard for Test for Surface Burning Characteristics of Building Materials.
 - i. 2043: Standard for Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.

B. Provide and construct ductwork systems in conformance with the latest editions of the following documents:

1. SMACNA HVAC Duct Construction Standards-Metal and Flexible.
 2. SMACNA HVAC Air Duct Leakage Test Manual.
 3. SMACNA HVAC Phenolic Duct Construction Standards.
 4. SMACNA - Accepted Industry Practice for Industrial Duct Construction" for duct pressures above +5" w.g. positive pressure or below -5" w.g. negative pressure. Where differences exist between SMACNA and the prevailing building code, the gauge or construction method of the submitted ductwork shall be the more stringent of the two standards.
 5. ASHRAE Systems and Equipment Handbook "Duct Construction" chapter.
 6. ASHRAE Fundamentals Handbook "Duct Design" chapter.
- C. Alternatives: The SMACNA standards and publications referenced in this Section of the specifications establish ductwork construction requirements.
1. Alternatives to these standards and publications may be submitted. Approval will be based on demonstration that such alternatives are equivalent and satisfy the functional requirements described in the referenced standards.
 2. Such demonstration shall include evidence that the alternatives proposed were tested in accordance with SMACNA procedures and with test results certified by an independent testing laboratory.
- D. All ductwork and equipment shall be seismically supported and braced to meet or exceed the minimum requirements of "SMACNA Seismic Restraint Manual-Guidelines for Mechanical Systems" and local building code requirements.
- E. Flame/Smoke Rating: All materials, including sealants and adhesives, exposed within plenum shall be noncombustible or have a flame-spread index of 25 or less, and smoke developed index of 50 or less, as tested by ASTM E84 (NFPA 255) Method or UL 723. All materials installed within a plenum shall meet these requirements or have a safety data sheet available to indicate that materials are non-combustible. In addition, the products, when tested, shall not drip flame particles, and flame shall not be progressive. Provide Underwriters Laboratories, Inc., label or listing; or satisfactory certified test report from an approved testing laboratory to prove the fire hazard ratings for materials proposed for use do not exceed those specified. Discrete plumbing, mechanical, and electrical products that are located in a plenum and have exposed combustible material shall be in accordance with UL 2043.
- 1.05 DEFINITIONS
- A. Class 0: Factory-made air ducts and connectors, compliant with ANSI/UL 181, having a surface burning characteristic of zero. Typically constructed of semi-rigid corrugated aluminum. This does not include sheet metal ductwork constructed per SMACNA Standards.
 - B. Class 1: Factory-made air ducts and connectors, compliant with ANSI/UL 181, having a flame spread index of not over 25 and a smoke developed index of not more than 50. Typically constructed of flexible ductwork, rigid fiberglass ductwork and plastic ductwork. This does not include sheet metal ductwork constructed per SMACNA Standards.
 - C. Flexible Air Duct (Factory-Made): Class 0 or Class 1 air ducts tested in accordance with 15 tests per ANSI/UL 181 and installed in conformance with the conditions of the listing and NFPA 90A/90B. Flexible ducts shall not be installed to serve more than two stories and shall not penetrate a fire-resistance rated assembly or construction. Maximum lengths of flexible ductwork shall not exceed lengths identified in this section or as limited by the AHJ, whichever is shorter.

- D. Flexible Duct Connector (Factory-Made): Class 0 or Class 1 connectors tested in accordance with 12 of 15 tests per ANSI/UL 181 and installed in conformance with the conditions of the listing and NFPA 90A/90B. Connectors include, but are not limited to, short flexible connections between air handlers and ductwork systems, uninsulated transition fittings, specialty shapes for diffuser connections, etc. Connectors shall not penetrate a wall, floor, or ceiling. Maximum lengths of flexible ductwork shall not exceed five foot (5') lengths or as limited by the AHJ, whichever is shorter.

1.06 SUBMITTALS

- A. Prior to construction, submit for approval on all materials and equipment:
1. Ductwork - Rigid, Flexible and Fabric.
 2. Ductwork Specialties.
 3. Flexible Connections.
 4. Sealants, Adhesives and Tapes.
 5. Flashings.
 6. Bird/Insect Screens.
 7. Duct Access Panels and Doors.
 8. Backdraft Dampers.
 9. Control Dampers.
 10. Diffusers, Grilles, and Registers.
 11. Fire/Smoke Dampers - Schedule of selected dampers must include the location, nominal size, free area velocity, and static pressure drop at free area velocity for each damper.
 12. Sound Traps.
 13. VAV Boxes.
 14. SMACNA "HVAC Duct Construction Standards - Metal and Flexible".
- B. Shop Drawings: Provide shop drawings of sheet metal ductwork and plenums as follows:
1. Draw to a scale not less than 1/8" to one foot, with sheet sizes equal to Contract Drawings.
 2. Show duct sizes, where possible use even duct sizes.
 3. Show fitting details.
 4. Show coordination with lighting fixtures, fire dampers, fire/smoke dampers, piping, diffusers, grilles, registers, fans, major electrical runs, cable trays and bus ducts.
- C. Shop Drawings: Provide shop drawings for field erected mechanical equipment:
1. Draw to a scale of 1/2" to one foot, with sheet sizes equal to Contract Drawings.
 2. Show plan, sections, elevations and details of all joints and enclosures.
 3. Detail access doors and hardware.
 4. Detail coil, damper, humidifier, filter and fan installations.
 5. Show access space for electrical components that are part of the equipment provided and/or installed such as power and control panels on humidifiers. This shall be coordinated with Division 26 and NEC.

- D. Certifications: Provide a duct schedule, certified by an officer of the sheet metal fabrication subcontractor, that the ductwork conforms to SMACNA standards, and for each sheet metal system furnished on the project include:
1. System name.
 2. Duct material.
 3. Duct gauge.
 4. SMACNA rectangular reinforcement number.
 5. SMACNA intermediate reinforcement number.
 6. SMACNA transverse reinforcement number.
 7. Rod diameter and type.
 8. Sealant type.
 9. Attachment method.
 10. Duct system design pressure.
- E. Construction IAQ Management Plan: Collaborate with the general contractor to submit and implement an IAQ Management Plan for the construction process meeting the requirements of the SMACNA IAQ Guidelines. This plan should address the protection of the ventilation system components during construction and cleanup of contaminated components after construction is complete. SMACNA IAQ Guideline recommends control measures in five areas. The IAQ Management Plan should address how compliance has been achieved in these required five areas as follows:
1. HVAC Protection
 - a. Shutdown of return side of existing HVAC system in areas affected by heavy construction.
 - b. Provision of temporary filters if existing or new systems must remain operational during construction.
 - c. Close supply, return and exhaust dampers and seal duct openings in areas subject to construction dust.
 2. Source Control
 - a. How will reduction of contaminants be reduced at the source?
 - b. What steps will be taken to employ low emitting products and sealants.
 - c. How will air handling equipment be cycled off when not needed?
 3. Pathway Interruption
 - a. Describe how the construction space will be ventilated as required to dilute contaminants.
 - b. Describe how occupied spaces adjacent to construction areas will be kept at positive pressure relative to spaces under construction.
 4. Housekeeping: Describe how the following housekeeping objectives will be implemented:
 - a. Reduction of dust generated by work will be suppressed.
 - b. Maintaining a frequent cleaning frequency for dust and particulates.
 - c. Remove spills or excess applications of solvent-containing products as soon as possible.

- d. Remove accumulated water and keep work areas as dry as possible.
 - e. Protect insulation materials from exposure to moisture.
5. Scheduling: Describe how overlap of construction activity and ongoing building occupancy activities will be minimized.
- F. Field Manual: Submit one copy of the SMACNA "HVAC Duct Construction Standards - Metal and Flexible". Maintain a second copy on the project site.
- G. Any ductwork installed without prior approval by the specifier, shall be replaced at the expense of the contractor.
- H. The contractor must comply with the enclosed specification in its entirety. If on inspections, the specifier finds changes have been made without prior approval, the contractor will make the applicable changes to comply with this specification, at the contractor's expense.
- I. At the discretion of the specifier, sheet metal gauges and reinforcing may be checked at various times to verify all duct construction is compliant.
- 1.07 DELIVERY, STORAGE, AND HANDLING
- A. Deliver products to the site in containers with manufacturer's stamp or label affixed.
 - B. Store and protect products against dirt, water, chemical, and mechanical damage. Do not install damaged components. Remove damaged products from project site.
- 1.08 WARRANTY
- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
 - B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 DUCTWORK

- A. Construct all ducts and plenum of gauges, and with joints, bracing, reinforcing, and other construction details in accordance with the latest construction standards previously listed. Metals shall be manufactured by United States Steel, Nucor or equal.
- B. Duct dimensions indicated on drawings are net, inside, clear dimensions. For internally lined ducts, add lining thickness to determine metal duct dimensions.
- C. Ducts shall be constructed of material gauges and reinforcement Class per SMACNA pressurization classifications to meet 150% of the pressure requirements for external static pressure scheduled on drawings for the fans serving each system. Where differences exist between SMACNA and the prevailing building code, the gauge or construction method of the submitted ductwork shall be the more stringent of the code or standard. Refer to Part III - Execution for matrix of pressure and leakage requirements.
- D. Ductwork gauge shall not be thinner than 26-gauge for all work.

2.02 SHEET METAL MATERIALS

- A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
- B. Galvanized Sheet Steel: Comply with ASTM A653/A653M.
 - 1. Galvanized Coating Designation: G60 (Z180) for ductwork inside the building envelope in non-corrosive environments. G90 (Z275) for ductwork installed external to the building and may be installed inside the building as an alternate to G60.
- C. Carbon-Steel Sheets: Comply with ASTM A1008/A1008M, with oiled, matte finish for exposed ducts.
- D. Stainless-Steel Sheets: Comply with ASTM A480/A480M, Type 304 or 316, as indicated in the "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B, No. 2D, No. 3, or No. 4 as indicated in the "Duct Schedule" Article.
- E. Aluminum Sheets: Comply with ASTM B209 (ASTM B209M) Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.
- F. Reinforcement Shapes and Plates: ASTM A36/A36M, steel plates, shapes, and bars; black and galvanized. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.
- G. Tie Rods: Galvanized steel, 1/4-inch (6-mm) minimum diameter for lengths 36 inches (900 mm) or less; 3/8-inch (10-mm) minimum diameter for lengths longer than 36 inches (900 mm).

2.03 DUCTWORK FABRICATION

- A. Rectangular Ducts
 - 1. Longitudinal Seams:
 - a. Grooved seam flat/pipe lock (L-3), standing seam (L-4), single corner seam (L-5) or butt/corner weld for +/- 10 in. w.g. service. Snaplock and button-lock (L-1 and L-2) type joints are only allowed when ductwork is installed inside the conditioned space and when duct static pressures are less than 2" w.c. (500Pa). Lateral Joints:
 - b. Slip drive joints, standard seams, flanges or welding as required by SMACNA HVAC Duct Construction Standards for system static pressure and sealed airtight. Flanged and gasketed joint fittings, such as Ductmate 25/35/45, Carlisle, MEZ Industries, or equal, are acceptable joint methods, but must be sealed as described previously. Transverse duct joints shall be constructed per Figure 1-4 for types T-8 through T-25. T-1 and T-5 slip joints are NOT allowed for transverse duct joints. T-5 slip joints may be used at connections to fire and smoke dampers as breakaway connections. Joint T-2, T-3, T-6 and T-7 reinforced slip joints are allowed below 2" static pressures.
 - c. Exposed Ductwork: All sealant or gaskets applied internally within joint.
 - d. Concealed Ductwork: Same as exposed ductwork, or sealant may be applied to the exterior side of joints.
 - e. Welded where required for leakproof and airtight operation and per code.

B. Round Ducts**1. Longitudinal Seams:**

- a. Spiral seam (RL-1), butt weld (RL-4), or grooved seam flat/pipe lock (RL-5) for +/- 10 in. w.g. service.

2. Lateral Joints:

- a. Exposed Ductwork: Beaded sleeve joint (RT-1), crimp joint bead (RT-5), or flange type joint. All joints secured with sheet metal screws. All sealant applied internally within joint.
- b. Concealed Ductwork: Same as exposed ductwork, or sealant may be applied to the exterior side of joints.
- c. Welded where required for leakproof and airtight operation.

C. Elbows

1. Construct long radius elbows with centerline not less than 1.5 times the duct width. Shorter radius elbows may be used where required to fit in restricted spaces, or as shown. For rectangular ductwork provide single thickness turning vanes on all short rectangular elbows less than 25" wide or provide double thickness turning vanes for short rectangular elbows 25" wide and greater. Number of vanes per SMACNA. Elbows with square throat and radius heel are NOT allowed.

D. Transitions

1. Construct transitions to not exceed the slopes identified per SMACNA HVAC Duct Construction Standards-Metal and Flexible. Slopes shall generally be no greater than 15%, and no greater than 30% where shown on the drawings.

E. Branch Connections

1. Provide 45° entry boots or radius taps for rectangular duct take-offs. Provide conical, bellmouth or 45° lo-loss boot taps for round duct take-offs. Straight 90° taps and spin-in taps are not allowed, except where round take-off duct size equals height of branch duct size. Provide volume dampers at each duct take-off for balancing. Provide insulation guards at transitions to lined ductwork.

F. Manufactured Joints

1. 316 stainless steel adjustable clamps with gaskets for connecting welded laterals, branches, and Y fittings. Manufacturer: CECO Environmental #KB Duct or equal.

2.04 RECTANGULAR DUCTWORK

- A. Construct rectangular ductwork to meet all functional criteria defined in of the SMACNA HVAC Duct Construction Standards-Metal and Flexible. All ductwork must comply with all local, code requirements. Ductwork shall be constructed of galvanized steel. Diagonally cross break all panels on ducts 30 inches wide and larger, or bead using automatic bead machine with beads at 12 inches on center or less. All connections shall utilize 45° boot take-offs. Bullhead tees and straight taps are not permitted.

1. Listed manufactured ductwork system are allowed where they are installed per the manufacturer's installation instructions and meet or exceed the requirements of the design requirements.

2.05 ROUND AND OVAL DUCTWORK

- A. Round and oval ductwork shall be constructed to SMACNA round ductwork requirements of galvanized sheet steel. Comply with SMACNA HVAC Duct Construction Standards-Metal and Flexible, based on indicated static-pressure class unless otherwise indicated. Longitudinal seams shall be spiral lock seams or continuous welded. Flat oval may be utilized in space-restricted areas. All elbows shall be long radius type with centerline radius to duct diameter of 1.5, exceptions will only be allowed at restricted space locations.
- B. Round or oval duct and fitting manufacturers:
1. McGill Airflow Corporation.
 2. Lindab.
 3. Semco.
 4. Sheet Metal Connectors.
 5. Spiral Manufacturing.
 6. Nordfab.
 7. Spiral Fittings.
 8. Or equal.
- C. Flat-Oval Ducts:
1. Indicated dimensions are the duct width (major dimension) and diameter of the round sides connecting the flat portions of the duct (minor dimension).
- D. Transverse Joints:
1. Fabricate according to SMACNA HVAC Duct Construction Standards-Metal and Flexible, for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions. All transverse joints, including mechanical flange type fittings, to be externally sealed at all joints.
 2. Exception: internal manufactured single or dual EPDM rubber gasket fittings do not require external sealant.
 3. Transverse joints in ducts larger than 50" diameter require flanged joints.
 4. Lap or snap lock seams are not permitted for round ductwork of any size.
- E. Longitudinal Seams:
1. Select seam types and fabricate according to SMACNA HVAC Duct Construction Standards-Metal and Flexible, Figure 3-2, "Round Duct Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA HVAC Duct Construction Standards-Metal and Flexible. All longitudinal joints shall be sealed airtight with sealant or continuous welding.
 2. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
 3. Fabricate flat-oval ducts larger than 72 inches in width (major dimension) with butt-welded longitudinal seams.
- F. Tees and Laterals:

1. Select types and fabricate compliant with SMACNA HVAC Duct Construction Standards-Metal and Flexible, Figure 3-5, "45 Degree Tees and Laterals", and Figure 3-6, "Conical Tees" and "45 Degree Boot Tees" for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions.
2. Spin-in type or other types of butt tees, bullhead tees or straight taps are not permitted.

G. Elbows:

1. Any deviation from a straight run shall be made using a gored or welded elbows or stamped elbows. Normal 90-degree elbows may include 5-gore fittings and the radius of the elbow is 1.5 times the diameter of the fabric duct. All gores shall be continuous metal or use fully welded joints/seams. Die stamped sheet metal elbows shall be fully welded on the heel and throat by an automated welder. Flexible duct elbows or adjustable gore type elbows are not allowed.
2. Construct long radius elbows with centerline not less than 1.5 times the duct width. Shorter radius elbows may be used where required to fit in restricted spaces with prior approval or where shown on the drawings.

2.06 DIFFUSERS, GRILLES AND REGISTERS

- A. All diffusers, grilles, and registers shall be selected to provide proper air distribution for the intended occupant application. All supply air devices shall be selected to provide a maximum air velocity of 50 fpm at three feet above the floor, unless otherwise noted. Manufacturer's representative shall carefully review Architectural and Mechanical drawings and ensure diffuser/grille/register selections will provide proper air distribution per the acoustical basis of design. Manufacturer at no additional expense to the Owner shall replace diffusers, grilles, and registers not providing proper distribution or excessive noise at scheduled airflow.
- B. All frames shall be selected to fit the ceiling type. Verify with Architectural Drawing. Each diffuser, grille and register shall be individually capable of balancing via duct mounted balancing dampers or attached opposed blade dampers. Provide unit opposed blade damper where individual duct mounted balancing dampers are not provided.
- C. Refer to schedule on drawings for sizes, capacities and patterns.
- D. Manufacturers: Titus, Krueger, Price, Nailor, or equal.

2.07 DUCTWORK SEALANT

- A. Duct tape, pressure sensitive type, is not allowed.
- B. Solvent-based and oil-based sealants are not allowed indoors.
- C. Seal all transverse joints, including mechanical joint flanges, similar to Ductmate, on all supply, return, exhaust, and outside air intake ducts.
- D. All sealant systems for outdoor application to be suitable for use in exposure to water, sunlight, temperatures extremes associated with project location.
- E. All sealant systems for indoor application to be meet VOC limits as specified in South Coast Air Quality Management District (SCAQMD) Rule #1168 limiting VOC's to 80 grams/liter for duct liner adhesives and 250 grams/liter for duct sealants.
- F. Indoor Application Water-Based Joint and Seam Sealant:

1. Flexible, adhesive sealant, suitable for high velocity and high pressure applications, UL 181B-M listed, UL 723 classified, and complying with NFPA requirements for Class 1 ducts.
 - a. Sealant shall be water based latex UL 181 B-M non-reinforced sealant.
 - b. Sealant shall meet flame spread rating of 0 and smoke developed rating of 0.
 - c. Flexibility on 1/4" mandrel.
 - d. Freeze/thaw stability - 5 cycles.
 - e. Service temperature: -20°F to +200°F (-29°F to +93°C).
 - f. ASTM 5590; Resistance to mold, mildew and water.
 - g. Meet all SMACNA seal classes.
 - h. Meet all SMACNA pressure classes (+/-): 1/2, 1, 2, 3, 4, 6, and 10" water gauge.
 2. Manufacturer: Carlisle (Hardcast) #Iron Grip 601 or #Flex-Grip 550 or #Spray-Seal, Ductmate #PROseal, Design Polymerics #DP1010 or #DP1020 or #DP 1010 Spray, or equal.
- G. Indoor Application Water-Based Joint and Seam Sealant with Extended Material Warranty:
1. Flexible, adhesive sealant, suitable for high velocity and high pressure applications, UL 181B-M listed, UL 723 classified, and complying with NFPA requirements for Class 1 ducts.
 - a. Sealant shall be water based latex UL 181 B-M non-reinforced sealant.
 - b. Sealant shall meet flame spread rating of 0 and smoke developed rating of 0.
 - c. Flexibility on 1/4" mandrel.
 - d. Freeze/thaw stability - 5 cycles.
 - e. Service temperature: -20°F to +200°F (-29°F to +93°C).
 - f. ASTM 5590; Resistance to mold, mildew and water.
 - g. Meet all SMACNA seal classes.
 - h. Meet all SMACNA pressure classes (+/-): 1/2, 1, 2, 3, 4, 6, and 10" water gauge.
 - i. Manufacturer: Carlisle (Hardcast) #Iron Grip 601 or #Flex-Grip 550 or #Spray-Seal and #Aluma-Grip AFT-701 rolled sealant, or equal.
 2. And, all transverse joints, longitudinal seams, and duct wall penetrations shall be sealed by a 30-mil rolled sealant. Rolled sealant shall be comprised of a 2-mil foil faced with 28 mils of butyl adhesive/sealant conforming to the product specifications. Rolled sealant shall have the following physical properties:
 - a. Peel Strength: 16 lbs. per linear inch.
 - b. Tensile strength: 955 psi
 - c. Elongation: 560%
 - d. Bonding time: Instant with full bond in 24 hours.
 - e. Resistance to mold, mildew and water.
 - f. Weather Resistance per ASTM G-53 @ 2000 hours QUV.
 - g. Service temperature: -20°F to +200°F (-29°F to +93°C).

- h. Surface burning characteristics: Flame spread/smoke developed rating of 20/40, tested in accordance with UL 723.
 - i. VOC: 0 g/l
 - j. Meet all SMACNA seal classes.
 - k. Meet all SMACNA pressure classes (+/-): 1/2, 1, 2, 3, 4, and 6" water gauge.
 - l. Manufacturer: Carlisle (Hardcast) #Aluma-Grip AFT-701 rolled sealant, or equal.
- H. Outdoor Application Two-Part Tape Sealing System:
- 1. Woven-fiber tape impregnated with gypsum mineral compound and modified acrylic/silicone activator to react exothermally with tape to form hard, durable airtight seal.
 - 2. Manufacturer: Carlisle (Hardcast) #Two Part II, McGill Uni-Cast, or equal.
- I. Outdoor Application Low VOC Solvent Based Joint and Seam Sealant:
- 1. Flexible, adhesive sealant, suitable for outdoor application on joints and seams.
 - a. Sealant shall be solvent based synthetic elastomeric. Water and UV resistant. Crack and peel resistant.
 - b. Compliant with ASMT E84 and UL 723. Sealant shall meet flame spread rating of 0 and smoke developed rating of 0 after cured.
 - c. Freeze/thaw stability - 5 cycles.
 - d. Service temperature: -20°F to +190°F (-29°F to +88°C).
 - e. VOC: 44 g/l.
 - f. ASTM 5590 compliant for resistance to mold, mildew and water.
 - g. Meet all SMACNA seal classes.
 - h. Meet all SMACNA pressure classes (+/-): 1/2, 1, 2, 3, 4, 6, and 10" water gauge.
 - 2. Manufacturer: Design Polymerics #DP1090 or equal.
- J. Rolled (Tape) Mastic Sealant for indoor and outdoor application on flat sheet metal duct joints. Aluminum substrate with modified butyl sealant. Compliant with UL 181B-FX. Rolled sealant shall have the following physical properties:
- a. Peel Strength: >10 lbs. per linear inch.
 - b. Bonding time: Instant tack with full bond in 24 hours.
 - c. Resistance to mold, mildew and water.
 - d. Weather Resistance per ASTM G-53 @ 2000 hours QUV.
 - e. Service temperature: -20°F to +180°F (-29°F to +82°C).
 - f. Surface burning characteristics: Flame spread/smoke developed rating of 5/25, tested in accordance with UL 723.
 - g. VOC: 0 g/l.
 - h. Meet all SMACNA seal classes.
 - i. Meet all SMACNA pressure classes (+/-): 1/2, 1, 2, 3, 4, 6" and 10" water gauge.
 - j. Roll width as required to maintain minimum 3/4" adhesion width on each side of joint.
 - k. City of Los Angeles RR#8069 approved.

- I. Manufacturer: Carlisle (Hardcast) #Foil-Grip 1404-181BFX rolled sealant, or equal.
- K. Manufacturers of duct sealant systems for various ductwork applications: Design Polymeric, Tremco, Dure Dyne, Carlisle Hardcast, Ductmate, Mon-Eco Industries, Sikaflex, and McGill AirSeal LLC.

2.08 FLEXIBLE DUCTWORK

- A. Flexible one-inch thick (minimum) insulated round ductwork, Class 0 or Class 1, may be utilized for final connections to each air outlet and inlet, unless shown otherwise on the plans. Duct shall have a minimum R-4.2 for ductwork enclosed in conditioned spaces and R-8.0 for ductwork installed in unconditioned spaces. Maximum length of flexible ductwork in each low pressure branch shall not exceed five (5') feet and maximum flexible connector lengths shall not exceed five (5') feet.
- B. All connections shall utilize welded conical tees, aluminum conical fitting, or manufacturer high efficiency branch take-offs. Spin-in type or other types of butt tees, bullhead tees or straight taps ARE NOT permitted. Manufacturers: Flexmaster #CBD, or 45° boot take-offs by Flexmaster #STO, or equal.
- C. Dampers regulators shall include end bearings as manufactured by DuraDyne, Ventlok or equal.
- D. Flexible ductwork for low pressure systems with positive static pressure up to 2" w.g. positive pressure and negative pressured up to 1/2" w.g. suitable for both terminal unit connection and diffuser/grilles. Flexible ductwork fittings may be used at seismic expansion joints and to accommodate vertical drift between building levels. Fabrication shall include a multiple laminate of aluminized polyester/mylar, fiberglass insulation, and polyester, mechanically locked to galvanized steel helix without adhesives, exterior fiberglass insulation and fire retardant polyester/mylar outer jacket. Manufacturers: Casco #L-181M, Flexmaster #Type 5B, Thermaflex #M-KC or EverClean, or equal.
- E. Flexible Duct Clamps: Stainless steel band with cadmium-plated hex screw to tighten band with a worm-gear action in sizes up to 18 inches to match duct size.

2.09 PRE-INSULATED PHENOLIC FOAM DUCT SYSTEM FOR INDOOR CONDITIONED LOCATIONS

- A. General
 - 1. Ductwork System materials, including the panel, adhesive, tape, sealant, flanges and gasket to be certified by Underwriters' Laboratory standard as a Class 1 air duct (UL 181)
 - 2. The preinsulated panels shall be manufactured of CFC-free phenolic foam thermo-bonded on both sides to a factory applied aluminum foil facing. The standard panel is to be no less than 1.15" (30mm) in thickness with minimum R-6 insulating value. Increase thickness as necessary to meet requirements of local energy code.
 - 3. All fabricated duct segments and fittings shall be designed to meet or exceed the minimum requirements of the "SMACNA HVAC Phenolic Duct Construction Standards" latest edition.
 - 4. Duct sizes are limited to maximum 80" x 80" operating up to 4" w.g. positive or 3" w.g. negative pressure class.
- B. System

1. The panels used in the fabrication of the ductwork system shall Pal Phenolic Duct rigid phenolic insulation panels with a thermal conductivity of 0.1977 BTU-in/hr•ft² °F and a minimum compressive strength of 29 psi, as manufactured by Pal International.
2. Pal Phenolic Duct rigid phenolic insulation panels shall comprise a 3.4–3.75 pcf nominal density CFC/HCFC–free rigid Phenolic insulation core with zero Ozone Depletion Potential (ODP), autohesively bonded on both sides with 60-micron aluminum internal liner and a 200-micron aluminum external liner. Both liners are to be solid aluminum with no perforations.
3. All other components required for the fabrication of the system shall be from the Pal Phenolic Duct System guidelines including the sealant, contact adhesive, aluminum tape, self–adhesive gasket, ductwork reinforcements, closures, connectors and flanges.

C. Fire and Smoke Performance

1. The rigid phenolic insulation panels shall achieve the following fire and smoke performance requirements:
 - a. ASTM E 84–low contribution to fire growth not exceeding 25 Flame Spread and 50 Smoke Developed indices.
 - b. UL 723 –low contribution to fire growth not exceeding 25 Flame Spread and 50 Smoke Developed indices.
 - c. UL 181 – UL/ULC classification as a Class 1 Air Duct to NFPA Standards 90A & 90B.

D. Sealant Material

1. All internal seams must be fully sealed with an unbroken layer of Pal Phenolic sealant.
2. Each ductwork section must be duly connected with an inter-locking, double sealed jointing system. Sufficient sealant should be applied to each layer in order to seal the rigid phenolic insulation panels and ensure minimum air leakage.
3. Ductwork reinforcement, if necessary, shall be applied to protect against side deformation from both positive and negative pressure.
4. All external seams where two separate panels join must be tiger clipped, taped and jacketed in watershed fashion whenever possible to achieve a permanent bond with a smooth appearance.

E. Manufacturers: AQC Industries #PalDuct, KoolDuct or equal.

2.10 PRE-INSULATED DUCT SYSTEM FOR OUTDOOR AND UNCONDITIONED LOCATIONS

A. General

1. Pre-manufactured exterior ductwork to be a double layered duct system using the Pal Phenolic duct panels pre-fabricated and assembled into inter-locking sections. This as an alternate method to contractor fabricated double wall sheet metal ductwork with internal insulation.
2. All fabricated duct segments and fittings shall be designed in accordance with “SMACNA HVAC Phenolic Duct Construction Standards” latest edition.
3. Duct sizes are limited to maximum 80” x 80” operating up to 4” w.g. positive or 3” w.g. negative pressure class.

B. System

1. The panels used in the fabrication of the ductwork system shall Pal Phenolic Duct rigid phenolic insulation panels with a thermal conductivity of 0.1977 BTU-in/hr•ft² °F and a minimum compressive strength of 29 psi, as manufactured by Pal International.
2. Assembled panels shall be a minimum of 2" thick and minimum R-10 insulating value.
3. Pal Phenolic Duct rigid phenolic insulation panels shall comprise a 3.4–3.75 pcf nominal density CFC/HCFC–free rigid Phenolic insulation core with zero Ozone Depletion Potential (ODP), autohesively bonded on both sides with 60-micron aluminum internal liner and a 200-micron aluminum external liner. Both liners are to be solid aluminum with no perforations.
4. All other components required for the fabrication of the system shall be from the Pal Phenolic Duct System guidelines including the sealant, contact adhesive, aluminum tape, self–adhesive gasket, ductwork reinforcements, closures, connectors and flanges.
5. Exterior weatherproof cladding shall be a 5 ply, zero permeability vapor barrier, puncture resistant, tear resistant, flexible, and meet UL-1709.

C. Fire and Smoke Performance

1. The rigid phenolic insulation panels shall achieve the following fire and smoke performance requirements:
 - a. ASTM E 84–low contribution to fire growth not exceeding 25 Flame Spread and 50 Smoke Developed indices.
 - b. UL 723 –low contribution to fire growth not exceeding 25 Flame Spread and 50 Smoke Developed indices.
 - c. UL 181 – UL/ULC classification as a Class 1 Air Duct to NFPA Standards 90A & 90B.

D. Sealant Material

1. All internal seams must be fully sealed with an unbroken layer of Pal Phenolic sealant.
2. Each ductwork section must be duly connected with an inter-locking, double sealed jointing system. Sufficient sealant should be applied to each layer in order to seal the rigid phenolic insulation panels and ensure minimum air leakage.
3. Ductwork reinforcement, if necessary, shall be applied to protect against side deformation from both positive and negative pressure.
4. All external seams where two separate panels join must be tiger clipped, taped and jacketed in watershed fashion whenever possible to achieve a permanent bond with weather protection and a smooth appearance.

E. Manufacturers: AQC Industries #QDuct, KoolDuct or equal.

2.11 PLENUMS AND EQUIPMENT CASINGS

- A. Construct casings and plenums in conformance with SMACNA. Minimum Pressure Class: Unless otherwise indicated construct plenums and casings to withstand either a negative or positive static pressure of 4" w.g.
- B. Single-Wall: Provide single-wall, casings and plenums where indicated on the drawings.
 1. Construct in accordance with SMACNA Standards.
 2. Use steel-angle-reinforced standing-seam construction.
 3. Locate intermediate bracing angles bolted to the casing 24 inches on centers.

4. Construct for static pressure indicated or for the maximum fan static pressure whichever is less.
5. Bolt to 3" high concrete pads using 1-1/2" x 1-1/2" x 1/4" thick galvanized steel structural sections.

C. Double-Wall: Provide double-wall insulated ductwork where indicated on the drawings.

1. Construct in accordance with SMACNA Standards. Provide insulation thicknesses to meet or exceed the minimum required by local energy codes.
2. Provide 2" (minimum) thick prefabricated double wall insulated metal panel assemblies, with 16-gauge aluminum or 18-gauge minimum galvanized steel outer sheets.
3. Provide 22-gauge galvanized steel inner sheets to encapsulate the insulation.
4. Casings shall be fully metal enclosed, insulated with 2" thick (minimum) rigid fiberglass insulation and conforming to NFPA 90A, with maximum flame spread of 25 and maximum smoke developed of 50.
5. Field or factory fabricate to size and configuration indicated on the drawings, using field verified dimensions.
6. Provide coordinated shop drawings.
7. Reinforce spans 10' or greater with structural steel sections to yield maximum deflection 1/4" at minus 10" w.g. or plus 10" w.g. static pressure.
8. Provide openings and doors, all factory framed, and reinforced with 304 stainless steel structural sections.
9. Construct doors of same material as casings, of sizes and locations indicated on the drawings but not smaller than 18" by 54", and conforming to SMACNA.
10. Provide doors, hinges and hardware factory fabricated and mounted.
11. Door swings shall open against air pressure, with door latches operable from either side.
12. Provide door seals with neoprene gaskets, which have an airtight seal.
13. Provide each door with a 10" by 10" wire reinforced double pane window.
14. Bolt base channel to 3" high concrete pads.

2.12 DUCTWORK SPECIALTIES

- A. General: Where specifically called for, materials for use in fabricating ductwork specialties shall be identical to that used to fabricate ductwork. See drawings and Part 3, Execution for schedule.
- B. Flexible Connections (Indoor Applications):
1. Provide flexible connectors at the discharge and inlet of fans, air handlers, rotating mechanical equipment, and where shown on the Drawings for proper vibration isolation.
 2. Neoprene (polychloroprene) impregnated glass cloth with 24-gauge (minimum) galvanized metal frame. Hypalon, teflon or silicone coated fabrics may be acceptable.
 3. Shall be airtight, watertight and fire retardant.
 4. Minimum density of 30 oz. per sq. yard.
 5. Temperature range: -40°F to 200°F
 6. Neoprene-only connectors are not allowed due to non-compliant surface-burning characteristics.

7. Minimum dimensions shall be 3" metal, 3" fabric, 3" metal up to maximum dimensions of 4" metal, 6" fabric, 4" metal as required by application.
 8. Manufacturers: Ventfabrics #Ventglas, Duro Dyne, Q Industries, Kinetics, Ductmate Proflex or Elgen.
- C. Flexible Connections (Outdoor Applications):
1. Provide flexible connectors at the discharge and inlet of fans, air handlers, rotating mechanical equipment, and where shown on the Drawings for proper vibration isolation.
 2. Hypalon (chlorosulfurated polyethylene) impregnated glass cloth with 24-gauge (minimum) galvanized metal frame.
 3. Shall be airtight, watertight and fire retardant. Resistant to sunlight, ozone and weather.
 4. Minimum density of 26 oz. per sq. yard.
 5. Temperature range: -50°F to 275°F
 6. Minimum dimensions shall be 3" metal, 3" fabric, 3" metal up to maximum dimensions of 4" metal, 6" fabric, 4" metal as required by application.
 7. Provide flexible cloth insulating blanket to encase flexible connections to maintain ductwork insulation integrity as follows:
 - 1) Jacket shall be UV and ozone resistant with Velcro attachment.
 - 2) Service Operating Temperature: 0-350°F.
 - 3) Jacket and Liner: silicon or teflon impregnated fiberglass or mineral wool cloth.
 - 4) Insulation: Aerogel, 2" thick (minimum) or R-8 equivalent (minimum), and thicker as required by local energy code.
 - 5) Fastening: 2" Nomex Velcro or 1" straps and stainless steel D-rings.
 - 6) Thread: Kevlar/stainless steel thread.
 - 7) Manufacturers: Thermal Energy Products, Coverflex, Thermaxx, Pacor, Unitherm, Advance Thermal, Fit Tight Covers, or equal.
 8. Manufacturers: Ventfabrics #Ventlon, Duro Dyne, Kinetics, Ductmate Proflex or Elgen.
- D. Volume and Splitter Dampers: Galvanized sheet metal blade and frame with Ventfabrics Inc., Ventlok operating hardware. For accessible dampers, provide #641 self-locking dial regulators and #644 self-locking dial regulators for insulated ductwork, #637 square end bearing, and #635 spring end bearing, as applicable. For inaccessible dampers, provide #666 or #677 concealed locking damper regulator with bearings as above. For static pressures above 3"wg, provide #640 HiVel dial regulator and #609 HiVel end bearing for accessible dampers. Regulators shall extend to and through ceiling with neatly installed hardware at the finished ceiling. For inaccessible dampers requiring adjustment through diffusers use Young Regulator, Bowden cable control system.
- E. Multi-louver Volume Dampers: 16-gauge galvanized steel frame. Opposed, 6" wide, 16-gauge galvanized steel blades. Concealed linkage in frame. Ruskin #CD35/OBD or equal.
- F. Ducts Through Roof: Unsupported duct penetration through a roof, without roof curbs, shall be 16-gauge (minimum), flashed and counterflashed, and provided with storm collars to secure a watertight construction.

- G. Bird/Insect Screens: 19-gauge (0.91 mm) galvanized after weld wire mesh (minimum gauge), 1/2" x 1/2" openings (maximum) set in a galvanized steel frame. Or, 23-gauge (0.57 mm) galvanized after weld wire mesh (maximum gauge), 3/8" x 3/8" openings (minimum) set in a galvanized steel frame. Verify minimum requirements per local code for outdoor air intake and exhaust outlets.
- H. Seismic Duct Connector (Indoors): Provide flexible connector at penetrations between two structural elements where the structural design has designated allowable seismic or settlement movement. Flexible EPDM elastomeric fabric bonded to a 1/4" steel perimeter flange on each end. EPDM shall be rated for maximum temperature of 250°F and 3 psi maximum. Connector shall be rated to meet or exceed structural design requirements with a minimum of 3" for axial compression, 3" axial extension, and 3" lateral deflection. Manufacturers: Mercer Rubber Co #ME-3/MI-9-3, Mason Industries #MD-4/MI-9, Flexicraft, Garlock, Hyspan, or equal.
- I. Hanging Cables with Adjustable Fastener: Wire rope hangers for maximum point loads not exceeding 100 lbs. (45 Kg) for supporting rigid galvanized ductwork not exceeding 18" (450 mm) diameter, and suspended diffusers/grilles/terminal units. Alternate to metal strap options per SMACNA's "HVAC Duct Construction Standards - Metal and Flexible".
1. Wire Rope: High tensile steel wire rope, to ASTM 1023/1023M, class A zinc coating; 7 by 7 or 7 by 19 cross-sectional construction; having a tensile strength of 256,000 psi (1,770 N per sq. mm); lengths, diameters, and wire construction to accommodate design loads and as indicated on Construction Shop Drawings.
 2. Adjustable Fastener: Mild steel (type EN1A), bright zinc plated, one-channel body; encasing a series of Type 302 stainless-steel springs with serrated self-locking grade 40 chrome steel balls, adjustable by means of an integrated mechanism, capable of accommodating load of 100 lbs. (45 kg) (maximum per hanger).
 3. Manufacturers: Gripple #Standard No. 2/3/4/5, Ductmate #Clutcher, or equal.

2.13 ACCESS DOORS

- A. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2 (7-2M), "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct." Access doors shall be insulated hollow core double construction. Access doors in exhaust ducts shall be of same, or heavier, gauge material as duct in which installed.
- B. Casing Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 9-16, "Casing Access Doors." Access doors shall be insulated hollow core double construction of same, or heavier, gauge material as duct in which installed.
- C. Minimum door size shall be 12" by 12" for simple manual access and up to 24" by 24" where personnel must pass through infrequently. Provide 20" x 54" (minimum) door for access to filters and more frequent maintenance.
- D. Maximum door leakage shall not exceed 10 cfm/sq.ft. at maximum operating pressure. Doors larger than four sq.ft. in area shall open against pressure.
- E. Doors:
1. Double wall, rectangular.

2. Galvanized sheet metal with insulation fill and gauge thickness as indicated for duct pressure class. Minimum 1" insulation thickness for doors up to 24" tall and 2" thick insulation for larger door assemblies as required per energy code. Insulation not required in exhaust duct access doors as allowed by local code.
3. Vision panel shall be provided on doors 24" x 60" and larger.
4. Fabricate doors airtight and suitable for duct pressure and air leakage class.
5. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets for doors up to 24" tall. For larger doors provide 1-1/2" by 1/8" flat stock or 14-gauge angle frame.
6. Gaskets: Closed cell neoprene rubber, 1" x 1/4" (minimum).
7. Access Door Manufacturers (Small Dimensions, Low Pressure Rating): CESCO, Pottorff, Ruskin, Vent Products, Air Balance, Ductmate Sandwich, United Enertech, or equal, as required by size and pressure application.

F. Hinges and Latches:

1. Access doors up to 14 by 14 inches (300 x 300 mm) square: Two hinges or continuous piano hinge and one sash lock. Doors shall not be removable.
2. Access doors up to 16 by 24 inches (400 by 600 mm) square: Two hinges or continuous piano hinge and two sash locks (minimum). Doors shall not be removable.
3. Access doors up to 24 by 48 inches (600 by 1200 mm): Three hinges or continuous piano hinge and two compression latches (minimum) with outside and inside handles.
4. Access doors larger than 24 by 48 inches (600 by 1200 mm): Four hinges or continuous piano hinge and two compression latches (minimum) with outside and inside handles.
5. Latch Manufacturer: Ventlok #100 Series hinges and latches on low pressure system doors up to 18" maximum dimension, #200 Series on larger low pressure system doors, #333 Series on high pressure systems with stops, or equal.

2.14 CONTROL DAMPERS

- A. General: Low leakage dampers shall be Class 1A with a maximum leakage rate of 3 cfm/ft² at 1.0 in wg pressure difference when tested to AMCA Standard 500.
- B. Damper Type One: Airfoil Low Leakage Dampers (Galvanized Steel or Aluminum)
1. Application: Commercial supply, return, and general exhaust air systems up to 3,000 fpm velocity. Damper shall be rated for -22°F to 122°F (-30°C to 50°C) minimum operating range.
 2. Frames to be 5" x 1"x 16-gauge galvanized steel hat-shaped channel or 5" x 1" x 0.125 anodized extruded aluminum hat channel with corner reinforcement.
 3. Blades: Airfoil shaped, single piece, 6" wide (maximum), 14-gauge galvanized steel or 6063-T5 anodized aluminum.
 - a. Action:
 - 1) Parallel blade for open and closed control, and economizer dampers.
 - 2) Opposed blade for modulating and air flow measurement control.
 4. Seals: Silicone rubber or EPDM blade and jam seals.
 5. Axles: 7/16" diameter steel (minimum), hex-shaped, mechanically attached to blade.
 6. Bearings: Self-lubricating stainless steel or molded synthetic sleeve.

7. Linkage to be concealed in frame.
8. Crank lever for operator to be provided.
9. Provide with mill finish on blades and frame.
10. Damper position indicator switch(es) as required by control sequence.
11. Manufacturer: Ruskin #CD60 or #CD50, Swartout, NCA PBD/OPD-AF-101, American Warming, Tamco, Air Balance, Greenheck, Pottorff, Nailor or equal.

C. Damper Type Two: Airfoil Low Leakage for Coastal and High Moisture Environments (Aluminum)

1. Application: Commercial supply, return, and general exhaust air systems where damper will be exposed to damp marine air and where velocity is less than 3,000 fpm. Damper shall be rated for -22°F to 122°F (-30°C to 50°C) minimum operating range.
2. Frame to be 5" x 1" x 0.125 anodized extruded aluminum hat channel with silicon side seals and corner reinforcement.
3. Blades: Airfoil shaped, single piece, 6" wide (maximum), 6063-T5 anodized aluminum.
 - a. Action:
 - 1) Parallel blade for open and closed control, and economizer dampers.
 - 2) Opposed blade for modulating and air flow measurement control.
4. Seals: Silicone rubber or EPDM blade and jam seals.
5. Axles: 1/2" diameter steel, hex-shaped, mechanically attached to blade.
6. Bearings: Self-lubricating stainless steel sleeve or molded synthetic sleeve.
7. Linkage to be concealed in frame.
8. Stainless steel hardware.
9. Damper position indicator switch(es) as required by control sequence.
10. Manufacturer: Tamco #SW Series, Ruskin #CD50, Swartout, NCA, Pottorff, American Warming, Air Balance, Greenheck or equal.

D. Damper Type Three: Heavy Duty Fan Discharge Control

1. Application: Velocity over 3,000 fpm as fan outlet damper.
2. Frames to be 8" x 2" x 12-gauge steel channel (minimum).
3. Blades to be 8" wide (maximum), 0.080 thick extruded aluminum airfoil design.
4. Seals: Silicone rubber or EPDM blade and jam seals.
5. Axles: 3/4" diameter steel, hex-shaped, mechanically attached to blade.
6. Bearings: Stainless steel sleeve type pressed into frame.
7. Linkage to be out of airstream with 10-gauge galvanized steel clevis type arms with crank lever operator.
8. Provide with mill finish on blades and frame.
9. Maximum temperature rating to be 300°F.
10. Manufacturer: Ruskin #CD102, Nailor, Swartout, Pottorff, American Warming, Air Balance, Greenheck or equal.

E. Damper Type Four: Low Leakage Airfoil Insulated Dampers

1. Application: Air handler intake and exhaust. Damper shall be rated for -25°F to 180°F (32°C to 83°C) minimum operating range.
2. Frames to be 5" x 1"x 16-gauge galvanized steel hat-shaped channel or 5" x 1" x 0.125 anodized extruded aluminum hat channel with corner reinforcement.
3. Blades: Insulated, single piece, 6" wide (maximum), 14-gauge galvanized steel or 6063-T5 anodized aluminum, R-3.3.
 - a. Action: Parallel blade for open and closed control.
4. Seals: Silicone rubber or EPDM blade and jam seals.
5. Axles: 7/16" diameter steel (minimum), hex-shaped, mechanically attached to blade.
6. Bearings: Self-lubricating stainless steel or molded synthetic sleeve.
7. Linkage to be concealed in frame.
8. Crank lever for operator to be provided.
9. Provide with mill finish on blades and frame.
10. Damper position indicator switch(es) as required by control sequence.
11. Manufacturer: Ruskin #IL35, Greenheck, Pottorff, Tamco, or equal.

F. Damper Type Five: Ultra Low Leakage Airfoil, Double Row Dampers

1. Application: Natural ventilation wall inlets and outlets with parallel (double row) damper blades. Damper shall be rated for -72°F to 275°F (-58°C to 135°C) minimum operating range.
2. Frames to be 8" x 1" steel or aluminum channel thermally broken with insulation within frame channels.
3. Blades: Airfoil shaped, single piece, 4" wide (maximum), 14-gauge galvanized steel or 6063-T5 anodized aluminum.
 - a. Action: Parallel blade for open and closed control.
4. Seals: Silicone rubber or EPDM blade and jam seals.
5. Axles: 7/16" diameter steel (minimum), hex-shaped, mechanically attached to blade.
6. Bearings: Self-lubricating stainless steel or molded synthetic sleeve.
7. Linkage to be concealed in frame
8. Crank lever for operator to be provided.
9. Provide with mill finish on blades and frame.
10. Damper position indicator switch(es) as required by control sequence.
11. Manufacturer: Ruskin #CD40x2, Greenheck, Pottorff, Tamco, or equal.

2.15 BACKDRAFT AND RELIEF DAMPERS

A. Light Duty Counterbalanced Backdraft Damper

1. Applications: Low pressure ductwork systems, including outside air intake and exhaust locations.
2. Frame: Extruded aluminum channel frame with flanges to match ductwork requirements.

3. Blades: Parallel blades, horizontal orientation, 0.025" (0.6 mm) minimum formed aluminum. Maximum 6" wide blades. Extruded vinyl blade seals mechanically attached to blade edge.
 4. Counterbalance: Adjustable steel weights mechanically attached to blade.
 5. Mounting: Vertically or horizontally oriented as shown on the drawings.
 6. Sized for maximum velocity of 1,500 fpm (7.6 m/s).
 7. Maximum back pressure of 2.0" w.g. (1.1 kPa).
 8. Maximum Pressure Drop Fully Open: 0.06" w.g. (15 Pa).
 9. Manufacturer: Ruskin #CBD2, Greenheck #WD Series, or equal.
- B. Heavy Duty Counterbalanced Backdraft Damper
1. Application: Medium pressure air ductwork and generator exhaust.
 2. Frame: Galvanized steel, 16-gauge (1.5 mm) wall thickness minimum with flanges to match ductwork requirements.
 3. Blades: Parallel blades, horizontal orientation, 0.05" (1.2 mm) minimum formed aluminum. Maximum 6" wide blades. Extruded vinyl blade seals mechanically attached to blade edge.
 4. Counterbalance: Adjustable steel weights mechanically attached to blade.
 5. Mounting: Vertically or horizontally oriented as shown on the drawings.
 6. Sized for maximum velocity of 2,500 fpm (12.7 m/s).
 7. Maximum back pressure of 4.5" w.g. (1.1 kPa).
 8. Maximum Pressure Drop Fully Open: 0.20" w.g. (50 Pa).
 9. Manufacturer: Ruskin #BD6, Greenheck #HB Series, Nailor #1380, or equal.
- C. Barometric Relief Damper
1. Applications: Gravity hood exhaust, room pressurization control and stairwell pressurization relief.
 2. Frame: Extruded aluminum channel frame, 0.090" (2.3 mm) wall thickness minimum with flanges to match ductwork requirements.
 3. Blades: Parallel blades, horizontal orientation, 0.063" (1.6 mm) minimum formed aluminum. Maximum 6" wide blades. Extruded vinyl blade seals mechanically attached to blade edge.
 4. Counterbalance: Adjustable on-blade counterweights for tuning of start-to-open and full open blade operation.
 5. Axle: 3/8" (9.5 mm) galvanized steel rod with roller bearings.
 6. Mounting: Vertically or horizontally oriented as shown on the drawings.
 7. Sized for maximum velocity of 1,000 fpm (5.1 m/s).
 8. Maximum back pressure of 2.0" w.g. (0.5 kPa).
 9. Start-Open Pressure: 0.05" w.g. (12.5 Pa).
 10. Manufacturer: Greenheck #BR-30 for vertical mounting, Greenheck #BD-10 for horizontal mounting, or equal.
- D. Round Counterbalanced Backdraft Damper

1. Dampers shall be of the two-blade design with separate axles. Blades shall be retained in closed position with tensioned spring and field adjustable for required opening pressure. Not allowed for installation in dryer exhaust, kitchen exhaust or bypass air applications.
2. Frame: 20-gauge (1.0 mm) minimum galvanized steel.
3. Blade: 0.016" thick (0.40 mm) minimum aluminum.
4. Blade Seals: Vinyl foam.
5. Axle: 3/16" (4.8 mm) minimum steel.
6. Maximum Velocity: 1,000 fpm (7.6 m/s).
7. Maximum Pressure Drop Fully Open: 0.06" w.g. (125 kPA).
8. Manufacturer: Ruskin #BDR2, Greenheck #WDR-53 or equal.

E. Light Duty Non-Counterbalanced Neoprene Backdraft Damper

1. Applications: Low pressure exhaust from small mechanical equipment less than 2,500 cfm.
2. Frame: 16-gauge galvanized steel with flanges to match ductwork requirements.
3. Blades: Neoprene coated fiberglass. Maximum 6" wide blades.
4. Mounting: Vertically or horizontally oriented as shown on the drawings.
5. Sized for maximum velocity of 1,000 fpm (5.1 m/s).
6. Manufacturer: Ruskin #NMW2 or equal.

2.16 LOUVERS

- A. Louvers are generally to be provided under Division 8 or as specified in the equipment schedules on the drawings. Where louvers are not covered on architectural plans and specifications, contractor is to provide louvers with the following minimum specifications:
1. Louvers to be 6" deep, 35° drainable fixed blade design, constructed of galvanized steel or extruded aluminum, or as specified on the plans.
 2. Frames to be constructed of 6" deep channel, aluminum or galvanized steel.
 3. Provide with 1/2" x 1/2" aluminum mesh bird screen mounted on backside of louver.
 4. Finish/color per architect/engineer's review of manufacturers color chart or custom color matching if required.
 5. Manufacturer: Ruskin #ELF6375DX or equal.

2.17 DUCT SMOKE DETECTORS (DSD)

- A. Duct mounted photoelectric smoke detector. One required for each heating or cooling system supplying air in excess of 2,000 cfm, for systems serving more than one occupancy type, and for control of each combination fire/smoke damper when not controlled by Division 26 area wide detection system.
- B. Coordinate with Division 26 work and electrical installer for power to smoke detector. Detector shall be installed in the system in compliance with Chapter 6 of the Mechanical Code and NFPA-72. Provide 24-volt power supply option and/or 24-volt transformer as required to coordinate with Division 26.

- C. Coordinate with control installer to assure that detector shall shut down the air-moving equipment when smoke is detected and close associated damper actuator(s). Sensor shall be selected to operate with air velocity rating from 100 to 4000 fpm. Provide with metal sampling tube. Provide remote test and reset station at ceiling or as otherwise indicated. Duct smoke detector shall be installed in the supply or return in compliance with the applicable mechanical or building code. Coordinate with Section 230900 and 230593 work.
- D. Provide additional duct smoke detectors per requirements of Section 6.4 of NFPA-90A. Provide one duct smoke detector at each story to the connection to a common supply and/or return and prior to any recirculation or fresh air inlet connection in air return systems having a capacity greater than 15,000 cfm and serving more than one story.
- E. Provide additional duct smoke detectors in high rise buildings and I-2 Occupancies per the Section 907.2 of the Building Code with duct smoke detectors in the main return and exhaust air plenums of each air-conditioning system having a capacity greater than 2,000 cfm.
- F. Manufacturer: System Sensor #D2 series or equal.

2.18 FIRE, SMOKE AND COMBINATION FIRE/SMOKE DAMPERS

- A. General:
 - 1. Provide UL labeled 3 hour rated fire dampers at 3-hour and greater penetrations.
 - 2. Provide UL labeled 1-1/2 hour rated fire dampers at less than 3-hour penetrations.
 - 3. All dampers to be certified under the latest UL Standard. Certification based on former non-current standards is unacceptable.
 - 4. All damper installations to conform with NFPA 90A and manufacturer's installation instructions. Details on drawings are shown for reference only.
 - 5. Install in ducts passing through walls, floors, and ceilings as required by code. Refer to Architectural and Mechanical plans for damper locations.
 - 6. Provide fire, smoke and fire/smoke dampers in locations as required by local code and NFPA-90A and 92A.
 - 7. Provide sleeves, slip joints, retaining angles, duct access doors, ceiling access panels, etc., as required to check and service the fire dampers. Slip or break away joints are not allowed to be taped or sealed.
 - 8. Access doors shall be tight fitting hinged with operable cam latches. Removable doors are not allowed. Access shall not require the use of keys, tools or special knowledge. The access point shall permanently labeled with 1" (25 mm) high letters: "FIRE DAMPER", "SMOKE DAMPER", or "FIRE/SMOKE DAMPER".
 - 9. All dampers to be designed for use in dynamic systems.
 - 10. Dampers shall be rated for Leakage Class I. Leakage Class II may be used if damper size is smaller than available Leakage Class I dampers.
 - 11. Dampers shall be certified for use by State and local authorities.
 - 12. Dampers shall be installed straight and true, level in all planes, and square in all dimensions. Dampers shall move freely without undue stress due to twisting, racking, bowing, or other installation error. Do not install actuators in area where moisture can penetrate actuator or where temperature exceeds 120°F.

13. All fire dampers shall be sized to provide equivalent free area through the damper equal to, or greater than, the free area of the connecting ductwork. Upsize fire dampers as required to minimize pressure drops. In no case is the damper pressure drop to exceed 0.20" w.g., but ideally less than 0.10" w.g. for low velocity dampers, as designed for total system static pressure allowance. Refer to submittal requirements in Part One of this section and requirements on the drawings.
- B. Radiation Ceiling Fire Dampers:
1. Bladed ceiling fire damper constructed and tested in conformance with UL-555C (dynamic rating).
 2. Fire damper shall have a fusible link that opens at 165°F (74°C) or 212°F (100°C) for high temperature duct applications. Installation shall be in accordance with damper manufacturer's instructions.
 3. Provide fire blanket where required to obtain listed fire rating.
 4. Manufacturers: Ruskin #CFD Series, Greenheck #CRD Series, or equal by Pottorff, Cesco, Nailor, or Air Balance.
- C. Dynamic Fire Dampers (FD) for use in Dynamic and Static Systems:
1. Curtain fire damper constructed and tested in conformance with UL-555C.
 2. Fire damper shall have a fusible link that opens at 165°F (74°C) or 212°F (100°C) for high temperature duct applications. Fire damper shall be equipped for vertical penetrations with manufacturer supplied sleeve. Installation shall be in accordance with damper manufacturer's instructions.
 3. Curtain damper shall not be located in air stream during system operation, Style B or C. Clear inside opening through fire damper is to match clear inside opening of duct. Fire dampers in lined ducts are to match size of sheet metal duct.
 4. Dynamic Closure Rating Velocity: 2000 fpm (minimum).
 5. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.10" w.g. at full air flow.
 6. Pressure rating: 4" w.g.
 7. Manufacturers: Ruskin #DIBD Series, Greenheck #DFD Series, or equal by Pottorff, Air Balance, Nailor or CESCO.
- D. Combination Fire and Smoke Dampers (FSD):
1. Required Locations:
 - a. Install at ducted penetrations through rated fire barriers, fire walls, rated ceilings, rated corridor ceilings, shaft enclosures, and smoke barriers and partitions as defined on Architectural drawings and Chapter 7 of the Building Code.
 - b. Per NFPA-90A install smoke dampers or combination fire/smoke dampers in systems with a capacity greater than 15,000 cfm to isolate the air handling equipment from the remainder of the system on the building supply and return side. Air handling units located on the floor they serve and only serving that floor are exempt. Air handling units located on the roof and serving only the floor immediately below the roof shall be exempt.
 2. General Requirements:
 - a. Dampers shall be Low Leakage Class 1 in accordance with UL 555S.

- b. Dampers shall be provided as a manufactured UL listed device with electric actuator. Actuator shall be attached to sleeve outside of air stream.
 - c. Temperature Rating: 165°F (74°C) or 212°F (100°C) for high temperature duct applications.
 - d. Mounting: Vertical or horizontal
 - e. Frame: 5" wide by 16-gauge roll formed, galvanized steel hat-channel, minimum.
 - f. Sleeve: Minimum 20-gauge thickness and minimum 16" long.
 - g. Bearings: Stainless steel, permanently lubricated sleeve type.
 - h. Each damper shall be equipped with a controlled 15 second electric heat-actuated release device. This device is to be equipped with a push-button reset. No manual fusible links are permitted. Installation shall be in accordance with damper manufacturer's instructions. Coordinate power and smoke detector connections with electrical installer. Integral smoke detection and actuating devices may be used if listed and approved for such service. Comply with building code requirements. All combination fire and smoke dampers shall automatically reset from closed to open position upon the reapplication of power to actuators, if temperature switch is not tripped.
 - i. Dampers shall be installed straight and true, level in all planes, and square in all dimensions. Dampers shall move freely without undue stress due to twisting, racking, bowing, or other installation error.
 - j. Voltage: Coordinate with Division 26 work and electrical installer for power to damper actuator. Provide 24 VAC, 120 VAC or 230 VAC power option to match power supply provided by Division 26. Prior to purchase and installation coordinate with Division 26 to align power requirements at no additional cost to Owner.
 - k. Electric Actuators: All gear and housing shall be steel. The actuator shall be direct coupled and employ a steel toothed cold-weld clamp for connecting to damper shafts. Aluminum clamps or set-screw attachments are not acceptable. Actuator shall be UL listed and manufactured under ISO 9001 quality control.
 - 1) Actuator shall carry a manufacturer's 5-year warranty.
 - 2) Damper position shall fail closed on loss of power.
 - 3) Actuator shall have microprocessor based motor controller providing electronic cut off at full open so that no noise can be generated while holding open. Holding noise level shall be inaudible. Actuator shall be incapable of burning out if stalled before full rotation is reached.
 - 4) Actuator shall have UL555S Listing by the damper manufacturer and be rated for 20,000 cycles minimum. Actuator shall draw no more than 0.23 amps at 120-volt running, or 0.11 amps holding at 120-volt (27 VA and 10 VA respectively for 24-volt power) for 70 in.lbs. torque.
 - 5) Stall and instantaneous type actuators are not acceptable.
 - 6) Do not install in areas where moisture can penetrate damper or actuator, nor where actuator temperature exceeds 122°F (50°C).
 - 7) Manufacturer: Belimo #FS Series or equal by Siemens, Johnson Controls, or Honeywell.
3. Required Options:

- a. Provide open or closed indicator assembly consisting of a single pole, double throw switch used to indicate damper blade position. Include switch mounting bracket, crank arm, blade bracket and linkage from blade to the switch. Or, provide optional actuator end switches to indicate damper open and damper closed positions. Coordinate with fire alarm system and FireFighter's Smoke Control Panel for remote indication and damper override control.
 - b. Provide a damper mounted testing module to permit test cycling of the damper actuator assembly as required for start-up testing and maintenance.
 - c. Provide integral duct smoke detector and coordinate with Division 26 for area smoke detection and comply with NFPA-90A and NFPA-72. All wiring to be provided by Division 26 installers. In buildings not equipped with an approved fire alarm system the smoke detection activation shall cause a visual signal and audible signal in a normally occupied area and be identified as air duct detector trouble. For exposed wall applications provide matching wall grille to maintain appearance and fire rating.
 - e. Temperature limited override: Provide a two-temperature electronic high temperature limit. A primary sensor at 165°F (or higher temperature as dictated by AHJ or Building Code) can be bypassed by an external electrical signal allowing the damper to reopen and remain open until the temperature reaches the setting of the secondary sensor at 350°F at which point the damper is closed and remains closed. Both sensors are to be equipped with manual resets.
4. Low Velocity Applications (1500 fpm or below):
- a. Maximum Rate Velocity: 1500 fpm.
 - b. Style: 3V grooved blades or airfoil-shaped, single piece, double skin with mechanically fastened silicone edge seals.
 - c. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.10" w.g. at full air flow.
 - d. Pressure rating: 4" w.g.
 - e. Manufacturers: Ruskin #FSD37 or #FSD60 or #FSD60-3, Ruskin #FSDR25 or #FSDR60 round style, Greenheck #FSD-211 or #FSD-231 or #FSD-311 or #FSD-311M, or equal by Pottorff, Nailor, Cesco or Air Balance.
5. High Velocity Applications (Greater than 1500 fpm):
- a. Maximum Rate Velocity: 4000 fpm.
 - b. Style: True airfoil-shaped, extruded aluminum blades with silicone edge seals.
 - c. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.20" w.g. at full air flow.
 - d. Pressure rating: 4" w.g.
 - e. Manufacturers: Ruskin #FSD60 or #FSD60-3, Greenheck #FSD-211 or #FSD-231 or #FSD-311 or #FSD-331, or equal by Pottorff, Nailor, Cesco or Air Balance.
6. Low and Medium Velocity Round Applications (3000 fpm or below):
- a. Maximum Rate Velocity: 3000 fpm.
 - b. Style: Two piece 14-gauge thickness galvanized steel with mechanically fastened silicone edge seals
 - c. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.15" w.g. at full air flow.

- d. Pressure rating: 4" w.g.
 - e. Manufacturers: Ruskin #FSDR25 or #FSDR60, Greenheck #FSDR-511, or equal by Pottorff, Nailor, Cesco or Air Balance.
7. Corridor Ceiling Application:
- a. Maximum Rate Velocity: 1500 fpm.
 - b. Style: 3V grooved blades or airfoil-shaped, single piece, double skin with mechanically fastened silicone edge seals.
 - c. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.10" sp w.g. at full air flow.
 - d. Pressure rating: 4" w.g.
 - e. Manufacturers: Ruskin #FSD60-C, Greenheck #CFSD-211, or equal by Pottorff, Nailor, Cesco or Air Balance.
- E. Smoke Dampers (SD):
1. Required Locations:
- a. Install at rated smoke barriers and partitions as defined on Architectural drawings and Chapter 7 of the Building Code.
 - b. Per NFPA-90A install smoke dampers in systems with a capacity greater than 15,000 cfm to isolate the air handling equipment from the remainder of the system on the building supply and return side. Air handling units located on the floor they serve and only serving that floor are exempt. Air handling units located on the roof and serving only the floor immediately below the roof shall be exempt.
2. General Requirements:
- a. Dampers shall be Low Leakage Class 1 in accordance with UL 555S.
 - b. Dampers shall be provided as a manufactured UL listed device with electric actuator. Actuator shall be attached to sleeve outside of air stream.
 - c. Temperature Rating: 165°F (74°C) or 212°F (100°C) for high temperature duct applications.
 - d. Mounting: Vertical or horizontal
 - e. Frame: 5" wide by 16-gauge roll formed, galvanized steel hat-channel, minimum.
 - f. Sleeve: Minimum 20-gauge thickness and minimum 12" long.
 - g. Bearings: Stainless steel, permanently lubricated sleeve type.
 - h. Smoke damper shall be equipped for vertical wall penetrations with manufacturer supplied sleeve and fail closed on loss of power. Each damper shall be equipped with a controlled 15 second electric heat-actuated release device. This device is to be equipped with a push-button reset. No manual fusible links are permitted. Installation shall be in accordance with damper manufacturer's instructions. Coordinate power and smoke detector connections with electrical installer. Integral smoke detection and actuating devices may be used if listed and approved for such service. Comply with building code requirements. All combination smoke and fire dampers shall automatically reset from closed to open position upon the reapplication of power to actuators, if temperature switch is not tripped.
 - i. Dampers shall be installed straight and true, level in all planes, and square in all dimensions. Dampers shall move freely without undue stress due to twisting, racking, bowing, or other installation error.

- j. Voltage: Coordinate with Division 26 work and electrical installer for power to damper actuator. Provide 24 VAC, 120 VAC or 230 VAC power option to match power supply provided by Division 26. Prior to purchase and installation coordinate with Division 26 to align power requirements at no additional cost to Owner.
- k. Electric Actuators: All gear and housing shall be steel. The actuator shall be direct coupled and employ a steel toothed cold-weld clamp for connecting to damper shafts. Aluminum clamps or set-screw attachments are not acceptable. Actuator shall be UL listed and manufactured under ISO 9001 quality control.
 - 1) Actuator shall carry a manufacturer's 5-year warranty.
 - 2) Actuator shall have microprocessor based motor controller providing electronic cut off at full open so that no noise can be generated while holding open. Holding noise level shall be inaudible. Actuator shall be incapable of burning out if stalled before full rotation is reached.
 - 3) Actuator shall have UL555S Listing by the damper manufacturer and be rated for 20,000 cycles minimum. Actuator shall draw no more than 0.23 amps at 120-volt running, or 0.11 amps holding at 120-volt (27 VA and 10 VA respectively for 24-volt power) for 70 in-lb torque.
 - 4) Stall and instantaneous type actuators are not acceptable.
 - 5) Do not install in areas where moisture can penetrate damper or actuator nor where actuator temperature exceeds 122°F (50°C).
 - 6) Manufacturer: Belimo #FS Series or equal by Siemens, Johnson Controls, or Honeywell.
- 3. Required Options:
 - a. Provide open or closed indicator option assembly consisting of a single pole and a double throw switch used to indicate damper blade position. Output from switch to position indicator light (LED, provided by Division 26) is by automatic temperature control contractor. Include switch mounting bracket, crank arm, blade bracket and linkage from blade to the switch.
 - b. Provide a test module to permit test cycling of the damper/actuator in the field
 - c. Provide integral duct smoke detector or coordinate with Division 26 for area smoke detection. Division 26 to provide all wiring. For exposed wall applications provide matching wall grille to maintain appearance and fire rating.
- 4. Low Velocity Applications (1500 fpm or below):
 - a. Maximum Rate Velocity: 1500 fpm.
 - b. Style: 3V grooved blades or airfoil-shaped, single piece, double skin with mechanically fastened silicone edge seals.
 - c. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.10" sp w.g. at full air flow.
 - d. Pressure rating: 4" w.g.
 - e. Manufacturer: Ruskin #SD-37, Ruskin #SD-60, Greenheck #SMD-201, Pottorff #SD-141, Pottorff #SD-151, or equal by Nailor, Cesco or Air Balance.
- 5. High Velocity Applications (Greater than 1500 fpm):
 - a. Maximum Rate Velocity: 4000 fpm.
 - b. Style: True airfoil-shaped, extruded aluminum blades with silicone edge seals.

- c. Allowable Pressure Drop: size damper as shown on drawings and as required to not exceed maximum allowable pressure drop of 0.20" sp wg at full air flow.
- d. Pressure rating: 4" wg.
- e. Manufacturer: Ruskin #SD-50, Greenheck #SMD-401, or equal by Pottorff, Nailor, Cesco or Air Balance.

2.19 VARIABLE AIR VOLUME TERMINAL UNITS

- A. Furnish and install variable volume zone boxes of the sizes and capacities shown on the Drawings.
- B. The control assemblies shall be pressure independent and shall be able to be reset to any airflow between zero and maximum scheduled CFM. The valves shall be normally open. The differential static pressure of the basic assembly shall not exceed 0.25" w.g. for all sizes with inlet velocities of 2,000 fpm or less.
- C. The air valve shall be galvanized steel or die cast aluminum; damper shafts shall operate in rustproof Delrin or equal, self-lubricating bearings. The air valve shall seat against durable gaskets and not exceed a 2% leakage rate per ARI standards.
- D. The control device shall be designed to maintain consistent flow measurement regardless of inlet flow deflection. Angled duct inlets, at 90° or less to the control device, shall not alter the maximum or minimum factory setting by more than 10%. The assembly shall incorporate a multi-point averaging differential pressure sensor mounted on the inlet.
- E. The cabinet assemblies shall be contained in a 22-gauge (minimum) galvanized steel box.
- F. Cabinet shall be internally insulated with liner that prevents fibers from entering the air stream.
 - 1. Insulation liner shall be 3/4" thick (minimum) or greater. Refer to schedule on drawing for additional requirements that may be more restrictive.
 - 2. Insulation types include, but are not limited to, the following:
 - a. Fiberglass or mineral wool acoustical duct liner bonded with a bio based thermosetting resin mat fiber-free facing.
 - b. Fiberglass or mineral wool insulation with a foil or sheetmetal facing.
 - c. Elastomeric or polyimide foam insulation with acrylic polymer airstream coating.
 - d. Natural (denim or recycled) fiber with bio based thermosetting resin mat fiber-free facing, foil facing or sheetmetal facing.
 - 3. Refer to Section 23 07 13 - Duct Insulation for additional requirements.
 - 4. Comply with ASTM E84, ASTM C1071, UL 723, UL 181, NFPA 90A and 90B, and UL Greenguard Low VOC certified.
 - 5. K-value: 0.25 Btu□in./(hr□ft²□°F) at 75°F (maximum).
 - 6. Flame spread index: ASTM E84, less than 25.
 - 7. Smoke developed index: ASTM E84, less than 50.

- G. Fabricate and install 5 foot (minimum) acoustically lined sheet metal discharge plenum on all air terminal units. Refer to detail on drawings for more information. Discharge plenum shall be mounted downstream of reheat coils where applicable. Inside dimension of plenum shall be 2" larger in height and 4" larger in width than the outlet of the air terminal unit or reheat coil, whichever is greater. Refer to detail on plans for additional information. This is required for acoustic noise dissipation. Hot Water Coil: Where scheduled on drawings, provide a single or double row hot water heating coil with aluminum fins mechanically bonded to copper coils. Coil velocity shall not exceed 700 FPM and static pressure loss shall not exceed 0.35" w.g. for a double row coil or 0.20" w.g. for a single row coil. Coil shall be pressure tested to 200 PSIG. Maximum water pressure drop shall be limited to 5 feet w.g. unless otherwise noted.
- H. Controls to be direct digital and connected to the BAS. Provide boxes without operator. Provide factory mounted low voltage transformer of sufficient capacity to power the DDC controls. Coordinate control with temperature Control Contractor. Provide factory mounted operator and thermostat control if not provided by Control Contractor.
- I. Manufacturer: Titus ESV-3000, Price SDV, Enviro-Tec SSD, or equal.

PART 3 EXECUTION

3.01 DUCTWORK GENERAL REQUIREMENTS

- A. Fabricate ducts with galvanized sheet steel, except as otherwise indicated and as follows:
1. All duct system appurtenances are to be the same material as ductwork including volume dampers and access panels.
 2. Where duct joints are not connected using flanges or manufactured assemblies, provide sheet-metal screws equally spaces around the joint or equivalent fastening method as required by mechanical code and SMACNA HVAC Duct Construction Standards-Metal and Flexible. Where sheet-metal screws are utilized provide a minimum of three screws on round ductwork and minimum four screws on rectangular ductwork. Maximum spacing between screws shall not be greater than 12" on center.
 3. Humidifier ductwork: Ductwork for humidifiers shall be constructed of 20-gauge stainless steel ductwork with longitudinal seam at top of horizontal runs and all joints sealed watertight. Duct length shall be as required by humidifier manufacturer, or as shown on drawings whichever is greater, to allow for full absorption of water vapor. This portion of duct shall include an integral drain pan and drain line connection.
 4. Shower Rooms: Exhaust ductwork serving shower rooms or other wet areas shall be constructed of stainless steel or aluminum. Where shower room exhaust ducts connect to a general exhaust riser, the non-ferrous ductwork with sealed joints need only extend to point of connection to the general exhaust riser.
 5. Environmental exhaust ductwork serving domestic clothes dryers shall be constructed of metal and shall have smooth interior surface. Provide backdraft damper at discharge to atmosphere.
 6. Underground Ducts:
 - a. Install per manufacturer's instructions.
 - b. Install ductwork when outdoor temperatures are no lower than 20°F and do not exceed 95°F.
 - c. Slope ducts at 1/8 inch per foot (minimum) to allow for drainage to an accessible low point for maintenance.

- d. All underground ductwork shall be pressure and leak tested prior to backfilling and prior to installation of concrete. Leak test report shall be submitted to Owner's Representative for review and approval.
 - e. Provide pea gravel or sand back fill all around ductwork.
7. Non-toxic and non-hazardous wet vapor exhaust, such as dishwasher, sterilizers, cart washers, and shower exhaust systems:
- a. Material: Type 304 or 316L stainless steel, minimum 24-gauge spiral or sheet metal ductwork with G90 zinc coating. Type 304 or 316L stainless steel fittings.
 - b. Joints: welded, or swaged lap-joint with silicon caulk and stainless steel sheet metal screws.
 - c. All accessories shall be stainless steel including dampers, damper hardware and turning vanes.
8. Hazardous/corrosive chemical exhaust, Radio-Isotope hood, and Bio-safety cabinet exhaust:
- a. Material: Type 316L stainless steel, minimum 18-gauge fully welded ductwork and fittings. Approved G90 galvanized steel may be used where required by local authority.
 - b. Joints: TIG welded. Weld may be either butt-weld or swaged joint with lap weld with lap running in direction of airflow. Welding rod shall be type 316L material. MIG welding technique not allowed. Inert gas purging inside ductwork not required.
 - c. All accessories shall be 316 stainless steel including dampers, air valves, damper hardware, etc.
 - d. Pressure testing: Refer to pressure classification and testing procedure table this specification section.
9. Chemical fume hood exhaust:
- a. Material: Type 316L stainless steel, minimum 18-gauge ductwork and fittings.
 - b. Joints: TIG welded. Weld may be either butt-weld or swaged joint with lap weld with lap running in direction of airflow. Welding rod shall be type 316L material. MIG welding technique not allowed. Inert gas purging inside ductwork not required.
 - c. Flanges: Manufactured 309 stainless steel clamp and frame.
 - d. All accessories shall be 316 stainless steel including dampers, air valves, damper hardware, etc.
 - e. Pressure testing: Refer to pressure classification and testing procedure table this specification section.
10. Perchloric Acid Fume Hood Exhaust:
- a. Material: Type 316L stainless steel, minimum 10-gauge fully welded ductwork and fittings.
 - b. Joints: TIG butt welded. Welding rod shall be type 316L material. MIG welding technique not allowed. Inert gas purging inside ductwork required to achieve a smooth and slag free interior joint bead
 - c. All accessories shall be 316 stainless steel.
 - d. Pressure testing: refer to pressure classification and testing procedure table this specification section.
11. Magnetically or Electrically sensitive rooms, including MRI rooms:

- a. All ductwork, fittings, grilles/diffuser, screws, etc, shall be constructed of aluminum in and around magnetically/electrically sensitive rooms. Refer to all DSA Submittal for location of these critical rooms.

3.02 DUCTWORK CONSTRUCTION AND SEALING CRITERIA

- A. Leakage classification of ductwork shall conform to the minimum requirements of Table 3.1 and Table 3.2 (see below) based on procedures of “SMACNA HVAC Duct Construction Standards- Metal and Flexible” and “SMACNA HVAC Air Duct Leakage Test Manual” as follows:

TABLE 3.1 DUCT LEAKAGE CLASSIFICATION			
DUCT WORKING PRESSURE CLASS	AIR PRESSURE LESS THAN +/- 0.5”WC	AIR PRESSURE +/-0.5” TO +/-2.99”	AIR PRESSURE +/-3” TO +/-10” WC
SMACNA Seal Class	C	B	A
Sealing Applicable	Transverse joints	Transverse joints and longitudinal seams	Transverse joints longitudinal seams and all duct wall penetrations
LEAKAGE CLASS			
Rectangular sheet metal SMACNA Leakage Class	6	6	4
Round sheet metal SMACNA Leakage Class	6	4	2
Note: Duct sealant ranges and classification are generally more restrictive than SMACNA guidelines.			

- B. Ductwork shall be constructed to SMACNA pressure class based on 150% of the maximum working pressure at connection to air handling unit, or better as specified herein. Unless called out otherwise on drawings the pressure classification of ductwork shall be as follows:

TABLE 3.2				
DUCT CONSTRUCTION CLASSIFICATION				
DUCT SYSTEM	LOCATION	WORKING PRESSURE (ESP FROM SCHEDULE)	BUILD TO SMACNA PRESSURE CLASS	BUILD TO SMACNA SEAL CLASS
Outdoor air intake	From outdoor air intake to AHU	-1" wc	-2" wc	B
Low pressure supply air	Downstream of air terminal units to grilles, registers or diffusers.	+0.5"	+1" wc	B
Low pressure supply air	From AHU to grilles, registers or diffusers.	+0.5 wc	+1" wc	B
Low pressure return air	From return grilles to AHU	-0.5" wc	-1" wc	B
Transfer air	From grille to grille, or acoustic boots or "z" bends	-/+0.25" wc	-/+0.5" wc	C
Med pressure supply air	From AHU to air terminal units	+6" wc	+10" wc	A
Med pressure supply air	From AHU to air terminal units	+4" wc	+6" wc	A
Med pressure supply air	From AHU to air terminal units	+2" wc	+3" wc	A
Med pressure return air	From air terminal units to AHU	-3" wc	-4" wc	A
Med pressure return air	From air terminal units to AHU	-2" wc	-3" wc	B
Med pressure return air	From air terminal units to AHU	-1" wc	-2" wc	B

TABLE 3.2				
DUCT CONSTRUCTION CLASSIFICATION				
DUCT SYSTEM	LOCATION	WORKING PRESSURE (ESP FROM SCHEDULE)	BUILD TO SMACNA PRESSURE CLASS	BUILD TO SMACNA SEAL CLASS
Relief air	From AHU to discharge at outdoors	+1" wc	+2" wc	B
General exhaust	From grille to exhaust fan	-1" wc	-2" wc	B
General exhaust	From exhaust fan to discharge at outdoors	+1" wc	+2" wc	B
Toilet/shower room exhaust	From grille to exhaust fan	-1" wc	-2" wc	B
Toilet/shower room exhaust	From exhaust fan to discharge at outdoors	+1" wc	+2" wc	B
Dust collection exhaust	From floor machine tool to dust collector	-8" wc	-10 " wc	A, or welded. Refer to specification

3.03 DUCTWORK LEAKAGE TESTING

- A. Refer to Section 23 05 93 - Testing, Adjusting and Balancing for air leakage testing requirements and procedures.

3.04 DUCTWORK SPECIALTIES INSTALLATION

- A. Ductwork is generally diagrammatically indicated and shall be generally installed as indicated. Do not scale Drawings for exact location of ducts. Install ducts to best suit field conditions and cooperate with other trades. Do not penetrate Structural members without consent of Architect or Structural Engineer. Check with Structural drawings prior to locating any penetrations. Duct sizes are indicated as net inside dimensions on the Drawings. The indicated dimensions shall be altered at the job site for the purpose of avoiding interferences and clearance difficulties to other dimensions producing the same air handling characteristics, provided such altered dimensions are approved by the Architect. Ducts shall be constructed in accordance with the latest edition of codes and standards identified in Part 1 and as shown on the Drawings.

1. Grilles, Registers and Diffusers: Install flush, squared, tightly sealed, and entirely covering sheet metal ductwork and gaskets. Thread sheet metal mounting screws tightly into sheet metal. All frames shall be selected to fit the ceiling type. Verify with Architectural Drawing. Each diffuser, grille and register shall be individually capable of balancing via duct mounted balancing dampers or attached opposed blade dampers. Provide unit opposed blade damper only where individual duct mounted balancing dampers are specifically noted as not provided. Duct connections shall fit securely to necks or collars behind face area. Provide all necessary transition pieces and duct collars to make connections from ductwork to neck sizes. Where ducts connect directly to necks or collars provide a minimum straight duct section of two times the duct diameter to the last elbow. Where minimum straight duct sections are not physically possible provide sheet metal plenum sized for approximately 500 fpm air velocity with duct tapped directly to side of plenum. Where building walls, floors and ceilings form portions of duct or plenum, provide gasketed angles or channels at junction points, securely bolted and sealed to building structure.
2. Install turning vanes in all mitered elbows in all ducts, so that tips are parallel with the sides of the ducts. Tips of acoustical turning vanes on outside radius shall be flush with acoustical lining.
3. Provide flexible connections to completely isolate fans from direct contact with all sheet metal work.
4. Provide access doors, as required, for access to valves, controllers, dampers and humidifier dispersion tubes. Access doors required in Product Conveying Vapor/Moisture Ductwork (see applicable paragraph above) shall not be installed in the bottom of the duct or in a manner to allow leaks.
5. Volume Dampers: Provide manual volume dampers in all supply, return and exhaust branch and run-out ductwork to grilles, diffusers, registers, and other inlet and outlet openings to facilitate balancing of air distribution systems. These are to be provided as part of contract whether shown on plans or not. Where ceilings are not accessible, provide access door or remote damper regulator. Volume dampers must be installed immediately downstream of each duct takeoff.
6. Multi-Blade Control Dampers: Provide control dampers as shown on drawings. Coordinate with BAS system provider for control actuators.
7. Splitters and splitter dampers shall not be installed in medium or low pressure supply ductwork to VAV systems.
8. Clean and pretreat surfaces before application of sealant. Conform to the manufacturer's cleaning procedures. Install sealants in conformance with manufacturer's instructions.
9. Except where noted, vertical ducts or horizontal ductwork penetrating fire rated ceilings, roofs, walls and floors shall be fire separated with UL listed and labeled fire dampers installed per UL tested assembly including sleeves and retaining angles. Provide additional fire dampers indicated on the Drawings and as otherwise required by the IBC and building inspector. Provide approved firestopping between damper frames and firewalls. Install fire dampers in accordance with NFPA Standards, requirements of the State Fire Marshal, and applicable codes. Ensure that fire dampers are installed in the open position.

10. For penetration of fire rated partitions which meet the IBC Chapter Seven requirements of non-Group H occupancy penetration of tenant separation and corridor walls in buildings with fire sprinklers provide metal sleeves as follows: A minimum 12 inch-long (0.30 m) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 1-1/2" by 1-1/2" by 0.060-inch steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 screws. The annular space between the steel sleeve and wall opening shall be filled with rock wool batting on all sides.
- B. Hangers and Supports: Securely fasten all ductwork to the building construction by means of hangers, supports, guides, anchors, and sway braces to maintain duct alignment, to prevent sagging, and to prevent noise and excessive strain on ductwork due to movement under operating conditions.
1. Maximum spacing between hangers shall not exceed ten (10) feet for rectangular sheet metal ductwork and twelve (12) feet for spiral round sheet metal ductwork. Provide hanger at each change in direction and at each branch takeoff. Refer to "SMACNA HVAC Duct Construction Standards Metal and Flexible" for additional requirements.
 2. Provide duct supports within two (2) feet of each: duct elbow; connection to flexible ductwork; connection to terminal units; connection to fan coil units; connection to exhaust fans, connection to air handling units, and fire and/or smoke dampers.
 3. Adequately mount and anchor all material and equipment as required. Include lateral bracing as required to prevent horizontal, seismic movement. Refer to IBC and Architectural and Structural Drawings for seismic requirements.
 4. Do not support ductwork from other ducts, pipes, fans or any other pieces of equipment.
 5. Powder driver fasteners shall not be used to support rectangular ducts larger than 40" maximum dimension. Powder driven fasteners shall not be allowed in existing facilities.
 6. Support round duct, larger than 36", shall have two hangers at each support point.
 7. Hangers and supports shall conform to SMACNA section "Hangers and Supports". Nail inserts, hangers and supports to formwork before slabs are poured. Cut off or remove nails, strap-ends and other projections, flush with concrete after forms are removed.
 8. Support vertical ducts, passing through floors with two continuous angles screwed to the duct and bearing to the floor and conforming to SMACNA section "Riser Support-From Floor". Blocking or shimming ducts will not be permitted.
- C. Other:
1. Fans: Align fans, motors, and drives. Install fans to render bearings accessible for lubrication without dismantling fans or ducts. Provide extended bearing oilers as required. Mount all fans on vibration isolators as specified.
 2. Insulation: Properly and neatly apply insulation on all material and equipment and apparatus, as specified, including all fittings. Apply insulation over clean, dry surfaces, with adjoining sections firmly butted together and canvas smoothly pasted over. When vapor barriers are specified, install continuous overall external surfaces of the entire system.
 3. Duct Sizing: Where duct sizes are not specifically shown on the plans or must be modified due to physical limitations, supply ducts may be sized at a maximum velocity of 1,500 fpm or 0.08" sp friction per 100 feet, whichever provides the larger duct, and return/exhaust/intake ducts may be sized at a maximum velocity of 1,000 fpm or 0.06" sp friction per 100 feet, whichever provides the larger duct. Refer to Basis of Design for further duct sizing criteria.

4. Humidifiers: Humidifier installation shall be approved by manufacturer and coordinated with all other systems. Condensate piping shall include p-traps as recommended by the humidifier manufacturer. Insulate exposed piping as required by the code
5. Exterior Ductwork: Ductwork located and installed outside the building envelope, on roof, grade or other location exposed to weather, shall be constructed and sealed airtight and watertight. The top of exterior ducts shall be crossbroken and sloped 1% towards edge of duct to eliminate any locations where rainwater can collect. Or, provide additional duct supports and mounting adjustments as necessary to prevent water retention on top of ductwork.
6. Double Wall Ductwork: Insulated ductwork located and installed outside the building envelope may be constructed of two layers of galvanized sheetmetal encapsulating the insulation layer. The inner duct shall be constructed as the main carrier duct with gauge and fabrication as required per the SMACNA Duct Construction Standards and minimum 24-gauge. The insulation layer shall be provided as required by the local energy code or Section 230713 Duct Insulation, whichever is greater. The outer sheetmetal layer shall be a non-pressurized layer, minimum 24-gauge, to encapsulate the insulation layer to prevent weather degradation and optimize the insulation effectiveness for the life of the building. The top layer shall be crossbroken and sloped 1% towards edge of duct to eliminate any locations where rainwater can collect. Or, provide additional duct supports and mounting adjustments as necessary to prevent water retention on top of ductwork.
7. Access Floor Diffusers: The mounting ring for floor mounted diffusers are to be affixed to the floor tiles using a clamp insert or other method approved for use with the floor diffuser.

3.05 FLEXIBLE DUCTWORK INSTALLATION

- A. Flexible insulated round ductwork connectors may be utilized where shown on the Drawings and for transitions between air handling equipment and rigid ductwork. A five (5) foot (maximum) length of flexible air duct shall be allowed to be used as an elbow at a terminal device or air outlet/inlet, unless shown otherwise on the Drawings. No intermediate joints are allowed. Seal each end using two wraps of tape listed in accordance with UL 181B and marked 181B-FX, followed by a mechanical stainless steel screw operated drawband. Plastic drawbands are not allowed. Support duct to maintain smooth shape without sagging. All connections shall utilize welded conical tees, aluminum conical fitting, Flexmaster #CBD, or 45° boot take-offs by Flexmaster #STO. Spin-in type or other types of butt tees, bullhead tees or straight taps are not permitted. Damper regulators shall include end bearings as manufactured by DuraDyne, Ventlok or equal.
- B. Flexible duct runouts to diffusers and grilles is limited to the following sizes:
 1. 6" diameter: Up to 100 cfm
 2. 8" diameter: Up to 200 cfm.
 3. 10" diameter: Up to 360 cfm.
 4. 12" diameter: Up to 600 cfm.
 5. 14" diameter: Up to 900 cfm.

3.06 EXPANSION JOINTS

- A. At a non-rated penetration through an expansion joint wall:
 1. Provide insulated flexible ductwork through expansion joint. Flexible connector shall be no longer than five feet between segments of rigidly attached ductwork.

- B. At a fire/smoke rated penetration through an expansion joint wall:
1. Provide required fire/smoke damper with sleeve through rated assembly as required by Building Code and manufacturer's instructions. Provide breakaway duct connections as required by manufacturer's listing. Ductwork bracing on either side of wall must not be rigid within ten feet of wall to allow for building movement. Seismic restraints must not be closer than ten feet of expansion joints on either side of wall. Following a building seismic/movement event the ductwork will need to be inspected and possibly reattached to the fire/smoke damper.

3.07 STAINLESS STEEL DUCTWORK

- A. For installations serving moisture, vapor, or fume exhaust.
1. For connections to hoods or equipment provide minimum 12" length flanged and bolted stainless steel spool piece connection.
 2. All fittings shall be long radius. Round elbows shall be minimum 5-gore.
 3. Slope horizontal ductwork back toward source connected equipment minimum 1% slope so that moisture and liquids may drain back toward equipment.
 4. Low point "traps" in the ductwork shall be fitted with a low point drain valve, 1/2" welded connection, stainless steel piping and valve.
 5. All welding to be completed by certified welders experienced in 316 stainless steel.

3.08 DUCTWORK SEALANT METHODS

- A. General
1. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
 2. All installation shall be in accordance with manufacturer's published recommendations.
 3. Cleanliness:
 - a. Before installing sealant, Surface must be dry and be free of dirt, oil, grease, and loose or foreign matter that could impair adhesion wipe ductwork to a visibly clean condition.
 - b. During construction, provide temporary closures of metal or taped polyethylene on open ductwork and duct taps to prevent construction dust or contaminants from entering ductwork system. Seal ends of ductwork prior to installation to keep ductwork interior clean. Remove closures only for installation of the next duct section.
 - c. During duration of construction, maintain the integrity of all temporary closures until air systems are activated.
 - d. Follow the Advanced Level requirements as found in the SMACNA Duct Cleanliness for New Construction Guidelines.
- B. Installation of Mastic/Sealant Duct System
1. One Part Sealant System:
 - a. Apply one-part sealant system at a 20 to 30 wet mil thickness with a brush, putty knife; caulk gun or spray to duct joints, fasteners and seams. Tool, if necessary, caulk bead with putty knife or brush. Let dry per manufacturer data sheet of a minimum of 48 hours.

2. Or, One Part Spray Applied Sealant System:
 - a. Use a manufacturer approved airless sprayer capable of application pressure up to 2,000 psi spraying through a minimum 0.111 tip. Apply in a smooth application perpendicular to the substrate at a rate of 20 to 30 wet mils to joints, seams and duct wall penetrations per manufacturer's technical data sheet. Let dry per manufacturer data sheet of a minimum of 48 hours.
- C. Installation of Mastic/Sealant Duct System with 10-Year Warranty
 1. Installation of Rolled Sealant Tape over Mastic/Sealant:
 - a. Cut desired length for each side of the ductwork; peel off release liner and center over joint, seam or penetration. The rolled sealant should completely cover the sealant. Use hand pressure to place the rolled sealant followed by a squeegee application. Lap tape end 2 inches (50 mm minimum). Squeegee rolled sealant to insure bond and complete adhesion to the duct. Instant adhesion requires precise positioning. Not re-positional. Four-Bolt flange requires applying corner pieces prior to applying the edge strips.
- D. Field Quality Control
 1. Allow duct sealant system to cure minimum 48 hours before pressure testing for the fluid applied Sealants. Rolled sealants can be tested immediately with duct leakage tester.
 2. Ductwork leakage testing and/or inspection shall be performed prior to installation of external ductwork insulation.
 3. Notify Owner's Representative a minimum of seven (7) calendar days in advance of leakage testing.
 4. Leaks identified during ductwork air leakage testing shall be repaired by:
 - a. Complete removal of the sealing materials.
 - b. Thorough cleaning of the joint surfaces.
 - c. Installation of multiple layers of sealing materials.
 5. Discrepancies found during testing and balancing between duct traverses and diffuser/grille readings shall result in re-inspection, repair and retest until discrepancies are eliminated.

3.09 INSTALLATION OF EXPOSED DUCTWORK

- A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.
- B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.
- C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.
- D. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.
- E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.10 FIRE AND COMBINATION FIRE/SMOKE DAMPER INSTALLATION

- A. Install per manufacturer's and UL installation requirements.
- B. For buildings with no fire alarm system all fire/smoke dampers shall be interconnected with the HVAC unit's controls and duct smoke detectors. The detection of smoke at any fire/smoke damper shall stop for HVAC unit fans and close all fire/smoke dampers. A single test/reset station shall be capable of resetting all devices back to normal operation.
- C. Smoke and fire/smoke dampers shall close upon activation of a listed smoke detector or detectors installed in accordance with Chapter 7 of the Building Code. Other than in mechanical smoke control systems, smoke and fire/smoke dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate. Coordinate with electrical installer for all work associated with smoke and fire/smoke damper wiring and smoke detector initiation.

3.11 CONTROL DAMPER INSTALLATION

- A. Note that installation of control dampers is a part of the mechanical contractor's work regardless of whether they are specified in this section or as part of products to be selected by the Control Contractor.
- B. When electric actuators are provided, dampers shall be installed to allow direct over the shaft mounting of actuators. No connecting rods and stand off brackets shall be necessary.
- C. Dampers shall be installed straight and true, level in all planes, and square in all dimensions. Dampers shall move freely without undue stress due to twisting, racking (parallelogramming), bowing, or other installation error.
- D. Blades shall close completely. Leakage shall not exceed manufacturer's specifications at rated static.
- E. Structural support shall be provided as necessary for all multi-section dampers.
- F. Where blankoffs or structural supports obstruct duct or air passages, the decrease in free area shall not exceed 15% of the damper face area unless otherwise specified here or on plans.
- G. No individual damper section may exceed 20 sq. ft.
- H. Dampers shall be parallel blades style for outside air economizer to facilitate improved mixing of outside air and return air. Airflows shall be directed towards each other.
- I. Where ducts penetrate an exterior surface install a Class I motorized damper at each outdoor air supply opening, exhaust opening, relief outlet, shaft vent and stairway vent, as required to comply with minimum requirements of the local Energy Code.
 - 1. Dampers shall be installed with automatic controls configured to close when the systems or spaces served are not in use or during unoccupied period warm-up and setback operation, unless the system served requires outdoor air or exhaust air or operates continuously or the dampers are opened to provide intentional economizer cooling.
 - 2. Stairway and shaft vent dampers shall be installed with automatic controls configured to open upon the activation of any fire alarm initiating device of the building's fire alarm system or the interruption of power to the damper.

3.12 SEISMIC REQUIREMENTS

- A. See Section 23 05 49 for specific requirements.

- B. All HVAC equipment and machinery shall be anchored to withstand forces generated by earthquake motions. As a minimum, equipment and equipment frames shall be designed to withstand a force of 100% of the weight of the equipment and frame acting at its center of gravity. Anchorage of the equipment and/or frame to the structure shall be for a force of four times gravity also acting at the center of gravity.
- C. The seismic calculations shall be the responsibility of contractor.
- D. Install ducts with hangers and braces designed to support the duct and to restrain against seismic forces required by applicable building codes. Comply with SMACNA-Seismic Restraint Manual: Guidelines for Mechanical Systems and ASCE/SEI 7.
 - 1. Space lateral supports a maximum of 40 feet (12 m) and longitudinal supports a maximum of 80 feet (24 m) on center.
 - 2. Brace each change of direction longer than 12 feet (3.7 m).
- E. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.
- F. Install cables so they do not bend across edges of adjacent equipment or building structure.
- G. Install cable restraints on ducts that are suspended with vibration isolators.
- H. Install seismic-restraint devices using methods approved by the AHJ.
- I. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.
- J. Drilling for and Setting Anchors:
 - 1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify the Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
 - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
 - 3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
 - 4. Set anchors to manufacturer's recommended torque, using a torque wrench.
 - 5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

3.13 EQUIPMENT

- A. Install equipment as shown on plans and in accordance with manufacturer's installation recommendations.

3.14 SUPPLY DIFFUSER AND REGISTER LOCATIONS

- A. Coordinate location of supply outlets with ceiling mounted smoke detectors. Locate outlets or outlet distribution so as to prevent airflow from inhibiting the operation of smoke detectors. Locate ceiling outlets a minimum of 3'-0" from smoke detectors.

3.15 PAINTING

- A. Where the interior surfaces of ductwork are visible through the blades of supply outlets, return inlets, and exhaust inlets - paint the interior visible surfaces with one coat of flat black paint.
- B. Ductwork exposed on the roof or exterior to the building shall be painted. Coordinate with Division 9 for requirements.

3.16 FIELD QUALITY CONTROL

- A. Do not insulate or conceal ductwork before inspection by Owner's Representative, Architect or Engineer. If ductwork is insulated and concealed prior this inspection the Contractor shall remove insulation and ceiling to permit inspection at no additional cost to the Owner. The Contractor shall replace the insulation and ceiling after final inspection at no additional cost to the Owner.
- B. Ductwork Deflection Criteria:
 - 1. Maximum inward and/or outward deflection at sheet metal panels shall be 3/4" under maximum static pressure operating conditions. Additional intermediate stiffening angles shall be installed where deflections exceed 3/4".
 - 2. Maximum inward and/or outward deflection at sheet metal elbows and joints shall be 1/4" under maximum static pressure operating conditions. Additional stiffening angles shall be installed where deflections exceed 1/4".
- C. Acceptance of duct systems shall be contingent upon conformance with the requirements specified in Section 23 05 93 - Testing, Adjusting and Balancing.

3.17 ADJUSTING AND CLEANING

- A. Clean the inside of plenums, casings, enclosures, fans, and accessible ductwork before starting fans. Blowout coils and condensate piping with compressed air. Comb all coil fins that may be bent. Install a clean set of filters in each system prior to testing and balancing. Proceed with testing and balancing. All dampers shall be locked in place.

3.18 DUCT SEALING ALTERNATIVE

- A. Occasionally a ducted system will experience leaks after the ductwork has been installed and sealed per one of the SMACNA duct sealant classifications. These leaks may not be identifiable until after ductwork has been installed and system air balancing and leakage testing has been engaged. At the contractor's option an alternative solution to sealing such leaks may include the use of a water based sealing agent that is introduced to the interior of the duct system.
 - 1. Manufacturer: AeroSeal LLC or approved equal. Application must be performed by manufacturer approved provider.
 - 2. Sealant must be UL 723 approved for smoke and flame spread.
 - 3. Sealant must be UL 181 approved for humidity, mold growth, temperature, erosion and puncture resistance.
- B. Duct Sealing Procedure:
 - 1. Preparation:
 - a. Inspect the entire duct shaft and horizontal plenums for major leakage sites (larger than 1/2" across).

- b. Mechanically clean duct shaft per NADCA (National Air Duct Cleaners Associations) standards if more than 1/8" of surface contaminants are visible on duct surfaces.
 - c. Repair all major leakage sites using mastic and fiberglass mesh tape per SMACNA standards.
 - d. Temporarily remove or protect all building controls and smoke detectors from aerosol particles as recommended by the Manufacturer.
 - e. Temporarily disable fire alarms and notify appropriate authorities.
 - f. Temporarily isolate air-moving equipment and block off air inlets and air outlets as recommended by the manufacturer.
 - g. Protect occupied spaces from aerosol particles as recommended by the Manufacturer.
 - h. Protect air-moving equipment, air inlets and outlets and other devices and appurtenances as recommended by the manufacturers.
2. Duct Sealing:
- a. Seal existing ductwork from the inside using automated aerosolized sealant injection as recommended by manufacturer or by manually caulking internally with sealant.
 - b. Sealant must cure within 2 hours with no odor or VOC off-gasing thereafter.
 - c. Sealant shall remain elastic (not harden rigidly) after curing.
 - d. Sealant shall be deposited substantially at areas of leakage only, and shall not coat interior duct walls, duct lining material, dampers, or turning vanes.
 - e. Seal all test holes using patching plates sealed with mastic.
 - f. Repair or replace insulation to match existing.
 - g. Seal all injection openings with duct access doors or replace ductwork to match existing.
3. Duct Reassembly and Cleanup:
- a. Reinstall building controls and smoke detectors.
 - b. Enable fire alarms and notify appropriate authorities.
 - c. Remove blocking, reinstall grills and registers, and enable air handling fans.
 - d. Cleanup sealant residue that may have adhered to surfaces in occupied areas as recommended by the Manufacturer.
 - e. All work shall be done in a substantial and workmanlike manner by factory-trained technicians.
4. Testing:
- a. Provide pre-sealing and post-sealing leakage profile reports indicating percentage reduction of duct leakage for both supply and return ductwork.
 - b. Retest ductwork and document compliance with air leakage requirements as identified in section 23 05 93 Testing, Adjusting and Balancing.
5. Warranty:

- a. The Contractor shall warrant that the aerosol sealant application will be free from defects for a period of 3 years from date of the sealing application. If defects should occur during this period, the Contractor shall repair or replace the defective duct seals, including the direct labor costs for performing the repair or replacement, at no additional cost to the Owner.

END OF SECTION

SECTION 23 34 00

FANS AND VENTS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 1, and shall include, but not necessarily be limited to, the following:
 - 1. Spun Aluminum and Steel Housed Centrifugal Exhaust Fans
 - a. General Duty Spun Aluminum Exhaust fan
 - b. Upblast Spun Aluminum Exhaust Fan for roof or sidewall mount
 - c. Upblast Spun Steel Exhaust Fan for high temperature kitchen exhaust
 - 2. Small Cabinet Fans (Ceiling Mounted and Inline)
 - 3. Housed Centrifugal Fans
 - a. Utility Set
 - 4. Tubular Fans
 - a. In-line tubular or square centrifugal fans.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00 - Basic HVAC Materials and Methods
- B. Section 23 05 93 - Testing, Adjusting and Balancing
- C. Section 23 07 13 - Duct Insulation
- D. Section 23 07 16 - Equipment Insulation
- E. Section 23 09 00 - Building Automation System (BAS) Controls
- F. Section 23 31 13 - Air Distribution
- G. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. **Manufacturer's Qualifications:** Provide air handling units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. **Certifications:** Provide certified ratings of units based on tests performed in accordance with ARI 430, "Central-Station Air Handling Units."
- C. **Codes and Standards:** Provide air handling units conforming to the requirements of the latest addition of the following:
1. **Air Movement and Control Association (AMCA):**
 - a. 99 Standards Handbook
 - b. 210 Laboratory Methods of Testing Fans for Rating [Unit shall bear AMCA Certified Rating Seal]
 - c. 300 Reverberant Room Method for Sound Testing of Fans [Unit shall bear AMCA Certified Rating Seal]
 - d. 301 Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - e. 500 Test Method for Louvers, Dampers, and Shutters
 2. **American National Standards Institute (ANSI):**
 - a. 9 Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 Test Performance of Air Filter Units
 3. **Air-Conditioning, Heating and Refrigeration Institute (AHRI):**
 - a. 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment
 - b. 410 Forced-Circulation Air-Cooling and Air-Heating Coils
 - c. 430 Central-Station Air-Handling Units
 - d. 440 Room Fan-Coil Air-Conditioners
 4. **American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):**
 - a. 15 Safety Code for Mechanical Refrigeration
 5. **National Electrical Manufacturers Association (NEMA):** Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
 6. **National Fire Protection Association (NFPA):** Provide air handling unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50.
 - a. 70 National Electrical Code
 - b. 90A Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B Standard for the Installation of Warm Air Heating and Air Conditioning Systems
 7. **Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA):** Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
 8. **Underwriters Laboratories, Inc. (UL):** Except for motors, provide electrical components required as part of air handling units, which have been listed and labeled by UL.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for air handling units showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, and finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.
- B. Shop Drawings: Submit shop drawings showing unit dimensions, weight loadings, required clearances, field connection details and methods of support. Draw to a scale of 1/4" per one foot. Include field fabricated mixing boxes, dampers and duct connections.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect equipment and products against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.08 SAFETY PROVISIONS

- A. Provide all open drives and fan wheels subject to maintenance and potential entanglement with protective guards or screens meeting OSHA requirements.

1.09 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 GENERAL FAN REQUIREMENTS

- A. Construction, Rating and Testing: Provide fans constructed and factory tested in accordance with the Air Moving and Conditioning Association (AMCA). All fan wheels shall be statically and dynamically balanced. Size, capacity and features as indicated on the Drawings. Provide extended bearing lubrication fittings where necessary to assure accessibility of all lubrication points.
- B. Motors and Drives: Provide premium efficiency drip-proof motors with temperature rise not greater than 40°C above ambient temperature or electronically commutated (EC) motors. Belt drive assemblies, where applicable, shall be capable of 150% of the motor rated horsepower on one less than the total number of belts, for belt drives with two or more belts.

- C. Accessories: Provide, as indicated on the Drawings and specified in other paragraphs of this Section, all related accessories to match the fan section, including access sections, diffusion sections, transition sections, flexible connections, vibration eliminators, and belt guards.
- D. Submissions: For shop drawings include complete dimensional and physical data, CFM, SP, HP, discharge arrangement, rotation, class, base details, and fan curves.

2.02 HOUSED CENTRIFUGAL EXHAUST FANS (ROOF MOUNTED DOWNBLAST TYPE)

- A. Manufacturer: Models as scheduled by Greenheck, Carnes, Cook, Penn, Twin City or equal. Size, capacity and features as indicated on the Drawings.
- B. Fan Housing:
 - 1. The fan housing shall consist of the motor cover, shroud, curb cap and lower windband and shall be constructed of heavy gauge aluminum. The housing shall have a rigid internal support structure and leakproof design. The shroud shall be one piece with a rolled bead for extra strength which directs the exhaust air downward. Birdscreen shall be provided between the fan housing and shroud.
- C. Fan Wheel:
 - 1. The fan wheel shall be centrifugal backward inclined, constructed of aluminum and shall include a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced in accordance to ANSI/AMCA Standard 204.
- D. General:
 - 1. A conduit chase shall be provided through the curb cap to the motor compartment for ease of electrical wiring.
 - 2. All fans shall bear the AMCA Certified Ratings Seal for sound and air performance. Each fan shall bear a permanently affixed manufacturer's engraved metal nameplate containing the model number and individual serial number for future identification.
 - 3. A disconnect switch shall be factory installed and wired from the fan motor to a junction box installed within the motor compartment or external to the fan.
 - 4. Motors and drives shall be readily accessible for maintenance.
- E. Motors: Provide direct drive or belt drive as scheduled on the Drawings.
 - 1. Direct drive motors:
 - a. Motors shall be premium efficiency or ECM as scheduled on the Drawings.
 - b. Motors shall be mounted out of the airstream on vibration isolators. Fresh air for motor cooling shall be drawn into the motor compartment through a large space between the fan shroud and the motor cover. Motors shall be readily accessible for maintenance.
 - c. All ECM motors shall be speed controllable to 20% of full speed (80% turndown). Speed shall be controlled by a potentiometer dial mounted at the motor or by a 0-10 vdc signal. Motor shall be 85% efficient at all speeds.
 - 2. Belt drive motors:
 - a. Motors shall be heavy duty ball bearing type, carefully matched to the fan load, and furnished at the specified voltage, phase and enclosure. Drive frame assembly shall be constructed of heavy gauge steel.

- b. Precision ground and polished fan shafts shall be mounted in permanently sealed, lubricated pillow block ball bearings. Bearings shall be selected for a minimum L₁₀ life in excess of 100,000 hours or L₅₀ life of 500,000 hours at maximum cataloged operating speed. Drives shall be sized for a minimum of 150% of driven horsepower. Pulleys shall be of the cast type, keyed and securely attached to the wheel and motor shafts. Motor pulleys shall be adjustable for final system balancing.

2.03 HOUSED CENTRIFUGAL EXHAUST FANS (ROOF MOUNTED UPBLAST TYPE)

- A. Manufacturer: Models as scheduled by Greenheck, Carnes, Cook, Penn, Twin City or equal. Size, capacity and features as indicated on the Drawings.
- B. Fan Housing:
 1. Leakproof fan housing shall consist of the motor cover, shroud, curb cap and one-piece windband and shall be constructed of heavy gauge aluminum. The housing shall have a rigid internal support structure and leakproof design. The shroud shall be one piece with a rolled bead for extra strength which directs the exhaust air upward. Birdscreen shall be provided between the fan housing and shroud.
 2. The windband shall be welded to the one-piece curb cap and on all sizes with UL/CUL-762.
- C. Fan Wheel:
 1. The fan wheel shall be centrifugal backward inclined, constructed of aluminum and shall include a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced in accordance to ANSI/AMCA Standard 204.
- D. General:
 1. A conduit chase shall be provided through the curb cap to the motor compartment for ease of electrical wiring. A NEMA 3R disconnect switch shall be factory installed and wired from the fan motor to a junction box installed within the motor compartment.
 2. Fan shall bear the AMCA Certified Ratings Seal for sound and air performance. Each fan shall bear a permanently affixed manufacturer's engraved metal nameplate containing the model number and individual serial number for future identification.
 3. A disconnect switch shall be factory installed and wired from the fan motor to a junction box installed within the motor compartment or external to the fan.
 4. Motors and drives shall be readily accessible for maintenance.
- E. Motors: Provide direct drive or belt drive as scheduled on the Drawings.
 1. Direct drive motors:
 - a. Motors shall be premium efficiency or ECM as scheduled on the Drawings.
 - b. Motors shall be mounted out of the airstream on vibration isolators. Fresh air for motor cooling shall be drawn into the motor compartment through a large space between the fan shroud and the motor cover. Motors shall be readily accessible for maintenance.
 - c. All ECM motors shall be speed controllable to 20% of full speed (80% turndown). Speed shall be controlled by a potentiometer dial mounted at the motor or by a 0-10 vdc signal. Motor shall be 85% efficient at all speeds.

2. Belt drive motors:
 - a. Motors shall be heavy duty ball bearing type, carefully matched to the fan load, and furnished at the specified voltage, phase and enclosure. Drive frame assembly shall be constructed of heavy gauge steel.
 - b. Precision ground and polished fan shafts shall be mounted in permanently sealed, lubricated pillow block ball bearings. Bearings shall be selected for a minimum L_{10} life in excess of 100,000 hours or L_{50} life of 500,000 hours at maximum cataloged operating speed. Drives shall be sized for a minimum of 150% of driven horsepower. Pulleys shall be of the cast type, keyed and securely attached to the wheel and motor shafts. Motor pulleys shall be adjustable for final system balancing. Third pulley to be included for ease of adjusting drive belt tension and to enhance belt life and compliant with smoke control applications.

F. Smoke Control Exhaust Option:

1. Provide three belt drives be sized for a minimum of 150% of driven horsepower. Pulleys shall be of the cast type, keyed and securely attached to the wheel and motor shafts. Motor pulleys shall be adjustable for final system balancing.
2. Fans shall be listed by Underwriters Laboratory for UL/cUL 705 for electrical components and UL/cUL Listed for Emergency Smoke Control Systems 500°F (260°C) for 4 hours and 1,000°F (538°C) for 15 minutes.

2.04 SMALL CABINET FANS (CEILING MOUNTED AND INLINE CABINET)

A. Ceiling mounted exhaust fans:

1. Manufacturer: Greenheck, Panasonic, Cook, Penn, Carnes, Twin City, Air King or equal.
2. General: Provide centrifugal direct drive type ceiling exhaust fan. The fan wheel(s) shall be of the forward curved centrifugal type and dynamically balanced.
3. Noise Data: Provide sone or octave band noise values at the required air delivery.
 - a. 0.3 sones at 80 cfm to 112 cfm
4. Fan Housing: The fan housing shall be constructed of heavy gauge galvanized steel. The housing interior shall be lined with 1/2 inch acoustical insulation. The outlet duct collar shall include a backdraft damper on all sizes and shall be spring loaded on larger units above 200 cfm.
 - a. Integral backdraft damper shall be totally chatterproof with no metal-to-metal contact.
 - b. Entire fan, motor and wheel assembly shall be easily removable without disturbing the housing.
 - c. Outlet shall be adaptable for horizontal or vertical discharge.
5. Motor speeds shall not exceed 1100 RPM and all fan motors shall be suitably grounded and mounted on rubber-in-shear vibration isolators.
6. Grille: For 300 cfm and smaller fans the grille shall be constructed of high impact polystyrene and for larger sizes the grille shall be constructed of aluminum. Grilles shall be non-yellowing.
7. The access for wiring shall be external. The motor disconnect shall be internal and of the plug in type. The motor shall be mounted on vibration isolators.
8. All fans shall bear the AMCA Certified Ratings Seal for sound and air performance and shall be UL/cUL Listed.

9. Provide the fan with the following required additional features:
 - a. Dual Speed operation integrated with both a humidistat and motion sensor to trigger high speed operation.
 - b. Single Speed operation integrated with humidistat and motion sensor to trigger operation of fan.
 - c. Remote wall mounted time switch, Intermatic Model E1210 with 10/20/30/60-minute digital push-buttons.
 - d. UL263/UL555C housing and damper assembly for installation in rated wood frame construction.

2.05 HOUSED CENTRIFUGAL FANS

A. Utility Set

1. Manufacturer: Trane, Loren Cook, Carnes, Industrial Air, Peerless-Winsmith, Penn, Aerovent, Twin City, or approved equal.
2. Direct Drive Utility Fans:
 - a. Supply, exhaust or return air fans shall be of the direct drive utility fan type, in AMCA Arrangement 4 with a single width, single inlet housing, in CW or CCW rotation as specified. The housing shall be constructed of heavy gauge galvanized steel with lock formed seams permitting no air leakage. The housing shall be easily rotated in the field to any of the eight standard discharge positions. Housing supports shall be constructed of heavy gauge galvanized steel to minimize vibration and rigidly support the motor and wheel.
 - b. The fan wheel shall be of the forward curved or backward inclined type and shall be constructed of heavy gauge aluminum. Wheels shall be statically and dynamically balanced. The wheel cone and fan inlet cone shall be carefully matched for maximum performance and operating efficiency. Motors shall be heavy duty ball bearing type matched to the fan load and furnished at the specified voltage, phase and enclosure.
3. Belt Drive Utility Fans:
 - a. Supply, exhaust and return air fans shall be of the belt driven utility fan type in AMCA Arrangement 10 with a single width, single inlet housing, in CW or CCW rotation as specified. The housing shall be constructed of heavy gauge steel with air tightlock formed seams. The housing shall be easily rotated in the field to any of the eight standard discharge positions. Housing and bearing supports shall be constructed of welded steel members to prevent vibration and to rigidly support the shaft and bearings.
 - b. Fan wheels shall be of the forward curved type, constructed of heavy gauge steel with uniform stamped steel blades. Wheels shall be statically and dynamically balanced. The wheel cone and fan inlet cone shall be carefully matched for maximum performance and operating efficiency.
 - c. Motors shall be heavy duty, ball bearing type, matched to the fan load and furnished at the specified voltage, phase and enclosure. The fan shaft shall be ground and polished solid steel mounted in heavy duty, permanently sealed, pillow block ball bearings. Bearings shall be selected for a minimum L50 life in excess of 200,000 hours of maximum cataloged operating speed. Drives shall be sized for a minimum of 150% of driven horsepower. Pulleys shall be of the fully machined cast iron type, keyed and securely attached to the wheel and motor shafts. The motor pulley shall be adjustable for final system balancing.

4. All fans shall bear the AMCA Certified Ratings Seal for air performance.

2.06 IN-LINE OR TUBULAR FANS

A. Inline Tubular or Square Centrifugal Fans

1. Manufacturer: Greenheck, Carnes, Cook, Penn, Twin City or approved equal.
2. Drive:
 - a. Belt Drive: Duct mounted supply, exhaust or return fans shall be of the centrifugal belt driven in-line type.
 - b. Direct Drive: Duct mounted supply, exhaust or return fans shall be of the centrifugal, direct driven in-line type.
3. Housing: The fan housing shall be of the square or cylindrical design as scheduled, constructed of heavy gauge galvanized steel or aluminum and shall include duct mounting collars. Fan construction shall include two removable access panels located perpendicular to the motor mounting panel. The access panels must be of sufficient size to permit easy access to all interior components.
4. The fan wheel shall be centrifugal backward inclined, constructed of aluminum and shall include a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced.
5. Motors shall be heavy-duty ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure. Fan motor shall be premium efficiency, open drip-proof foot mounted, continuous duty and suitable for operation in either vertical or horizontal or angular position. Provide VFD compatible motors where indicated on the drawings.
6. Motors and Drive Access:
 - a. Belt Driven: Motor and drives shall be mounted out of the airstream. Motors shall be readily accessible for maintenance. Precision ground and polished fan shafts shall be mounted in permanently sealed, lubricated pillow block ball bearings. Bearings shall be selected for a minimum L10 life in excess of 100,000 hours (L50 life at 500,000 hours) at maximum cataloged operating speed. Drives shall be sized for a minimum of 150% if driven horsepower. Pulleys shall be of the fully machined cast iron type, keyed and securely attached to the wheel and motor shafts. Motor pulleys shall be adjustable for final system balancing.
 - b. Direct Drive: Motors shall be readily accessible for maintenance.
 - 1) Variable speed capability: For all direct drive fans with motors through $\frac{3}{4}$ " hp, the fan shall be equipped with a DC electronic commutation type motor (ECM). Motor shall be speed controllable to 20% of full speed (80% turndown). Speed shall be controlled by a potentiometer dial mounted at the motor or by a 0-10 vdc signal. Motor shall be 85% efficient at all speeds.
7. A NEMA 1 disconnect switch shall be provided as standard, except with explosion resistant motors, where disconnects are optional. Factory wiring shall be provided from motor to the handy box.
8. All fans shall bear the AMCA Certified Ratings Seal for both sound and air performance. The fan manufacturer must furnish published sound power level data based on actual tests on the fan sizes being furnished, and conducted in accordance with current AMCA standards. Such data is to define Sound Power Levels (PWL), re: 10-12 watts for each of the eight (8) frequency bands. Manufacturers furnishing estimate data will not be approved.

9. Each fan shall bear a permanently affixed manufacturer's nameplate containing the model number and individual serial number for future identification.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Coordinate motor starters with Division 26 and controls contractor.
- B. Install in accordance with manufacturer's instructions.
- C. Examine site to verify if site is ready to receive work. Provide layout drawings of air handlers and fan locations to electrical installer.
- D. Install unit on vibration isolators.
- E. Install 3" flexible duct connection at inlets and outlets of units.
- F. Control installers shall install all wiring associated with control signals into the fan starters.
- G. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
- H. Exhaust fans servicing risers with subducts shall operate continuously and shall be connected to backup generator power supply or other uninterruptible backup power as required by the Building Code and NFPA. Coordinate with Division 26 work. Center fans between four adjacent sprinklers.
 1. Vertical clearance from the HVLS fan to sprinkler deflector shall be a minimum of three feet.
 2. All HVLS fans to be interlocked to shut down immediately upon receiving a waterflow signal from the alarm system in accordance with the requirements of NFPA 72.

3.02 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four-hours travel from the job site.

END OF SECTION

This page intentionally left blank

SECTION 23 35 00
SPECIAL EXHAUST SYSTEMS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. Provide engineered variable volume exhaust system for each group of exhaust equipment. All work to be furnished and installed under this Section shall comply with all the requirements of Division 1, and shall include, but not necessarily be limited to, the following:
 - 1. Dust collection system.
- B. Section 23 05 00: Basic HVAC Materials and Methods
- C. Section 23 05 93: Testing, Adjusting and Balancing
- D. Section 23 09 00: Building Automation System (BAS) Controls
- E. Section 23 09 02: Variable Frequency Drives
- F. Section 23 31 13: Air Distribution
- G. Division 26: Electrical

1.03 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide exhaust fans and controls that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:
 - 1. Air Movement and Control Association (AMCA):
 - a. 99-10 Standards Handbook
 - b. 99-0410 Classification for Spark Resistant Construction
 - 2. American Conference of Occupational Safety and Health (ACGIH) - Industrial Ventilation: A Manual of Recommended Practice.
 - 3. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of the exhaust systems, which comply with NEMA Standards.

4. National Fire Protection Association (NFPA): Provide internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. NFPA 70: National Electrical Code
 - b. NFPA 90A: Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. NFPA 90B: Standard for the Installation of Warm Air Heating and Air Conditioning Systems.
 - d. NFPA 91: Standard for Exhaust System for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids.
 - e. NFPA 211: Standard for Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances.
 - f. NFPA 654: Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids.
 - g. NFPA 664: Standard for Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities.
 - h. NFPA 1500: Standard on Fire Department Occupational Safety and Health Program.
5. National Institute for Occupational Safety and Health (NIOSH) - Current Intelligence Bulletin 50: Carcinogenic effects of exposure to diesel exhaust.
6. Occupational Safety and Health Administration (OSHA) – Part 1990 Identification, Classification, and Regulation of Carcinogens.
7. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
8. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of air handling units, which have been listed and labeled by UL.
 - a. UL 705 – Power Ventilators.
9. Canadian Standards Association (CSA)
 - a. CSA – CAN3-B255-M81 – Mechanical Flue-Gas Exhausters.

1.04 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for exhaust fans showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, and finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations. Submit control devices and exhaust ductwork.
- B. Shop Drawings: Submit shop drawings showing unit dimensions, required clearances, field connection details and methods of support. Draw to a scale of 1/4" per one foot.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.
- D. System Sizing Criteria:
 1. Exhaust fan location

- a. Outdoor wall or roof mount

1.05 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, lint filters are in place, bearings lubricated, and fan has been test run under observation.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect equipment and products against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.07 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.
- C. Provide with two-year (24 months) warranty on entire fan assembly.
- D. Provide with ten-year warranty against corrosion perforation of exhaust fan cabinet and components.

PART 2 PRODUCTS

2.01 GENERAL SYSTEM REQUIREMENTS

- A. Provide a coordinated exhaust system including exhaust fan, nozzles, ductwork variable frequency drive, controller and duct pressure sensor, and ductwork for each interconnected exhaust system.

2.02 DUST COLLECTORS

- A. Cyclone dust collector system shall be capable of providing cyclonic cleaning of incoming product conveying air stream. Collector fan shall centrifugally move the heavy dirt and dust to the sidewalls of the collections assembly and thereby force the dust and dirt to the base of the unit for collection. System to be mounted outside the building and clean air to be exhausted directly to atmosphere. Dirt and dust shall be funneled into a 55-gallon drum (supplied by others) via a drum cover with transition. Collection system shall be factory-assembled and meet the airflow requirements as scheduled on the drawings. The collector shall be bolted and welded construction with a removable bottom cone section.
- B. Provide the following features, including options identified on the drawings:
 - 1. Stack silencer with outlet pointed away from noise sensitive direction.
 - 2. Steel or aluminum fan wheel.
 - 3. TEFC explosion proof motor.
 - 4. Final after filter assembly with MERV-15 filtration.
 - 5. Base and leg assembly.

6. Bottom outlet base support for 55-gallon drums.
 7. Multi-coat paint finish with 2,000-hour salt spray performance and color to match building. Coordinate color selection with Owner's Representative.
 8. Minimum 48" clearance beneath hopper funnel and top of 55-gallon drum.
 9. NEMA 4 control with timer and BAS interface for remote start/stop control.
 10. Magnehelic differential pressure gauge across filter media.
 11. 10-year warranty.
- C. Manufacturers: Donaldson Torit #Cyclone Series, United Air Specialists #C Series, Car-Mon or equal.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Examine site to verify if site is ready to receive work. Provide layout drawings of exhaust fans, exhaust ductwork, controllers and transducers to the electrical installer.
- C. Install exhaust fan per manufacturer's installation instructions.
- D. Install 3" flexible duct connection at inlet to exhaust fan. Provide additional 3" flexible duct connection at outlet of inline fans.
- E. Provide accessories and fittings for complete and fully operational systems.
- F. Coordinate motor starters with Division 26 and controls contractor.
- G. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.

3.02 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four-hours travel from the job site.end of section

END OF SECTION

SECTION 23 41 00

AIR FILTRATION

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. This Section includes factory fabricated air filter devices and media utilized to remove particulate matter and gaseous contaminants in HVAC applications.
- B. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Air filters.
 - 2. Filter racks.
 - 3. Carbon filters.
 - 4. Odoroxidant media.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00: Basic HVAC Materials and Methods
- B. Section 23 31 13: Air Distribution

1.04 DEFINITIONS

- A. ASHRAE: American Society of Heating, Refrigeration and Air Conditioning Engineers
- B. IEST: Institute of Environmental Sciences and Technology
- C. UL: Underwriters Laboratories.
- D. Atmospheric Dust Spot Efficiency – per ASHRAE Standard 52.1 – Gravimetric and Dust Spot Procedures for Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter. Information deleted as this Standard was closed by ASHRAE in 2008.
- E. DOP: Dioctyl Phthalate, a carcinogen that was part of the original military-defined process of testing HEPA filters, no longer used to evaluate filters. Where noted, HEPA/ULPA filters should be evaluated using polystyrene latex spheres (PSL).
- F. HEPA: High-Efficiency Particulate Air filter, a filter with a factory confirmed efficiency of no less than 99.97% when evaluated on particles 0.3 microns in size.

- G. ULPA: Ultra Low Penetration Air Filter, a filter with a factory confirmed efficiency of no less than 99.9995% when evaluated on particles 0.12 microns in size.
- H. HEGA: High Efficiency Gas Adsorber, box-style filter with a removal rate on specified contaminants exceeding 95%.
- I. MERV: Minimum Efficiency Reporting Value per ASHRAE Standard 52.2 - Method of Testing General Ventilation Air Cleaning Devices for Removal by Particle Size
- J. MERV-A: A value from Appendix J in ASHRAE Standard 52.2 that is reflective of an air filters ability to maintain efficiency over time. The MERV-A should be equivalent to the respective MERV of the specified filter.

1.05 QUALITY ASSURANCE

- A. Codes and Standards: Provide filters conforming to the requirements of the latest addition of the following:
1. ANSI/AHRI-850: Performance Rating of Commercial and Industrial Air Filter Equipment.
 2. UL-900: Standard for Safety Air Filter Units.
 3. UL-586: Standard for High-Efficiency, Particulate, Air Filter Units.

4. ASHRAE 52.2: Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size.
5. NFPA-70: National Electrical Code.
6. NFPA-90A: Standard for the Installation of Air-Conditioning and Ventilating Systems.
7. NFPA-90B: Standard for the Installation of Warm Air Heating and Air-Conditioning Systems.
8. IEST-RP-CC001: HEPA and ULPA Filters.

B. Design Criteria

1. Air flow not to exceed rated capacity
2. Initial and final resistance not to exceed scheduled values.
3. Air filters shall be accessible for cleaning or replacement.

C. Manufacturer shall provide evidence of facility certification to ISO-9001:2008.

1.06 SUBMITTALS

- A. Product Data: Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final (with dirty filter allowance) pressure drop at rated airflow; efficiency and test method; UL classification; furnished specialties; and accessories for each model indicated. Manufacturers literature and sales drawings acceptable.
- B. Shop Drawings: Include plans, evaluations, sections, and details to illustrate component assemblies and attachments.
- C. Show filter holding mechanism assembly, dimensions, materials and methods of installation and sealing in drawings.
- D. Include setting drawings, templates and requirements for installing anchor bolts and anchorages.
- E. Operation and Maintenance Data: For each type of filter and filter holding mechanism to include in emergency, operation and maintenance manuals.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect all products against dirt, water, chemical, and mechanical damage. Do not install damaged products. Remove damaged materials from project site.
- C. Furnish extra filters that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel. This requirement excludes disposable filter media.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to the following (for HVAC Air Filters, Terminal HEPA Filter Modules, Adsorbers, Built-up Bank Holding Frames, Side-Access Housings and Bag-in/Bag-out Containment Housings):
1. Camfil (Farr)
 2. American Air Filter International (Flanders, PrecisionAire)
 3. Filtration Group <https://store.filtrationgroup.com/hvac/hvac-pleated-air-filters>
 4. Clarcor Air Filtration Products (AirGuard, ATI, Purolator)
 5. Eco-Air
- B. Air Filter Gages and Pressure Switches
1. Dwyer Instruments
- C. Non-ionizing, polarized media electronic air cleaners
1. Dynamic Air Quality Solutions

2.02 CONSTRUCTION FILTERS – MERV-7

- A. Air handling equipment shall not be operated without construction pre-filters in place and shall be medium efficiency, extended area, disposable type of the quantity and size indicated on the drawings.
- B. The filter media shall have a minimum efficiency reporting value of MERV-7 when evaluated under the guidelines of ASHRAE Standard 52.2.
- C. The filter media area and initial resistance shall be:
- | | | |
|-------------------------|---------------------------|--------------------|
| 1. For a 2" deep filter | 10 pleats per linear foot | Maximum 0.28" w.g. |
| 2. For a 4" deep filter | 9 pleats per linear foot | Maximum 0.20" w.g. |
- D. Manufacturer: Camfil #Aeropleat III or equal.

2.03 PREFILTERS AND SINGLE-STAGE PRIMARY FILTERS – EFFICIENCY MERV 8

- A. Air handling equipment shall not to be operated without filters installed (ex: see construction filter section). Minimum efficiency during normal operation shall be no less than MERV 8.
- B. The filter shall have a minimum efficiency reporting value of MERV 8 when evaluated under the guidelines of ASHRAE Standard 52.2.
- C. Each filter shall consist of a cotton and synthetic blend media, a welded wire media support grid and a high wet-strength beverage board enclosing frame.
- D. The filter media area and initial resistance shall be:
- | | | |
|-------------------------|---------------------------|--------------------|
| 1. For a 2" deep filter | 15 pleats per linear foot | Maximum 0.31" w.g. |
| 2. For a 4" deep filter | 11 pleats per linear foot | Maximum 0.27" w.g. |

- E. Manufacturer: Camfil #Farr 30/30 or equal.

2.04 SINGLE-STAGE 1" AND 2" PRIMARY FILTERS – EFFICIENCY MERV 13

- A. The filter shall have a minimum efficiency reporting value of MERV 13 when evaluated under the guidelines of ASHRAE Standard 52.2. Final resistance of 1.0" w.g.
- B. Each filter shall consist of a cotton and synthetic blend media, a welded wire media support grid and a high wet-strength beverage board enclosing frame.
- C. The filter media area and initial resistance shall be:
1. 1" filter depth 15 pleats per linear foot Initial Resistance 0.47" at 375 fpm.
 2. 2" filter depth 15 pleats per linear foot Initial Resistance 0.25" at 375 fpm.
 3. 4" filter depth 12 pleats per linear foot Initial Resistance 0.29" at 500 fpm.
- D. Manufacturer: Filtration Group #Aerostar Green Pleat, or equal.

2.05 SECONDARY FILTERS – MINI-PLEAT 4" DEEP TYPE EFFICIENCY MERV 11, 13, OR 14 AS NOTED ON DRAWINGS

- A. Air filters shall be 4" deep high efficiency ASHRAE box style filters consisting of mini-pleated wet laid fine fiber media, thermoplastic resin separators, frame to media adhesive and high wet strength beverage board enclosing frame. Sizes shall be as noted on drawings or other supporting materials.
- B. Filter media shall be of one continuous sheet of micro fine wet-laid glass mat filter media formed into uniformly spaced pleats and formed into a mini-pleat pack configuration. Thermoplastic pleat separators shall provide uniform media separation to promote uniform airflow throughout the media. The enclosing frame shall be of high wet strength beverage board which shall be bonded to the entire periphery of the media pack to prevent air bypass. The frame shall include integral diagonal support members to ensure maintained media spacing and pleat stability. The diagonal support members shall be bridge-engineered to prevent filter racking and ensure filter configuration integrity. Filter shall be bi-directional with regard to airflow.
- C. The filter shall have a Minimum Efficiency Reporting Value of MERV-11, MERV-13 or MERV-14 as stated on the drawings.
- D. The filter shall be capable of withstanding 5" w.g. without failure of the media pack.
- E. Performance of the filter shall comply with the following minimum performance data based on a 24" by 24" by 4" filter tested at 2000 CFM.
- F. Minimum Filter Requirements:

Efficiency	Initial Resistance (w.g.)	Media Area
MERV 11	0.33"	113 sq. ft. based upon 24" by 24" by 4 size
MERV 13	0.44"	113 sq. ft. based upon 24" by 24" by 4 size
MERV 14	0.60"	113 sq. ft. based upon 24" by 24" by 4 size

- G. Manufacturer: Camfil #Opti-Pac or equal.

2.06 SECONDARY FILTERS – DEEP PLEAT 12” DEEP BOX-STYLE - EFFICIENCY MERV 11, 13, OR 14 AS NOTED ON DRAWINGS

- A. Air filters shall be high-efficiency ASHRAE high lofted supported media disposable type assembled in a compact and secure enclosing frame. Sizes shall be as noted on drawings.
- B. The filter media shall be of micro fine glass laminated to a reinforcing backing to form a uniform lofted media blanket. The media blanket shall be formed into uniform tapered radial pleats and bonded to a stiffened backing that is bonded to the downstream side of the media to preclude media oscillation. The media shall be mechanically and chemically bonded within the frame to prevent air bypass. The enclosing frame shall be constructed of corrosion resistant galvanized steel. Media support contour stabilizers shall be mechanically fastened to diagonal support members to create a rigid and durable filter enclosure. There shall be a minimum of four contour stabilizers on the air entering side and four on the air exiting side.
- C. The filter shall have a Minimum Efficiency Reporting Value of MERV-9, MERV-11, MERV-13, or MERV-14 as stated on the drawings.
- D. The filter shall be capable of withstanding 10” w.g. without failure of the media pack.
- E. Performance of the filter shall comply with the following minimum filter performance data based on a 24” by 24” by 12” filter tested at 2000 CFM:

Efficiency	Initial Resistance (w.g.)	Media Area
MERV 9 & 9-A	0.36”	58 sq. ft. based upon 24” by 24” by 12 size
MERV 11 & 11-A	0.31”	53 sq. ft. based upon 24” by 24” by 12 size
MERV 13 & 13-A	0.41”	53 sq. ft. based upon 24” by 24” by 12 size
MERV 14 & 14-A	0.53”	53 sq. ft. based upon 24” by 24” by 12 size

- F. Manufacturer: Camfil #Riga-Flo or equal.

2.07 SECONDARY FILTERS – DEEP PLEATED 12” V-BANK STYLE PLEAT-IN-PLEAT BOX-STYLE - EFFICIENCY MERV 11, 13, OR 14 AS NOTED ON DRAWINGS

- A. Air filters shall be high-efficiency ASHRAE pleat-in-pleat V-bank disposable type assembled in a compact and secure enclosing frame. Sizes shall be as noted on drawings or other supporting materials.

- B. Filter media shall be of micro fine glass formed into uniformly spaced pleats separated by glass filament separators and formed into a mini-pleat pack design. Each mini-pleat pack shall be assembled into a V-bank configuration with an appropriate number of packs to obtain required pressure drop. The media packs shall be bonded to the inside periphery of the enclosing frame with a fire-retardant phosphorus-free sealant. The enclosing frame shall include modular injection-molded plastic channels bonded to the media pack to prevent air bypass. Injection-molded modular plastic supports shall be placed on the air entering and air exiting sides. The filter shall have a nominal 1" header that is an integral component of the enclosing frame. Injection-molded rigid plastic end caps shall be bonded to the top and bottom of the enclosing structure to ensure a rigid and durable filter. A gasket shall be included on header-to-header sealing surfaces to eliminate air bypass between headered filters. Filter shall be bi-directional with regard to airflow.
- C. The filter shall have a Minimum Efficiency Reporting Value of MERV-11, MERV-13, MERV-14, or MERV-16 as stated on the drawings.
- D. Performance of the filter shall comply with the following minimum filter performance data based upon a 24" by 24" by 12" deep filter tested at 2000 cfm:

Efficiency	Initial Resistance (w.g.)	Media Area
MERV 11 & 11-A	0.22"	200 sq. ft. based upon 24" by 24" by 12 size
MERV 13 & 13-A	0.27"	200 sq. ft. based upon 24" by 24" by 12 size
MERV 14 & 14-A	0.29"	200 sq. ft. based upon 24" by 24" by 12 size
MERV 16 & 16-A	0.64"	200 sq. ft. based upon 24" by 24" by 12 size

- E. The filter shall be capable of withstanding 10" w.g. without failure of the media pack.
- F. Manufacturer: Camfil #Durafil or equal.
- 2.08 SECONDARY (OR SINGLE-STAGE) FILTERS – MULTI-POCKET HIGH EFFICIENCY MERV 11, 13, OR 14 AS NOTED ON DRAWINGS

- A. Air filters shall be high efficiency ASHRAE extended surface pocket style filters consisting of high loft air laid micro fine glass media, a reinforced ABS plastic header, ABS plastic pocket retainers, and bonding agents to prevent air bypass and ensure leak free performance.
- B. Filter media shall consist of high-density air laid lofted micro fine glass media that is chemically bonded to a synthetic micro mesh media support backing forming a lofted filter blanket.
- C. Individual pockets shall contain a minimum of 40 stitching support points per square foot of media area. All stitching centers shall be sealed through the use of a foam based sealant that shall remain pliable throughout the life of the filter. The sides and ends of each pocket shall be sewn with a chain-link over lock stitch.
- D. Pockets shall be formed into tapered pleats, supported by controlled media space stitching, to promote uniform airflow across the surface of the media. At any point, the sizes of the upstream and downstream passages shall be proportional to the volume of filtered air. The pockets shall also have a conical configuration to minimize contact with HVAC system components.

- E. Support members shall include an ABS plastic header and ABS plastic pocket retainers. The header shall be joined to the media to prevent air bypass. Individual pocket retainers shall be attached to the header frame with anchor ports allowing for visual confirmation. Bypass between pockets shall be eliminated through a snap-to-seal pocket retainer that shall be an integral part of the two-piece header design. The frame shall form a rigid and durable support assembly.
- F. The air exiting side of the air tunnels include a pocket flange to ensure pocket integrity throughout the life of the filter. A downstream pocket-to-pocket partition shall provide additional pocket separation to ensure full flow through the entire media area.
- G. A filter-to-filter sealing gasket shall be installed on one of the vertical members of the filter header.
- H. The filter shall have a Minimum Efficiency Reporting Value of MERV-11, MERV-13, MERV-14, or MERV-15 as stated on the drawings.
- I. Performance of the filter shall comply with the following minimum filter performance data based upon a 24" by 24" by 22" deep 8-pocket filter tested at 2000 cfm:

Efficiency	Initial Resistance (w.g.)	Media Area
MERV 9 & 9-A	0.20"	58 sq. ft. based upon 24" by 24" by 22" size
MERV 11 & 11-A	0.28"	58 sq. ft. based upon 24" by 24" by 22" size
MERV 13 & 13-A	0.45"	58 sq. ft. based upon 24" by 24" by 22" size
MERV 14 & 14-A	0.68"	58 sq. ft. based upon 24" by 24" by 22" size

- J. The manufacturer shall warranty that the filter shall be capable of withstanding 10.0" w.g. without failure of the filter.
- K. Manufacturer: Camfil #Hi-Flo ES or equal.
- 2.09 HEPA FILTER – STANDARD CAPACITY – ALUMINUM SEPARATORS – (99.97%, 99.99%) - 12" DEEP AS NOTED ON THE DRAWINGS
- A. Air filters shall be HEPA grade standard capacity air filters with waterproof micro glass fiber media, corrugated aluminum separators, urethane sealant, a galvanized 16-gauge steel enclosing frame and sealing gasket. Sizes shall be as noted on drawings or other supporting materials.
- B. Filter media shall be one continuous pleating of micro fine glass fiber media. Pleats shall be uniformly separated by corrugated aluminum separators incorporating a hemmed edge to prevent damage to the media. The media pack shall be potted into the enclosing frame with a fire-retardant urethane sealant. The enclosing frame shall be of galvanized 16-gauge steel, shall be bonded to the media pack to form a rugged and durable enclosure. The filter shall be assembled without the use of fasteners to ensure no frame penetrations. Overall dimensional tolerance shall be correct within $-1/8"$, $+0"$, and square within $1/8"$. A poured-in-place seamless sealing gasket shall be included on the downstream side of the enclosing frame to form a positive seal upon installation.

- C. The filter shall have a tested efficiency of 99.97%, 99.99%, or 99.999% as stated on the drawings when evaluated according to IEST Recommended Practice. Initial resistance to airflow shall not exceed 1.0" w.g. at rated capacity.
 - D. The filter shall be capable of withstanding 10" w.g. without failure of the media pack.
 - E. Manufacturer: Camfil #Absolute XS or equal.
- 2.10 HEPA FILTER – HIGH CAPACITY – ALUMINUM SEPARATORS – (99.97%, 99.99%) -12" DEEP AS NOTED ON THE DRAWINGS
- A. HEPA filters shall be HEPA grade high-capacity air filters with waterproof micro glass fiber media, tapered corrugated aluminum separators, urethane sealant, a galvanized 16-gauge steel enclosing frame, and (neoprene sealing gasket, seamless gasket). Sizes shall be as noted on drawings.
 - B. Filter media shall be one continuous pleating of micro glass fiber media. Pleats shall be uniformly separated by tapered corrugated aluminum separators incorporating a hemmed edge to prevent damage to the media. The media pack shall be potted into the enclosing frame through the use of a urethane sealant. The enclosing frame of galvanized 16-gauge steel, shall be bonded to the media pack and form a rugged and durable enclosure. The filter shall be assembled without the use of fasteners to assure no frame penetrations. Overall dimensional tolerance shall be correct within -1/8", +0", and square within 1/8". A poured-in-place seamless sealing gasket shall be included on the downstream side of the enclosing frame to form a positive seal upon installation.
 - C. The filter shall have a tested efficiency of 99.97%, 99.99%, 99.999% as stated on the drawings when evaluated under the guidance of IEST Recommended Practice RP-CC001.
 - D. Initial resistance to airflow shall not exceed 1.35" w.g. at rated capacity. The filter shall be capable of withstanding 10" w.g. without failure of the media pack.
 - E. All filters shall be bagged and packaged in heavy-duty cardboard boxes. Each box shall contain a liner to minimize shock and vibration of the HEPA filter.
 - F. Manufacturer: Camfil #Absolute XH or equal.
- 2.11 HEPA FILTERS – ULTRA HIGH CAPACITY – PLEAT-IN-PLEAT V-STYLE (95%, 99.97%, 99.99%) AS NOTED ON THE DRAWINGS
- A. Air filters shall be absolute grade HEPA filters consisting of pleated media packs assembled in a V-bank configuration, polyurethane sealant, anodized aluminum enclosure and seamless sealing gasket. Sizes shall be as noted on enclosed drawings.
 - B. Filter media shall be micro fiber glass formed into minipleat pleat-in-pleat V-bank design. The media packs shall be potted into the enclosing frame with fire retardant polyurethane sealant. An enclosing frame of anodized extruded aluminum shall form a rugged and durable enclosure. A seamless sealing gasket shall be included on the downstream side of the filter to form a positive seal upon installation.
 - C. Filter efficiency at 0.3 micron shall be 95%, 99.99%, 99.999% as stated on the drawings when evaluated according to the IEST Recommended Practice for applicable type. Initial resistance shall not exceed 1.0" w.g. at rated capacity or 0.50" w.g. for 95% filters.

- D. All filters shall be bagged and packaged in heavy-duty cardboard boxes. Each box shall contain a liner to minimize shock and vibration of the HEPA filter.
- E. Manufacturer: Camfil #Filtra 2000 or equal.

2.12 DUCTED LAMINAR FLOW TERMINAL HEPA FILTER HOUSINGS AND FILTERS -99.99% (ROOM SIDE REPLACEABLE)

- A. Filter housing shall include anodized aluminum module, offset filter knife-edge for gel seal filter mating, stainless steel mounting hardware and adjustable air diffusion disc. Sizes shall be as noted on drawings. Primary housing components shall be constructed of anodized aluminum framing material, aluminum back plate and aluminum diffusion disk. Unit shall be designed for installation into T-Bar ceiling grid or a gypsum/plaster ceiling. The housing shall include a chamfered detail along the room side opening to receive a mating flange along the downstream side of the filter. The mating surface shall form a continuous flush fit free of gaps. The housing shall include an offset knife-edge to interface with a gel seal filter. Stainless steel mounting hardware shall facilitate convenient servicing of the module from the room side of the housing. The housing shall include an integral diffusion disc that allows filter-to-filter balancing from room side of module without removal of the filter. Housing shall be supplied with a 10" or 12" collar for duct connection to air system. The collar shall include an integral continuous raised ridge to assist in securing flexible duct.
- B. Air filters shall be high efficiency individually tested and certified panel filters consisting of aluminum enclosing frame, low-outgassing sealant, continuous filament pleat separators and micro glass media filter pack. Sizes shall be as noted on drawings or other supporting materials. Filter shall be manufactured in a Class 10,000 (M5.5, ISO Class 7) cleanroom and tested in a Class 100 (M3.5, ISO Class 5) clean space. Filter media shall be one continuous pleating of micro glass fiber media formed into a uniform pack depth. Pleat spacing shall be by continuous glass filament separators to prevent media-to-media contact and promote uniform airflow through the media pack. The media pack shall be completely encapsulated in a polyurethane sealant creating a rigid self-supporting pack. The sealant shall be low out gassing, fire-retardant and self-extinguishing. The enclosing frame, of anodized aluminum profiles, shall be joined together with secure internal corner clips to form a rugged and durable enclosure. Overall dimensional tolerance shall be correct within +0, -1/8", and square within 1/4". Gaskets, unless otherwise noted, shall be low outgassing cleanroom grade cellular urethane foam. Corners shall be dovetailed to form an interlocking joint and positive seal.
- C. Manufacturer: Filter module and filter shall be Camfil Slimline RSR and Camfil Megalam panel or equals.

2.13 TERMINAL HEPA MODULES (DISPOSABLE) – 99.99%

- A. Unit shall be ducted high efficiency ceiling module consisting of anodized aluminum frame, a galvanized back plate, 41-mm filter pack, polyurethane encapsulating sealant and dual access ports. Maximum module depth shall not exceed 4.73". Sizes shall be as noted on drawings. Filter housing shall be constructed of an anodized aluminum frame mated with a galvanized steel back plate. It shall be designed for installation into a T-Bar ceiling grid system. The media pack shall have a maximum depth of 1.61" (41 mm) and shall have an efficiency of 95 @ 0.3 micron, 99.99% @ 0.3 micron, 99.9995% @ MPPS. Pleat spacing shall be by continuous glass filament separators to prevent media-to-media contact and promote uniform airflow through the media pack. The media pack shall be completely encapsulated in a polyurethane sealant creating a rigid self-supporting pack. The sealant shall be low out gassing, fire-retardant and self-extinguishing. The module shall include an adjustable airflow diffusion disc that is adjustable from the room side through an access port. A second port, accessible from the room side, shall be provided to allow aerosol test challenge introduction or pressure drop

measurement. Housing shall be supplied with a 10" or 12" collar that includes an integral continuous raised ridge for duct side connection to air system.

B. Manufacturers: Camfil #Megalum Terminal Diffuser or equal.

2.14 FAN POWERED HEPA FILTER MODULES – 99.99% (ROOM SIDE REPLACEABLE) (NOTE TO EDITOR: RARELY USED.)

A. Self-contained fan powered HEPA filter module. Refer to schedule on drawings.

B. Module shall provide vertical laminar air flow. Unit to meet or exceed IEST-RP2 Specifications for Laminar Air flow devices, 90 FPM+/- 10 FPM.

C. Fan Filter Modules shall be UL listed.

D. Filter Media: Separatorless, high strength, water-proof, micro-fiberglass High Efficiency Particulate Air (HEPA) filter with a minimum efficiency of 99.99% at 0.3 micron, aerosol challenged.

E. Motor/Blower Assembly: Direct drive continuous duty motor with inherent overload protection. Assembly is designed to provide rate airflow through an increase from 0.425" to 0.85" w.g.

F. Construction

1. Aluminum filter plenum with integral blower housing.

2. Threaded nuts in each corner to seismic hanger loops.

3. HEPA filter, factory sealed in an extruded aluminum frame for leak-free operation, furnished with a neoprene gasket.

4. The filter face guard shall be removable, perforated anodized aluminum screen.

G. Sound level: Sound level shall not exceed 53 dBA at three feet at normal operation levels.

H. Vibration shall not exceed 0.1 micro inch. Average to be 0.05 mil peak to peak.

I. Options to be included:

1. Solid-state speed control.

2. 12-inch diameter duct collar for 24" x 48" and 10-inch diameter collar for 24" x 24".

3. Room side replaceable filter construction, which allows filter removal and installation without disturbing the unit or adjacent ceiling components.

4. Adaptor to allow fan powered HEPA filter installation in a gypsum board ceiling.

2.15 ADSORBER – ACTIVATED CARBON ADSORBERS – MOLECULAR CONTAMINANT REMOVAL – HEGA

- A. Air filters shall be high efficiency gas adsorbers, with (adsorbent selection), (number of beds) adsorbent beds, a (bed depth) bed depth enclosed in a high-impact polystyrene enclosing frame. Sizes shall be as noted on drawings. Adsorbent shall be (activated virgin coconut shell carbon, nuclear grade carbon, ASZM-TEDA carbon). There shall be (number of beds) beds of adsorbent arranged in a V-bank configuration to reduce system resistance to airflow. Adsorbent bed depth shall be (1", 2"). Adsorber screens shall be perforated and supported by external spacers to prevent bed distortion during filling and shake process. The enclosing frame shall be of high-impact polystyrene plastic and shall be designed for disposal through incineration. The frame shall form a rigid and durable enclosure. A 1/4" thick neoprene sealing gasket shall be included on the upstream side of the HEGA enclosing frame to form a positive seal upon installation.
- B. The HEGA shall have a minimum mechanical efficiency of 99.9%, and be tested and packaged in accordance with IEST-RP-CC-008-84. The HEGA filter shall be capable of operation to 120°F. The filter bed shall have a residence time of (insert value) seconds at (rated airflow) cfm.
- C. Manufacturer: Camfil or equal.

2.16 UNIVERSAL ASHRAE GRADE HOLDING FRAMES

- A. Filter holding frame shall be constructed of 16-gauge galvanized steel. The frame shall be assembled from two corner sections and welded to assure a rigid and durable frame assembly for built-up bank HVAC level application. Centering dimples shall be an integral part of the frame to assist in aligning final filter and pre-filter if applied.
- B. Frame-to-frame installation holes shall be an integral part of the frame, two holes on each vertical and three holes on top and bottom. The top of the frame shall be identified with etching.
- C. The frame shall include eight integral corrosion resistant compression tabs, four on each horizontal member, to facilitate filter installation without the use of tools or other fasteners.
- D. A 3/4" filter sealing flange shall be an integral component of the holding frame. All corners shall be flush mitered.
- E. A replaceable filter-to-frame sealing gasket shall be installed on the flange to prevent air bypass and ensure that the filter seats securely against the sealing flange.
- F. Holding Frames shall be assembled to form built-up filter banks with the use of nuts and bolts and vertical support members as detailed on manufacturer provided drawings. (Refer to details of assembly and support drawings.)
- G. Dow 732 Sealant shall be applied to the periphery of all holding frames prior to clamping, assembly and bolting.
- H. Manufacturer: Camfil FastFrame or equal.

2.17 TWO STAGE SIDE ACCESS FILTER HOUSING FOR ASHRAE PARTICULATE FILTERS (SIDE LOADING)

- A. Filter housing shall be multi-stage air filter housing consisting of 16-gauge galvanized steel enclosure, multi-filter adaptable extruded aluminum filter mounting track, dual-access doors, three static pressure taps, door and filter gaskets and seals. In-line housing depth shall not exceed 25".

- B. Sizes shall be as noted on drawings.
- C. The housing shall be constructed of 16-gauge galvanized steel, stainless steel, or aluminum with standing flanges to facilitate attachment to other HVAC system components. Corner posts of Z-channel construction shall ensure housing stability and rigidity. The housing shall be weatherproof and suitable for rooftop/outdoor installation without modification.
- D. The housing shall incorporate the capability of multiple stages of filtration without modification to the housing. A filter track, of extruded aluminum construction shall be an integral component of housing construction. The track shall accommodate a 2" or 4" deep pre-filter, a 2" or 4" deep intermediate particulate or carbon filter, and a 6" or 12" deep rigid or pocket final filter.
- E. Dual access swing-open doors shall include high-memory sponge neoprene gasket to facilitate a door-to-filter seal against all individual stages of filtration. Each door shall be equipped with adjustable and replaceable positive sealing UV-resistant star-style knobs and replaceable door hinges.
- F. The housing shall include three pneumatic fittings to allow the installation of static pressure gauge(s) to evaluate pressure drop across the pre-filter, the secondary filter, the final filter, or any combination of the installed filters.
- G. Leakage at rated airflow, upstream to downstream of filter and slide mechanism shall not exceed 1% at 3.0" w.g. Leakage into or out of the housing shall be less than 1% at 3.0" w.g.
- H. Accuracy of pneumatic pressure fittings, when used to evaluate a single-stage, or multiple filter stages, shall be accurate within $\pm 3\%$ at 0.6" w.g.
- I. Housing integrity to listed performance values shall be available on request from the housing manufacturer.
- J. Manufacturer: Camfil #GlidePack MultiTrack 25 or equal.

2.18 SIDE ACCESS ADSORBER HOUSING WITH CARBON CANISTERS

- A. Air filters shall be (plastic disposable, stainless steel factory rechargeable) loose-fill sorbent canisters and matching (face-access holding frames, side access housings). Canister size shall be (5.7" diameter x 18" length, 5.7" diameter x 24" length). There shall be 16 canisters per 2000 cfm rated airflow at 500 fpm.
- B. Sorbent canisters shall be constructed of (disposable ABS + HDPE plastic, refillable 22-gauge stainless steel) and shall be capped with a (plastic, stainless steel) end plate. Each canister shall include a minimum of (30, 115) airflow perforations per square inch of cylinder surface area. Perforations shall be a minimum of (0.090", 0.060") diameter in size. Each canister shall include a mounting assembly with three integral bayonets for mounting to matching cylindrical mounting flange/frame. An integral gasket seal shall be factory-installed to ensure a bypass-free seal to the mounting flange/frame. Each canister shall contain at least 0.0485 cu. ft. of sorbent per 6" of canister length. Media bed depth shall be 1.0".

- C. Sorbent shall be Camfil (select one of the following): (CFS – 201 activated carbon), (CFS - 202, impregnated carbon for adsorption of corrosive and acidic gases), (CFS – 204, impregnated carbon for adsorption of ammonia and basic gases), (CFS - 101, activated alumina impregnated with Campure 4, 4% potassium permanganate), (CFS - 103, activated alumina impregnated with Campure 6XL, 6% potassium permanganate and proprietary impregnations), (CFS-102, -- activated alumina impregnated with Campure 8, 8% potassium permanganate), (CFS - 002, blended activated carbon and Campure 4),(CFS - 004, blended activated carbon and Campure 6XL). Manufacturer may recommend blends of the adsorbent medias listed above or other sorbent medias as dictated by the intended application.
- D. System pressure drop shall not exceed (0.63, 0.59)" w.g. at a velocity of 500 fpm when proper quantity of (18", 24") cylinders are mounted to matching canister holding frame(s). Canister to mounting hardware procedure shall form a mechanical connection with a seal limiting air bypass across canister mounting assembly. Initial single-pass removal efficiency shall be >95% for specified gases, per manufacturer's test methodology at gas concentrations no greater than 100 ppm. Manufacturer shall demonstrate uniformity of air flow via computational fluid. Manufacturer shall document adsorbent capacity of canisters to a minimum required removal efficiency for representative molecular contaminant(s)*.
- E. Canister installation shall provide sound attenuation of at least +5 dBA at 220 Hz, +10 dBA at 440 Hz, and +15 dBA at 1760 Hz. Manufacturer shall provide an independent report of canister sound attenuation performance from a recognized testing laboratory. Initial resistance to airflow with charged panels installed shall not exceed 0.35" w.g. at 500 fpm.

2.19 HEPA FILTER HOLDING FRAMES (FOR BUILT-UP BANKS) (GASKET SEAL OR FLUID SEAL)

- A. Gasket seal holding frames shall be constructed of 14-gauge galvanized steel or 304 SST. Frames shall be welded and include centering dimples, pre-drilled mounting holes, filter sealing flange and swing bolt assemblies. An appropriate number of swing bolts to match air filters shall also be included. Sizes shall be as noted on drawings. Annular based centering dimples shall be an integral component to assist in proper seating of filter gasket to filter sealing flange. Assembly holes shall be within dimples to recess assembly bolts. Filter securing swing bolt assemblies, of the same construction as the frame, shall be offset to facilitate multiple filter installations. The assembly shall include appropriate swing bolts to match filter depth and equi-bearing clamps to allow uniform filter gasket sealing. The sealing assembly shall be capable of sealing each element with 30 inch/lbs. of torque to 50% filter gasket compression.
 - 1. Manufacturer: Camfil MagnaFrame II or equal.
- B. Fluid seal holding frames shall be constructed of 14-gauge galvanized steel or 304 SST. Frames shall be welded and include centering dimples, pre-drilled mounting holes, knife-edge filter sealing flange and swing bolt assemblies. An appropriate number of swing bolts to match air filters shall also be included. Sizes shall be as noted on drawings. Filter frame shall be all-welded construction of 14-gauge galvanized steel or 304 SST. The frame shall include pre-drilled mounting holes to align frame-to-frame and ensure built-up bank support. Annular based centering dimples shall be an integral component to assist in proper seating of filter gel seal channel to frame sealing knife-edge. Assembly holes shall be within dimples to recess assembly fasteners. Additional filter receptacle guides on the top and bottom of the holding frame shall assist in filter alignment. Filter securing swing bolt assemblies, of the same construction as the frame, shall be offset to facilitate multiple filter installations. The assembly shall include appropriate swing bolts to match filter depth and equi-bearing clamps to allow uniform filter sealing. The sealing assembly shall create a scan capable filter to frame assembly seal.

1. Manufacturer: Camfil MagnaFrame III or equal.

2.20 CONTAINMENT – BAG-IN/BAG-OUT HOUSINGS

- A. Side-access bag-in/bag-out, gasket seal housing. The housing shall be adequately reinforced to withstand a negative or positive pressure of 15" water gage. Housing design and filter arrangement shall allow air to enter and exit housing without changing direction. The housing shall accommodate standard size filters that do not require any special attachments or devices to function properly in the housing. Sizes shall be noted on drawings.
- B. Housing shall be constructed of 14-gauge and 11-gauge T-304 stainless steel. All pressure retaining joints and seams shall be continuously welded with no porosities. Joints and seams requiring intermittent welds, such as reinforcement members, shall be intermittently welded. Housing shall be free of burrs and sharp edges. All weld joints and seams that are a portion of any gasket setting surface (duct connection flanges and filter sealing surfaces), shall be ground smooth and flush with adjacent base metals. All welded joints and seams shall be wire brushed to remove heat discoloration. The housing shall be reinforced to withstand a positive or negative pressure of 15" w.g. The upstream and downstream ductwork connections shall have 1 1/2" outward-turned flanges.
- C. The housing shall have a bagging ring around each filter access port that is sealed by a gasketed filter access door. The filter access door gasket shall be silicone and shall be replaceable, if necessary. The bagging ring shall have two (2) continuous formed raised ridges to secure the PVC change-out bag. The bagging ring shall be hemmed on the outer edge to prevent the change-out bag from tearing.
- D. Ancillary hardware including filter clamping mechanism, door handles, door studs and labels shall be 300 series stainless steel. The threaded pivot blocks in the filter clamping mechanisms shall be of brass construction. Filter access door knobs shall be cast aluminum and designed to prevent galling of threads.
- E. A filter clamping mechanism shall be operated by means of a standard wrench from outside the housing. The clamping mechanism shall include two pressure channel assemblies with eight springs per filter and exert a minimum filter sealing force of 1,400 pounds per full size filter, 1050 pounds per half size filter, and 700 pounds per quarter size filter. The force shall be applied as an even, uniform load along at least 80% of the top and bottom of each filter outer frame. The filter clamping mechanism adjustment penetration through the housing wall shall be sealed airtight.
- F. One (1) manufactured PVC change-out bag shall be furnished with each filter access port. Change-out bags shall be 8-mil. thick with a yellow translucent, non-sticking, matte finish. It shall include a 1/4" diameter elastic shock cord hemmed into the opening of the bag so when stretched around the housing bagging ring flange, a secure fit is created. The bag shall include three (3) integral glove ports to assist in filter change-out. One (1) nylon security strap shall be included per filter access port to prevent the bag from sliding off the bagging flange during the change-out process. Design of components shall be such that all change-out operations shall be within the bag so there is a barrier between the worker and the filter at all times.
- G. All welding procedures, welders, and welder operators shall be qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX and AWS D9.1 Specification for Welding of Sheet Metal. All production welds shall be visually inspected by qualified personnel.

- H. The filter housing shall be factory tested for filter fit, flatness of filter sealing surface and operation of filter clamping mechanism. The filter sealing surface and the complete assembly pressure boundary shall be leak tested by the pressure decay method as defined in ASME N510 Testing of Nuclear Air Cleaning Systems. The filter sealing surface shall be tested at +10" water gage and have a maximum leak rate of 0.0005 cfm per cubic foot of housing volume. The overall system pressure boundary shall be leak tested at +15" water gage and have a maximum leak rate of 0.0005 cfm per cubic foot of housing volume.
- I. Filter bags shall be capable of continuous operating to temperature extremes of 0°F to 150°F.
- J. Multi-wide housing shall be equipped with a filter removal rod to pull the filters to the change-out position. The removal rod shall operate from the inside of the filter change out bag.
- K. Manufacturer: Camfil GB-series or equal.

2.21 NON-IONIZING, POLARIZED MEDIA ELECTRONIC AIR CLEANERS

- A. Operation: The Air Cleaner shall have an active electrostatic field that polarizes a dielectric media. It shall not ionize airborne particles or produce ozone.
- B. Laboratory Testing Performance: Using the ASHRAE 52.2 protocol with carbon black in the test dust, the Air Cleaner shall test at MERV 13. Using the ASHRAE 52.2-NC protocol (with no carbon in the loading dust), the Air Cleaner shall test at MERV 15. As installed, it shall have a clean static pressure drop of less than 0.3" w.g. at 500 feet per minute and shall increase in resistance no more than 0.25" w.g. with a dust loading of 2,855 grams. It shall hold a total of 4,582 grams of dust at its final resistance of 1.4" w.g. per 24x24 module. Any substitute Air Cleaner must meet these MERV ratings, static pressures and loading characteristics. The Air Cleaner manufacturer must provide testing from an approved ASHRAE test lab to verify MERV rating, operational and loading performance.
- C. Field Performance: The Air Cleaner manufacturer shall produce at least two documented installation references, including client contact information with the following criteria:
 - 1. Air Cleaners shall have operated continuously for a minimum of 2.5 years with no pre-filtration and without media change and achieved an increase of less than .2 inches of static pressure at a face velocity of ~500fpm, in an urban environment. Air cleaner installations must be greater than 10,000 cfm and serving office and/or hospital space.
 - 2. In an urban environment, Air Cleaners must have demonstrated the ability to achieve indoor ultra-fine particle and black carbon levels that are up to 94% lower than the concentrations in the air outside the building. Outdoor air levels brought into in the building must be based on the ASHRAE Standard 62 Ventilation Rate Procedure.
 - 3. Air Cleaners shall have a documented ability to reduce TVOC levels by 50-60% in a single pass. Air Cleaners must have already been in service for over 90 days. Tests must be administered by an independent, third-party and readings must be taken immediately upstream and downstream of the Air Cleaning system over at least a 24-hour period.
- D. Construction: The Air Cleaner modules shall consist of four or six individual Air Cleaner Panels that are nominally 1" in depth, arranged in V's within the module. The construction of the Air Cleaner frame and screens shall be aluminum, and the module side panels and attachment flanges shall be of galvanized steel. The Air Cleaner modules and each component thereof must have a positive seal where necessary to prevent bypass of unfiltered air.
- E. Electronics: The high voltage powerheads shall require 24 volts AC input and have a 9.5kV DC output. The powerheads must be fully potted and connected in parallel.

- F. Control Panel: The 24VAC power supply must be a UL or CSA certified transformer, class "2" type, which shall permit one side of the secondary output (24V) to be attached to electrical ground. A Filter Minihelic gauge shall be installed in the Unit Control Panel (optional direct readout or signal tied into building automation).
- G. Filter Media: Each Air Cleaner shall have a disposable and recyclable media pad with a minimum of a class "2" fire rating. It shall have a positive seal in the overall filter assembly.
- H. Configuration: The Air Cleaners will be arranged in pre-fabricated module assemblies nominally 12" or 18" in height, of varying widths up to 48", and 24" in depth in direction of airflow. The number of modules and width shall be such that the face velocity thru the filter bank shall be no more than 550 fpm. Dynamic. Provide side or face load configuration system as indicated on air handler schedule. Minimum requirements: 24" doors/access panels on both sides of filter section and 25" unobstructed upstream/downstream space in the filter section.
- I. Electrical Connection: The Air handler manufacturer shall provide a fully operational filter section for field connection and field electrical tie-in. All 24VAC electrical and control wiring integral to the Air Cleaner modules and Control Panel, including the access door interlocks, are to be provided by the Air Cleaner manufacturer for connection in the field or factory. All line voltage connections and wiring are the responsibility of the contractor.
- J. Maximum Allowable Static Pressure: To minimize energy consumption, the AHU fan system has been designed for specific pressure drop through the Air Cleaning system. The fan system is designed for a maximum of 0.75" w.g when the filters are dirty.
- K. Construction and Start-up: If the AHU is operating during construction, the Air Cleaner bank shall be protected using roll or other media. These should be removed after 30 days from initial startup.
- L. Replacement Media (optional): The AHU manufacturer is responsible to purchase and store sufficient replacement filters so as not to exceed a total static pressure of 0.75" w.g (Matching #11 above) for a period of 4 years from final acceptance. Material responsibility not to exceed total media changes of 6 times per year.
- M. Manufacturer: Dynamic Air Quality Solutions Model V8 Air Cleaning System or equal.

2.22 GAS AND VAPOR PHASE CONTROL MEDIA AND TRAYS

- A. Activated Carbon Media
 1. HVAC grade virgin carbon granules, 4 x 6 mesh.
 2. Carbon tetrachloride (CTC) activity of 60, minimum, with a ball abrasion hardness of 95 minimum per ASTM D-380.
 3. Ash content - 5% maximum per ASTM D-2866.
 4. Moisture content - 5% maximum by weight.
 5. Bulk density - .50 - .54 g/ml (31-34 #/cu. ft.) as packed.
 6. Media shall be loaded into trays by the vendor, but shall not be installed until immediately prior to beneficial occupancy and all paints and cleaning solvents are dry.
- B. Odoroxidant Media

1. Impregnated activated alumina media with a U.L. Class 1 rating designed to remove gaseous vapors such as H₂S, SO₂, SO₃, Ethylene (Olefins), Formaldehyde and Methy/Ethyl Mercaptans. It also has the ability to adsorb and absorb products of Aldehydes, light organic vapors, organic acids and inorganic acids.
2. Physical properties:
 - a. Built in color indicator Purple
 - b. Shape Spherical
 - c. Mean Particle Diameter 1/8" - 3/16"
 - d. Moisture, Maximum 15% w/w
 - e. Bulk Density 50 lbs/ft
 - f. Active Ingredients Potassium Permanganate (KMnO₄), 4% by weight,
 - g. Inert Ingredients Alumina (Al₂O₃)
 - h. U.L. Class 1 Rating Yes
3. Manufacturer: Unisorb Mark 2 or equal.

C. Media Trays

1. Constructed of non-corrosive high impact polystyrene with internal separators and filled with HVAC grade virgin carbon media.
2. Capable of being reloaded with fresh carbon in the field.

2.23 BUBBLE-TIGHT ISOLATION DAMPER

- A. Dampers shall be butterfly type consisting of circular blade, mounted to axle within formed flanged frame.
- B. Frame shall be constructed of steel channel with a clean and smooth interior surface.
- C. Blade shall be minimum 1/4-inch thick and be complete with full circumference silicone blade seal mechanically attached to blade with full circumference retainer ring. Adhesive seals are not acceptable.
- D. The axle shall be supported in sealed, relubricable, ball bearings mounted outboard of frame and be complete with axle shaft seals. Damper shall be actuated by external hand wheel gear operator, where indicated as manual type on drawings. For dampers serving the Damper frame and blade shall be fabricated from hot rolled steel.
- E. All parts not otherwise protected shall be given one coat of epoxy- polyamide coating.
- F. Dampers shall be designed and tested for bubble-tight leakage performance at the specified design pressure.
- G. Each damper shall be individually tested for leakage in conformance to AMCA Standard 500-D-98.

- H. Provide electric damper motors where motorized damper control is indicated on drawings. Damper motors to be 120 volts. "Fast acting" electric damper motors are required and able to close damper in one (1) second. Electric rotary actuator to have high torque, integral single phase, reversible, capacitor run motors and equipped with factory set travel limit switches, and motor brake. Damper motor to have auxiliary contacts for digital I/O signal from building direct digital control system.
- I. Manufacturer/model: Flanders #DBT-E-316/304-xx (sized to match duct diameter per drawings), Ruskin, Camfill, or equal.

PART 3 EXECUTION

3.01 TEMPORARY AND CONSTRUCTION FILTERS

- A. Provide temporary filters, pre-filters and high efficiency filters, for use in filter banks during the construction period. If excessive dust, dirt and debris are encountered during the construction period the contractor shall replace the temporary filters at no additional cost to the Owner. At no time during the construction period are systems to be operated without pre-filters and final filters in place.
- B. The Contractor shall provide continuous maintenance of the temporary filters in all units during the entire construction, start-up, testing, and final acceptance activities. The Contractor shall provide additional temporary filters as necessary to facilitate completion of all start-up, testing and commissioning activities.
- C. Contractor Option: Protect all 40% or higher efficient filters upstream of air handling units during construction with temporary blankets of 1/2" MERV-7 polyester or fiberglass filter media or 2" disposable panel filters, U.L. Class 2 listed. Remove prior to air balancing and prior to acceptance. Replace any dirty filters that were not adequately protected during construction.

3.02 FILTER FRAME INSTALLATION

- A. Install filter banks and holding frames leak tight and structurally sound to eliminate air bypass.
- B. Filter banks three filters high or higher: provide 3" wide 16-gauge galvanized or stainless steel stiffeners between each vertical row of filters. Caulk frames before installing. After installation caulk any gaps appearing at the leading edge of the holding frames. Use DAP "Butyl Gutter and Lap Sealer." After erection of the filter bank and caulking, tape the joints between filter frames on the downstream side with aluminum foil duct tape.
- C. HEPA filter frames over 6" deep do not require stiffeners, only taping and caulking. HEPA filter frames must be bolted together; welding will not be acceptable.
- D. Framing modules require sealant and stiffening only between modules and around the periphery.

3.03 FILTER INSTALLATION AND EXECUTION

- A. Install filter frames according to manufacturer's written instructions.
- B. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.

- C. The appropriate fastener, as recommended by the manufacturer, shall secure each filter at its corner with a minimum four (4) fasteners per filter.
- D. Install filters in position to prevent passage of unfiltered air.
- E. Install filter gage for each filter bank, including pre-filters, final filters and HEPA filters.
- F. Install filter gage static-pressure taps upstream and downstream of filters to measure pressure drop through the filters. Mount filter gages on outside of filter housing or filter plenum in an accessible position. One gage may be used where filters are mounted immediately adjacent without intervening clear space. Adjust and level inclined gages.
- G. Coordinate filter installations with duct and air-handling unit installations.
- H. Electrical wiring and connections are specified in Division 26 Specification Sections.
- I. Ground equipment according to Division 26 Section - Grounding and Bonding for Electrical Systems.

3.04 FIELD QUALITY CONTROL

- A. Filter cartridges shall be capable of easily being loaded and unloaded through access doors in the housings or access sections.

3.05 START-UP PROCEDURE

- A. No fan shall be operated unless all particulate filters as specified (except gas phase filters) are installed, along with temporary pre-filter media.
- B. When the pressure drop of the temporary media reaches 0.5" W.G. during construction, replace it with the spare set. If not used, deliver the spare set to the owner at job completion.
- C. Gas phase carbon trays shall not be installed until just prior to beneficial occupancy and all paint is dry and cleaning solvents are completely evaporated. Test and balance contractor shall allow for resistance of carbon trays in his work by simulating their resistance on the system.

3.06 CLEANING

- A. After completing system installation and testing, adjusting, and balancing air-handling and air-distribution systems, clean filter housings and install new filter media.

3.07 SPARE FILTERS

- A. Furnish one new complete spare set of filter cartridges for each filter bank listed below on completion and acceptance of the work:
 - 1. Medium and high efficient bag filters.
 - 2. Medium and high efficient rigid filters.
 - 3. DOP-rated 95% and HEPA filters.
- B. Final air balancing shall be performed with clean filters in place. If temporary construction filters are clean, as determined by test and balance agency, these temporary filters may be used for final balancing. Install final spare sets of filters only if, and when, directed by Owner's Representative. If not installed, deliver to Owner's Representative in sealed carton.

- C. Replace all panel filters which are not temporary pre-filters with a new set at job completion and furnish Owner's Representative with an additional set in sealed cartons.
- D. Furnish owner with one set of spare trays loaded with carbon, if carbon housings or adsorbers are specified on this project.

END OF SECTION

This page intentionally left blank

SECTION 23 44 00

UV COIL IRRADIATION

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this section shall include, but not necessarily be limited to, the following:
 - 1. System for UVC irradiation of cooling coil.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Division 01: General Requirements
 - 1. Section 01 91 13: General Commissioning Requirements
- B. Division 23: Mechanical
 - 1. Section 23 05 00 - Basic HVAC Materials and Methods
 - 2. Section 23 73 12 - Custom Factory Air Handling Unit
 - 3. Section 23 73 13 - Modular Air Handler

1.04 QUALITY ASSURANCE

- A. Manufacturer Qualifications:
 - 1. Manufactured items furnished shall be the current, cataloged product of the manufacturer.
 - 2. Replacement parts shall be readily available and stocked in the USA.
- B. Independent testing: The unit shall be tested by an independent test laboratory and shall be verified to provide output per one-inch arc length of not less than 9 $\mu\text{W}/\text{cm}^2$ at one meter in a 400 fpm airstream of 50°F. Unit shall comply with ANSI/UL Standards 153, 1598, 1995, and CSA and CE standards. The manufacturer shall be an ISO 9001 certified facility.
- C. Codes and Standards:
 - 1. All work shall be in full accordance with all applicable codes, ordinances and code rulings.
 - 2. The Contractor shall furnish without any extra charge the labor and material required for compliance of codes.

3. Perform all tests required by governing authorities and as required under all Division 23 Sections. Provide written reports on all tests.
4. Electrical devices and wiring shall confirm to the latest standards of NEC; all devices shall be UL listed and so identified.
5. All HVAC work shall comply with the Americans with Disabilities Act (ADA).

D. Product Control

1. Protection: Use all means necessary to protect materials before, during, and after installation and to protect the installed work and materials of all other trades.
2. All work shall be in accordance with the applicable codes listed in Division 01. No extra charge will be paid for furnishing items required by the regulations but not specified herein or shown on the Drawings. Should there be any direct conflict between the Drawings and/or Specifications and the above rules and regulations, the rules and regulations shall take precedence.
3. The Drawings and Specifications do not undertake to list every item that will be installed. When an item is necessary for the satisfactory operation of the system, it shall be furnished without extra cost. Work called for in the Specifications, but not on the Drawings, or vice versa, shall be done as though required by both. Lack of specific mention of any work necessary for proper completion of the work in the Specifications and/or Drawings, shall not lessen the Contractor's responsibility.
4. Manufacturers' directions shall be followed in all cases where manufacturers of articles used in this Contract furnish directions covering points not shown on the Drawings or specified herein. Manufacturers' directions do not take precedence over the Drawings and Specifications. Where manufacturers' directions are in conflict with the Drawings and Specifications, submit these conflicts to the Engineer and receive clarification before installing the work.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for all lamps, fixtures, controls indicating dimensions.
- B. In order to guarantee the adequate coil treatment performance, the UVC vendor shall specify in detail, a manufacturer approved layout of the number of UVC sources required and their respective position (distance from the coil, alignment on the coil as well as on which side of the coil the UV source is to be installed).
- C. Maintenance Data: Submit maintenance instructions, including instructions for system upkeep, lamp replacement, and spare parts lists. Include this data, product data, and shop drawings in operating and maintenance manuals.

1.06 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 GENERAL

- A. Air handling units scheduled with UV coil treatment are to be equipped with ultraviolet chilled water coil irradiation system factory installed in the air handler using a custom configured rack design.
- B. The UVC Emitter, TM and fixture shall be factory assembled and tested. They shall consist of a fixture, power supply, reflector, emitter sockets and emitter, and monitoring.
- C. Preapproved manufacturers include SterilAire, UV Resources, Fresh Aire UV, Ultra Violet Devices Inc. (UVDI), Sanuvox, or equivalent.
- D. Performance Criteria:
1. To effectively irradiate the HVAC coil surface and maximize the UV irradiation onto the coil, each UVC lamp will be mounted to a ^{[[SEP]]}parabolic reflector made of aluminum, reflecting at least 90% of the UVC (254 nm) energy, optimizing the UVC output of the lamp onto the coil that will continuously clean the coil and drain pan, kill odor causing mold and fungus that may develop in an HVAC unit and keep the airflow through the coil at optimum to maximize energy efficiency
 2. Adequate performance is defined as the irradiation intensity required so that a microorganism requiring a lethal UV dose of 100,000 microwatts/cm² will not survive more than 60 minutes anywhere on the treated surface of the coil after 17,000 hours of operation. In order to validate the performance of the proposed arrangement, the vendor shall submit a manufacturer approved computer simulation showing the resulting microorganism kill (time map) of the treated surface of the coil after 17,000 hours of operation.
- E. Fixture Construction:
1. The fixture shall be constructed of 304 stainless steel to withstand HVAC environments.
 2. The reflector shall be constructed of heavy gauge, specular finished aluminum alloy with approximately 85% reflectance at 254 nm wavelength. The aluminum parabolic reflector will be built from an aluminum extrusion aerodynamically shaped to be capable of withstanding air velocities up to 2000 ft/min. without wobble, vibration or whistle noise.
 3. The housing shall be equipped with 1/2" electrical conduit opening/s on each end to facilitate wiring fixture-to-fixture coupling. All components shall be in one integral assembly to maximize serviceability.
- F. UVC Emitter Lamps and lamp sockets:
1. The Emitter sockets are medium bi-pin, double click safety, twist lock type. They shall be constructed of UVC-resistant polycarbonate.
 2. The Emitter shall be a very high output, hot cathode, T5 diameter, medium bi-pin type that produces germicidal UVC of 253.7 nm. The DE Emitter shall operate in air velocities of up to 2000 fpm and air temperatures of 35-140 °F. It shall produce no ozone or other secondary contaminants.
 3. The UVC net output directed at the coil will be at least 10 microwatts/cm² per inch of lamp at 1 meter (after Burn-In time) in the 245 nm to 266 nm. band while operating at nominal temperature in an air stream moving at 400 fpm.
- G. Electrical Requirements:

1. The power source will be an electronic type, rapid start with a power factor greater than 0.95 and an energy conversion of at least 75%. The power supply shall be a Class P2 with a power factor greater than 0.98 and a power conversion of greater than 90%. The power supply design shall include RF and EMI suppression. The power supply shall be designed to maximize photon production, irradiance and reliability in cold airstreams of 45-140 °F, 100% RH. The power supply shall be available in 110-277 V, 50/60 Hz, single phase.
 2. The ballast will be mounted in an adequate aluminum enclosure that will enable it to be mounted on a rigid surface outside of the AHU, protecting the power source from moisture and humidity.
 3. Safety interlock switches are to be installed on all access doors where UV intensity may be present. Manufacturer to provide CAUTION LABELS to be installed on these access doors.
- H. Monitoring: Install a monitoring system to provide indication of equipment status. Monitoring shall include dry contacts for interface with the BMS system and include at each Ballast Box an electronic device that will enable the monitoring of either 1 or 2 lamp fixtures including:
1. Lamp on indicator to insure that a lamp is functioning
 2. Lamp out indicator to warn if a lamp has failed.
 3. Lamp replacement indicator to notify that the lamp has reached its design performance specification (17,000 operating hours), and is due for replacement
- I. Warranty
1. The power source will carry a 15-year ballast warranty.
 2. The high intensity UVC lamp will be guaranteed for 17,000 hours.
 3. The control electronics (if supplied) will carry a 3-year warranty.

PART 3 EXECUTION

3.01 GENERAL

- A. Workmanship shall be performed by licensed journeymen or master mechanics and electricians and shall result in an installation consistent with the best practices of trades.
- B. Each UVC source will be clamp-mounted for easy installation, positioning and maintenance onto standard 3/4-inch (1.87 cm) electrical conduit or aluminum tubing, supplied by the vendor or field supplied and installed as a permanent support structure. The support structure will be adequately fixed with non-corrosive hardware so that the UVC source does not vibrate or loosen.
- C. Mounting Location: According to the 2008 ASHRAE Handbook, HVAC Systems and Equipment, Chapter 16, titled Ultraviolet Lamp Systems, UVGI Systems can be installed Upstream or Downstream of the Cooling Coil. Both locations have advantages and disadvantages. The custom air handling unit manufacturer to coordinate with the supplier of UVC equipment to determine the best mounting location to facilitate protection of lamps, ease of maintenance, and maximum treatment benefit.

3.02 MANUFACTURER'S DIRECTIONS

- A. Follow manufacturer's directions and recommendations in all cases where the manufacturers of articles used on this Contract furnish directions covering points not shown on the Drawings or covered in these Specifications.

3.03 INSTALLATION

- A. Coordinate the work between the various Mechanical Sections and with the work specified under other Divisions of the work or contracts toward rapid completion of the entire project. If any cooperative work must be altered due to lack of proper supervision or failure to make proper provisions in time, then the work hereunder shall include all expenses of such changes as are necessary in the work under other contracts, and such changes shall be directly supervised by and made to the satisfaction of the Engineer.
- B. Inspect all material, equipment, and apparatus upon delivery and do not install any that may be subject to rejection as a result of damage or other defects.

END OF SECTION

This page intentionally left blank

SECTION 23 52 00

NON-CONDENSING BOILERS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Hot Water Boiler (30 psi, 3 pass, Fire Tube)
 - 2. Hot Water Boiler (Cast Iron Section Type)
 - 3. Copper Fin Tube Hot Water Boiler
 - 4. Hot Water Boiler (Forced Draft Flexible Watertube Gas Fired HW)
 - 5. Commercial Pool Heater
 - 6. Boiler Sequence Control

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230593: Testing, Adjusting and Balancing
- C. Section 230716: Equipment Insulation
- D. Section 230900: Building Automation System (BAS) Controls
- E. Section 232113: Hydronic Piping, Valves and Specialties
- F. Section 232123: Hydronic Pumps
- G. Section 233113: Air Distribution
- H. Section 235220: Steam Boilers
- I. Section 238239: Heat Transfer
- J. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide boilers conforming to the requirements of the latest addition of the following:
 - 1. American Boiler Manufacturer's Association (ABMA) "Standard Test Procedure for Packaged Firetube Boilers". Label boiler with ABMA emblem on boiler nameplate.
 - 2. American National Standards Institute (ANSI):
 - a. B31.1 - Power Piping
 - b. Z21.13b – Gas-Fired Low-Pressure Steam and Hot Water Boilers
 - 3. American Society of Mechanical Engineers (ASME): Boiler and Pressure Vessel Code
 - a. Section VIII D1 - Rules for Construction of Pressure Vessels including Addendums
 - b. Section VIII D2 - Rules for Construction of Pressure Vessels including Addendums
 - c. Section IX - Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators including Addendums
 - 4. National Electrical Manufacturers Association (NEMA): Provide electrical components which comply with NEMA Standards.
 - 5. National Fire Protection Association (NFPA):
 - a. 70 - National Electrical Code

1.05 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 - 1. The proposed substitution does not affect dimensions shown on drawings.
 - 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 - 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 - 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, and installation instructions.

- B. Shop Drawings: Submit manufacturer's shop drawings indicating dimensions, weight loading, required clearances, methods of assembly of components, and location and size of each field connection.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, tube replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.
- D. Wiring Diagrams: Submit manufacturer's ladder-type wiring diagrams for power and control wiring required. Differentiate between factory-installed and field-installed wiring.
- E. Boiler Certification: The boiler manufacturer shall submit evidence that the boiler(s) meet the requirements of the standards specified.
- F. Vent Manifolds Coordination: For boiler plant installation requiring multiple boilers venting into a common vent stack, provide vent submittal with sign-off by the submitted boiler manufacturer attesting to their approval of the proposed venting arrangement.
- G. Commissioning Test Plan: Submit test plan for boilers. Plan shall include test schedules, and names and titles of the test personnel who will be participating in the commissioning tests. The test personnel must be employees of the boiler manufacturer or the manufacturer's designated representatives. Plan shall include false loading of boilers, if the anticipated building loads at the time of test do not meet capacity requirements. Submittals shall have detailed layout for temporary equipment, if such equipment is needed, even if it is not specified or shown on the Drawings.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.
- C. Rigging: Comply with the manufacturer's rigging and installation instructions.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 GENERAL

- A. For multiple boiler installations with boilers vented to a common vent, the boilers shall be symmetrically air-fuel coupled such that any changes in the combustion air-flow or flue flows shall affect the BTUH input without affecting the combustion quality.

2.02 HOT WATER BOILER (30 PSI, 3 PASS, FIRE TUBE)

A. General:

1. Furnish and install, where shown on the plans, hot water boiler having the capacity and features detailed herein and scheduled on plans. Unit shall include burner for firing on [gas] [combination gas/No. 2 oil] [No. 2 oil]. The units shall be of the three-pass scotch design with water cooled rear combination chamber and two passes of fire tubes, and shall be constructed in accordance with the ASME Code for 30 lbs. water.
2. The unit(s) shall have a gross output rating as scheduled on plans. A refractory lined access opening with Pyrex observation port shall be provided to permit entry into the rear combustion chamber. Access to tube sheets and fire tubes for inspection or cleaning shall be provided without disconnecting any fuel piping or electrical wiring. Unit(s) shall be of gas tight construction throughout. Front flue doors shall be gas tight and lined with insulating refractory. Unit(s) shall be provided with lifting loops.
3. Unit(s) shall be provided with a factory installed enameled steel jacket insulated with mineral fiber insulation. Heavier insulation shall be installed at selected locations to provide additional protection of the jacket at potential external pressure points. Heavier insulation shall also be installed along the top length of the boiler at the centerline. Hand hole and washout openings shall be in accordance with the ASME Code requirements. Manhole (250-750 HP).
4. All tubes shall be set with roller expander at each end. Tubes shall not be welded to the tube sheets. Refractory baffling between passes will not be permitted.
5. Unit(s) shall be assembled and wired with burner, controls, trim and skid type base installed at the factory.

B. Standard Equipment:

1. Boiler trim shall consist of the following mounted, piped, and wired:
 - a. Relief valves
 - b. Low water cut off
 - c. Pressure gauge
 - d. Thermometer
 - e. Drain valve
 - f. Air flow safety switch
 - g. Flue gas thermometer
 - h. Flue damper
 - i. High limit controls
 - j. High-low-off firing sequence
 - k. Fuel-air and firing rate controls
 - l. Control cabinet
 - m. Low fire hold aquastat

C. Burner and Associated Equipment:

1. Fuel burning equipment shall be forced draft type, factory assembled, wired, mounted, and tested. The entire unit shall bear the Underwriter's Laboratories label and shall be ready for field connection to power and fuel supply. Equipment shall include: forced draft fan with air NEMA-1A control cabinet containing electronic flame safeguard and programmer, control circuit switch, necessary switching relays, indicating lights for major operations, numbered terminal strip, numbered wiring, engraved nameplates.
2. All motors shall be for ____ volts, ____ hertz, (one) (three) phase operation. Controls shall be 115 volt, 60 hertz, single phase. Necessary fuses, motor contactor or magnetic motor starters with thermal overload protection, and a step-down control circuit transformer shall be provided with the control cabinet.
3. Fuel burning equipment shall be set and adjusted by a factory authorized representative to burn ____ G.P.H. of No. (2) (4) (5) (6) oil (and) (or) ____ C.F.H. of having a ____ sp. gr. with ____ in W.C. pressure at inlet of burner manual gas cock. Unit efficiency based on flue gas analysis, shall be not less than 80%.
4. Owner's representative shall be present to receive instructions in care and maintenance of the unit(s) at the time it is started up by the service representative.
5. Gas Units (20-750 HP):
 - a. Gas burners shall be of the (flange mounted 20-250) (base mounted 300-750) annular port flame retention type including a main gas control group consisting of [safety gas valve (20-50)] [motorized gas valve with proof of closure (60-100)] [two motorized gas valves, one with proof of closure (125-750)]; gas volume control valve with adjustable cam operator (100-750); gas pressure regulator; gas gauge; and [one gas cock (20-50)] [two lubricated plug cocks (60-750)]; high and low gas pressure interlocks (60-750); normally open vent valve (300-750); provision for pressure check (20-750); gas-electric ignition assembly consisting of a pilot burner, 6,000 volt ignition transformer, unitized safety gas valve, gas pressure regulator and gas cock.
 - b. Controls to include air flow safety switch, ultra-violet flame detector, low fire interlock (60-750), and all necessary controls and linkage for [on-off (20-50)] [two position with proved low fire start (60-80)] [modulated with low fire start (100-750)].
 - c. Fuel air control shall provide [two position (60-80)] regulation of the air damper and the gas volume control valve by means of a [damper motor (60-80)] [modutrol motor (100-750)].
 - d. Provide Fireye fault indicator Model 53SE2 mounted on burner control panel.]
6. Combination Gas-Pressure Atomizing Oil Units (20-400 HP):
 - a. Gas-oil burner shall consist of a [flange mounted (20-250)] [base mounted (300-400)] combination annular port flame retention type gas burner and mechanical pressure atomizing oil burner for No. 2 oil. Gas side shall include necessary controls for [on-off firing (20-50)] [two position firing with proved low fire start (60-80)] [modulated firing with proved low fire start (100-400)]. Oil side shall include necessary controls for [on-off firing (20)] [on-off firing with low fire start (30-50)] [two position firing with proved low fire start (60-80)] [modulated firing with proved low fire start (100-400)].
 - b. Gas controls shall include a main gas control group consisting of {[one safety gas valve (20-50)] [one motorized gas valve with proof of closure (125-400)]; gas volume control valve with adjustable cam operator (100-400); gas pressure regulator, gas gauge and [one gas cock (20-50)] [two lubricated plug cocks (60-400)]; high and low gas pressure interlocks (60-400); normally open vent valve (300-400); gas gauge; provision for pressure check (20-400)]; {Standard IRI gas train}.

- c. Oil controls shall include a [two state oil pump mounted on burner (20-125)] [two stage separate oil pump assembly mounted on boiler skid (150)] [one stage separate oil pump assembly mounted on boiler skid (200-400)] [one atomizing oil nozzle (20-30)] [three atomizing oil nozzles (40-400)]; oil solenoid valve(s); oil filter, oil metering control valve with adjustable cam operator (100-400).
- d. Controls for both fuels shall include an ultra-violet flame detector; air flow safety switch and [direct spark ignition with 10,000 volt ignition transformer (oil units 20-50)] [gas-electric ignition assembly consisting of a pilot burner, 6,000 volt ignition transformer, unitized safety gas valve, gas pressure regulator and gas cock (gas 20-400) (oil units 60-400)].
- e. Fuel-air control shall provide [two position (60-80)] [modutrol motor (100-400)]. Fuel regulation of the oil metering control valve shall be by modutrol motor (100-400).
- f. Changeover from one fuel to the other shall be accomplished by means of a manual fuel selector switch in the control cabinet. No changes in linkage, burner position or mechanical adjustment shall be necessary when changing fuels. The fuel selector switch shall provide, through the combustion control relay, proper ignition timing for the fuel being burned.
- g. Provide fireye fault indicator Model 53SE2 mounted on burner control panel].

D. Manufacturer: Cleaver Brooks, Burnham Series 3.

2.03 HOT WATER BOILER (CAST IRON SECTIONAL TYPE)

A. General:

1. Furnish and install, where shown on the plans, hot water boiler having the capacity and features detailed herein and scheduled on plans. Unit shall include burner for firing on gas. The units shall be of the sectional cast iron type and shall be constructed in accordance with the ASME Code for 30 lbs. water.
2. Port openings to have elastomer sealing rings. Sections to have aligning lugs and sockets to assure proper section alignment of port openings.
3. Unit to have water backed combustion area with water circulation completely around fire box.
4. Unit to have cast iron flue collar with built-breeching damper.
5. Provide unit with burner mounting plate with refractory, aluminized steel gas collector, observation ports on front and back section, side cleanouts plates, 60 psi ASME safety relief valve, combination high limit and low limit controls, combination pressure temperature gauge and built-in air eliminator.

B. Jacket and Insulation:

1. Unit to have steel jacket with powder-coat finish.
2. Unit to be completely insulated.

C. Standard Equipment:

1. Boiler trim shall consist of the following mounted, piped, and wired:
 - a. Relief valves
 - b. Low water cut off
 - c. Pressure gauge

- d. Thermometer
- e. Drain valve
- f. Air flow safety switch
- g. Flue gas thermometer
- h. Flue damper
- i. High limit controls
- j. High-low-off firing sequence
- k. Fuel-air and firing rate controls
- l. Control cabinet
- m. Building Control System interface including contacts for start/stop, on/off status, and indication of alarm.
- n. Low fire hold aquastat
- o. CSD-1 Approved Valves and Controls

D. Burner and Associated Equipment:

1. Fuel burning equipment shall be forced draft type, factory assembled, wired, mounted, and tested. The entire unit shall bear the Underwriter's Laboratories label and shall be ready for field connection to power and fuel supply. Equipment shall include: forced draft fan with air NEMA-1A control cabinet containing electronic flame safeguard and programmer, control circuit switch, necessary switching relays, indicating lights for major operations, numbered terminal strip, numbered wiring, engraved nameplates.
2. All motors shall be for 120 volts, 60 hertz, (one) phase operation. Controls shall be 115 volt, 60 hertz, single phase. Necessary fuses, motor contactor or magnetic motor starters with thermal overload protection, and a step-down control circuit transformer shall be provided with the control cabinet.
3. Fuel burning equipment shall be set and adjusted by a factory authorized representative to burn 641 C.F.H. of gas having a 0.60 sp. gr. with 5.7 in W.C. pressure at inlet of burner manual gas cock. Unit efficiency based on flue gas analysis, shall be not less than 80%.
4. Owner's representative shall be present to receive instructions in care and maintenance of the unit(s) at the time it is started up by the service representative.
5. Gas burners shall be of the flange mounted annular port flame retention type including a main gas control group consisting of safety gas valve; gas pressure regulator; gas gauge; and one gas cock; gas-electric ignition assembly consisting of a pilot burner, 6,000 volt ignition transformer, unitized safety gas valve, gas pressure regulator and gas cock.
6. Controls to include air flow safety switch, ultra-violet flame detector, and all necessary controls and linkage for on-off.

E. Manufacturer: Weil-Mclain as specified or approved equal by Burnham or Smith.

2.04 COPPER FIN TUBE HOT WATER BOILER

- A. General: Factory packaged unit shall include boiler, burner, painted steel jacket, controls and accessories all piped and wired for single point field connections. Units shall carry packaged label of A.G.A. and be in accordance with ASME/CSD-1, all codes required by the local governing authorities and as indicated on the schedule data sheet. A certified factory fire-test shall be provided with data sheets furnished to Engineer and Owner. ASME certified, labeled, stamped and designed for 160 PSIG water in accordance with Section IV of ASME Code. Manufacturer's Representative to provide services for field testing and adjusting of boiler and controls to meet design requirements. Unit(s) shall be a minimum of 85% Thermal efficiency and shall be non-condensing.
- B. Boiler Type: Vertical copper water tube with straight $\frac{1}{2}$ " I.D. finned copper tubes rolled into top and bottom headers. Tubers shall be intermeshed for maximum heat transfer and shall be warranted ten (10) years against thermal shock.
1. Combustion chamber shall be 16-gauge and constructed of corrosion resistant aluminum. It shall be enclosed in an air tight 14-gauge steel outer cabinet with an insulating air space between the combustion chamber and outer cabinet. The outer cabinet shall be finished on both sides with a baked epoxy finish. A glass sight port shall be provided for burner observation.
- C. Boiler Trim: Shall be as follows:
1. Combination temperature/pressure gauge.
 2. ASME rated water relief valve.
 3. Low water cut-off.
 4. Water flow switch.
 5. Drain valve.
 6. Operating controller.
 7. Limit control with manual reset.
 8. Fuel-air controller (as required).
 9. Barometric damper.
- D. Burner Type: Power type radial fired with screen type diffuser for full 360° flame pattern. To include blower assembly and fuel-air mixture assembly controlled by multiple calibrated brass orifices and venturi core to measure air flow to burner. Orifices and venturi core removable without removing burner from boiler. Air flow switch.
- E. Gas Burner: Minimum pilot safety burner shall consist of gas-electric spark ignition with 100% safety shut-off pilot, solenoid gas valve, pressure regulator and shut-off cock. Minimum main gas train shall include manual shut-off valve, pressure regulating valve, dual safety gas valves, manual test valve high-low pressure switches and manifold pressure gauge. Gas train shall be factory packaged to meet insurance requirements as indicated.
- F. Control Panel: NEMA 1 enclosure mounted on boiler. Power source to be 120V/60H/1P. Components to include blower motor contactor; Honeywell R 895C flame safeguard and program controller; diagnostic annunciator to include lights for power on, load demand, ignition, pilot, main flame, low water, low gas pressure, low combustion air, high water temperature and flame failure; relays as required and terminal strip
- G. Manufacturer: Thermal Solutions Evolution, Harsco Patterson-Kelly PK Thermific Velox, Hamilton 88.

2.05 HOT WATER BOILER (FORCED DRAFT FLEXIBLE WATERTUBE GAS FIRED HW)

A. General:

1. Furnish and install, where shown on the plans, hot water boiler having the capacity and features detailed herein and scheduled on plans. Unit shall include forced draft reduced Nox burner for firing on combination gas/No. 2 oil. The unit shall be of the water tube design and shall be constructed in accordance with the ASME Heating Boiler Code, Section IV, and shall bear the ASME "H" Stamp for a maximum working pressure of 125 psig.
2. Accepted manufacturers are Bryan, Cleaver-Brooks, or Unilux.
3. The Boiler shell shall be constructed of welded steel boiler plate. Boiler shall be constructed with adequately sized upper drums, water legs and tube headers, providing proper internal thermal water circulation, not requiring an external circulation source. Water tubes are to be 1 1/2" O.D., 12 gauge steel, four-pass, flexible serpentine bend design, not subject to thermal shock damage. Individual water tubes shall be easily removable and replaceable without either welding or rolling. Entry into combustion chamber or major disassembly of the jacket shall not be required to remove or replace tubes.
4. The boiler shall be constructed and assembled as a completely packaged unit.
5. The boiler shall have no less than 5 sq.ft. Of heating surface per boiler horsepower. (6,695 BTU per sq.ft.)
6. The Unit shall be provided with a factory installed galvanized and painted steel jacket designed with air separation insulation.
7. Unit shall be assembled and wired with burner, controls, trim and skid type base installed at the factory.
8. Boiler shall be built with an integrated extended surface heat extractor and guaranteed for 80% combustion efficiency.

B. Combustion Chamber and Flueways

1. Access: A hinged access door shall be provided near the front of the boiler to provide an access opening of not less than 20" wide by 30" high, for full access to the combustion chamber and burner head. Remaining panels shall be individually removable. All access panels shall be affixed to the pressure vessel frame, full gasketed for pressurized firing.
2. Pressurization: The boiler combustion chamber and flueways shall be designed to operate at an overfire pressure of up to 2" w.c.
3. Welded Construction: All joints of the flue-gas containing section shall be fully seal welded, except for the pressure-tight gasketed panels on the access side.
4. Insulation: All interior walls of the flue-gas containing section shall be lined with high temperature insulation. The floor beneath the tubes shall be lined with insulating refractory and mineral fiber back-up insulation. The boiler shall be warranted for 20 years against thermal shock on a non-pro-rated basis.
5. Jacket: The boiler shall be complete with an insulated metal jacket consisting of:
 - a. Structural steel frame.
 - b. Heavy gauge, zinc-coated rust resistant steel casing, painted with a suitable primer and enamel.
 - c. Individually removable access doors, with handles providing easy access to combustion chamber and tube access panels.

C. Burner and Associated Equipment:

1. Fuel burning equipment shall be forced draft type, modulating, factory assembled, wired, mounted, and tested. The entire unit shall bear the Underwriter's Laboratories label and shall be ready for field connection to power and fuel supply. Equipment shall include: forced draft fan with air NEMA-1A control cabinet containing electronic flame safeguard and programmer, control circuit switch, necessary switching relays, indicating lights for major operations, numbered terminal strip, numbered wiring, engraved nameplates. Burner shall be capable of internal controlled Nox not to exceed 30 ppm at 3% O₂.
2. All motors shall be for 460 volts, 60 hertz, three phase operation. Controls shall be 115 volt, 60 hertz, single phase. Necessary fuses, motor contactor or magnetic motor starters with thermal overload protection, and a step-down control circuit transformer shall be provided with the control cabinet.
3. Fuel burning equipment shall be set and adjusted by a factory authorized representative to burn No. 2 oil and natural gas. In the oil fired mode the burner shall be capable of a 3:1 turndown ratio. In the gas fired mode the burner shall be capable of operating with a 4:1 turndown ratio. In the gas fired mode, the burner shall control excess air for a constant 15% over the entire firing range. Changeover between oil and gas firing is to be accomplished without the need for any manual burner or nozzle adjustment or modification. Integrally mounted oil pump is to be automatically decoupled from operation when gas burner is operating. Alternately, an external oil pump package is to be provided complete with all controls for interface with the burner. Provide necessary auxiliary contacts for wiring to Facility EMS system for remote fuel changeover.
4. Owner's representative shall be present to receive instructions in care and maintenance of the unit(s) at the time it is started up by the service representative.
5. Burner manufacturer is to be Weishaupt, Gordon-Piatt.

D. Boiler trim shall consist of the following mounted, piped, and wired:

1. ASME Relief valves
2. Pressure gauge
3. Thermometer
4. Drain valve
5. Water temp. control aquastat
6. CSD-1 Approved Valves and Controls
7. Manual reset type low water cutoff
8. Manual Reset High limit controls
9. Control cabinet
10. Multiple boiler sequencing controls.
11. Gas train components for each boiler shall comply with factory mutual requirements and as a minimum, shall be as follows:
 - a. Automatic gas valve operator.
 - b. Auxiliary safety shut-off valve.
 - c. Pilot solenoid valve.
 - d. Electric spark ignition assembly with 100 percent
 - e. safety shut-off pilot.

- f. Main manual gas shut-off valve.
- g. Pilot cock
- h. Pilot and main gas pressure regulators.
- i. Air safety switch.
- j. Electronic combustion safety control with UV sensor.
- k. Low water cut-off
- l. High/Low gas pressure switches for fuel pressure supervision.
- m. Shutdown on high or low gas pressure.

E. Indirect Heat Exchanger (For domestic water heating units):

- 1. Each boiler selected for domestic water heating application shall be equipped with double walled indirect heat exchangers with a capacity as listed on drawings.
- 2. Construction to be of heavy copper seamless tubing attached to brass heads. Unit to be hydrostatically tested at 200 psi.
- 3. Heat exchangers are to be attached to boiler shell by means of a gasket and stud type connection and shall be easily removable and replaceable.

2.06 COMMERCIAL POOL HEATER

- A. General: Factory packaged unit shall include burner, integral heat exchanger, painted steel jacket, controls and accessories all piped and wired for single point field connections. Units shall carry packaged label of A.G.A. and be in accordance with ASME/CSD-1, all codes required by the local governing authorities and as indicated on the schedule data sheet. A certified factory fire-test shall be provided with data sheets furnished to Engineer and Owner. ASME certified, labeled, stamped and designed for 160 psig water in accordance with Section IV of ASME Code. Manufacturer's Representative to provide services for field testing and adjusting of boiler and controls to meet design requirements. Unit(s) shall be a minimum of 80% Thermal efficiency and shall be non-condensing.
- B. Manufacturer: Laars Pennant-PNCP, Raypak, Lochinvar Aquas.
- C. Heater Type: Heater shall be a unit designed specifically for swimming pool heating applications and specifically designated as such by the manufacturer. The heater shall be atmospheric type using titanium stainless steel burners. It shall not require blower motors to supply combustion air or to create venting action. The fuel-air mixture shall be factory set for maximum combustion efficiency and shall be tamperproof in the field
- D. Heat Exchanger:
 - 1. The pool heater shall be of the straight tube design and shall have no blind passages or concealed pockets in the water containing section. The heater shall be fitted with a built-in automatic flow control device which shall maintain a constant water velocity over all direct fired heating surfaces to prevent lime formation in the heater over a wide range of filter flow rates.
 - 2. Inspection covers permitting complete visual inspection and cleaning of all wet internal surfaces shall be provided on headers at each end and held in place by heat treated corrosion resistant steel cap screws. All waterways shall be copper or bear fused ceramic coating to positively protect the boiler from corrosion.
 - 3. The entire wet section of the heater shall be removable and replaceable without damage or disassembly of combustion chamber and/or burner sections.

4. The water tubes shall be made of integral-finned copper tubing of 7/8" ID x 0.065 wall thickness with fins of 0.40" minimum height spaced at 7 fins per inch. The tubes shall be rolled directly into an ASME header of gray cast iron protected by a ceramic coating fused into the metal at not less than 1,100° F. Non-metallic gaskets shall be exterior to the jacket structure and combustion chamber to avoid deterioration from overheating. The complete heat transfer section shall be hydrostatically tested at 400 psi, be ASME inspected and approved, and protected by an ASME pressure relief valve set to 75 psi.
- E. Combustion Chamber and Jacket: Chamber to be lined with a castable refractory approved for temperatures at not less than 2,100 °F. The outer jacket shall be unitized shell and frame construction fabricated of galvanized steel and finished with acrylic epoxy baked at not less than 400°F.
- F. Controls: The heater shall be factory equipped with low voltage 24 volt controls as follows:
 1. Solid state electronic pilot flame supervision to de-energize main burner controls within one second of a pilot failure
 2. Close differential aquastat specifically designed for swimming pool control
 3. High temperature limit control
 4. Pressure flow switch
 5. 24 volt control transformer
 6. Automatic electric pilot ignition (gas only).

2.07 BOILER SEQUENCE CONTROL

- A. General: Provide, as part of the boiler control system, a separate microprocessor based lead-lag sequencing system for the heating hot water boilers and the indirect domestic water boilers. The control shall be pre-engineered and programmed exclusively for the operation of multiple hot water full modulation boilers. The control shall provide an on-off and 135 ohm modulation signal to each boiler to maintain a desired header supply water temperature.
- B. Setpoint: The control shall accept a 4-20 mA input for remote setpoint adjustment from building EMCS control system for outside air reset adjustment. The 4-20 mA input shall correspond to a 140 to 200 degree supply boiler water temperature to prevent boilers from operating outside their safe operating range.
- C. Digital Display: The control shall provide an L.E.D. "Bar Graph" display of each boilers approximate percent modulation. The control shall also provide a red L.E.D. display of header water temperature, setpoint, gain adjustment and each boilers exact percent modulation. In addition, the digital display shall be used to indicate the following settings as they are being adjusted:
 1. Ignition Start Point: Adjustable from 0-50% to determine the percent modulation a stage must achieve before the next stage is activated. There shall be an independent adjustment of this setting for each burner.
 2. Purge Timer: Adjustable from zero to 10 minutes to determine the delay time between a burner being energized and the beginning of modulation.
 3. Lag Boiler Start Timer: Adjustable from one to 60 minutes to delay starting of lag boiler after being called. This allows the lead boiler to catch the load and avoid unnecessary boiler cycling.
 4. Additional Indications: Indicator lights shall be provided to indicate the lead boiler selected and all activated stages.

5. Control Switches: Each boiler shall have an “On-Auto-Off-Stand By” control switch for control or isolation of individual boilers. An additional “Lead Boiler” selection switch shall be provided for automatic or manual lead boiler selection.
6. Sensor: Temperature sensor shall be low cost thermistor type, provided with immersion well and electrical junction box for header mounting in ½” NPT tapping.
7. Battery Back-Up: A lithium battery shall be included to maintain all setpoints in the event of power failure.
8. Remote Intercept: The control shall have the capability of being field upgraded to allow for remote communication. Communication shall be via standard telephone lines, RS232 or RS485. No external components shall be required for remote communication. Access to the control shall be via a dumb terminal or personal computer. No proprietary software shall be required.
9. Sequence of Operation: Initiation of boiler operation shall occur after proof of heating water demand has been occurred in the building. In general, a minimum of three heating water valves shall open on call for heating before operating the boiler sequencing. On a drop in system temperature the lead boiler will be energized. After an adjustable time delay, to allow the boilers firing sequence to elapse, the control shall begin modulating the lead burner upward from the ignition startpoint at a rate proportional to the system temperature rate-of-change and the “gain” setting. At a field selected percent modulation start point, if more capacity is required, the next stage will be energized after the lag boiler start time delay, and proceed according to the system rate-of-change and “gain setting”. Additional stages will be added as required and controlled in a similar manner. As system temperature or pressure rises, the control will decrease the modulation of the last boiler on line so as not to over shoot the set point. Once a boiler has been modulated down to its' ignition start point, it will be held there while the previous stage's modulation is reduced. The last boiler on line will not be de-energized until the previous stage's modulation has dropped below its modulation start point. Additional stages will be controlled and de-energized in a similar manner as required.
10. Domestic hot water operations: Similar to above, except, the system will sense storage tank temperature as the primary controlled variable. For each boiler brought on line start the associated circulating pump between the boiler and the storage tank.
11. Alarm Contacts: Provide alarm status contacts for each boiler for remote annunciation to building EMS system.
12. Boiler Monitoring: Provide integral to panel a Honeywell Keypad Display Module (S7800A1001) to interface to boiler flame safeguard for burner status and trouble shooting. A common display may be used with a selector switch to select which boiler to monitor.
13. Enclosure: A wall mounted, NEMA Type 12 or better enclosure shall be provided. Enclosure shall incorporate a window to allow full view of all digital and lamp indications without opening panel door.
14. U.L. Listing: Control panel shall be U.L. listed and labeled as an industrial control panel as a complete system.

2.08 EMERGENCY SHUTDOWN SWITCH

- A. Emergency boiler room shutdown switch for mounting outside boiler room doors. Mechanical to provide and install for complete and operational system per ASME CDS-1. Switch shall work independently of Building Automation System. Features shall include:
 1. Emergency off push button. Button shall be red with white lettering. 1-1/2” diameter. Button type shall include latching action upon activation. Button type shall be “turn-to-reset” after a boiler incident has been resolved.

2. Housing: Polycarbonate or metal for recessed wall installation. Cover shall be clear and hinged to protect button from accidental activation.
 3. Output: SPDT relay for 120-240 V AC service.
 4. Operating Temperature Range: -40°F to 250 °F.
 5. Mounting: Located switch at 48" above finished floor in compliance with ADA.
- B. Signage: Mount aluminum or plastic warning sign above switch. Sign shall be minimum 7" wide by 5" tall with red background and white lettering. Text of sign shall be "BOILER EMERGENCY SHUTOFF".
- C. Switch Manufacturers: Safety Technology International #Stopper Station Series.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.
1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
 2. Examine mechanical spaces for suitable conditions where boilers will be installed. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. All equipment, unless otherwise shown or noted, is to be installed in accordance with industry standards and manufacturer's recommended installation instructions.
- B. Boilers are to be installed on concrete housekeeping pads. Provide manufacturer and code clearance all around and provide minimum 48" clearance between boilers.
- C. Install boiler trim not installed at factory.
- D. Connect to supply and return water piping, natural gas/fuel piping, flue vent, combustion air duct and relief piping.
- E. Relief valves are to be piped and terminated 1" above approved termination location.
- F. Flush and clean boilers, in accordance with manufacturer's start-up instructions, and in presence of boiler manufacturer's representative. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls
- G. Hydrostatically test assembled boiler(s) and piping in accordance with applicable sections of ASME "Boiler and Pressure Vessel Code".
- H. Arrange for inspection of boiler and piping, observation of hydrostatic testing, and for certification of completed boiler units by an authorized inspector in accordance with NBBPVI NB23. Provide all scaffolding, ladders, opening of vessels, filling, draining, lights, closing of vessels and services to support the authorized inspector.

- I. PH Neutralizers are to be piped with PVC tubing. All piping to be per manufacturer's diagrams and instructions. Neutralizer tube to be secured to floor or wall out of normal walking path. The tubes and p-traps are to be filled with water before firing any boiler. Neutralizer tube to be charged prior to installation and a minimum of material for one recharge to be supplied.

3.03 EMERGENCY BOILER SHUTDOWN

- A. All automatically fired boilers with input greater than 400,000 Btuh shall have a manually operated remote shutdown switch to shutdown boiler(s) and associated equipment. Activation of the emergency shutdown switch shall immediately shut off the fuel or energy supply and initiate the boiler shutdown sequence in accordance with manufacturer's recommendations where applicable.
- B. The shutdown switch should be located just outside the boiler room door and marked with signage for easy identification. Consideration should be given to the type and location of the switch to safeguard against tampering. If the boiler room door is on the building exterior, the switch should be located just inside the door. If there is more than one door to the boiler room, there should be a switch located at each door.
- C. Comply with local building and mechanical codes for additional requirements. Comply with ASME CDS-1 and ASME Boiler and Pressure Vessel Code (BPVC) Section HG-634.
- D. Provide conduit, wiring, relays, devices, etc., as required for complete and operational emergency shutdown system including shutdown of boiler(s) and associated pump(s) and valve(s) as necessary. Coordinate with electrical design as necessary. Shutdown system shall operate independently of BAS, but BAS should monitor activation of switch for remote indication. Coordinate with BAS contractor for interface.

3.04 CONNECTIONS PIPING INSTALLATION REQUIREMENTS ARE SPECIFIED IN OTHER DIVISION 23 SECTIONS. DRAWINGS INDICATE GENERAL ARRANGEMENT OF PIPING, FITTINGS, AND SPECIALTIES.

- A. Connect piping to boilers, except safety relief valve connections, with flexible connectors of materials suitable for service. Flexible connectors and their installation are specified in Section 230500 "Basic HVAC Materials and Methods."
- B. Connect gas piping full size to boiler gas-train inlet with union.
- C. Connect hot-water piping to supply- and return-boiler tappings with shutoff valve and union or flange at each connection.
- D. Install piping from safety relief valves to nearest floor drain, floor sink or other approved location.
- E. Install piping from safety valves to drip-pan elbow and to nearest floor drain.
- F. Connect breeching full size to boiler outlet.
- G. Install piping adjacent to boiler to allow service and maintenance.
- H. Ground equipment according to Section 260526 "Grounding and Bonding."
- I. Connect wiring according to Section 260519 " Low-Voltage Electrical Power Conductors and Cables."

- J. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.05 STARTUP SERVICE

- A. Engage a factory-authorized service representative to test, inspect, and adjust boiler components and equipment installation and to perform startup service.
- B. Perform installation and startup checks according to manufacturer's written instructions.
- C. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
- D. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
- E. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- F. Adjust initial temperature set points.
- G. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- H. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose, without additional cost.
- I. Prepare written report that documents testing procedures and results.

3.06 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify boiler mounting, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

END OF SECTION

SECTION 23 52 13
ELECTRIC BOILERS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Electric Hot Water Boilers
 - 2. Boiler trim and accessories

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230593: Testing, Adjusting and Balancing
- C. Section 230716: Equipment Insulation
- D. Section 230900: Building Automation System (BAS) Controls
- E. Section 232113: Hydronic Piping, Valves and Specialties
- F. Section 232123: Hydronic Pumps
- G. Section 238239: Heat Transfer
- H. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide boilers conforming to the requirements of the latest addition of the following:
 - 1. American National Standards Institute (ANSI):
 - a. B31.1 - Power Piping
 - 2. American Society of Mechanical Engineers (ASME): Boiler and Pressure Vessel Code

- a. Section VIII D1 - Rules for Construction of Pressure Vessels including Addendums
 - b. Section VIII D2 - Rules for Construction of Pressure Vessels including Addendums
 - c. Section IX - Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators including Addendums
3. National Electrical Manufacturers Association (NEMA): Provide electrical components which comply with NEMA Standards.
 4. National Fire Protection Association (NFPA):
 - a. 70 - National Electrical Code

1.05 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 1. The proposed substitution does not affect dimensions shown on drawings.
 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, and installation instructions.
- B. Shop Drawings: Submit manufacturer's shop drawings indicating dimensions, weight loading, required clearances, methods of assembly of components, and location and size of each field connection.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, tube replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.
- D. Wiring Diagrams: Submit manufacturer's ladder-type wiring diagrams for power and control wiring required. Differentiate between factory-installed and field-installed wiring.
- E. Boiler Certification: The boiler manufacturer shall submit evidence that the boiler(s) meet the requirements of the standards specified.

- F. Commissioning Test Plan: Submit test plan for boilers. Plan shall include test schedules, and names and titles of the test personnel who will be participating in the commissioning tests. The test personnel must be employees of the boiler manufacturer or the manufacturer's designated representatives. Plan shall include false loading of boilers, if the anticipated building loads at the time of test do not meet capacity requirements. Submittals shall have detailed layout for temporary equipment, if such equipment is needed, even if it is not specified or shown on the Drawings.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.
- C. Rigging: Comply with the manufacturer's rigging and installation instructions.

1.08 WARRANTY

- A. Provide minimum two-year warranty on boiler system and pressure vessel from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 GENERAL

- A. Refer to drawings for capacities and characteristics.
- B. Manufacturers: Lochinvar #BW Series, Bryan #BE Series.

2.02 MANUFACTURED UNITS

- A. Description: Factory-fabricated, -assembled, and -tested electric boilers with trim and controls necessary to generate hot water.
- B. Pressure Vessel: Carbon-steel or cast-iron pressure vessel mounted on structural-steel base.
- C. Nozzles: Flanges or NPT threads for water inlet and outlet and heating element inserts; threaded connections for trim and controls.
- D. Insulation: Multiple layers of glass-fiber insulation. Minimum 2 inch (50 mm) thickness (total).
- E. Jacket: Galvanized sheet metal casing with baked-enamel or powder-coated protective finish and removable panels with snap-in or interlocking closures for access to pressure vessel.
- F. Lifting Lugs: Welded to pressure vessel, extending above jacket.
- G. Heating Elements: Copper or Incoloy-sheathed, replaceable electric-resistance element, rated 20-kW maximum, with maximum 75 W/sq. in. (11.5 W/sq.cm) over the heat-transfer length.

1. Seismic Fabrication Requirements: Fabricate mounting base and attachment to boiler, accessories, and components with reinforcement strong enough to withstand seismic forces defined in Section 230549 "Seismic Restraint for Piping, Ductwork, and Equipment" when mounting base is anchored to building structure.
 - H. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - I. ASME Compliance: Fabricate and label boilers to comply with 2021 ASME Boiler and Pressure Vessel Code.
 - J. NFPA Compliance: Design and fabricate boilers to comply with NFPA 70, Article 424.
 - K. UL Compliance: Test boilers for compliance with UL 834. Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
- 2.03 TRIM FOR HOT-WATER BOILERS
- A. Include devices sized to comply with ASME B31.1 or ASME B31.9.
 - B. Aquastat Controllers: Operating auto-reset high limit.
 - C. Safety Relief Valve: ASME rated and mounted vertically.
 - D. Pressure and Temperature Gage: Minimum 3-1/2-inch (89 mm) diameter, water pressure and temperature gage. Gages shall have operating pressure and operating temperature ranges, so normal operating range is about 50 percent of full range.
 - E. Boiler Air Vent: Automatic.
 - F. Dip-tube in water outlet.
 - G. Drain Valve: Minimum NPS 3/4 inch (DN 20) hose-end ball valve sized according to requirements of authorities having jurisdiction.
- 2.04 CONTROLS
- A. Refer to Section 230900 "Building Automation System (BAS) Controls" and sequence of operation.
 - B. Boiler operating controls shall include the following devices and features:
 1. Control transformer.
 2. Step controller.
 3. Recycling relay returns controller to off position after power failure.
 4. Multistage thermostat.
 5. Control-circuit switch.
 6. Visual indication for each step.
 7. Supply-voltage indicator.
 8. Set-Point Adjust: Set points shall be adjustable.

9. Sequence of Operation: Electric, factory-fabricated and field-installed panel to control element sequence controller to maintain space temperature in response to thermostat with heat anticipator located in heated space.
 - a. Include automatic, alternating-operation sequence for multiple boilers to provide equal runtime for boilers.
- C. Safety Controls: To maintain safe operating conditions, safety controls limit boiler operation.
 1. High Cutoff: Automatic reset stops boiler if operating conditions rise above set point or maximum boiler design temperature and/or pressure.
 2. Low-Water Cutoff Switch: Electronic or Float and electronic probe shall prevent boiler operation on low water. Cutoff switch shall be automatic-reset type.
 3. Audible Alarm: Factory mounted on control panel with silence switch; shall sound alarm for above conditions.
 4. Hardwired Points:
 - a. Monitoring: On/off status and common trouble alarm as a minimum.
 - b. Control: On/off operation and hot water supply temperature set-point adjustment as a minimum.
 5. A communication interface with building automation system shall enable building management system operator to remotely control and monitor the boiler from an operator workstation. Control features available and monitoring points displayed locally at boiler control panel shall be available through building automation system.

2.05 ELECTRICAL POWER

- A. Single-Point Field Power Connection: Factory-installed and -wired switches, transformers, and electrical devices necessary shall provide a single-point field power connection to boiler.
 1. Field power interface shall be to fused disconnect switch or non-fused disconnect switch. Refer to electrical design drawings for power wiring and connection to circuit breaker.
 2. Interlock with door to de-energize power with door open.
- B. Electrical Enclosures: NEMA 250, Type 1 enclosure with hinged door and key-locking handle.
- C. Install factory wiring outside of an enclosure in a metal raceway.
- D. Comply with NFPA 70.
- E. Connectors: Mechanical lugs bolted to copper bus bars or distribution blocks with pressure connectors.
- F. Contactors: Three-pole magnetic contactors, listed for 500,000 cycles at full load.
- G. Factory-wired internal control devices and heating elements. Wiring shall be numbered and color coded to match wiring diagram.

2.06 EMERGENCY SHUTDOWN SWITCH

- A. Emergency boiler room shutdown switch for mounting outside boiler room doors. Mechanical to provide and install for complete and operational system per ASME CDS-1. Switch shall work independently of Building Automation System. Features shall include:

1. Emergency off push button. Button shall be red with white lettering. 1-1/2" diameter. Button type shall include latching action upon activation. Button type shall be "turn-to-reset" after a boiler incident has been resolved.
 2. Housing: Polycarbonate or metal for recessed wall installation. Cover shall be clear and hinged to protect button from accidental activation.
 3. Output: SPDT relay for 120-240 V AC service.
 4. Operating Temperature Range: -40°F to 250 °F.
 5. Mounting: Located switch at 48" above finished floor in compliance with ADA.
- B. Signage: Mount aluminum or plastic warning sign above switch. Sign shall be minimum 7" wide by 5" tall with red background and white lettering. Text of sign shall be "BOILER EMERGENCY SHUTOFF".
- C. Switch Manufacturers: Safety Technology International #Stopper Station Series.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.
1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
 2. Examine mechanical spaces for suitable conditions where boilers will be installed. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. All equipment, unless otherwise shown or noted, is to be installed in accordance with industry standards and manufacturer's recommended installation instructions.
- B. Boilers are to be installed on concrete housekeeping pads. Provide manufacturer and code clearance all around and provide minimum 48" clearance between boilers.
- C. Install boiler trim not installed at factory.
- D. Connect to supply and return water piping, drain and relief piping.
- E. Relief valves are to be piped and terminated above approved termination location as required by code.
- F. Flush and clean boilers, in accordance with manufacturer's start-up instructions, and in presence of boiler manufacturer's representative. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls.
- G. Hydrostatically test assembled boiler(s) and piping in accordance with applicable sections of ASME "Boiler and Pressure Vessel Code".

3.03 EMERGENCY BOILER SHUTDOWN

- A. All electric boilers with input greater than 117 kW shall have a manually operated remote shutdown switch to shutdown boiler(s) and associated equipment. Activation of the emergency shutdown switch shall immediately shut off the energy supply and initiate the boiler shutdown sequence in accordance with manufacturer's recommendations where applicable.
- B. The shutdown switch should be located just outside the boiler room door and marked with signage for easy identification. Consideration should be given to the type and location of the switch to safeguard against tampering. If the boiler room door is on the building exterior, the switch should be located just inside the door. If there is more than one door to the boiler room, there should be a switch located at each door.
- C. Comply with local building and mechanical codes for additional requirements. Comply with ASME CDS-1 and ASME Boiler and Pressure Vessel Code (BPVC) Section HG-634.
- D. Provide conduit, wiring, relays, devices, etc., as required for complete and operational emergency shutdown system including shutdown of boiler(s) and associated pump(s) and valve(s) as necessary. Coordinate with electrical design as necessary. Shutdown system shall operate independently of BAS, but BAS should monitor activation of switch for remote indication. Coordinate with BAS contractor for interface.

3.04 CONNECTIONS

- A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect piping to boilers, except safety relief valve connections, with flexible connectors of materials suitable for service. Flexible connectors and their installation are specified in Section 230500 "Basic HVAC Materials and Methods."
- C. Connect hot-water piping to supply and return water boiler tapplings with shutoff valve and union or flange at each connection.
- D. Install piping from safety relief valves to nearest floor drain, floor sink or other approved location.
- E. Install piping from safety valves to drip-pan elbow and to nearest floor drain.
- F. Install piping adjacent to boiler to allow service and maintenance.
- G. Ground equipment according to Section 260526 "Grounding and Bonding."
- H. Connect wiring according to Section 260519 " Low-Voltage Electrical Power Conductors and Cables."
- I. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.05 STARTUP SERVICE

- A. Engage a factory-authorized service representative to test, inspect, and adjust boiler components and equipment installation and to perform startup service.
- B. Perform installation and startup checks according to manufacturer's written instructions.

- C. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
- D. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
- E. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- F. Adjust initial temperature set points.
- G. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- H. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose, without additional cost.
- I. Prepare written report that documents testing procedures and results.

3.06 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify boiler mounting, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

END OF SECTION

SECTION 23 52 16
CONDENSING BOILER

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 1. Commercial Firetube Condensing Hot Water Boiler
 2. Commercial Watertube Condensing Hot Water Boiler
 3. Residential Condensing Hot Water Boiler
 4. Condensate Neutralizer

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230548: Vibration Isolation for Piping, Ductwork and Equipment
- C. Section 230593: Testing, Adjusting and Balancing
- D. Section 230716: Equipment Insulation
- E. Section 230900: Building Automation System (BAS) Controls
- F. Section 232113: Hydronic Piping, Valves and Specialties
- G. Section 232123: Hydronic Pumps
- H. Section 233113: Air Distribution
- I. Section 238239: Heat Transfer
- J. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.

- B. Codes and Standards: Provide boilers conforming to the requirements of the latest addition of the following:
1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. All components to comply with NEMA Standards.
 2. ASHRAE/IES 90.1 Compliance: Boilers shall have minimum efficiency according to "Gas and Oil Fired Boilers - Minimum Efficiency Requirements."
 3. UL Compliance: Test boilers for compliance with UL 795. Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
 4. CSA Compliance: Test boilers for compliance with CSA B51.
 5. American Boiler Manufacturer's Association (ABMA) "Standard Test Procedure for Packaged Firetube Boilers". Label boiler with ABMA emblem on boiler nameplate.
 6. AHRI certified efficiency shall be equal to or greater than specified efficiency. Testing shall be done to BTS2000 Standards.
 7. American National Standards Institute (ANSI):
 - a. B31.1: Power Piping.
 - b. Z21.13: Gas-Fired Low Pressure Steam and Hot Water Boilers, including addendums.
 8. American Society of Mechanical Engineers (ASME):
 - a. Boiler and Pressure Vessel Code (BPVC):
 - 1) Section IV: Rules for Construction of Heating Boilers.
 - 2) Section VIII D1: Rules for Construction of Pressure Vessels including Addendums.
 - 3) Section VIII D2: Rules for Construction of Pressure Vessels including Addendums.
 - 4) Section IX: Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators including Addendums.
 9. National Fire Protection Association (NFPA):
 - a. 70: National Electrical Code.

1.05 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
1. The proposed substitution does not affect dimensions shown on drawings.
 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.

- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, and installation instructions.
- B. Seismic Qualification Certificates: For boiler, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Shop Drawings: Submit manufacturer's shop drawings indicating dimensions, weight loading, required clearances, methods of assembly of components, and location and size of each field connection.
- D. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, tube replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.
- E. Wiring Diagrams: Submit manufacturer's ladder-type wiring diagrams for power and control wiring required. Differentiate between factory-installed and field-installed wiring.
- F. Boiler Certification: The boiler manufacturer shall submit evidence that the boiler(s) meet the requirements of the standards specified.
- G. Vent Manifolds Coordination: For boiler plant installation requiring multiple boilers venting into a common vent stack, the vent design is to be provided by the same manufacturer's representative as the boiler manufacturer's representative. In addition, a sign-off is required from the submitted boiler manufacturer attesting to their approval of the proposed venting arrangement.
- H. Commissioning Test Plan: Submit test plan for boilers. Plan shall include test schedules, and names and titles of the test personnel who will be participating in the commissioning tests. The test personnel must be employees of the boiler manufacturer or the manufacturer's designated representatives. Plan shall include false loading of boilers, if the anticipated building loads at the time of test do not meet capacity requirements. Submittals shall have detailed layout for temporary equipment, if such equipment is needed, even if it is not specified or shown on the Drawings.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.

- C. Rigging: Comply with the manufacturer's rigging and installation instructions.

1.08 WARRANTY

- A. Refer to Section 230500 for basic warranty requirements.
- B. Guarantee and warranties: The entire boiler/burner package shall be guaranteed and warranted by the boiler manufacturer.
 - 1. Warranty Period for the Pressure Vessel and Heat Exchanger: The boiler manufacturer shall warranty against failure due to:
 - a. Flue gas condensate corrosion, and/or defective material or workmanship for a period of ten (10) years, non-prorated, from the date of shipment from the factory.
 - b. Thermal shock or stress, for a period of twenty (20) year, minimum, non-prorated warranty against damage.
 - 2. Warranty Period for the Burner: The boiler manufacturer shall warranty the mesh burner head against defective material or workmanship for a period of five (5) years, non-prorated, from the date of shipment from the factory.
 - 3. Warranty Period for all other components: The boiler manufacturer will repair or replace any part of the boiler that is found to be defective in workmanship or material for a period of two (2) years, non-prorated, from the date of shipment from the factory.

PART 2 PRODUCTS

2.01 GENERAL

- A. For multiple boiler installations with boilers vented to a common vent, the boilers shall be symmetrically air-fuel coupled such that any changes in the combustion air-flow or flue flows shall affect the BTUH input without affecting the combustion quality.

2.02 COMMERCIAL FIRETUBE CONDENSING BOILER

- A. Designs not requiring a dedicated boiler pump either internally to the boiler or as a secondary system pump. The Condensing Boiler shall function properly in a Primary Pumping Variable Flow System with motorized isolation valves on individual boilers.
 - 1. Manufacturers: Fulton Endura, Aerco Benchmark, Cleaver-Brooks Clearfire, Viessmann Vitocrossal, Lochinvar Crest, Riello RTC, Raypak XVers-Type H.
- B. Designs which require a dedicated boiler pump:
 - 1. Acceptable Manufacturers: Hamilton EVO, Lochinvar Knight XL.
- C. General: Factory packaged unit shall include boiler, burner, painted insulated steel jacket, controls and accessories all piped and wired for single point field connections. Unit's burner and controls shall be in accordance with ASME/CSD-1 and all codes required by the local governing authorities and as indicated on the design criteria data sheet. Boiler's minimum overall efficiency shall be listed in mechanical schedule. ASME certified, labeled, stamped, and designed for 125 PSIG water in accordance with Section IV of ASME Code. Unit shall be designed to Seismic Zone requirements applicable to boiler location. Manufacturer's Representative to provide services for field testing and adjusting of boiler and controls to meet design requirements.

- D. Boiler Type: Stainless steel firetube boiler for positive pressurized firing. Fully condensing. Positive pressure Category IV for individually vented boiler.
- E. Minimum Construction Features:
1. Boiler shall be mounted on heavy steel base.
 2. Boiler pressure vessel to have dual return design to maximize operating efficiency.
 3. Boiler shall be provided with a drain and means to flush and clean the heat exchanger.
 4. Boiler shall be covered with a minimum of 1/2 inch of insulation under a gas tight casing.
 5. Burner shall be provide a means for readily accessible furnace access.
 6. The boiler shall permit either no minimum flow or provide control to cycle the burner off at zero flow allowing the boiler to be suitable for operation in Primary Pumping Variable Flow System.
- F. Critical Efficiency Related Performance Criteria:
1. Regardless of the venting materials specified in the construction documents, the submitted boiler shall be capable of being vented with PVC, CPVC, or Polypropylene.
 2. The boiler shall be capable of operating in a variable primary piping arrangement with turndown and controls able to meet the target loop set point.
- G. Burner:
1. General: Forced draft natural gas burner, woven fiber mesh design, with variable speed blower fan; motor; air damper; linkage; air flow switch; fuel train; and control panel. Burners and controls to conform to ASME/CSD-1 and other insurance requirements as indicated. Burner designed for sealed combustion.
 2. Gas Train: Minimum main gas train shall include manual shut-off valve, pressure regulating valve, dual gas valves, manual test valve, and high-low gas pressure switches. Gas train shall be factory packaged to meet insurance requirements as indicated.
 3. Excess Air: The burner shall be capable of operating at no greater than 8.0% excess O₂ over the entire modulation range to maximize seasonal combustion and thermal efficiencies.
 4. NO_x Emissions: When operating on natural gas, the burner shall maintain a level of <20 ppm over the complete combustion range at a 3% O₂ correction. The natural gas burner shall be configurable down to <9 ppm NO_x when operating on 460/3/60 electrical service.
- H. Boiler Plant Turndown: Effective plant capacity turndown is to be a minimum of 10:1. This may be achieved by combination of multiple boilers with boiler turndown. Minimum boiler turndown to be no less than five to one.
- I. Boiler Trim: To include the following:
1. Temperature gauge.
 2. Pressure gauge.
 3. ASME safety relief valve.
 4. Operating control.
 5. Limit control with manual reset.
 6. Low water cut-off or flow switch for boilers with low volume heat exchangers.
 7. Modulating controller.

8. Condensate neutralizer kit.
9. Drain valve.

J. Control:

1. Panel: Boiler mounted enclosure to include fusing; step-down control transformer and boiler controls.
2. Boiler controls shall feature a standard, factory installed graphic LCD screen display with navigation dial or touchscreen interface and includes the following standard features:
 - a. Outdoor air reset: Boiler shall calculate the set point using a field installed, factory supplied outdoor sensor and an adjustable reset curve.
 - b. Time clock: Boiler shall have an internal time clock with the ability to time and date stamp lock-out codes and maintain records of runtime.
 - c. Maintenance reminder: Boiler shall have the ability to display a, customizable maintenance notification screen. All notifications are adjustable by the installer based upon months of installation, hours of operation, and number of boiler cycles.
 - d. English Error codes: Boiler shall have a user interface that displays a red error screen with fault codes that are displayed in English and include a date and time stamp for ease of servicing.
 - e. Anti-cycling control: Boiler shall have the ability to set a time delay after a heating demand is satisfied allowing the boiler to block a new call for heat. The boiler will display an anti-cycling blocking on the screen until the time has elapsed or the water temperature drops below the anti-cycling differential parameter. The anti-cycling control parameter is adjustable by the installer.
 - f. Isolation valve control: Boiler shall have the ability to control a 2-way motorized control valve. Boiler shall also be able to force a fixed number of valves to always be energized regardless of the number of boilers that are firing.
 - g. BMS integration with 0-10V DC input: The Control shall allow an option to Enable and control set point temperature by sending the boiler a control input signal.
 - h. Data logging: Boiler shall have non-volatile data logging memory including last 10 lockouts, space heat run hours, domestic hot water run hours and ignition attempts. All data should be visible on the boiler screen.
3. The boiler shall have a built in Cascade controller to sequence and rotate lead boiler to ensure equal runtime while maintaining modulation of up to eight boilers of different BTUH inputs without utilization of an external controller. The factory installed, internal cascade controller shall include:
 - a. Lead lag: The Control module shall allow only one boiler to fire at the beginning of a call for heat. Once the lead boiler is in full fire and the control calculates that additional heat is required it will call on an additional boiler as needed.
 - b. Efficiency optimization: The Control module shall allow multiple boilers to simultaneously fire at minimum firing rate in lieu of Lead/Lag.
 - c. Rotation of lead boiler: The Control module shall change the lead boiler every hour for the first 24 hours after initializing the Cascade. Following that, the leader will be changed once every 24 hours.
 - d. For multi-boiler installations, in the event of the lead master control boiler being powered down for service or failure, the controls shall automatically shift the assignment of master controller duty to an active boiler including the reassignment of the remote header sensor

- e. Boiler on board controller shall include the following capability:
 - 1) Set-Point Adjust: Set points shall be fully adjustable by the installer.
 - 2) Sequence of Operation: Factory installed controller to modulate burner firing rate to maintain system water temperature in response to call for heat.
 - 3) Sequence of Operation: Boiler shall come standard with outdoor reset control which will control burner firing rate to reset supply-water temperature inversely with outside-air temperature.
- 4. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation and include:
 - a. High Temperature Limit: Automatic and manual reset stops burner if operating conditions rise above maximum boiler design temperature. Limit switch to be manually reset on the control interface.
 - b. Low-Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be manually reset on the control interface.
 - c. Blocked Inlet Safety Switch: Manual-reset pressure switch field mounted on boiler combustion-air inlet.
 - d. High and Low Gas Pressure Switches: Pressure switches shall prevent burner operation on low or high gas pressure. Pressure switches to be manually reset on the control interface.
 - e. Blocked Drain Switch: Blocked drain switch shall prevent burner operation when tripped. Switch to be manually reset on the control interface.
 - f. Low air pressure switch: Pressure switches shall prevent burner operation on low air pressure. Switch to be manually reset on the control interface.
 - g. Optional Audible Alarm: Factory mounted on control panel with silence switch; shall sound alarm for any lockout conditions.
- 5. Building Automation System Interface:
 - a. Hardwired Interface: Boiler shall have the ability to receive a 0-10V or 4-20 mA signal from a building management system to control setpoint and start/stop.
 - b. Communication Interface: Factory installed Modbus gateway interface or BACnet MSTP or IP interface to enable building automation system to monitor, control, and display boiler status and alarms.
- K. Manufacturers Field Services: Provide (2) days of start-up, balancing, testing, and owner instruction. Testing shall include written reports on boiler firing rate, turndown, efficiency, motor amperage, O₂, CO, NO_x levels, flue gas temperature, ambient temperature, and all control settings.

2.03 WATER-TUBE CONDENSING BOILERS

- A. Description: Factory-fabricated, -assembled, and -tested, stainless steel, water-tube condensing boiler with heat exchanger sealed pressure tight, built on a steel base, including insulated jacket; flue-gas vent; combustion-air intake connections; water supply, return, and condensate drain connections; and controls.
- B. Manufacturers: Lochinvar Knight XL, Hamilton EVO, Hamilton 3VO, RBI Infinite Energy 2, Raypak X-Fyre, HTP Mod Con, Thermal Solutions Arctic, Viessmann Vitodens 200-W, Camas DynaForce .

- C. Heat Exchanger:
 - 1. 316 L Stainless steel heat exchanger
 - 2. Staged designs consisting of a non-condensing ferrous or copper tube heat exchanger in combination with a condensing stainless steel heat exchanger is prohibited by this specification.
- D. Combustion Chamber: Stainless steel, sealed.
- E. Burner: Forced draft drawing from gas premixing valve.
- F. Blower: Variable speed centrifugal fan to operate during each burner firing sequence and to prepurge and postpurge the combustion chamber.
 - 1. Motors: Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - a. Motor Sizes: Minimum size as indicated; if not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
- G. Gas Train: Combination gas valve with manual shutoff and pressure regulator.
- H. Ignition: Direct spark ignition that includes flame safety supervision and 100 percent main-valve shutoff.
- I. Integral Circulator: Circulator to meet or exceed the warranty of the boiler heat exchanger.
- J. Casing:
 - 1. Jacket: Sheet metal, with snap-in or interlocking closures.
 - 2. Finish: Primed and pre-painted.
 - 3. Insulation: Minimum ½ -inch- (12.5-mm-) mineral-fiber insulation surrounding the heat exchanger.
 - 4. Combustion-Air Connections: Inlet and vent duct collars.
- K. Boiler Plant Turndown: Effective plant capacity turndown is to be a minimum of 10:1. This may be achieved by combination of multiple boilers with boiler turndown. Minimum boiler turndown to be no less than five to one.
- L. Boiler Trim with following features:
 - 1. Combination temperature/pressure gauge
 - 2. ASME safety relief valve
 - 3. Operating control
 - 4. Limit control with manual reset
 - 5. Low water cut-off or flow switch cut-off
 - 6. Modulating controller
 - 7. Condensate neutralizer kit
 - 8. Drain valve
- M. Control:

1. Panel: Boiler mounted enclosure to include fusing; step-down control transformer and boiler controls.
2. Boiler controls shall feature a standard, factory installed graphic LCD screen display with navigation controls. The controls are to include the following standard features:
 - a. Boiler Pump Control: Provide control of the dedicated boiler pump for either variable speed control or constant speed control as required by the manufacturer to maintain a designed temperature rise across the heat exchanger with a minimum temperature rise of 20 degrees F and a maximum temperature rise of 60 degrees F. Project specific temperature rise shall be ____ at full fire.
 - b. Outdoor air reset: Boiler shall calculate the set point using a field installed, factory supplied outdoor sensor and an adjustable reset curve.
 - c. Time clock: Boiler shall have an internal time clock with the ability to time and date stamp lock-out codes and maintain records of runtime.
 - d. Error codes: Boiler shall have a user interface that displays an error screen with fault codes for ease of servicing.
 - e. Anti-cycling control: Boiler shall have the ability to set a time delay after a heating demand is satisfied allowing the boiler to block a new call for heat. The boiler will display an anti-cycling blocking on the screen until the time has elapsed or the water temperature drops below the anti-cycling differential parameter. The anti-cycling control parameter is adjustable by the installer.
 - f. BMS integration with 0-10V DC input: The Control shall allow an option to Enable and control set point temperature by sending the boiler a 0-10V input signal.
3. The boiler shall have a built in Cascade controller to sequence and rotate lead boiler to ensure equal runtime while maintaining modulation of up to 8 boilers of different btu inputs without utilization of an external controller. The factory installed, internal cascade controller shall include:
 - a. Lead lag: The Control module shall allow only one boiler to fire at the beginning of a call for heat. Once the lead boiler is in full fire and the control calculates that additional heat is required it will call on an additional boiler as needed.
 - b. Efficiency optimization: The Control module shall allow multiple boilers to simultaneously fire at minimum firing rate in lieu of Lead/Lag.
 - c. Rotation of lead boiler: The Control module shall change the lead boiler every hour for the first 24 hours after initializing the Cascade. Following that, the leader will be changed once every 24 hours.
 - d. Boiler on board controller shall include the following capability:
 - 1) Set-Point Adjust: Set points shall be fully adjustable by the installer.
 - 2) Sequence of Operation: Factory installed controller to modulate burner firing rate to maintain system water temperature in response to call for heat.
 - 3) Sequence of Operation: Boiler shall come standard with outdoor reset control which will control burner firing rate to reset supply-water temperature inversely with outside-air temperature.
4. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation and include:
 - a. High Temperature Limit: Automatic and manual reset stops burner if operating conditions rise above maximum boiler design temperature. Limit switch to be manually reset on the control interface.

- b. Low-Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be manually reset on the control interface.
 - c. Blocked Inlet Safety Switch: Manual-reset pressure switch field mounted on boiler combustion-air inlet.
 - d. High and Low Gas Pressure Switches: Pressure switches shall prevent burner operation on low or high gas pressure. Pressure switches to be manually reset on the control interface.
 - e. Blocked Drain Switch: Blocked drain switch shall prevent burner operation when tripped. Switch to be manually reset on the control interface.
 - f. Low air pressure switch: Pressure switches shall prevent burner operation on low air pressure. Switch to be manually reset on the control interface.
 - g. Optional Audible Alarm: Factory mounted on control panel with silence switch; shall sound alarm for any lockout conditions.
5. Building Automation System Interface:
- a. Hardwired Interface: Boiler shall have the ability to receive a 0-10V system from a building management system and control by the following:
 - 1) 0-10V DC input to control Setpoint
 - 2) 0-10V DC input Enable/Disable signal
 - b. Communication Interface: Factory installed Modbus gateway interface or BACnet IP interface to enable building automation system to monitor, control, and display boiler status and alarms.
- N. Manufacturers Field Services: Provide (2) days of start-up, balancing, testing, and owner instruction. Testing shall include written reports on boiler firing rate, turndown, efficiency, motor amperage, O₂, CO, NO_x levels, flue gas temperature, ambient temperature, and all control settings.

2.04 SMALL/RESIDENTIAL CONDENSING BOILER

- A. General: Factory packaged high efficiency condensing unit shall include boiler, burner, painted jacket, controls and accessories all piped and wired for single point field connections.
- 1. The boiler shall be high efficiency condensing units that meet or exceed an efficiency of 92% tested and certified to AFUE standards, and exceed ASHRAE/103-93 minimum efficiency requirements. The boiler shall be Energy Star approved. The boiler shall be constructed in accordance with ANSI Standard for Gas-Fired Low-Pressure Steam and Hot Water Boilers, ANSI Z21.13b-1994, Canadian National Standard CGA-4.9-1999.26UB, UL/ULC (File #MH27745). Listed and be in accordance with all codes and authorities having jurisdiction. The boiler shall bear the ASME "H" Stamp for working pressure of 125 psi and shall be national board listed.
 - 2. The boiler heat exchanger and combustion shell shall be constructed entirely of 316-L or 439 stainless steel. The combustion shell shall be designed to collect condensation allowing it to be discharged by gravity to an approved plumbing discharge location. The heat exchanger tubes shall be water tight with high temperature o-rings to the header, which are held in place with stainless steel banding.

3. The boiler shall be a sealed combustion system of natural or liquid propane gas-fueled with a modulating power burner and positive pressure discharge. The intake/exhaust shall be piped with a Minimum diameter Plastic PVC or ABS schedule 40, 80 solid, Non Foam Core of a diameter specified by the manufacturer. Boiler shall be approved for both direct-horizontal venting as well as vertical venting. The exhaust shall maintain a minimum of 1/4" per foot slope toward boiler to control condensate and rainwater. All related intake/exhaust piping shall be approved for zero clearance to any combustible surface. Boiler shall operate at combustion efficiency no less than 92%. The combustion block shall be insulated and secured in a durable non-ferrous enclosure. All components shall be located in the front of the heater for access of serviceability.
4. The operation of the boiler shall be in a closed-loop-pressurized system, which shall have properly sized thermal expansion tank(s), or meet local codes. Boiler shall be supplied with an ASME rated 30 PSI relief valve and equipped with a water pressure switch to monitor system pressure.
5. The boiler shall have a load matching modulating range of a minimum 3.7:1 ratio to BTU/hr output. To prevent short cycling, the boiler shall step fire on start-up before engaging full modulation.
6. The blower motor shall have permanently lubricated sealed ball bearings, with inherent overload protection. Motors shall be mounted inside the unit casing.
7. Manufacturer: Hamilton EVO, Lochinvar Cadet, Lochinvar Knight, HTP Elite, Burnham Alpine, Lennox GWM-IE, Viessmann Vitodens 200-W B2HB, Aerco EST 399.

B. Connections:

1. Gas supply: Shall be a minimum size of 3/4" inside diameter for boilers less than 200,000 BTU's, and 1 1/4" gas connections for boilers of 399,000 with CSD-1 gas train. Check sizing charts if larger sizes are required due to long distances and other gas competing appliances.
2. Supply and Return Water: The boiler shall have a minimum 1 1/4" Supply and Return water connections for boilers less than 200,000 BTU's, and 2" connections for boilers of 399,000 BTU's.
3. Condensate water: Shall be directed to an approved plumbing termination location or to the exterior of the building via minimum 3/4" copper Type L tubing at a 1/4" per foot slope away from the boiler (larger diameter pipe may be necessary for longer lengths). If condensate is directed to a drain, a condensate neutralizer must be utilized or sanitary sewer shall connect downstream of readily used fixture and waste pipe shall be acid resistant. If proper boiler condensate grade is not obtainable, a condensate pump must be installed to elevate condensate to termination location.

C. Controls

1. The heating unit shall include integral operating controls to govern all operations and energy input. Controls shall be integrated solid-state temperature and spark ignition control with integral diagnostics. A service disconnect switch shall be factory installed on the exterior of the boiler. Boiler shall include factory installed control sensors on the boiler water connections inlet and outlet.
2. The boiler shall provide integral outdoor reset control. The control shall have a differential switch with setting 6-12-20-30 differential range with an operating range of 70° F -190° F with a resettable high limit switch. The control shall utilize an algorithm to fully adjust the firing rate while maintaining the desired output temperature.
3. Controller shall include self-diagnostic controls which monitor all interlocks and provide fault information with an easy computer interconnection port for clear data viewing and downloading to a PC.

4. Controller shall consist of a main circuit board with power supply transformer and provide the following functions on the main circuit board:
 - a. Power supply unit for voltage supply of controller.
 - b. Micro controller for controlling and monitoring the boiler unit.
 - c. Various analog sensor connections (temperature sensors).
 - d. LCD and LEDs for displaying data and operating conditions of the controller.
 - e. Pushbuttons for operating the controller.
 - f. Various plug connections.
5. Boiler shall include the following boiler control safeties, integral to control board:
 - a. Safety Limit high limit switch w/manual reset, factory set at 225°F.
 - b. Safety Limit Flue w/manual reset, factory set at 210°F.
 - c. High Limit w/manual reset on outlet pipe, factory set at 230°F.
 - d. Flame Failure Lockout after three tries. Retry ignition sequence every hour.
 - e. Combustion air/exhaust proving switch w/Manual reset.
 - f. Gas Valve continuity check w/Manual reset.
 - g. Flame sensor detector fault w/Manual reset.
 - h. Supply sensor continuity check w/Manual reset.
 - i. Fan Speed parameter check w/Manual reset.
6. The following are required accessories provided with the boiler as part of the bid package. These accessories shall include all components necessary to install and operate the boiler and comply with state codes.
 - a. Low Water Cut Off w/manual reset.
 - b. Concentric flue.
 - c. ASME Boiler safety relief valve.
 - d. Flue gas condensate neutralizing kit.
7. The following are typical accessories that shall be provided in the system construction to provide a complete and operational system and as specified in the construction documents.
 - a. Circulating pump, flanged, with a flow rate & foot of head sized to boiler and system.
 - b. Shut off valves and flange set.
 - c. Y-strainer.
 - d. Zone circulator control.
 - e. Pressure gauges on inlet and outlet.
 - f. Thermometer on inlet and outlet.
 - g. Air separator.
 - h. Hydronic expansion tank.
 - i. Pressure reducing valve adjustable from 10-25 psi.
 - j. Back flow preventer.

8. Electrical System

- a. The electrical system shall conform to National Electrical Code requirements. The control circuit shall be 24 volts AC, wire in accordance with NEC Class II requirements. The control circuit wire shall not be smaller than 18 AWG. Each wire shall end with a service loop and be securely fastened by an approved method. Each wire in the unit shall be numbered for ease of service tracing. All electrically actuated components shall be easily accessible from the front of the unit without reaching over exposed high voltage components or rotating parts. The blower motor shall have thermal and short circuit protection. Line voltage and 24 volt control circuit wiring shall be routed in separate bundles.
- b. All wiring and transformers shall be provided by this Division unless otherwise indicated in construction documents. Coordinate with electrical contractor for line voltage power.

2.05 CONDENSATE WATER NEUTRALIZER

- A. Provide PH Neutralizer for condensate neutralization on all condensing boilers.
- B. Manufacturer: J.M. Boiler Works, Axiom Neutra Series PH neutralizer.

2.06 EMERGENCY SHUTDOWN SWITCH

- A. Emergency boiler room shutdown switch for mounting outside boiler room doors. Mechanical to provide and install for complete and operational system per ASME CDS-1. Switch shall work independently of Building Automation System. Features shall include:
 1. Emergency off push button. Button shall be red with white lettering. 1-1/2" diameter. Button type shall include latching action upon activation. Button type shall be "turn-to-reset" after a boiler incident has been resolved.
 2. Housing: Polycarbonate or metal for recessed wall installation. Cover shall be clear and hinged to protect button from accidental activation.
 3. Output: SPDT relay for 120-240 V AC service.
 4. Operating Temperature Range: -40°F to 250 °F.
 5. Mounting: Located switch at 48" above finished floor in compliance with ADA.
- B. Signage: Mount aluminum or plastic warning sign above switch. Sign shall be minimum 7" wide by 5" tall with red background and white lettering. Text of sign shall be "BOILER EMERGENCY SHUTOFF".
- C. Switch Manufacturers: Safety Technology International #Stopper Station Series.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.
 1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

2. Examine mechanical spaces for suitable conditions where boilers will be installed. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. All equipment, unless otherwise shown or noted, is to be installed in accordance with industry standards and manufacturer's recommended installation instructions.
- B. Boilers are to be installed on concrete housekeeping pads or concrete inertia base. Provide manufacturer and code clearance all around and provide minimum 48" clearance between boilers. Provide neoprene isolation pads or vibration isolators as required by manufacturer or as shown on drawings.
- C. Install boiler trim not installed at factory.
- D. Connect to supply and return water piping, natural gas/fuel piping, flue vent, combustion air duct and relief piping.
- E. Relief valves are to be piped and terminated 1" above approved termination location.
- F. Flush and clean boilers, in accordance with manufacturer's start-up instructions, and in presence of boiler manufacturer's representative. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls
- G. Hydrostatically test assembled boiler(s) and piping in accordance with applicable sections of ASME "Boiler and Pressure Vessel Code".
- H. Arrange for inspection of boiler and piping, observation of hydrostatic testing, and for certification of completed boiler units by an authorized inspector in accordance with NBBPVI NB23. Provide all scaffolding, ladders, opening of vessels, filling, draining, lights, closing of vessels and services to support the authorized inspector.
- I. Install boiler manufacturer provided condensate "air-traps" where provided with condensing boilers. Install traps per manufacturer's instructions and install condensate piping as required by local code.
- J. PH Neutralizers are to be piped with PVC tubing. All piping to be per manufacturer's diagrams and instructions. Neutralizer tube to be secured to floor or wall out of normal walking path. The tubes and p-traps are to be filled with water before firing any boiler. Neutralizer tube to be charged prior to installation and a minimum of material for one recharge to be supplied.

3.03 EMERGENCY BOILER SHUTDOWN

- A. All automatically fired boilers with input greater than 400,000 Btuh shall have a manually operated remote shutdown switch to shutdown boiler(s) and associated equipment. Activation of the emergency shutdown switch shall immediately shut off the fuel or energy supply and initiate the boiler shutdown sequence in accordance with manufacturer's recommendations where applicable.
- B. The shutdown switch should be located just outside the boiler room door and marked with signage for easy identification. Consideration should be given to the type and location of the switch to safeguard against tampering. If the boiler room door is on the building exterior, the switch should be located just inside the door. If there is more than one door to the boiler room, there should be a switch located at each door.

- C. Comply with local building and mechanical codes for additional requirements. Comply with ASME CDS-1 and ASME Boiler and Pressure Vessel Code (BPVC) Section HG-634.
- D. Provide conduit, wiring, relays, devices, etc., as required for complete and operational emergency shutdown system including shutdown of boiler(s) and associated pump(s) and valve(s) as necessary. Coordinate with electrical design as necessary. Shutdown system shall operate independently of BAS, but BAS should monitor activation of switch for remote indication. Coordinate with BAS contractor for interface.

3.04 CONNECTIONS

- A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect piping to boilers, except safety relief valve connections, with flexible connectors of materials suitable for service. Flexible connectors and their installation are specified in Section 230500 "Basic HVAC Materials and Methods."
- C. Connect gas piping full size to boiler gas-train inlet with union.
- D. Connect hot-water piping to supply- and return-boiler tappings with shutoff valve and union or flange at each connection.
- E. Install piping from safety relief valves to nearest floor drain, floor sink or other approved location.
- F. Install piping from safety valves to drip-pan elbow and to nearest floor drain.
- G. Connect breeching full size to boiler outlet.
- H. Install piping adjacent to boiler to allow service and maintenance.
- I. Ground equipment according to Section 260526 "Grounding and Bonding."
- J. Connect wiring according to Section 260519 " Low-Voltage Electrical Power Conductors and Cables."
- K. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.05 STARTUP SERVICE

- A. Engage a factory-authorized service representative to test, inspect, and adjust boiler components and equipment installation and to perform startup service.
- B. Perform installation and startup checks according to manufacturer's written instructions.
- C. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
- D. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
- E. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

- F. Adjust initial temperature set points.
- G. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- H. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose, without additional cost.
- I. Verify onboard master control is automatically shifted to available functioning boilers in multiple boiler installations. Cycle through boiler bank to ensure that all boilers shift and accept the master controller duty.
- J. Prepare written report that documents testing procedures and results.

3.06 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify boiler mounting, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

END OF SECTION

SECTION 23 52 19

AIR TO WATER HEAT PUMP

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes: Packaged, air-cooled, electric-motor-driven, scroll compressors, water Heat Pump.

1.02 SUBMITTALS

- A. Product Data: Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.

PART 2 PRODUCTS

2.01 PACKAGED AIR TO WATER HEAT PUMP

- A. Description: Factory-assembled and performance-tested water heat pump complete with base and frame, condenser casing, compressors, compressor motors and motor controllers, evaporator, condenser coils, condenser fans and motors, electrical power, controls, and accessories.
- B. Cabinet:
 - 1. Base: Galvanized-steel base extending the perimeter of water chiller. Secure frame, compressors, and evaporator to base to provide a single-piece unit.
 - 2. Frame: Rigid galvanized-steel frame secured to base and designed to support cabinet, condenser, control panel, and other chiller components not directly supported from base.
 - 3. Casing: Galvanized steel.
 - 4. Finish: Coat base, frame, and casing with rustproof polyester paint.
- C. Compressors:
 - 1. Description: Positive-displacement direct drive with hermetically sealed casing.
 - 2. Each compressor provided with crankcase oil heater, and suction strainer.
 - 3. Capacity Control: On-off compressor cycling.
 - 4. Oil Lubrication System: Automatic pump with strainer, sight glass, filling connection, filter with magnetic plug, and initial oil charge.
 - 5. Vibration Isolation: Mount individual compressors on vibration isolators.
 - 6. Compressors must be enclosed in acoustically insulated and weatherproof compartment.
- D. Refrigeration:
 - 1. Refrigerant: R-410a. Classified as Safety Group A1 according to ASHRAE 34.
 - 2. Refrigerant Compatibility: Parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.

3. Refrigerant Circuit: Each circuit shall include a thermal-expansion valve, a reverse cycle valve, a liquid separator, a liquid accumulator, a filter-dryer, a sight glass with moisture indicator, a liquid accumulator, a liquid-line solenoid valve, and an insulated suction line.
 4. Each unit shall have two refrigeration circuits.
- E. Evaporator:
1. Brazed Plate:
 - a. Direct-expansion, single-pass, brazed-plate design.
 - b. Type 316 stainless-steel construction.
 - c. Heat exchanger shall have two independent refrigerant circuits, one water circuit
 2. Heater: Factory-installed and -wired electric heater with integral controls designed to protect the evaporator.
 3. Evaporator shall be provided with a factory installed inlet strainer.
- F. Air-Cooled Condenser:
- 1.
 2. Condenser shall be constructed of copper pipes and aluminum fins.
 3. Condenser shall use V-block configuration.
 4. Fans: Direct-drive propeller type with statically and dynamically balanced fan blades, arranged for vertical air discharge.
 5. Fan Motors: Inverter driven totally enclosed nonventilating (TENV) or totally enclosed air over (TEAO) enclosure, with permanently lubricated bearings, and having built-in overcurrent- and thermal-overload protection.
 6. Fan Guards: Steel safety guards with corrosion-resistant coating.
 7. Unit shall be able to modulate the fan speed based on high pressure when in cooling mode, and based on low pressure when in heating mode.
- G. Controls:
- 1.
 2. Unit shall be equipped with a standalone microprocessor based control system. The control logic shall be designed to maximize operating efficiency and equipment life with protections for operation under unusual conditions. The system shall intelligently stage the unit to sustain leaving water temperature precision and stability while minimizing compressor cycling.
 3. The controller shall support the following safety and operating controls: high pressure switches for each refrigerant circuit; loss of flow in the evaporator water circuit; condenser fan staging by head pressure; digital setting of low evaporator water temperature cutout, high pressure cutout, suction pressure cutout, and freeze protection cutout; compressor soft loading; demand limit control based on 4-20 mA DC signal input; automatic circuit lead/lag based on fewest operating hours (with manual override); chilled water reset based on an externally applied 4-20 mA signal.
 4. The keypad/display shall provide access to all vital equipment data. Data shall include full description of current unit status, set point parameters, and alarms.

5. Control system shall: continuously perform self-diagnostic checks; monitor all system temperatures, pressures and safeties; and shall automatically shut down a compressor, refrigerant circuit or entire unit should a fault occur. Diagnostic function shall provide operator with a pre-alarm status indication allowing time to take corrective action prior to a safety shutdown.
6. Controller shall provide output contact closure for control of chilled water pump
7. The chiller shall be capable of communications with any Building Automation System supporting BACnet, Modbus and LONworks communications protocol. The information communicated between the BAS and the factory mounted unit controllers shall include the reading and writing of data to allow unit monitoring, control and alarm notification as specified in the unit sequence of operation and the unit points list.

H. Defrost

1. The units must include intelligent defrost. This allows the unit to go in defrost only when is needed, avoiding unnecessary defrost cycles. This shall be achieved by monitoring the suction pressure decay and the OAT.
2. The unit must have the ability to defrost one circuit at the time.
3. Timed defrost is not allowed.
4. Heat pumps performance and efficiency should take into consideration of defrost cycles.
5. Defrost cycle should not usually be less than 2 minutes and not more than 6 minutes.
6. During defrost cycle, condenser fan should be off.
7. Defrost will start only when external air temperature is less than 50F .
8. Low pressure threshold on the coil should be less than 5.2 bar/75.42 Psi.
9. When the pressure variations between clean and uncleaned coil is 0.6 bar/8.70 psi, defrost will start automatically.
10. Minimum time between two defrost should be greater than 15 minutes

2.02 SOURCE QUALITY CONTROL

- A. Heat pump shall be manufactured in an ISO 9001 certified facility.
- B. Each unit shall be factory performance tested on a third party certified test stand to ensure proper operation, full load efficiency and full load capacity. Test reports shall be made available to owner and engineer upon request.
 1. Functional Test
 - a. Pre-charge unit with nitrogen and test for leakage
 - b. Establish a vacuum to remove all gas and to eliminate moisture inside the refrigerant circuit
 - c. Charge the unit with refrigerant
 - d. Connect the evaporator and condensers inlet and outlet water connections to the testing room plant
 - e. Set the water flow to the design flow rate
 - f. Connect power to the unit and carry out test of voltage and frequency on the electrical panel
 - g. Program the microprocessor control with basic working parameters

- h. Set up the valves and trim the refrigerant charge
 - i. Start up each compressor and test electrical data
 - j. Set up all the pressure switches
 - k. Calibrate the various temperature and pressure probes on the circuit
2. Performance Test
- a. Test the following alarms on the microprocessor through run test
 - 1) High pressure alarm
 - 2) Low pressure alarm
 - 3) Compressors alarm
 - 4) Evaporator freeze alarm
 - b. Test probe failures
 - c. Run the chiller in the production climatic test chamber at full load conditions
 - d. Record the performance data on the test report sheet and provide a copy to engineer and owner.
3. Sound Compliance: Chiller sound power levels shall be rated according to ISO 9614-2 and sound pressure levels rated to ISO 3744 standards. If alterations are made to a standard chiller to comply with the sound requirements, the manufacturer must provide a sound performance test in a certified facility. It shall provide overall "A" weighted sound pressure levels based on measurement taken 30 feet from the side of the heat pump.
4. Products shall be designed, tested, rated and certified in accordance with, and installed in compliance with applicable sections of the following standards and codes:
- a. AHRI 550/590 and 551/591-water chilling packages using the vapor compression cycle
 - b. AHRI 370-sound rating of large outdoor refrigerating and air-conditioning equipment
 - c. ANSI/ASHRAE 34-Number designation and safety classification of refrigerants
 - d. ASHRAE 90.2-Energy Standard of Building except Low-rise Residential Buildings
 - e. ANSI/NFPA 70-National Electrical Code(N.E.C)
 - f. Confirm to Intertek Testing Services for construction of chiller and provide ETL listed Mark.
 - g. The unit should have IP24 protection level for outdoor installation.
5. There should be arrangements for standard factory performance witness test on In-house AHRI certified test chambers. Custom factory test should be arranged to see the performance of the unit at any given operating conditions within limits of operating envelope for the specified unit's size.
- 2.03 APPROVED MANUFACTURERS AND MODELS
- A. AERMEC shall be the base of the Design (BOD) using NRB Heat pump.
 - B. Multistack
 - C. York

D. Trane

2.04 DELIVERY, STORAGE AND HANDLING

- A. All outdoor units, indoor units, controls and piping components shall be stored and handled according to the manufacturer's recommendation.
- B. All outdoor units, indoor units, refrigerant branch units, controls and piping components shall be stored and handled according to the manufacturer's recommendation.

2.05 WARRANTY

- A. Each unit's parts are warranted to be free from manufacturing defects for up to 1 year from the date of installation.
- B. Each Unit's compressor is warranted for 1 year from the date of start up. Start up must be done within 90 days of installation. Otherwise the warranty will start from the date of installation.
- C. Valves, storage tank, expansion tank and control are warranted to be free from defects for up to 1 year from the date of installation.
- D. Complete Air to Water Heat Pump Warranty including labor (3-yr part & labor)

END OF SECTION

This page intentionally left blank

SECTION 23 57 00
HEAT EXCHANGERS FOR HVAC

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Shell and tube heat exchangers.
 - 2. Gasketed plate and frame type heat exchangers.
 - 3. Brazed plate and frame heat exchangers.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230548: Vibration Isolation for Piping, Ductwork and Equipment
- C. Section 230549: Seismic Restraint for Piping, Ductwork and Equipment.
- D. Section 230593: Testing, Adjusting and Balancing
- E. Section 230716: Equipment Insulation
- F. Section 230900: Building Automation System (BAS) Controls
- G. Section 232113: Hydronic Piping, Valves and Specialties
- H. Section 232123: Hydronic Pumps
- I. Section 232213: Steam and Condensate Piping, Valves and Specialties
- J. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide systems that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.

- B. Codes and Standards: Provide components and pumps conforming to the requirements of the latest addition of the following:
 - 1. American Society of Mechanical Engineers (ASME): Boiler and Pressure Vessel Code
 - a. Section VIII D1 -Rules for Construction of Pressure Vessels including Addendums
 - b. Section VIII D2 - Rules for Construction of Pressure Vessels including Addendums
 - c. Section IX - Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators including Addendums
 - d. B31.1 - Power Piping

1.05 SOURCE QUALITY CONTROL

- A. Hydrostatically test heat exchangers to minimum of one and one-half times pressure rating before shipment.
- B. Heat exchangers will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, gasket material, finishes of materials, and installation instructions.
- B. Shop Drawings: Submit manufacturer's shop drawings indicating dimensions, weight (shipping, operating), required clearances, methods of assembly of components, and location and size of each field connection.
- C. Maintenance Data: Submit operation and maintenance instructions, including instructions for lubrication, tube replacement, gasket replacement schedule, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.
- C. Rigging: Comply with the manufacturer's rigging and installation instructions.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 SHELL-AND-TUBE HEAT EXCHANGERS

- A. Description: Packaged assembly of tank, heat-exchanger coils, and specialties.
- B. Construction: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1 when system pressures exceed 15 psig (1.0 bar).
- C. Configuration: Refer to schedule on Drawings with U-tube with removable, straight tube with removable, or straight tube with fixed bundle.
- D. Shell Materials: Steel or stainless steel.
- E. Head:
 - 1. Materials: Cast iron, cast stainless steel, fabricated steel, fabricated steel with removable cover, fabricated stainless steel or fabricated stainless steel with removable cover.
 - 2. Flanged and bolted to shell.
- F. Tube: Seamless copper, cupronickel or stainless steel tubes.
 - 1. Tube diameter is determined by manufacturer based on service.
- G. Tubesheet Materials: Steel or stainless steel.
- H. Baffles: Steel or stainless steel.
- I. Piping Connections: Factory fabricated of materials compatible with heat-exchanger shell. Attach tappings to shell before testing and labeling.
 - 1. NPS 2 (DN 50) and Smaller: Threaded ends in accordance with ASME B1.20.1.
 - 2. NPS 2-1/2 (DN 65) and Larger: Flanged ends in accordance with ASME B16.5 for steel and stainless steel flanges and in accordance with ASME B16.24 for copper and copper-alloy flanges.
- J. Support Saddles:
 - 1. Fabricated of material similar to shell.
 - 2. Fabricate foot mount with provision for anchoring to support.
- K. Capacities and Characteristics: Refer to schedule on Drawings.
- L. Manufacturer: Bell and Gossett #SU or WU Series, Alfa Laval.

2.02 GASKETED-PLATE HEAT EXCHANGERS

- A. Configuration: Freestanding assembly, consisting of frame support, top and bottom carrying and guide bars, fixed and movable end plates, tie rods, individually removable plates, and one-piece gaskets. Floor-mounted heat exchangers must have integral legs with mounting feet.
- B. Construction: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1 when system pressures exceed 15 psig (1.0 bar).
- C. Frame:

1. Capacity to accommodate 20 percent additional plates in future.
 2. Painted carbon steel with provisions for anchoring to support.
- D. Top and Bottom Carrying and Guide Bars: Painted carbon steel, aluminum, or stainless steel.
1. Fabricate attachment of heat-exchanger support bars and guide bars with reinforcement strong enough to resist heat-exchanger movement during seismic event when heat-exchanger support bars and guide bars are anchored to building structure.
- E. End-Plate Material: Painted carbon steel.
- F. Tie Rods and Nuts: Steel or stainless steel.
- G. Plate Material: Refer to schedule on Drawings. 0.024 inch (0.6 mm) thick, minimum, thick before stamping. Stainless steel Type 304, 316, Alloy C276, Alloy 254 SMO or Titanium as scheduled.
- H. Gasket Materials: EPDM rubber, or better. Include maintenance schedule for replacement of gaskets based on application.
- I. Piping Connections: Factory fabricated of materials compatible with heat-exchanger shell. Attach tappings to shell before testing and labeling.
1. NPS 2 (DN 50) and Smaller: Threaded ends in accordance with ASME B1.20.1.
 2. NPS 2-1/2 (DN 65) and Larger: Flanged ends in accordance with ASME B16.5 for steel and stainless steel flanges and in accordance with ASME B16.24 for copper and copper-alloy flanges.
- J. Enclose plates in solid aluminum or stainless steel removable shroud.
- K. Capacities and Characteristics: Refer to schedule on Drawings.
- L. Manufacturer: Alfa Laval #AQ10 Series, Bell & Gossett #GPX Series.

2.03 BRAZED-PLATE HEAT EXCHANGERS

- A. Configuration: Brazed assembly, consisting of embossed or pressed stainless steel plates brazed together and two end plates, one with threaded nozzles and one with pattern-embossed plates. Floor-mounted heat exchangers must have factory-furnished integral legs with mounting feet.
- B. Construction: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1 when system pressures exceed 15 psig (1.03 bar).
- C. End-Plate Material: Type 316 stainless steel.
- D. Threaded Nozzles: Type 316 stainless steel.
- E. Plate Material: Type 316 stainless steel.
- F. Brazing Material: Copper or nickel.
- G. Capacities and Characteristics: Refer to schedule on Drawings.

- H. Manufacturer: Alfa Laval #CB Series, Bell & Gossett #BPX Series.

2.04 ACCESSORIES

- A. Hangers and Supports:
 - 1. Factory or custom-built steel supports and saddles for mounting where located on drawings.
 - 2. Supports and saddles to ensure both horizontal and vertical support of heat exchanger.
- B. Shroud for gasketed plate heat exchanger: Provide steel, stainless steel or aluminum sheet shroud.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine areas for compliance with requirements for installation tolerances and for structural rigidity, strength, anchors, and other conditions affecting performance of heat exchangers.
- B. Examine roughing-in for heat-exchanger piping to verify actual locations of piping connections before equipment installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF HEAT EXCHANGER, GENERAL

- A. Equipment Mounting:
 - 1. Install floor-mounted heat exchangers on cast-in-place concrete equipment bases. Install all heat exchangers level and plumb in accordance with manufacturer's recommendations. Install floor-mounted and wall-hung steam heat exchangers at sufficient height, using sufficient length supports, to achieve required steam and condensate pipe pitch. Comply with requirements for equipment bases and foundations specified in Division 3 work.
 - 2. Comply with requirements for vibration isolation and seismic control devices.

3.03 INSTALLATION OF SHELL-AND-TUBE HEAT EXCHANGER

- A. Install heat exchangers on saddle supports.
- B. Heat-Exchanger Supports: Mount heat exchanger on steel saddles and supports specifically designed for each heat exchanger.
- C. Fabricate attachment of saddle supports to pressure vessel with reinforcement strong enough to resist heat-exchanger movement during seismic event when heat-exchanger saddles are anchored to building structure.

3.04 INSTALLATION OF GASKETED-PLATE HEAT EXCHANGER

- A. Install wall-mounted gasketed-plate heat exchanger on custom-designed wall supports anchored to structure as indicated on Drawings.

- B. Install floor-mounted gasketed-plate heat exchangers on cast-in-place concrete equipment base and fasten legs to base as indicated on Drawings.
- C. Install metal shroud over installed gasketed-plate heat exchanger in accordance with manufacturer's written instructions.

3.05 INSTALLATION OF BRAZED-PLATE HEAT EXCHANGER

- A. Install wall-mounted brazed-plate heat exchanger on custom-designed wall supports anchored to structure as indicated on Drawings.
- B. Install floor-mounted brazed-plate heat exchangers on cast-in-place concrete equipment base and fasten legs to base as indicated on Drawings.

3.06 PIPING CONNECTIONS

- A. Comply with requirements for piping specified in Section 232113 Hydronic Piping, Valves and Specialties and Section 232213 Steam and Condensate Piping and Specialties. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Comply with requirements for piping specified in Section 232213 Steam and Condensate Piping and Specialties. Drawings indicate general arrangement of piping, fittings, and specialties.
- C. Maintain manufacturer's recommended clearances for tube removal, service, and maintenance.
- D. Install piping adjacent to heat exchangers to allow space for service and maintenance of heat exchangers. Arrange piping for easy removal of heat exchangers.
- E. Install shutoff valves at heat-exchanger inlet and outlet connections.
- F. Install pressure-relief valves on heat-exchanger shells where a connection has been provided on shell. When no shell pressure-relief valve connection has been provided, install pressure-relief valve on shell outlet piping before any isolation valves.
- G. Install pressure-relief valves on heat-exchanger tube outlet piping before any isolation valves.
- H. Pipe pressure-relief valves, full size of valve connection, to floor drain.
- I. Install vacuum breaker at heat-exchanger steam inlet connection.
- J. Install hose end valve to drain shell.
- K. Install thermometer on each heat-exchanger fluid inlet and outlet piping.
- L. Install pressure gauges on each heat-exchanger fluid inlet and outlet piping.
- M. Insulate entire shell of heat exchanger, fittings, and appurtenances so that no surfaces are exposed as required to meet energy code requirements and maximize energy efficiency.

3.07 CLEANING

- A. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris, and repair damaged finishes.

- B. Isolate heat exchangers from piping before flushing piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blind flanges in flanged joints to isolate equipment.
- C. Flush heat-exchanger piping systems with clean water; then remove and clean or replace strainer screens before reopening flow to heat exchangers.

3.08 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify pump systems mounting, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four-hours travel from the job site.

SECTION 23 64 00
AIR COOLED CHILLERS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SUMMARY

- A. Section Includes:
 - 1. Packaged air-cooled chillers.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230593: Testing, Adjusting and Balancing
- C. Section 230716: Equipment Insulation
- D. Section 230900: Building Automation System (BAS) Controls
- E. Section 232113: Hydronic Piping, Valves and Specialties
- F. Section 232123: Hydronic Pumps
- G. Section 233113: Air Distribution
- H. Division 26: Electrical

1.04 DEFINITIONS

- A. BAS: Building Automation System.
- B. COP: Coefficient of performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.
- C. EER: Energy-efficiency ratio. The ratio of the cooling capacity given in terms of Btu/h to the total power input given in terms of watts at any given set of rating conditions.
- D. IPLV: Integrated part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by AHRI 506/110 and referenced to AHRI standard rating conditions.

- E. kW/Ton (kW/kW): The ratio of total power input of the chiller in kilowatts to the net refrigerating capacity in tons (kW) at any given set of rating conditions.
- F. NPLV: Nonstandard part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by AHRI 506/110 and intended for operating conditions other than AHRI standard rating conditions.

1.05 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Chillers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
- B. Site Altitude: Chiller shall be suitable for altitude in which installed without affecting performance indicated. Make adjustments to affected chiller components to account for site altitude.
- C. Performance Tolerance: Comply with the following in lieu of AHRI 506/110:
 - 1. Allowable Capacity Tolerance: 5 percent.
 - 2. Allowable IPLV/NPLV Performance Tolerance: 5 percent.
- D. Acoustics: Sound pressure levels for the complete unit shall not exceed the following specified levels. Provide the necessary acoustic treatment to chiller as required. Sound data shall be measured according to AHRI Standard 575-87. Data shall be in dB. Data shall be the highest levels recorded at all load points. Test shall be in accordance with AHRI Standard 575.
 - 1. Sound Pressure levels by octave band:

Octave Band	63	125	250	500	1000	2000	4000	8000	dB
--------------------	-----------	------------	------------	------------	-------------	-------------	-------------	-------------	-----------

1.06 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide systems that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide systems conforming to the requirements of the latest addition of the following:
 - 1. Air Movement and Control Association (AMCA):
 - a. 99: Standards Handbook
 - b. 210: Laboratory Methods of Testing Fans for Rating [Unit shall bear AMCA Certified Rating Seal]
 - c. 300: Reverberant Room Method for Sound Testing of Fans [Unit shall bear AMCA Certified Rating Seal]
 - d. 301: Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - e. 500: Test Method for Louvers, Dampers, and Shutters
 - 2. American Society for Testing and Materials (ASTM):

- a. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus.
 - b. A123: Standard Specification for Zinc (Hot-Dipped Galvanized) Coatings on Iron and Steel Products.
 - c. A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - d. D1654: Standard Test Method for Evaluation of Painted or Coated Specimens Subjected to Corrosive Environments.
3. American National Standards Institute (ANSI):
 - a. 9: Load Ratings and Fatigue Life for Ball Bearings
 - b. 11: Load Ratings and Fatigue Life for Roller Bearings
 - c. 207: Refrigerant-Containing Components and Accessories, Non-electrical
 - d. 303: Refrigeration and Air Conditioning Condensing and Compressor Units
 - e. 465: Central Cooling Air Conditioners
 - f. 900: Test Performance of Air Filter Units
 4. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 210: Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment
 - b. 270: Sound Performance Rating of Outdoor Unitary Equipment
 - c. 550/590: Performance Rating of Water-Chilling and Heat Pump Water-Heating Packages using the Vapor Compression Cycle.
 - 1) Submit certified data for performance at 25, 50, 75 and 100 percent of full load capacity.
 5. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 15: Safety Code for Mechanical Refrigeration.
 6. American Society of Mechanical Engineers (ASME): Boiler and Pressure Vessel Code:
 - a. Section VIII D1: Rules for Construction of Pressure Vessels including Addendums.
 - b. Section VIII D2: Rules for Construction of Pressure Vessels including Addendums.
 - c. Section IX: Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators including Addendums.
 7. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
 8. National Fire Protection Association (NFPA): Provide unit insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70: National Electrical Code.
 - b. 90A: Standard for the Installation of Air Conditioning and Ventilating Systems.
 - c. 90B: Standard for the Installation of Warm Air Heating and Air Conditioning Systems.
 9. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."

10. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL. Chiller(s) shall be constructed in accordance with UL 465 "UL Standard for Safety Central Cooling Air Conditioners". Listing by Electrical Testing Laboratories (ETL) with an ETL label may also be acceptable.

1.07 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 1. The proposed substitution does not affect dimensions shown on drawings.
 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.08 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
 1. Performance at AHRI standard conditions and at conditions indicated.
 2. Performance at AHRI standard unloading conditions.
 3. Minimum evaporator flow rate.
 4. Refrigerant capacity of chiller.
 5. Oil capacity of chiller.
 6. Fluid capacity of evaporator.
 7. Characteristics of safety relief valves.
 8. Fluid capacity of condenser and heat-reclaim condenser.
 9. Minimum entering condenser-fluid temperature.
 10. Performance at varying capacities with constant-design entering condenser-fluid temperature. Repeat performance at varying capacities for different condenser-fluid temperatures from design to minimum in 5 F.
 11. Minimum entering condenser-air temperature.
 12. Maximum entering condenser-air temperature.
 13. Performance at varying capacities with constant-design entering condenser-air temperature. Repeat performance at varying capacities for different entering condenser-air temperatures from design to minimum in 10 F.
- B. LEED Submittals:

1. Product Data for Credit EA4: Documentation indicating that equipment and refrigerants comply.

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, load distribution, required clearances, method of field assembly, components, and location and size of each field connection.
2. Wiring Diagrams: For power, signal, and control wiring.

1.09 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:

1. Structural supports.
2. Piping roughing-in requirements.
3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

B. Certificates: For certification required in "Quality Assurance" Article.

C. Seismic Qualification Certificates: For chillers, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Source quality-control reports.

E. Startup service reports.

F. Warranty: Sample of special warranty.

1.10 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each chiller to include in emergency, operation, and maintenance manuals.

1.11 QUALITY ASSURANCE

A. AHRI Certification: Certify chiller according to AHRI 550 and AHRI 590 certification program(s).

B. AHRI Rating: Rate chiller performance according to requirements in AHRI 506/110.

C. ASHRAE Compliance:

1. ASHRAE 15 for safety code for mechanical refrigeration.
2. ASHRAE 147 for refrigerant leaks, recovery, and handling and storage requirements.

- D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.
- E. ASME Compliance: Fabricate and label chiller to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, and include an ASME U-stamp and nameplate certifying compliance.
- F. Comply with NFPA 70.
- G. Comply with requirements of UL and UL Canada and include label by a qualified testing agency showing compliance.

1.12 DELIVERY, STORAGE, AND HANDLING

- A. Ship chillers from the factory fully charged with refrigerant.
- B. Ship each chiller with a full charge of refrigerant. Charge each chiller with nitrogen if refrigerant is shipped in containers separate from chiller.
- C. Ship each oil-lubricated chiller with a full charge of oil.
- D. Package chiller for export shipping in totally enclosed crate and bagging.

1.13 COORDINATION

- A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.
- B. Coordinate sizes, locations, and anchoring attachments of structural-steel support structures.
- C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.14 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.
- C. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of chillers that fail in materials or workmanship within two (2) year warranty period.
 - 1. Complete chiller including refrigerant and oil charge.
 - 2. Complete compressor and drive assembly including refrigerant and oil charge.
 - 3. Refrigerant and oil charge.
 - 4. Loss of refrigerant charge for any reason.

PART 2 PRODUCTS

2.01 GENERAL REQUIREMENTS

- A. Description: Factory-assembled and run-tested chiller complete with base and frame, condenser casing, compressors, compressor motors and motor controllers, evaporator, condenser coils, condenser fans and motors, electrical power, controls, and accessories.
- B. Fabricate base, frame, and attachment to chiller components strong enough to resist chiller movement during a seismic event when chiller base is anchored to field support structure.
- C. Manufacturers: Subject to compliance with requirements, provide products by one of the following manufacturers offering products that may be incorporated into the Work. This includes but is not limited to the following:
 1. Carrier Corporation.
 2. Daikin
 3. Trane.
 4. York International Corporation.

2.02 ACOUSTICS

- A. Manufacturer must provide both sound power and sound pressure data in decibels. Sound pressure data per ARI 370 must be provided in 8 octave band format at full load. In addition, A-weighted sound pressure at 30 feet should be provided at 100%, 75%, 50% and 25% load points to identify the full operational noise envelope. Sound power must be provided in 1/3 octave band format to highlight any tonal quality issues. If manufacturer cannot meet the noise levels (per the attached chart), sound attenuation devices and / or barrier walls must be installed to meet this performance level
- B. Sound Pressure at 30 feet

Sound Pressure at 30 feet											
63 Hz	125 Hz	250 Hz	500 Hz	1 k Hz	2K Hz	4K Hz	8K Hz	Overall dBA	75% load	50% Load dBA	25% Load dBA

Sound Power											
63 Hz	125 Hz	250 Hz	500 Hz	1 k Hz	2K Hz	4K Hz	8K Hz	Overall dBA	75% load	50% Load dBA	25% Load dBA

- C. [OPTIONAL] Each compressor on two-compressor units shall have a factory-installed, rigid, sound enclosure with removable panels for compressor access.

2.03 CABINET:

1. Base: Galvanized-steel base extending the perimeter of chiller. Secure frame, compressors, and evaporator to base to provide a single-piece unit.
2. Frame: Rigid galvanized-steel frame secured to base and designed to support cabinet, condenser, control panel, and other chiller components not directly supported by base.
3. Casing: Galvanized steel.
4. Finish: Coat base, frame, and casing with a corrosion-resistant coating capable of withstanding a 500-hour salt-spray test according to ASTM B117.
5. Sound-reduction package designed to reduce sound level without affecting performance and consisting of the following:
 6. Acoustic enclosure around compressors.
 7. Reduced-speed fans with acoustic treatment.
8. Security Package: Provide removable grilles or louvered panels with fasteners for additional protection of compressors, evaporator, and condenser coils without inhibiting service access. Finish to match cabinet.

2.04 REFRIGERATION

A. Refrigerant:

1. Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
2. Refrigerant by compressor type:
- 3.

Compressor	Acceptable Refrigerant
Screw	R-134
Scroll	R-410a

2.05 COMPRESSORS

A. Scroll Compressors:

1. Compressors:
 - a. Description: Positive-displacement direct drive with hermetically sealed casing.
 - b. Each compressor provided with suction and discharge service valves, crankcase oil heater, and suction strainer.
2. Retain option in first subparagraph below if capacity control below the smallest chiller step is required. See Evaluations.
3. Capacity Control: On-off compressor cycling[, plus hot-gas bypass].
4. Oil Lubrication System: Automatic pump with strainer, sight glass, filling connection, filter with magnetic plug, and initial oil charge.
5. Retain subparagraph below for factory-installed vibration isolation. McQuay and York are the only listed manufacturers offering these isolators.
6. Vibration Isolation: Mount individual compressors on vibration isolators.
7. Compressor Motors:

- a. Hermetically sealed and cooled by refrigerant suction gas.
 - b. High-torque, two-pole induction type with inherent thermal-overload protection on each phase.
8. Compressor Motor Controllers:
- a. Across the Line: NEMA ICS 2, Class A, full voltage, non-reversing.
- B. Screw Compressors:
1. Description: Positive displacement, hermetic or semi-hermetic compressor.
 2. Casing: Cast iron, precision machined for minimum clearance about periphery of rotors.
 3. Rotors: Manufacturer's standard one- or two-rotor design.
 4. Each compressor provided with suction and discharge shutoff valves, crankcase oil heater, and suction strainer.
 5. Service: Easily accessible for inspection and service.
 6. Capacity Control: On-off compressor cycling and modulating slide-valve assembly or port unloaders combined with hot-gas bypass, if necessary, to achieve performance indicated.
 - a. Maintain stable operation throughout range of operation. Configure to achieve most energy-efficient operation possible.
 - b. Standard operating range varies among manufacturers. Not all listed manufacturers comply with options in first subparagraph below without hot-gas bypass. Consult manufacturer for requirements.
 - c. Operating Range: From 100 to 20 percent of design capacity.
 7. Condenser-Air Unloading Requirements over Operating Range: [Constant-design entering condenser-air temperature] [Drop-in entering condenser-air temperature of 5 deg F (3 deg C) drop for each 10 percent in capacity reduction] <Insert conditions>.
 8. For units equipped with a variable frequency controller, capacity control shall be both "valveless" and "stepless," requiring no slide valve or capacity-control valve(s) to operate at reduced capacity.
 9. Oil Lubrication System: Consisting of pump if required, filtration, heater, cooler, factory-wired power connection, and controls.
 10. Provide lubrication to bearings, gears, and other rotating surfaces at all operating, startup, shutdown, and standby conditions including power failure.
 - a. Thermostatically controlled oil heater properly sized to remove refrigerant from oil.
 - b. Factory-installed and pressure-tested piping with isolation valves and accessories.
 - c. Oil compatible with refrigerant and chiller components.
 - d. Positive visual indication of oil level.
 11. Vibration Control:
 - a. Vibration Balance: Balance chiller compressors and drive assemblies to provide a precision balance that is free of noticeable vibration over the entire operating range.
 - b. Overspeed Test: 25 percent above design operating speed.
 12. Retain subparagraph below for factory-installed vibration isolation.
 13. Isolation: Mount individual compressors on vibration isolators.
 14. Compressor Motors:

- a. Hermetically sealed and cooled by refrigerant suction gas.
 - b. High-torque, induction type with inherent thermal-overload protection on each phase.
15. Compressor Motor Controllers:
- a. Across the Line: NEMA ICS2, Class A, full voltage, non-reversing, or solid state.
 - b. Star-Delta, Reduced-Voltage Controller: NEMA ICS2, closed transition, or solid state.
 - c. Variable Frequency Controller:
 - 1) Motor controller shall be factory mounted and wired on the chiller to provide a single-point, field-power termination to the chiller and its auxiliaries.
 - 2) Description: NEMA ICS2; listed and labeled as a complete unit and arranged to provide variable speed by adjusting output voltage and frequency.
 - 3) Enclosure: Unit mounted, NEMA 250, with hinged full-front access door with lock and key.
 - 4) Integral Disconnecting Means: Door-interlocked, NEMA AB1, instantaneous-trip circuit breaker with lockable handle. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 65,000 A.
 - 5) Technology: Pulse width modulated (PWM) output suitable for constant or variable torque loads.
 - 6) Motor current at start shall not exceed the rated load amperes, providing no electrical inrush.
- C. Magnetic Levitated Centrifugal Compressor
1. Chiller to have one MagLev™, magnetic bearing, oil-free, two-stage, hermetical centrifugal compressor. Compressor to contain integrated variable speed drive with soft start and movable inlet guide vane assembly.
 2. Compressor to be microprocessor controlled. Compressor to be networked to master controller via Etherbus connection with a refresh rate of 50 microseconds and the micro processor of the compressor to control the variable speed drive and inlet guide vanes on the compressor to maximize unit efficiency.
 3. The compressor shall be capable of coming to a controlled safe stop in the event of a power outage. Unit shall be capable of auto restart in the event of a power outage, once power has been restored.
 4. The compressor is required to be mechanically and electrically isolated to facilitate proper maintenance, service, and or removal.
- 2.06 REFRIGERANT CIRCUITS:
- A. Refrigerant: Type as indicated on Drawings.
 - B. Refrigerant Type: R-134a, R-410a. Classified as Safety Group A1 according to ASHRAE 34.
 - C. Refrigerant Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
 - D. Refrigerant Circuit: Each shall include a thermal- or electronic-expansion valve, refrigerant charging connections, a hot-gas muffler, compressor[suction] and discharge shutoff valves, a liquid-line shutoff valve, a [replaceable-core]filter-dryer, a sight glass with moisture indicator, a liquid-line solenoid valve, and an insulated suction line.

E. Pressure Relief Device:

1. Comply with requirements in ASHRAE 15 and in applicable portions of ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. ASME-rated, spring-loaded pressure relief valve; single- or multiple-reseating type.

2.07 EVAPORATOR:

A. Shell-and-tube design.

1. Direct-expansion (DX) type with fluid flowing through the shell, and refrigerant flowing through the tubes within the shell.
2. Code Compliance: Tested and stamped according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 - a. Shell Material: Carbon steel.
 - b. Shell Heads: Removable carbon-steel heads located at each end of the tube bundle.
 - c. Fluid Nozzles: Terminated with [mechanical-coupling] [flanged] end connections for connection to field piping.
 - d. Tube Construction: Individually replaceable copper tubes with enhanced fin design, expanded into tube sheets.
 - e. Retain subparagraph below if required to mount evaporator remote from chiller.
 - f. Remote Mounting: Designed for remote field mounting where indicated. Provide kit for field installation.

B. Flooded Shell & Tube Design:

1. The evaporator is to be of shell and tube construction. Evaporator to be constructed of a single shell. Evaporator to be of flooded type with refrigerant surrounding the tubes and water passing through the tubes. Tubes to be enhanced and rifled. Internal intermediate tube supports, liquid eliminator baffle plate, pressure relief vent, water drains and vents required. Pressure relief to be spring loaded self-seating type in accordance to ASHRAE 15 standard. Evaporator to be pressure tested at a test pressure of 1.1 times the operating pressure however no less than 100 PSIG. Evaporator, water boxes, suction piping, and any other component subject to condensate shall be insulated with a UL recognized 3/4" or 1-1/2" closed cell insulation. All joints and seams to be sealed so a vapor barrier is created. Factory mounted differential pressure transmitters required for flow safety. Paddle flow switches are not acceptable. Heat Exchangers to feature enhanced and rifled individual tubes. Tubes shall be individually replaceable. Tubes shall be mechanically rolled into steel tube sheets and sealed with Loctite® or equivalent sealant. Waterside to be designed to a minimum of 150 psig or 300 psig, whichever is specified. Piping connections to be either mechanical grooved connection or flange, whichever is specified. Evaporator tubes shall be serviceable without removing water connections when an even number of passes is specified.

C. Brazed Plate Design Note to editor: The brazed plate is typically used with modular style chillers. Airstack scroll based chillers are typical.

1. Each evaporator shall be a brazed-plate heat exchanger constructed of 316 stainless steel and be designed, tested, and stamped in accordance with UL 1995 Heating and Cooling Equipment.

2.08 AIR-COOLED CONDENSER:

- A. Plate-fin coil with integral subcooling on each circuit, rated at 450 psig (3103 kPa).
 - 1. Construct coil casing of galvanized or stainless steel.
 - 2. Construct coils of copper tubes mechanically bonded to aluminum, aluminum with precoated epoxy-phenolic, or copper fins.
 - 3. Coat coils with a baked-epoxy, corrosion-resistant coating after fabrication.
 - 4. Optional: Provide condenser coils with louvers, baffles, or hoods to protect against hail damage.
 - B. Fans: Direct-drive propeller type with statically and dynamically balanced fan blades, arranged for vertical air discharge.
 - C. Fan Motors: Totally enclosed non-ventilating (TENV) or totally enclosed air over (TEAO) enclosure, with permanently lubricated bearings. Equip each motor with overload protection integral to either the motor or chiller controls.
 - D. Fan Guards: Steel safety guards with corrosion-resistant coating.
- 2.09 ELECTRICAL POWER:
- A. Not all manufacturers provide all features indicated in subparagraphs below. Verify availability with manufacturers.
 - B. Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point field-power connection to chiller.
 - C. House in a unit-mounted, NEMA 250, Type 3R enclosure with hinged access door with lock and key or padlock and key.
 - D. Wiring shall be numbered and color-coded to match wiring diagram.
 - E. Install factory wiring outside of an enclosure in a raceway.
 - F. Field-power interface shall be to NEMA KS1, heavy-duty, fused disconnect switch.
 - 1. Disconnect means shall be interlocked with door operation.
 - 2. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 65,000 A.
 - G. Provide each motor with overcurrent protection.
 - H. Overload relay sized according to UL 1995 or an integral component of chiller control microprocessor.
 - I. Phase-Failure and Undervoltage Relays: Solid-state sensing with adjustable settings.
 - J. Control Transformer: Unit-mounted transformer with primary and secondary fuses and sized with enough capacity to operate electrical load plus spare capacity.
 - 1. Power unit-mounted controls where indicated.
 - 2. Power unit-mounted, ground fault interrupt (GFI) duplex receptacle.
 - K. Control Relays: Auxiliary and adjustable time-delay relays.

- L. For chiller electrical power supply, indicate the following:
 - 1. Current and phase to phase for all three phases.
 - 2. Voltage, phase to phase, and phase to neutral for all three phases.
 - 3. Three-phase real power (kilowatts).
 - 4. Three-phase reactive power (kilovolt amperes reactive).
 - 5. Power factor.
 - 6. Running log of total power versus time (kilowatt-hours).
 - 7. Fault log, with time and date of each.
 - 8. <Insert features>.

- M. Variable Speed Drive:
 - 1. The chiller shall be equipped with a variable speed drive. Please refer to section 2.03 B for compressor requirements. The variable speed drive to utilize Insulated Gate Bi-Polar Transistors. Variable speed drive to create simulated AC voltage as required by the motor connected to it.
 - 2. Variable Speed drive in conjunction with the compressors inlet guide vanes will be controlled via compressor microprocessor to optimally match the lift and load requirements.
 - 3. The compressor circuit is required to have a line reactor and circuit breaker.

2.10 CONTROLS:

- A. Standalone and microprocessor based.
- B. Enclosure: Share enclosure with electrical power devices or provide a separate enclosure.
- C. Operator Interface: Multiple-character digital or graphic display with dynamic update of information and with keypad or touch-sensitive display located on front of control enclosure. In either imperial or metric units, display the following information:
 - 1. Revise list below to suit Project. Verify availability of displayed information with chiller manufacturers. Some information may be optional; other information may not be available from all listed manufacturers.
 - 2. Date and time.
 - 3. Operating or alarm status.
 - 4. Operating hours.
 - 5. Outdoor-air temperature if required for chilled-water reset.
 - 6. Temperature and pressure of operating set points.
 - 7. Entering and leaving temperatures of chilled water.
 - 8. Refrigerant pressures in evaporator and condenser.
 - 9. Saturation temperature in evaporator and condenser.
 - 10. No cooling load condition.
 - 11. Elapsed time meter (compressor run status).
 - 12. Pump status.
 - 13. Antirecycling timer status.

14. Percent of maximum motor amperage.
 15. Current-limit set point.
 16. Number of compressor starts.
- D. Control Functions:
1. Revise list below to suit Project. Verify availability; functions may vary among manufacturers and models.
 2. Manual or automatic startup and shutdown time schedule.
 3. Entering and leaving chilled-water temperatures, control set points, and motor load limits. Chilled-water leaving temperature shall be reset based on [return-water] [outdoor-air] [space] temperature.
 4. Current limit and demand limit.
 5. External chiller emergency stop.
 6. Antirecycling timer.
 7. Automatic lead-lag switching.
 8. Variable evaporator flow.
 9. Thermal storage.
- E. Manually Reset Safety Controls: The following conditions shall shut down chiller and require manual reset:
1. Low evaporator pressure or high condenser pressure.
 2. Low chilled-water temperature.
 3. Refrigerant high pressure.
 4. High or low oil pressure.
 5. High oil temperature.
 6. Loss of chilled-water flow.
 7. Control device failure.
- F. Trending: Capability to trend analog data of up to five parameters simultaneously over an adjustable period and frequency of polling.
- G. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.
- H. Control Authority: At least four conditions: Off, local manual control at chiller, local automatic control at chiller, and automatic control through a remote source.
- I. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display chiller status and alarms.
1. Monitoring: On-off status, common trouble alarm, electrical power demand (kilowatts), electrical power consumption (kilowatt-hours).
 2. Control: On-off operation, chilled-water discharge temperature set-point adjustment, electrical power demand limit.

3. Protocol Interface points: Provide the chiller with a BAS communication interface coordinated with the building automation system. The appropriate modular plug-in is to be provided to enable the unit controller to communicate using standardized protocols, either LONTALK, Modbus or BACnet without a separate gateway.
 - a. The Factory mounted DDC controller(s) shall support operation on a BACnet®, Modbus® or LONMARKS ® network via one of the data link / physical layers listed below as specified by the successful Building Automation System (BAS) supplier.
 - 1) BACnet MS/TP master (Clause 9)
 - 2) BACnet IP, (Annex J)
 - 3) BACnet ISO 8802-3, (Ethernet)
 - 4) LONMARKS FTT-10A. The unit controller shall be LONMARKS® certified.
 - b. The information communicated between the BAS and the factory mounted unit controllers shall include the reading and writing of data to allow unit monitoring, control and alarm notification as specified in the unit sequence of operation and the unit points list.
 - c. For chillers communicating over a LONMARKS network, the corresponding LONMARKS external Interface File (XIF) shall be provided with the chiller submittal data.
 - d. ASHRAE 135 (BACnet)] Industry-accepted, open-protocol communication interface with the BAS shall enable the BAS operator to remotely control and monitor the chiller from an operator workstation. Control features and monitoring points displayed locally at chiller control panel shall be available through the BAS.
 - 1) All communication from the chiller unit controller as specified in the points list shall be via standard BACnet objects. Proprietary BACnet objects shall not be allowed. BACnet communications shall conform to the BACnet protocol (ANSI/ASHRAE 135-2020). A BACnet Protocol Implementation Conformance Statement (PICS) shall be provided along with the unit submittal.

2.11 INSULATION:

- A. Material: Closed-cell, flexible elastomeric, thermal insulation complying with ASTM C534, Type I for tubular materials and Type II for sheet materials.
- B. Second option in first subparagraph below may not be offered by all listed manufacturers.
- C. Thickness: 1-1/2 inches (38 mm).
 1. Factory-applied insulation over cold surfaces of chiller components.
 2. Adhesive: As recommended by insulation manufacturer and applied to 100 percent of insulation contact surface. Seal seams and joints.
 3. Apply protective coating to exposed surfaces of insulation to protect insulation from weather.

2.12 REQUIRED OPTIONS:

- A. Retain one or more of four subparagraphs below to add features furnished by chiller manufacturer.

- B. Consult manufacturers for flow-switch requirements. Some chiller models of some manufacturers have other forms of protection built into chiller design and do not require flow switches. Some manufacturers offer factory-mounted flow switches as standard. Carrier, for example, factory mounts a thermal-dispersion-type flow switch on some models.
- C. Factory-furnished, chilled-water flow switches for field installation.
- D. Individual compressor suction and discharge pressure gages with shutoff valves for each refrigerant circuit.
- E. Before retaining spring isolators for use on rotary-screw chillers, consult a vibration consultant to verify suitability.
- F. Factory-furnished neoprene or spring isolators for field installation.
- G. Retain subparagraph below only if requested by Owner. Servicing of chiller by unqualified personnel is not recommended by chiller manufacturers and may void chiller warranty.
- H. Tool Kit: Chiller manufacturer shall assemble a tool kit specially designed for use in serving the chiller(s) furnished. Include special tools required to service chiller components not readily available to Owner service personnel in performing routine maintenance. Place tools in a lockable case with hinged cover. Provide a list of each tool furnished and attach the list to underside of case cover.
- I. Hot Gas Bypass: allows unit operation to 10 percent of full load. Includes factory-mounted hot gas bypass valve, solenoid valve, and manual shutoff valve for each circuit. Shall be ready for field piping according to manufacturer instructions.
- J. Low Ambient Control: Fan VFD allows unit operation down to -10°F (-23.3°C).
- K. High ambient control box for operation in ambient temperatures from 105°F to 125°F.
- L. Ground Fault Protection: Factory installed circuit breaker to protect equipment from damage from line-to-ground fault currents less than those required for conductor protection.
- M. Phase loss with under/over voltage protection and with LED indication of the fault type to guard against compressor motor burnout.
- N. Factory-mounted thermal dispersion type flow switch.
- O. Field-mounted, paddle type, chilled water flow switch field wired to the control panel.
- P. Evaporator inlet strainer, 40-mesh with extension pipe and Victaulic couplings.
- Q. Screw compressor sound reduction package.
 - 1. Each rotary screw compressor will include a muffler as standard and each condenser fan will be low noise as standard.
 - 2. In addition to the sound reducing features on the standard unit, add insulating sound material to the suction and discharge lines of each refrigerant circuit and reduces the maximum speed of each condenser fan.
 - 3. In addition to the sound reducing features above, add a flexible, metallic connection at the suction and discharge of each compressor, a pre-formed 'sound box' encapsulating each compressor and reduces the maximum speed of each condenser fan. The fan speed can be set for sound reduction from 100% 60% of maximum fan speed.

- R. Remote operator interface panel (field-wired).
- S. 115V GFI convenience outlet.
- T. BAS interface module, factory mounted.

2.13 SOURCE QUALITY CONTROL

- A. Perform functional tests of chillers before shipping.
- B. Factory run test each air-cooled chiller with water flowing through evaporator. Test the following conditions:
 - 1. Design conditions indicated.
 - 2. Chiller operating at calculated worst-case sound condition.
 - 3. At four point(s) of varying part-load performance to be selected by Owner at time of test.
 - 4. Prepare test report indicating test procedures, instrumentation, test conditions, and results. Submit copy of results within one week of test date.
- C. For chillers located outdoors, rate sound power level according to AHRI 370.

2.14 OPTIONAL FACTORY-INSTALLED PUMP PACKAGE

- A. The pump package shall be factory mounted and wired on the chiller. The chiller controller shall provide a pump start/stop signal when operation is required. On dual pump systems, the chiller shall provide also automatic alternating of pump starts and duty/standby functionality. The package shall be equipped with:
 - 1. Single Pump Model 4380: single spring inside-seal, vertical, in-line, radially split-case pump, serviceable without breaking pipe connections. The motor and pump rotating assembly shall be serviceable without removing the pump casing from the line, or,
 - 2. Dual Pumps in a Single Casting Model 4392: single-spring inside-seal vertical, in-line, radially split-case pumps, mounted in a common casing with a common inlet connection and outlet connection and including a flapper valve to prevent recirculation when only one pump is operating. An isolation valve shall be included to allow one pump to operate when the other is removed. The pumps shall be designed for duty/standby, not parallel operation.
- B. Pump package shall also be equipped with:
 - 1. "Y" type inlet strainer.
 - 2. Combination triple-duty outlet valve having a drip-tight discharge shutoff valve, non-slam check valve, and flow throttling valve.
 - 3. Combination suction guide with flow stabilizing outlet vanes and stainless steel strainer with a disposable fine-mesh strainer for start-up.
 - 4. Factory power and control wiring from the AGZ chiller to the pump package control panel.
 - 5. Flow switch mounted and wired.
 - 6. Interconnecting Schedule 40 piping with Victaulic couplings.
 - 7. Insulation of all cold surfaces.
- C. Package Options
 - 1. Water pressure gauges on the pump suction and discharge.

2. Expansion tank with size increments from 4.4 to 90 gallons, field installed (small sizes can be factory mounted).
3. Air separator with air vent, field installed.
4. Pump VFD for variable chilled water flow capability.
5. The VFD shall be completely sensorless requiring no field installation or wiring of sensors. The drive shall incorporate an integrated graphical user interface that shall provide running and diagnostic information and identify faults and status in clear English language. Faults shall be logged / recorded for interrogation at a later date. The keypad shall incorporate Hand-Off-Auto pushbuttons to enable switching between auto control modes and manual control. The drive shall incorporate a USB port for direct connection to a PC and an RS485 connection with Modbus RTU protocol. The built-in BAS mode shall be equipped with the same protocol as the chiller.
6. Control software shall provide automatic speed control in variable volume systems without the need for pump mounted (internal/external) or remotely mounted differential pressure system feedback sensor. Control mode setting and minimum / maximum head and flow set-points shall be set at the factory and be user adjustable via the inbuilt programming interface.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine chillers before installation. Reject chillers that are damaged.
- B. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting chiller performance, maintenance, and operations before equipment installation.
 1. Final chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 CHILLER INSTALLATION

- A. Install chillers on support structure indicated.
- B. See Section 230548 Vibration Isolation and Seismic Restraint for Piping, Ductwork, and Equipment for required vibration isolation requirements.
- C. Concrete base and concrete materials and installation requirements are specified in Division 3.
 1. Concrete Bases: Anchor chiller mounting frame to concrete base.
 - a. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 - b. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 - c. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

- d. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - e. Cast-in-place concrete materials and placement requirements are specified in Division 3.
- D. Vibration Isolation: See Section 230548 "Vibration Isolation for Piping, Ductwork and Equipment".
- E. Buffer Tank Provision: If chilled water system total volume is less than 6 gallons per ton of capacity (10 gallons for low temperature/ice storage systems) or less than a 3 minute total system changeover flow, install a buffer tank sized as needed to achieve the minimum total system water volume. See Section 232113: Hydronic Piping, Valves and Specialties for tank specification.
- F. Equipment Mounting:
- 1. Install chillers on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 - 2. Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration Isolation for Piping, Ductwork, and Equipment".
- G. Maintain manufacturer's recommended clearances for service and maintenance.
- H. Charge chiller with refrigerant and fill with oil if not factory installed.
- I. Install separate devices furnished by manufacturer and not factory installed.

3.03 CONNECTIONS

- A. Comply with requirements for piping specified in Section 232113 "Hydronic Piping, Valves and Specialties." Drawings indicate general arrangement of piping, fittings, and specialties
- B. Install piping adjacent to chiller to allow service and maintenance.
- C. Evaporator Fluid Connections: Make connections to chiller with a flanges or mechanical couplings.
- D. Connect each chiller drain connection with a union and drain pipe. Extend the pipe, full size of connection, to approved receptor drain. Provide a shutoff ball valve at each connection.

3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Verify that refrigerant charge is sufficient and chiller has been leak tested.
 - 3. Verify that pumps are installed and functional.
 - 4. Verify that thermometers and gages are installed.
 - 5. Operate chiller for run-in period.
 - 6. Check bearing lubrication and oil levels.
 - 7. For chillers installed indoors, verify that refrigerant pressure relief device is vented outdoors.
 - 8. Verify proper motor rotation.

9. Verify static deflection of vibration isolators, including deflection during chiller startup and shutdown.
 - B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assembly, installation, and connection.
 - C. Prepare test and inspection startup reports.
- 3.05 COMMISSIONING:
- A. This contractor shall provide a startup test plan for chiller(s) coordinating with the chiller manufacturer, control contractor, and electrical contractor. Plan shall include test schedules, and names and titles of the test personnel who will be participating in the commissioning tests.
- 3.06 DEMONSTRATION
- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain chillers.

END OF SECTION

SECTION 23 64 16
WATER COOLED CHILLERS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SUMMARY

- A. This Section includes water-cooled, electric-motor driven, water chillers with the following features:
 - 1. Microprocessor-controlled liquid chiller shall use a hermetic compressor.
 - 2. Microprocessor-based BACnet BTL certified controls.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230903: Refrigerant Detection and Alarm for refrigerant monitors, alarms, supplemental equipment, and ventilation equipment interlocks.

1.04 DESIGN REQUIREMENTS

- A. General: Provide a complete water-cooled hermetic centrifugal compressor water-chilling package as specified herein. Machine shall be provided according to referenced standards Section 1.2. In general, unit shall consist of a compressor, condenser, evaporator, lubrication system, starter and control system.
- B. Note: Chillers shall be charged with a refrigerant not subject to the Montreal Protocol and the U. S. Clean Air Act.
- C. Performance: Refer to schedule on the drawings. The chiller shall be capable of stable operation to ten percent of full load with standard AHRI entering condensing water relief without the use of hot gas bypass.
- D. Efficiencies: Performance of the submitted equipment shall meet and/or exceed the scheduled equipment performance in the construction documents schedule of equipment. Manufacturers listed in the specification are listed as acceptable subject to submittal of equipment with identical or superior performance of the scheduled equipment. Minimum efficiencies shall meet or exceed the values required by the local energy code.
- E. Seismic: Chillers shall withstand the effects of earthquake motions determined according to SEI/ASCE 7. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces noted elsewhere in these specifications and the unit will be fully operational after the seismic event.

- F. Acoustics: Sound pressure levels for the complete unit shall not exceed the following specified levels. Provide the necessary acoustic treatment to chiller as required. Sound data shall be measured according to AHRI Standard 575-87. Data shall be in dB. Data shall be the highest levels recorded at all load points. Test shall be in accordance with AHRI Standard 575.

1. Octave Band

Octave Band	63	125	250	500	1000	2000	4000	8000	dB

1.05 REFERENCES

- A. Comply with the following codes and standards:
1. AHRI 550/590: Certify chiller according to AHRI 590 certification program.
 2. AHRI Rating: Rate water chiller performance according to requirements in AR"1 506/110, "Water Chilling Packages Using the Vapor Compression Cycle."
 3. NFPA 70
 4. NEC
 5. OSHA
 6. ASME Section VIII: Fabricate and stamp water chiller heat exchangers to comply with ASME Boiler and Pressure Vessel Code.
- B. ANSI/ASHRAE 15: Safety code for mechanical refrigeration.
- C. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.06 DEFINITIONS

- A. EER: Energy-efficiency ratio.
- B. IPLV: Integrated part-load value.

1.07 SUBMITTALS

- A. Product Data: Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings: Complete set of manufacturer's certified prints of water chiller assemblies, control panels, sections and elevations, and unit isolation. Wiring Diagrams: Power, signal, and control wiring.
- C. Coordination Drawings: Floor plans drawn to scale and coordinated with the following:
1. Structural supports.
 2. Piping roughing-in requirements.
 3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
 4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

- D. Certificates: For certification required in "Quality Assurance" Article.
- E. Source quality-control test reports.
- F. Startup service reports.
- G. Operation and Maintenance Data: For each water chiller to include in emergency, operation, and maintenance manuals.
- H. Warranties: Special warranties specified in this Section.

1.08 QUALITY ASSURANCE

- A. AHRI Certification: Signed by manufacturer certifying compliance with requirements in AHRI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle."
- B. ASHRAE Certification: Signed by manufacturer certifying compliance with ASHRAE 15 for safety code for mechanical refrigeration. Comply with ASHRAE Guideline 3 for refrigerant leaks, recovery, and handling and storage requirements.
- C. ASME Compliance: Fabricate and label water chiller heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
- D. Comply with NFPA 70.
- E. Compressor impellers shall be dynamically balanced and over-speed tested by the manufacturer at a minimum of 120% design operating speed. Each compressor assembly shall undergo a mechanical run-in test to verify vibration levels, oil pressures, and temperatures are within acceptable limits.
- F. Each compressor assembly shall be proof tested at a minimum 204 psig (1406 kPa) and leak tested at 185 psig (1276 kPa) with a tracer gas mixture.
- G. Entire chiller assembly shall be proof tested at 204 psig (1406 kPa) and leak tested at 185 psig (1276 kPa) with a tracer gas mixture on the refrigerant side. The water side of each heat exchanger shall be hydrostatically tested at 1.3 times rated working pressure.
- H. Prior to shipment, the chiller automated controls test shall be executed to check for proper wiring and ensure correct controls operation.

1.09 DELIVERY, STORAGE, AND HANDLING

- A. Unit shall be stored and handled in accordance with manufacturer's instructions.
- B. Unit shall be shipped with all piping and control wiring factory installed.
- C. Unit shall be shipped charged with oil and full charge of refrigerant or a nitrogen holding charge as specified on the equipment schedule.
- D. Unit shall be shipped with firmly attached labels that indicate name of manufacturer, chiller model number, chiller serial number, and refrigerant used.

1.10 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

1.11 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.
- C. Provide with five (5) year warranty on compressors and refrigerant.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following manufacturers offering products that may be incorporated into the Work. This includes but is not limited to the following:
 - 1. Daikin (McQuay)
 - 2. Trane
 - 3. Carrier Corporation
 - 4. YORK International Corporation

2.02 MANUFACTURED UNIT

- A. Description: Factory-assembled and -tested chiller complete with compressor, compressor motor, compressor motor controller, lubrication system, evaporator, condenser, controls, interconnecting unit piping and wiring, and indicated accessories.
- B. Retain first subparagraph below if limited space is available for installation.
- C. Disassemble chiller into major assemblies as required by the installation after factory testing and before packaging for shipment.
- D. For chillers with dual compressors, provide each compressor with a dedicated motor and motor controller, and provide for continued operation when either compressor-drive assembly fails or is being serviced.
- E. Fabricate chiller mounting base with reinforcement strong enough to resist chiller movement during a seismic event when chiller is anchored to field support structure.

2.03 REFRIGERATION

- A. Refrigerant:
 - 1. Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
 - 2. Refrigerant by compressor type:

Compressor	Acceptable Refrigerant
Centrifugal	R-123, R-134a
Screw	R-134a
Scroll	R-410a
Reciprocating	R-22

3. R-123; ASHRAE 34, Class B1 or R-134a; ASHRAE 34, Class A1.
- B. Refrigerant Flow Control: Manufacturer's standard refrigerant flow-control device satisfying performance requirements indicated.
- C. Pressure Relief Device:
1. Comply with requirements in ASHRAE 15 and in applicable portions of ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 2. For Chillers Using R-123: Provide either a rupture disc constructed of frangible carbon, spring-loaded, pressure relief valve; single- or multiple-reseating type.
 3. For Chillers Using R-134a: ASME-rated, spring-loaded, pressure relief valve; single- or multiple-reseating type. Pressure relief valve(s) shall be provided for each heat exchanger. Condenser shall have dual valves with one being redundant and configured to allow either valve to be replaced without loss of refrigerant.
- D. Refrigeration Transfer: Provide service valves and other factory-installed accessories required to facilitate transfer of refrigerant from chiller to a remote refrigerant storage and recycling system. Comply with requirements in ASHRAE 15 and ASHRAE 147.
- E. Refrigerant Isolation for Chillers Using R-134a: Factory install isolation valves in the compressor discharge line to the condenser and the refrigerant liquid line leaving the condenser to allow for isolation and storage of full refrigerant charge in the chiller condenser shell. In addition, provide isolation valve on suction side of compressor from evaporator to allow for isolation and storage of full refrigerant charge in the chiller evaporator shell.
- F. Purge System:
1. For chillers operating at subatmospheric pressures (using R-123 refrigerant), factory install an automatic purge system for collection and return of refrigerant and lubricating oil and for removal of noncondensables including, but not limited to, water, water vapor, and noncondensable gases.
 2. System shall be a thermal purge design, refrigerant or air cooled, equipped with a carbon filter that includes an automatic regeneration cycle.
 3. Factory wire to chiller's main power supply and system complete with controls, piping, and refrigerant valves to isolate the purge system from the chiller.
 4. Construct components of noncorrodible materials.
 5. Controls shall interface with chiller control panel to indicate modes of operation, set points, data reports, diagnostics, and alarms.
 6. Efficiency of not more than 0.02 lb of refrigerant per pound of air (9 g of refrigerant per gram of air) when rated according to AHRI 580.

7. Operation independent of chiller per ASHRAE 147.

G. Positive-Pressure System:

1. For chillers operating at sub-atmospheric pressures (using R-123 refrigerant), factory install an automatic positive-pressure system.
2. During nonoperational periods, positive-pressure system shall automatically maintain a positive pressure for atmosphere in the refrigerant pressure vessel of not less than 0.5 psig (3 kPa) adjustable up to a pressure that remains within the vessel design pressure limits.
3. System shall be factory wired and include controller, electric heat, pressure transmitter, or switch.

2.04 COMPRESSOR DRIVE ASSEMBLY

A. Maglev or oil free centrifugal compressor

1. Compressor-drive assembly
 - a. Description: Single-stage or multistage, variable-displacement, centrifugal-type compressor driven by an electric motor.
 - 1) Provide oil-free compressor technology using either a permanent magnet synchronous motor, magnetic bearings, integral variable frequency controller, and digital electronic controls or other alternative technology.
 - b. Compressor:
 - 1) Casing: Cast iron, precision ground.
 - 2) Impeller: High-strength cast aluminum or cast-aluminum alloy on carbon- or alloy-steel shaft.
 - c. Drive: Direct-drive, hermetic design using an electric motor as the driver.
 - d. Compressor Motor:
 - 1) Continuous-duty, squirrel-cage, induction-type, two-pole motor with energy efficiency required to suit chiller energy efficiency indicated or permanent magnet motor.
 - 2) Factory mounted, aligned, and balanced as part of compressor assembly before shipping.
 - 3) Motor shall be of sufficient capacity to drive compressor throughout entire operating range without overload and with sufficient capacity to start and accelerate compressor without damage.
 - 4) Provide motor with thermistor or RTD to monitor temperature and report information to chiller control panel.
 - e. Vibration Balance: Balance chiller compressor and drive assembly to provide a precision balance that is free of noticeable vibration over the entire operating range.
 - 1) Overspeed Test: 25 percent above design operating speed.
 - f. Service: Easily accessible for inspection and service.
 - 1) Compressor's internal components shall be accessible without having to remove compressor-drive assembly from chiller.
 - 2) Provide lifting lugs or eyebolts attached to casing.
 - g. Economizers: For multistage chillers, provide interstage economizers.

- h. Capacity Control: Modulating, variable-inlet, guide-vane assembly combined with hot-gas bypass, if necessary, to achieve performance indicated.
 - 1) Maintain stable operation that is free of surge, cavitation, and vibration throughout range of operation. Configure to achieve most energy-efficient operation possible.
 - 2) Operating Range: From 100 to 15 percent of design capacity.
 - 3) Condenser-Fluid Unloading Requirements over Operating Range: Drop-in entering condenser-fluid temperature of 2.5 F (1.4 C) for each 10 percent in capacity reduction
 - 4) Chillers with variable frequency controllers shall modulate compressor speed with variable-inlet, guide-vane control to achieve optimum energy efficiency.
 - i. Oil Lubrication System: Shall not be required for operation.
- B. Oil-lubricated centrifugal compressor
- 1. The compressor shall be a hermetic centrifugal. {Request for substitution of open drive chiller must include an air handler sized for mechanical room cooling.}
 - 2. The impeller shall be statically and dynamically balanced. The compressor shall be vibration tested and not exceed a level of 0.14 IPS.
 - 3. Movable inlet guide vanes shall accomplish unloading. Compressors using an unloading system that requires penetrations through the compressor housing or linkages, or both that must be lubricated and adjusted are acceptable provided the manufacturer provides a five-year inspection agreement consisting of semi-annual inspection, lubrication, and annual change out of any compressor seals. A statement of inclusion must accompany any quotations.
 - 4. If the compressor is not equipped with guide vanes for each stage and movable discharge diffusers, then furnish hot gas bypass and select chillers at 5% lower kW/ton than specified to compensate for bypass inefficiency at low loads.
 - 5. For open motor units, an oil reservoir shall collect any oil and refrigerant that leaks past the seal. A float device shall be provided to open when the reservoir is full, directing the refrigerant/oil mixture back into the compressor housing. Manufacturer shall warrant the shaft seal, reservoir, and float valve system against leakage of oil and refrigerant to the outside of the refrigerating unit for a period of 5 years from the initial start-up including parts and labor to replace a defective seal and any refrigerant required to trim the charge original specifications.
 - 6. The chiller should be able to unload to 15% of design tonnage with constant entering condenser water temperature.
 - 7. Motor: Motor shall be 460 volt, 3 phases, 60 hertz with six terminal posts for wye delta starting. Continuous duty for minimum of 15 years with a maximum number of starts expected of 15,000 and a minimum delay between starts of 30 minutes.
 - 8. Lubrication System: The compressor shall have an independent lubrication system to provide lubrication to all parts requiring oil. Provide a heater in the oil sump to maintain oil at sufficient temperature to minimize affinity of refrigerant, and a thermostatically controlled water-cooled oil cooler. Coolers located inside the evaporator or condenser are not acceptable due to inaccessibility. A positive displacement oil pump shall be powered through the unit control transformer.
- C. Screw compressor
- 1. Compressor:
 - a. Description: [Hermetic] [or] [open], positive displacement, and oil lubricated.

- b. Casing: Cast iron, precision machined for minimum clearance about periphery of rotors.
 - c. Rotors: Manufacturer's standard one-, two-, or three-rotor design.
 - d. Drive Coupling: For chillers with open drives, provide flexible disc with all-metal construction and no wearing parts to ensure long life without the need for lubrication.
 - e. Seals: Seal drive assembly to prevent refrigerant leakage.
2. Compressor Motor:
- a. Continuous-duty, squirrel-cage, induction-type motor with energy efficiency required to suit chiller energy efficiency indicated.
 - b. Factory mounted, aligned, and balanced as part of compressor assembly before shipping.
 - c. Motor shall be of sufficient capacity to drive compressor throughout entire operating range without overload and with sufficient capacity to start and accelerate compressor without damage.
 - d. First option in first subparagraph below is standard offering and is suitable for most indoor applications. Retain second, third, or fourth option if chiller is installed outdoors or regularly exposed to high levels of moisture. Consult manufacturer.
 - e. For chillers with open drives, provide motor with [open-dripproof] [weather-protected, Type I] [weather-protected, Type II] [totally enclosed] enclosure.
 - f. Provide motor with thermistor or RTD in [single motor winding] [each of three-phase motor windings] to monitor temperature and report information to chiller control panel.
 - g. Provide motor with thermistor or RTD to monitor bearing temperature and report information to chiller control panel.
 - h. Subparagraph below is not required for most indoor applications; retain if required.
 - i. Provide open-drive motor with internal electric heater, internally powered from chiller power supply.
3. Vibration Balance: Balance chiller compressor and drive assembly to provide a precision balance that is free of noticeable vibration over the entire operating range.
- a. Overspeed Test: 25 percent above design operating speed.
4. Service: Easily accessible for inspection and service.
- a. Verify availability of requirements in two subparagraphs below with manufacturer.
 - b. Compressor's internal components shall be accessible without having to remove compressor-drive assembly from chiller.
 - c. Provide lifting lugs or eyebolts attached to casing.
 - d. Capacity Control: Modulating slide-valve assembly or port unloaders combined with [a variable frequency controller, if applicable, and]hot-gas bypass, if necessary, to achieve performance indicated.
 - e. Maintain stable operation throughout range of operation. Configure to achieve most energy-efficient operation possible.
 - f. Standard operating range varies among manufacturers. Not all listed manufacturers comply with options in first subparagraph below without hot-gas bypass. Consult manufacturer for requirements.
 - g. Operating Range: From 100 to [20] [15] [10] [5] [zero] <Insert number> percent of design capacity.

1. Description: Positive-displacement direct drive with semihermetically sealed and accessible bolted casings.
2. Each compressor provided with suction and discharge service valves, crankcase oil heater, and suction strainer.
3. Operating Speed: 1750 rpm for 60-Hz applications.
4. Retain first option in first subparagraph below for water chillers with multiple compressors. Retain second option if Project requires capacity control to near-zero cooling load.
5. Capacity Control: Combinations of cylinder unloading and on-off compressor cycling[of multiple compressors][, plus hot-gas bypass]. Compressor shall be capable of operating at part-load conditions without increased vibration over normal vibration at full-load operation and shall be capable of continuous operation at its lowest step of unloading.
6. Oil Lubrication System: Automatically reversible, positive-displacement pump with strainer, sight glass, filling connection, filter with magnetic plug, and initial oil charge.
7. Vibration Isolation: Mount individual compressors on either neoprene or spring isolators.
8. Retain subparagraph below for projects with stringent acoustical requirements. Sound-reduction packages are typically an optional feature.
9. Sound-reduction package shall consist of acoustic enclosures around the compressors that are designed to reduce sound level without affecting performance.
10. Compressor Motors:
 - a. Hermetically sealed and cooled by refrigerant suction gas.
 - b. High-torque, four-pole induction type with inherent thermal-overload protection on each phase.
 - c. Compressor Motor Controllers:
 - 1) Retain one of two subparagraphs below. Part-wind start is not available on all sizes of water chillers.
 - 2) Across the Line: NEMA ICS 2, Class A, full voltage, nonreversing.
 - 3) Part-Wind Start: NEMA ICS 2, Class A, reduced voltage, nonreversing.

2.05 EVAPORATOR – SHELL AND TUBE

- A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from condenser.
- B. Evaporator shall be of the shell-and-tube type, designed, constructed, tested and stamped according to the requirements of the ASME Code, Section VIII. Regardless of the operating pressure, the refrigerant side of each vessel will bear the ASME stamp indicating compliance with the code and indicating a test pressure of 1.1 times the working pressure, but not less than 100 psig. Provide intermediate tube supports at a maximum of 24 inch spacing.
- C. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.
- D. Designed to prevent liquid refrigerant carryover from entering compressor.
- E. Provide evaporator with sight glass or other form of positive visual verification of liquid-refrigerant level.
- F. Tubes:

1. Individually replaceable from either end and without damage to tube sheets and other tubes.
 2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
 3. Material: Copper
 4. Nominal OD: 3/4 inch (19 mm)
 5. Minimum Wall Thickness: 0.025 inch (0.6 mm)
 6. External Finish: Manufacturer's standard.
 7. Internal Finish: Enhanced or smooth].
- G. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.
- H. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.
- I. Water Box:
1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
 2. Standard type for water box with piping connections. Standard type for water box without piping connections.
 3. Provide water boxes with lifting lugs or eyebolts.
 4. Retain one of first two subparagraphs below for special applications.
 5. Nozzle Pipe Connections: Grooved with mechanical-joint coupling and flange adapter.
 6. Thermistor or RTD temperature sensor factory installed in each nozzle.
 7. Fit each water box with 3/4-inch (19-mm) drain connection at low point and vent connection at high point, each with threaded plug.
- J. Additional Corrosion Protection:
1. Electrolytic corrosion-inhibitor anode.
 2. Retain one of two subparagraphs below.
 3. Coat wetted surfaces with a corrosion-resistant finish.
 4. Using same material as tubes, clad surfaces of end tube sheets in contact with fluid. Coat other wetted surfaces, including water boxes, with a corrosion-resistant finish.
- 2.06 EVAPORATOR – BRAZED FRAME NOTE TO EDITOR: THIS CONSTRUCTION IS TYPICAL OF MODULAR CHILLERS LIKE MULTISTACK.
- A. Each evaporator shall be brazed plate heat exchangers constructed of 316 stainless steel; designed, tested, and stamped in accordance with UL 1995 code for 650 psig working pressure on the evaporator and 650 psig working pressure on the condenser. The evaporator heat exchanger shall be mounted below the compressor, to eliminate the effect of migration of refrigerant to the cold evaporator with consequent liquid slugging on start-up.
- 2.07 CONDENSER – SHELL AND TUBE
- A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from evaporator.

- B. Condenser shall be of the shell-and-tube type, designed, constructed, tested and stamped according to the requirements of the ASME Code, Section VIII. Regardless of the operating pressure, the refrigerant side of each vessel will bear the ASME stamp indicating compliance with the code and indicating a test pressure of 1.1 times the working pressure, but not less than 100 psig. Provide intermediate tube supports at a maximum of 24 inch spacing.
- C. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.
- D. Designed to prevent direct impingement of high-velocity hot gas from compressor discharge on tubes.
- E. Provide condenser with sight glass or other form of positive visual verification of refrigerant charge and condition.
- F. Tubes:
 - 1. Individually replaceable from either end and without damage to tube sheets and other tubes.
 - 2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
 - 3. Tube materials vary among manufacturers and chiller models; verify availability with manufacturer. First option in first subparagraph below is current standard of listed manufacturers.
 - 4. Material: [Copper] [Copper-nickel alloy] [Stainless steel] [Titanium] [Copper, copper-nickel alloy, stainless steel, or titanium] <Insert material>.
 - 5. Retain one of four options in first subparagraph below. First and fourth options give manufacturer the choice. Second option limits size available from listed manufacturers. Only Trane offers third option.
 - 6. Nominal OD: [Manufacturer's choice] [3/4 inch (19 mm)] [1 inch (25 mm)] [3/4 or 1 inch (19 or 25 mm)].
 - 7. External Finish: Manufacturer's standard.
 - 8. Internal Finish: [Enhanced] [Smooth] [Enhanced or smooth].
- G. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.
- H. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.
- I. Water Box:
 - 1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
 - 2. Standard type for water box with piping connections. Standard type for water box without piping connections.
 - 3. Provide water boxes with lifting lugs or eyebolts.
 - 4. Retain one of first two subparagraphs below for special applications.
 - 5. Nozzle Pipe Connections: Grooved with mechanical-joint coupling and flange adapter.
 - 6. Thermistor or RTD temperature sensor factory installed in each nozzle.
 - 7. Fit each water box with 3/4-inch (19-mm) drain connection at low point and vent connection at high point, each with threaded plug.

J. Additional Corrosion Protection:

1. Electrolytic corrosion-inhibitor anode.
2. Retain one of two subparagraphs below.
3. Coat wetted surfaces with a corrosion-resistant finish.
4. Using same material as tubes, clad surfaces of end tube sheets in contact with fluid. Coat other wetted surfaces, including water boxes, with a corrosion-resistant finish.

2.08 CONDENSER – BRAZED FRAME

- A. Each condenser shall be brazed plate heat exchangers constructed of 316 stainless steel; designed, tested, and stamped in accordance with UL 1995 code for 650 psig working pressure on the evaporator and 650 psig working pressure on the condenser. The condenser heat exchanger shall be mounted below the compressor, to eliminate the effect of migration of refrigerant to the cold evaporator with consequent liquid slugging on start-up.

2.09 INSULATION

- A. Closed-cell, flexible elastomeric thermal insulation complying with A STM C 534, Type I for tubular materials and Type II for sheet materials.
- B. Second option in subparagraph below may not be available from all manufacturers as a standard factory option. Consult manufacturer.
- C. Thickness: 3/4 inch (19 mm)
- D. Adhesive: As recommended by insulation manufacturer.
- E. Factory-applied insulation over all cold surfaces of chiller capable of forming condensation. Components shall include, but not be limited to, evaporator shell and end tube sheets, evaporator water boxes including nozzles, refrigerant suction pipe from evaporator to compressor, cold surfaces of compressor, refrigerant-cooled motor, and auxiliary piping.
 1. Apply adhesive to 100 percent of insulation contact surface.
 2. Before insulating steel surfaces, prepare surfaces for paint, and prime and paint as indicated for other painted components. Do not insulate unpainted steel surfaces.
 3. Seal seams and joints to provide a vapor barrier.
 4. After adhesive has fully cured, paint exposed surfaces of insulation to match other painted parts.

2.10 ELECTRICAL

- A. Factory installed and wired, and functionally tested at factory before shipment.
- B. Single-point, field-power connection to circuit breaker. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 42,000 A.
- C. NEMA ICS 2-rated motor controller for auxiliary motors, hand-off-auto switch, and overcurrent protection for each motor. Provide variable frequency controller for each variable-speed motor furnished.
- D. Control-circuit transformer with primary and secondary side fuses.

- E. Terminal blocks with numbered and color-coded wiring to match wiring diagram. Spare wiring terminal block for connection to external controls or equipment.

2.11 MOTOR STARTING AND CONTROL SELECT EITHER MOTOR STARTER OR VFD

A. Motor Starter:

1. Choose either factory mounted or field mounted:
 - a. The main motor starter is to be factory mounted and fully wired to the chiller components and factory tested during the run test of the unit.
-- OR --
 - b. The main motor starter is to be furnished by the chiller manufacturer and shipped loose for floor mounting and field wiring to the chiller package. It shall be free-standing with NEMA-1 enclosure designed for top entry and bottom exit and with front access.
2. For open drive air-cooled motors the chiller manufacturer shall be responsible for providing the cooling of the refrigeration machinery room. The sensible cooling load shall be based on the total heat rejection to the atmosphere from the refrigeration units.
3. General Starter Requirements:
 - a. The starter shall be coordinated with the chiller package(s) making certain all terminals are properly marked according to the chiller manufacturer's wiring diagrams.
 - b. The starter shall be equipped with a redundant motor control relay (MCR). The relay shall interconnect the starter with the unit control panel and directly operate the main motor contactor. The MCR shall constitute the only means of energizing the motor starter.
 - c. The main contactors shall have a normally open auxiliary contact rated at 125VA pilot duty at 115 VAC. An additional set of normally open contacts shall be provided on the MCR.
 - d. There shall be electronic overloads in each phase, which will permit continuous operation at 107% of the rated load amps of each motor. The overloads shall have a must-trip setting of 125% of the rated load amps. Overloads shall be manual reset and shall de-energize the main contactors when the overcurrent occurs. The overloads shall be adjustable, have manual reset, be ambient compensated, and set for Class 10 operation.
 - e. Each starter shall have a current transformer and adjustable voltage dropping resistor(s) to supply a 5.0 VAC signal at full load to the unit control panels.
 - f. Each starter shall be equipped with a line-to-115 VAC control transformer, fused in both the primary and secondary, to supply power to the control panels, oil heaters and oil pumps.
 - g. Each starter shall include the following:
 - 1) Under voltage/over voltage and phase failure and reversal protection
 - 2) Load break disconnect switch
 - 3) Current limiting power fuses
 - h. Main Control Relays
 - 1) A motor control relay shall be provided to interlock the starter with the chiller. The relay shall constitute the only means of energizing the motor starter. No other devices (manual or automatic) with the capability of energizing the starter can be used. The starter is to be controlled by the unit microprocessor.

- i. Motor Protection and Overloads
 - 1) The starter shall include overload protection functions. These controls include:
 - (a) Solid state overload (overcurrent) protection
 - (b) Phase unbalance protection
 - (c) Phase reversal and phase loss protection.
 - (d) Adjustable overload to closely match motor performance
 - (e) Three current transformers to measure motor current and a fourth current transformer for input to the chiller microprocessor.
- j. Undervoltage (UV) Relay
 - 1) The undervoltage relay is an adjustable three-phase protection system that is activated when the voltage falls below a predetermined safe value and is factory set at 85% of nominal.
- k. Control Voltage Transformer
 - 1) The starter is to be provided with a 3KVA control transformer with both secondary and primary fuses to supply control power to the chiller.
- l. Additional Standard Components
 - 1) Mechanical type solderless connectors to handle wire sizes indicated by the NEC.
 - 2) Three vertically mounted current limiting power fuse blocks (fuses included)
 - 3) Magnetic three-pole, vacuum break contactor
 - 4) Single phase control circuit transformer
 - 5) Vertically mounted control circuit primary current limiting fuses
 - 6) Current transformers
 - 7) Control circuit terminal blocks and secondary fuses
 - 8) Phase failure and reversal relay
- 4. Low Voltage (200 through 600 volts): Low Voltage (200 through 600 volts) motor controllers are to be continuous duty AC magnetic type constructed according to NEMA standards for Industrial Controls and Systems (ICS) and capable of carrying the specified current on a continuous basis. The starter shall be: Select one of the following two starter options:
 - a. Solid-State Reduced Voltage - Starter shall be furnished with silicon controlled rectifiers (SCR) connected for starting and include a bypass contactor. When operating speed is reached, the bypass contactor shall be energized removing the SCRs from the circuit during normal running.

-- OR --
 - b. Wye-Delta Closed Transition - The starter shall be equipped with properly sized resistors to provide a smooth transition. The resistors shall be protected with a transition resistor protector, tripping in a maximum of two seconds, locking out the starter, and shall be manually reset. A clearly marked transition timer shall be adjustable from 0 to 30 seconds or a current sensing device shall initiate transition when the starting current drops to 90% of the unit RLA.

--OR--
- 5. Medium Voltage (601 through 7200 volts). The starter shall be:

- a. Solid-State Reduced Voltage - Starter shall be furnished with silicon controlled rectifiers (SCR) connected for starting and include a bypass contactor. When operating speed is reached, the bypass contactor shall be energized removing the SCRs from the circuit during normal running.

--OR--

- b. Across-the-Line type with primary contactor allowing locked rotor amps to reach the motor when energized, including items a through f above.

--OR--

- c. Autotransformer type factory wired to the 65% tap with drawout magnetic, three-pole, vacuum break shorting contactor, drawout magnetic, two-pole, vacuum break starting contactor, and open delta starting auto-transformer factory set at 65%. Including items a through F except for isolating safety switch in lieu of load break disconnect switch in item f ii.

--OR--

- d. Primary Reactor type with drawout magnetic, three-pole, vacuum break shorting assembly, and three-phase starting reactor, factory set at the 65% tap. All medium and high voltage starters shall have the following components:

B. Variable Frequency Controller

1. Motor controller shall be factory mounted and wired on the chiller to provide a single-point, field-power termination to the chiller and its auxiliaries.
2. Description: NEMA ICS 2; listed and labeled as a complete unit and arranged to provide variable speed by adjusting output voltage and frequency.
3. Enclosure: Unit mounted, NEMA 250, Type 1, with hinged full-front access door with lock and key.
4. Integral Disconnecting Means: Door-interlocked, NEMA AB 1, instantaneous-trip circuit breaker with lockable handle. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 42,000 A.
5. Technology: Pulse width modulated (PWM) output with insulated gate bipolar transistors (IGBT); suitable for variable torque loads.
6. Controller shall consist of a rectifier converter section, a digital/analog driver regulator section, and an inverter output section.
 - a. Rectifier section shall be a full-wave diode bridge that changes fixed-voltage, fixed-frequency, ac line power to a fixed dc voltage. Silicon controller rectifiers, current source inverters, and paralleling of devices are unacceptable. Rectifier shall be insensitive to phase rotation of the ac line.
 - b. Regulator shall provide full digital control of frequency and voltage.
 - c. Inverter section shall change fixed dc voltage to variable-frequency, variable ac voltage, for application to a squirrel-cage motor. Inverter shall produce a sine-coded, pulse width modulated (PWM) output wave form and shall conduct no radio-frequency interference back to the input power supply.
7. Output Rating: Three phase; with voltage proportional to frequency throughout voltage range.
8. Operating Requirements:
 - a. Input AC Voltage Tolerance: [460-V ac, plus 10 percent or 506 V maximum] <Insert voltage and tolerance>.

- b. Input frequency tolerance of 60 Hz, plus or minus 2 Hz.
 - c. Capable of driving full load, without derating, under the following conditions:
 - 1) Ambient Temperature: 0 to 50 deg C.
 - 2) Relative Humidity: Up to [90] [95] percent (noncondensing).
 - 3) Altitude: [3300 feet (1005 m)] [6600 feet (2010 m)].
 - d. Minimum Efficiency: 96 percent at 60 Hz, full load.
 - e. Minimum Displacement Primary-Side Power Factor: 95 percent without harmonic filter, 98 percent with harmonic filter.
 - f. Overload Capability: 1.05 times the full-load current for 7 seconds.
 - g. Starting Torque: As required by compressor-drive assembly.
 - h. Speed Regulation: Plus or minus 1 percent.
 - i. Isolated control interface to allow controller to follow control signal over a 10:1 speed range.
 - j. To avoid equipment resonant vibrations, provide critical speed lockout circuitry to allow bands of operating frequency at which controller shall not operate continuously.
 - k. Capable of being restarted into a motor coasting in either the forward or reverse direction without tripping.
9. Internal Adjustability Capabilities:
- a. Minimum Output Frequency: 6 Hz.
 - b. Maximum Output Frequency: 60 Hz.
 - c. Acceleration: 2 seconds to a minimum of 60 seconds.
 - d. Deceleration: 2 seconds to a minimum of 60 seconds.
 - e. Current Limit: 30 percent to a minimum of 100 percent of maximum rating.
10. Self-Protection and Reliability Features: Subjecting the controller to any of the following conditions shall not result in component failure or the need for replacement:
- a. Overtemperature.
 - b. Short circuit at controller output.
 - c. Ground fault at controller output. Variable frequency controller shall be able to start a grounded motor.
 - d. Open circuit at controller output.
 - e. Input undervoltage.
 - f. Input overvoltage.
 - g. Loss of input phase.
 - h. Reverse phase.
 - i. AC line switching transients.
 - j. Instantaneous overload, line to line or line to ground.
 - k. Sustained overload exceeding 100 percent of controller rated current.
 - l. Starting a rotating motor.

11. Motor Protection: Controller shall protect motor against overvoltage and undervoltage, phase loss, reverse phase, overcurrent, overtemperature, and ground fault.
12. Automatic Reset and Restart: Capable of [three] <Insert number> restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Controller shall be capable of automatic restart on phase-loss and overvoltage and undervoltage trips.
13. Visual Indication: On face of controller enclosure or chiller control enclosure; indicating the following conditions:
 - a. Power on.
 - b. Run.
 - c. Overvoltage.
 - d. Line fault.
 - e. Overcurrent.
 - f. External fault.
 - g. Motor speed (percent).
 - h. Fault or alarm status (code).
 - i. DC-link voltage.
 - j. Motor output voltage.
 - k. Input kilovolt amperes.
 - l. Total power factor.
 - m. Input kilowatts.
 - n. Input kilowatt-hours.
 - o. Three-phase input voltage.
 - p. Three-phase output voltage.
 - q. Three-phase input current.
 - r. Three-phase output current.
 - s. Three-phase input voltage total harmonic distortion.
 - t. Three-phase input current total harmonic distortion.
 - u. Output frequency (Hertz).
 - v. Elapsed operating time (hours).
 - w. Diagnostic and service parameters.
14. Operator Interface: At controller or chiller control panel; with start-stop and auto-manual selector with manual-speed-control potentiometer.
15. Control Signal Interface:
 - a. Electric Input Signal Interface: A minimum of two analog inputs (0 to 10 V or 0/4-20 mA) and six programmable digital inputs.
16. Chiller Capacity Control Interface: Equip chiller with adaptive control logic to automatically adjust the compressor motor speed and the compressor pre-rotation inlet vane position independently to achieve maximum part-load efficiency in response to sensor inputs that are integral to the chiller controls.

2.12 CONTROLS

- A. Coordinate this article with Section 230900 Building Automation System Controls.
- B. Control: Standalone and microprocessor based, with all memory stored in nonvolatile memory so that reprogramming is not required on loss of electrical power.
- C. Enclosure: Unit mounted, NEMA 250, Type 1 hinged, factory wired with a single-point, field-power connection and a separate control circuit.
- D. Operator Interface: Multiple-character digital or graphic display with dynamic update of information and with keypad or touch-sensitive display located on front of control enclosure. In either imperial or metric units selectable through the interface, display the following information:
 - 1. Revise list below to suit Project. Verify availability of displayed information with chiller manufacturers. Some information may be optional; other information may not be available from all listed manufacturers.
 - 2. Date and time.
 - 3. Operating or alarm status.
 - 4. Fault history with not less than last 10 faults displayed.
 - 5. Set points of controllable parameters.
 - 6. Trend data.
 - 7. Operating hours.
 - 8. Number of chiller starts.
 - 9. Outdoor-air temperature or space temperature if required for chilled-water reset.
 - 10. Entering- and leaving-fluid temperatures of evaporator and condenser.
 - 11. Difference in fluid temperatures of evaporator and condenser.
 - 12. Fluid flow of evaporator and condenser.
 - 13. Fluid pressure drop of evaporator and condenser.
 - 14. Refrigerant pressures in evaporator and condenser.
 - 15. Refrigerant saturation temperature in evaporator and condenser shell.
 - 16. Compressor refrigerant suction and discharge temperature.
 - 17. Compressor bearing temperature.
 - 18. Motor bearing temperature.
 - 19. Motor winding temperature.
 - 20. Oil temperature.
 - 21. Oil discharge pressure.
 - 22. Phase current.
 - 23. Percent of motor rated load amperage.
 - 24. Phase voltage.
 - 25. Demand power (kilowatts).
 - 26. Energy use (kilowatt-hours).
 - 27. Power factor.

28. For chillers equipped with variable frequency controllers and harmonic filters, include the following:
 - a. Output voltage and frequency.
 - b. Voltage total harmonic distortion for each phase.
 - c. Supply current total demand distortion for each phase.
 - d. Inlet vane position.
 - e. Controller internal ambient temperature.
 - f. Heatsink temperature.
 29. Purge suction temperature if purge system is provided.
 30. Purge elapsed time if purge system is provided.
- E. Control Functions:
1. Manual or automatic startup and shutdown time schedule.
 2. Entering and leaving chilled-water temperatures, control set points, and motor load limits. Evaporator fluid temperature shall be reset based on return-water temperature.
 3. Current limit and demand limit.
 4. Condenser-fluid temperature.
 5. External chiller emergency stop.
 6. Variable evaporator flow.
 7. Thermal storage.
 8. Heat reclaim.
- F. Manually Reset Safety Controls: The following conditions shall shut down chiller and require manual reset:
1. Low evaporator pressure, temperature, pressure or temperature; high condenser pressure.
 2. Low evaporator fluid temperature.
 3. High compressor-discharge temperature.
 4. Loss of condenser-fluid flow.
 5. Loss of evaporator fluid flow.
 6. Motor overcurrent.
 7. Motor overvoltage.
 8. Motor undervoltage.
 9. Motor phase reversal.
 10. Motor phase failure.
 11. Sensor- or detection-circuit fault.
 12. Processor communication loss.
 13. Motor controller fault.
 14. Extended compressor surge.
 15. Excessive air-leakage detection for chillers using R-123 refrigerant.

- G. Trending: Capability to trend analog data of up to five parameters simultaneously over an adjustable period and frequency of polling.
- H. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.
- I. Control Authority: At least four conditions: Off, local manual control at chiller, local automatic control at chiller, and automatic control through a remote source.
- J. Communication Port: RS-232 port, USB 2.0 port, or equivalent connection capable of connecting a printer and a notebook computer.
- K. Retain paragraph below if chiller controls interface with the BAS. Coordinate with Section 230900 "Instrumentation and Control for HVAC."
- L. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display chiller status and alarms.
 - 1. Provide the chiller with a BAS communication interface coordinated with the building automation system. The appropriate modular plug-ins is to be provided to enable the unit controller to communicate using standardized protocols, either LONTALK, Modbus or BACnet without a separate gateway.
 - 2. The Factory mounted DDC controller(s) shall support operation on a BACnet®, Modbus® or LONMARKS® network via one of the data link / physical layers listed below as specified by the successful Building Automation System (BAS) supplier.
 - a. BACnet MS/TP master (Clause 9)
 - b. BACnet IP, (Annex J)
 - c. BACnet ISO 8802-3, (Ethernet)
 - d. LONMARKS FTT-10A. The unit controller shall be LONMARKS® certified.
 - 3. The information communicated between the BAS and the factory mounted unit controllers shall include the reading and writing of data to allow unit monitoring, control and alarm notification as specified in the unit sequence of operation and the unit points list.
 - 4. For chillers communicating over a LONMARKS network, the corresponding LONMARKS external Interface File (XIF) shall be provided with the chiller submittal data.
 - 5. ASHRAE 135 (BACnet)] Industry-accepted, open-protocol communication interface with the BAS shall enable the BAS operator to remotely control and monitor the chiller from an operator workstation. Control features and monitoring points displayed locally at chiller control panel shall be available through the BAS.
 - a. All communication from the chiller unit controller as specified in the points list shall be via standard BACnet objects. Proprietary BACnet objects shall not be allowed. BACnet communications shall conform to the BACnet protocol (ANSI/ASHRAE135-2020). A BACnet Protocol Implementation Conformance Statement (PICS) shall be provided along with the unit submittal.

2.13 FINISH

- A. Paint chiller, using manufacturer's standard procedures, except comply with the following minimum requirements:
 - 1. Provide at least two coats of alkyd-modified, vinyl enamel finish with a total dry film thickness of at least 4 mils (0.10 mm).

2. Paint surfaces that are to be insulated before applying the insulation.
3. Paint installed insulation to match adjacent uninsulated surfaces.

- B. Provide Owner with quart container of paint used in application of topcoat to use in touchup applications after Project Closeout.

2.14 ACCESSORIES

A. Flow Switches:

1. Chiller manufacturer shall furnish a switch for evaporator and condenser and verify field-mounting location before installation.
2. Pressure Differential Switches:
 - a. Construction: Wetted parts of body and trim constructed of Type 316 stainless steel.
 - b. Performance: Switch shall withstand, without damage, the full-pressure rating of the heat exchanger applied to either port and exhibit zero set-point shift due to variation in working pressure.
 - c. Set Point: Screw type, field adjustable.
 - d. Electrical Connections: Internally mounted screw-type terminal blocks.
 - e. Switch Enclosure: NEMA 250, Type 4
 - f. Switch Action: Double-pole, double-throw switch with one pole field wired to the chiller control panel and the other pole field wired to the BAS.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Before water chiller installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, piping, and electrical to verify actual locations, sizes, and other conditions affecting water chiller performance, maintenance, and operations.
 1. Final water chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 WATER CHILLER INSTALLATION

- A. See Section 230548 Vibration Isolation for required vibration isolation requirements.
- B. Where Section 230548 calls for chillers to be mounted to a concrete base coordinate with concrete materials and installation requirements as specified in Division 3.
 1. Concrete Bases: Anchor chiller mounting frame to concrete base.
 - a. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 - b. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

- c. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - d. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - e. Cast-in-place concrete materials and placement requirements are specified in Division 3.
- C. Maintain manufacturer's recommended clearances for service and maintenance.
 - D. Charge water chiller with refrigerant if not factory charged.
 - E. Buffer Tank Provision: If chilled water system total volume is less than 6 gallons per ton of capacity (10 gallons for low temperature/ice storage systems) or less than a 3 minute total system changeover flow, install a buffer tank sized as needed to achieve the minimum total system water volume. See Section 232113: Hydronic Piping, Valves and Specialties for tank specification.
 - F. Install separate devices furnished by manufacturer.

3.03 CONNECTIONS

- A. Chilled and condenser-water piping installation requirements are specified in Section 232113 HVAC Piping, Valves and Specialties. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to water chillers to allow service and maintenance.
- C. Evaporator Connections: refer to piping diagrams for required valves and fittings.
- D. Condenser Connections: refer to piping diagrams for required valves and fittings
- E. Install shutoff valves at chilled-water and condenser-water inlet and outlet connections.
- F. Refrigerant Pressure Relief Valve Connections: Extend vent piping to the outside without valves or restrictions.
- G. Ground water chillers according to Division 26 "Grounding and Bonding."
- H. Connect wiring according to Division 26 "Conductors and Cables."
- I. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assemblies, installations, and connections.
- C. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
 - 1. Verify that refrigerant charge is sufficient and water chiller has been leak tested.
 - 2. Verify that pumps are installed and functional.

3. Verify that thermometers and gages are installed.
 4. Operate water chiller for run-in period according to manufacturer's written instructions.
 5. Check bearing lubrication and oil levels.
 6. Verify that refrigerant pressure relief is vented outside.
 7. Verify proper motor rotation.
 8. Verify static deflection of vibration isolators, including deflection during water chiller startup and shutdown.
 9. Verify and record performance of chilled- and condenser-water flow and low-temperature interlocks.
 10. Verify and record performance of water chiller protection devices.
 11. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.
 12. Prepare a written startup report that records results of tests and inspections.
- D. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose.

3.05 CHILLER FAULT CODES AND ALARMS

- A. The chiller manufacturer shall provide a listing of all chiller operational codes, alarms, and fault codes sorted into three categories for use by the BAS system and building operator prior to controls programming, start-up, and Commissioning. The categories shall be as follows:
1. Yellow: for information only. (No action needed by building operator).
 2. Orange: fault codes and alarms with automatic reset. (For information and BAS system logging only. No action required by building operator)
 3. Red: fault codes and alarms with manual reset needed. (Action required by building operator.)
 4. The intent of this requirement is to assist the BAS controls programmer and Building operator minimize nuisance alarms and prioritize the chiller diagnostic information in a usable fashion

3.06 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain water chillers. Refer to Division 1 Section "Demonstration and Training".

END OF SECTION

SECTION 23 64 27

WATER TO WATER HEAT PUMP/CHILLER

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Screw chillers
 - 2. Charge of refrigerant and oil.
 - 3. Controls and control connections.
 - 4. Chilled water connections.
 - 5. Starters.
 - 6. Electrical power connections.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230593: Testing, Adjusting and Balancing
- C. Section 230716: Equipment Insulation
- D. Section 230900: Building Automation System (BAS) Controls
- E. Section 233113: Air Distribution
- F. Section 232123: Pumps and Hydronic Specialties
- G. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide chiller units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide chiller units conforming to the requirements of the latest addition of the following:

1. American National Standards Institute (ANSI):
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 207 - Refrigerant-Containing Components and Accessories, Nonelectrical
 - d. 303 - Refrigeration and Air Conditioning Condensing and Compressor Units
 - e. 465 - Central Cooling Air Conditioners
 - f. 900 - Test Performance of Air Filter Units
2. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 210 - Unitary Air Conditioning Equipment
 - b. 270 - Sound Rating of Outdoor Unitary Equipment
 - c. 550/590 - Centrifugal or Rotary Screw Water-Chilling Packages
 - 1) Submit certified data for performance at 25, 50, 75 and 100 percent of full load capacity.
3. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 15 - Safety Code for Mechanical Refrigeration
4. American Society of Mechanical Engineers (ASME): Boiler and Pressure Vessel Code
 - a. Section VIII D1 - Rules for Construction of Pressure Vessels including Addendums
 - b. Section VIII D2 - Rules for Construction of Pressure Vessels including Addendums
 - c. Section IX - Qualification Standard for Welding and Brazing Procedures, Welders, Brazers, and Welding and Brazing Operators including Addendums
5. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
6. National Fire Protection Association (NFPA): Provide unit insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code (NEC)
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
7. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL. Chillers shall be constructed in accordance with UL-465 "Central Cooling Air Conditioners". Listing by Electrical Testing Laboratories (ETL) with an ETL label may also be acceptable.

1.05 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 1. The proposed substitution does not affect dimensions shown on drawings.
 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.

4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.06 SUBMITTALS

- A. **Product Data:** Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.
- B. **Shop Drawings:** Submit manufacturer's shop drawings indicating dimensions, weight loading, required clearances, methods of assembly of components, and location and size of each field connection.
- C. **Maintenance Data:** Submit maintenance instructions, including instructions for lubrication, tube replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.
- D. **Wiring Diagrams:** Submit manufacturer's electrical requirements for power wiring. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Differentiate between factory-installed and field-installed wiring.
- E. **Commissioning Test Plan:** Submit test plan for chillers. Plan shall include test schedules, and names and titles of the test personnel who will be participating in the commissioning tests. The test personnel must be employees of the chiller manufacturer or the manufacturer's designated representatives. Plan shall include false loading of chillers, if the anticipated building loads at the time of test do not meet capacity requirements. Submittals shall have detailed layout for temporary equipment, if such equipment is needed, even if it is not specified or shown on the Drawings.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.
- C. **Rigging:** Comply with the manufacturer's rigging and installation instructions.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.
- C. Provide with five (5) year warranty on compressors.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Climatemaster, Mammoth, Florida Heat Pump.

2.02 GENERAL:

- A. Furnish and install Water Source Heat Pumps, as indicated on the plans. Equipment shall be completely assembled, piped and internally wired. Capacities and characteristics as listed in the schedule and the specifications that follow.
- B. Water-to-Water Heat Pumps:
 - 1. Units shall be supplied completely factory built for an entering source water temperature range from 20° to 110°F (-6.7° to 43.3°C) and entering (heating) load water temperature range from 60° to 120°F (15.6° to 48.9°C) or entering (cooling) load water temperature range of 50° to 90°F (10.0° to 32.2°C) as standard. Equivalent units from other manufacturers can be proposed provided approval to bid is given 10 days prior to bid closing. All equipment listed in this section must be rated and certified in accordance with American Refrigeration Institute / International Standards Organization (ARI / ISO) and Canadian Standards Association (CSA-US). The units shall have ARI / ISO and CSA-US labels. All units shall be fully quality tested by factory run testing under normal operating conditions and water flow rates as described herein perform detailed heating and cooling mode tests, and quality cross check all operational and test conditions to pass/fail data base. Detailed report card will ship with each unit displaying all test performance data. Note: If unit fails on any cross check, system shall not be allowed unit to ship. Serial numbers will be recorded by factory and furnished to contractor on report card for ease of unit warranty status. Units tested without water flow are not acceptable
 - 2. Basic Construction:
 - a. All units must have a minimum of three access panels for serviceability of compressor compartment. Units having only one access panel to compressor shall not be acceptable.
 - b. The heat pumps shall be fabricated from heavy gauge G90 galvanized steel with powder coat paint finish. Both sides of the steel shall be painted for added protection. All interior surfaces shall be lined with ½ inch (12.7mm) thick, dual density, 1-3/4 lb/ft³ (28 kg/m³) acoustic type glass fiber insulation. Insulation placement shall be designed in a manner that will eliminate any exposed edges.
 - c. Standard cabinet panel insulation must meet NFPA 90A requirements, air erosion and mold growth limits of UL-181, stringent fungal resistance test per ASTM-C1071 and ASTM G21, and shall meet zero level bacteria growth per ASTM G22.
 - d. Cabinets shall have separate holes and knockouts for entrance of line voltage and low voltage control wiring. All factory installed wiring passing through factory knockouts and openings shall be protected from sheet metal edges at openings by plastic ferrules. Supply and return water connections shall be copper IPT fittings, and shall be securely mounted flush to the cabinet corner post allowing for connection to a flexible hose without the use of a back-up wrench. Water connections that protrude through the cabinet or require the use of a backup wrench shall not be allowed. All water connections and electrical knockouts must be in the compressor compartment corner post as to not interfere with the serviceability of unit. Contractor shall be responsible for any extra costs involved in the installation of units that do not have this feature.

- e. Contractor must ensure that units can be easily removed for servicing and coordinate locations of electrical conduit and lights with the electrical contractor. Unit(s) shall have exterior indicator lights showing, 1) compressor operation (on/off) and 2) unit "fault" status. Contractor shall be responsible for providing control circuitry and indicator lights for units not providing this feature.
3. Refrigerant Circuit:
 - a. Units shall have a sealed refrigerant circuit including a high efficiency scroll compressor designed for heat pump operation, a thermostatic expansion valve for refrigerant metering, a reversing valve, coaxial (tube in tube) refrigerant to water heat exchangers, and safety controls including a high pressure switch, low pressure switch (loss of charge), and low water temperature sensors. Access fittings shall be factory installed on high and low pressure refrigerant lines to facilitate field service. Units shall have 2 independent refrigeration circuits. Activation of any safety device shall prevent compressor operation via a microprocessor lockout circuit.
 - b. Hermetic compressors shall be internally sprung. The compressor(s) shall have a dual level vibration isolation system. The compressor(s) will be mounted on computer selected vibration isolation springs to a large heavy gauge compressor mounting tray plate, which is then isolated from the cabinet base with rubber grommets for maximized vibration attenuation.
 - c. Compressor shall have thermal overload protection. Refrigerant to water heat exchangers shall be of copper inner water tube and steel refrigerant outer tube design, rated to withstand 450 PSIG (3101 kPa) working refrigerant pressure and 450 PSIG (3101 kPa) working water pressure.
 - d. Refrigerant metering shall be accomplished by thermostatic expansion valve only. Expansion valves shall be dual port balanced types with external equalizer for optimum refrigerant metering. Units shall be designed and tested for operating ranges of entering water temperatures from 20° to 110°F (-6.7° to 43.3°C). Reversing valve shall be four-way solenoid activated refrigerant valve, which shall default to heating mode should the solenoid fail to function.
 4. Electrical:
 - a. A control box shall be located within the unit compressor compartment and shall contain a 50VA transformer, 24 volt activated, 2 or 3 pole compressor contactor, terminal block for thermostat wiring and solid-state controller for complete unit operation. Reversing valve wiring shall be routed through this electronic controller. Units shall be name-plated for use with time delay fuses or HACR circuit breakers. Unit controls shall be 24 Volt and provide heating or cooling as required by the remote aquastat / sensor. Two compressor units shall have a solid-state time delay relay and random start to prevent both compressors from starting simultaneously.
 5. Solid State Control System (CXM):
 - a. Units shall have a solid-state control system. Units utilizing electro-mechanical control shall not be acceptable. The control system microprocessor board shall be specifically designed to protect against building electrical system noise contamination, EMI, and RFI interference. The control system shall interface with a heat pump type thermostat. The control system shall have the following features:
 - 1) Anti-short cycle time delay on compressor operation.
 - 2) Random start on power up mode.
 - 3) Low voltage protection.
 - 4) High voltage protection.
 - 5) Unit shutdown on high or low refrigerant pressures.

- 6) Unit shutdown on low water temperature.
 - 7) Option to reset unit at thermostat or disconnect.
 - 8) Automatic intelligent reset. Unit shall automatically reset the unit 5 minutes after trip if the fault has cleared. If a fault occurs 3 times sequentially without thermostat meeting temperature, then lockout requiring manual reset will occur.
 - 9) Ability to defeat time delays for servicing.
 - 10) Light emitting diode (LED) on circuit board to indicate high pressure, low pressure, low voltage, high voltage, freeze protection, condensate overflow, and control voltage status.
 - 11) The low-pressure switch shall not be monitored for the first 120 seconds after a compressor start command to prevent nuisance safety trips.
 - 12) 24V output to cycle a motorized water valve or other device with compressor contactor.
 - 13) Unit Performance Sentinel (UPS). The UPS warns when the heat pump is running inefficiently.
 - 14) Source water coil low temperature sensing (selectable for water or anti-freeze).
 - 15) Load water coil low temperature sensing.
6. Protocol interface board. Available protocols are BACnet MS/TP, Modbus, or Johnson Controls N2. The choice of protocol shall be field selectable/changeable via the use of a simple selector switch. Protocol selection shall not require any additional programming or special external hardware or software tools. This will permit all units to be daisy chain connected by a 2-wire twisted pair shielded cable. The following points must be available at a central or remote computer location:
- a. Source leaving water temperature
 - b. Load leaving water temperature
 - c. Command of space temperature setpoint
 - d. Cooling status
 - e. Heating status
 - f. Low temperature sensor alarm
 - g. Low pressure sensor alarm
 - h. High pressure switch alarm
 - i. Hi/low voltage alarm
 - j. Unoccupied / occupied command
 - k. Cooling command
 - l. Heating command
 - m. Fault reset command
 - n. Itemized fault code revealing reason for specific shutdown fault (any one of 7) This option also provides the upgraded 75VA control transformer with load side short circuit and overload protection via a built in circuit breaker.
- C. Warranty: The manufacturer shall warranty equipment for a period of 12 months from start up or 18 months from shipping (whichever occurs first).

PART 3 EXECUTION

3.01 INSTALLATION

- A. All equipment, unless otherwise shown or noted, is to be installed in accordance with industry standards and manufacturer's recommended installation instructions.
- B. Align chiller package on concrete foundations.
- C. Install unit on vibration isolators.
- D. Connect to chilled and condenser water piping.
- E. Arrange piping for easy dismantling to permit tube cleaning and removal of tubes.
- F. Provide an approved self contained breathing apparatus located convenient to the equipment room for emergency use.
- G. Route pressure relief pipes to the outside per the Mechanical Code.
- H. All control wiring necessary to interface starter and chiller control panel is the responsibility of this contractor.
- I. Division 26 is responsible for main chiller power brought to starter and starter to motor power. All other power wiring necessary to operate equipment provided with and necessary to the operation of the chiller shall be provided by this contractor. This includes wiring for oil pumps, purge units or other ancillary chiller equipment.
- J. Provide a lighted pilot emergency shutdown switch and wiring located with 10 feet on the exterior of the entry to shut down the chiller and initiate refrigeration exhaust fan (REF) operation.
- K. Insulate water box.

3.02 SEISMIC REQUIREMENTS

- A. All HVAC equipment and machinery shall be anchored to withstand forces generated by earthquake motions. As a minimum, equipment and equipment frames shall be designed to withstand a force of 100% of the weight of the equipment and frame acting at its center of gravity. Anchorage of the equipment and/or frame to the structure shall be for a force of 100% gravity also acting at the center of gravity.
- B. Piping and ductwork connecting to equipment shall be seismically braced per SMACNA "Seismic Restraint Manual: Guidelines for Mechanical Systems".
- C. The seismic calculations shall be the responsibility of contractor.

3.03 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify chiller mounting, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the jobsite.

END OF SECTION

SECTION 23 65 00

COOLING TOWERS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Cooling towers.
 - 2. Fluid coolers.
 - 3. Controls and control connections.
 - 4. Condenser water connections.
 - 5. Makeup water and drainage connections.
 - 6. Automatic chemical control system.
 - 7. Starters and variable frequency drives
 - 8. Electrical power connections.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods.
- B. Section 230593: Testing, Adjusting and Balancing.
- C. Section 230900: Building Automation System (BAS) Controls.
- D. Section 232113: Hydronic Piping, Valves and Specialties.
- E. Section 232123: Hydronic Pumps.
- F. Section 232500: HVAC Water Treatment.
- G. Section 232501: Non-Chemical HVAC Water Treatment.
- H. Section 232535: Open Condenser Loop Soft Water Treatment.
- I. Section 232613: Water Filtration for Open-Loop Hydronic Systems.
- J. Division 26: Electrical.

1.04 QUALITY ASSURANCE

- A. **Manufacturer's Qualifications:** Provide systems that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. **Structural Performance:** Tower and tower support structure shall withstand the effects of locally defined gravity loads, seismic loads, dead loads, live loads, winds loads and stresses within limits and under conditions indicated according to the Building Code and ASCE 7. Coordinate support structure requirements with Structural Engineer.
- C. **Codes and Standards-**Provide components conforming to the requirements of the latest addition of the following:
 - 1. **Factory Mutual Approval (where required by Owner or AHJ):** The tower shall be listed in the current FM Approval Guide and conform to the FM Approval Standard for Cooling Towers, Class Number 4930 that is approved for use without sprinkler systems. The tower shall have successfully passed full scale fire testing, static and cyclic wind pressure testing, large missile impact testing and structural design evaluation as administered by FM Approvals.
 - 2. **American National Standards Institute (ANSI):**
 - a. A58.1: Minimum Design Loads for Buildings and Other Structures.
 - 3. **Cooling Tower Institute (CTI):**
 - a. ATC-105: Standard Specifications for Thermal Testing of Wet/Dry Cooling Towers.
 - b. ATC-128: Code for Measurement of Sound from Water Cooling Towers.
 - c. ATC-140: Isokinetic Drift Measurement Test Code for Water Cooling Towers.
 - d. STD-111: Standard Specifications Gear Speed Reducers for Application on Water-Cooling Towers.
 - e. STD-131: Fiberglass-Reinforced Plastic Panels.
 - f. STD-201: Standard for Thermal Performance Certification of Evaporative Heat Rejection Equipment.
 - g. STD-201RS: Standard for Certification of Water Cooling Tower Thermal Performance.
 - h. WTG-142: Treatment of Galvanized Cooling Tower to Prevent White Rust.
 - i. ESG-151: Variable Frequency Drive Application Guidelines for Cooling Towers.
 - 4. **National Electrical Manufacturers Association (NEMA):** Provide electrical components which comply with NEMA Standards.
 - 5. **National Fire Protection Association (NFPA):**
 - a. 70: National electrical Code.
 - 6. **Occupational Safety and health Administration (OSHA):** Construct stairways and ladders in conformance with OSHA requirements.
 - 7. **Underwriters Laboratories (UL):** Provide electrical components which comply with UL Standards.
 - 8. **Energy Compliance:** Equipment shall meet and/or exceed the minimum requirements of ASHRAE 90.1 Energy Standards for Buildings or local State Energy Code, as applicable.
- D. **Certification:** Submit certification of tower conformance to CTI design and testing standards, CTI Certification Standard STD-201.

- E. Design and certify towers for a wind load of 30 pounds per square foot.
- F. Drift Eliminators: Achieve drift reduction to 0.002 percent (maximum) of the recirculated water volume for counter-flow towers and to 0.005 percent (maximum) for cross-flow towers.

1.05 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 - 1. The proposed substitution does not affect dimensions shown on drawings.
 - 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 - 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 - 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for units showing dimensions, weights (shipping, installed, and operating), capacities, ratings, performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, and installation instructions. Include the following:
 - 1. Maximum flow rate.
 - 2. Minimum flow rate.
 - 3. Drift loss as percent of design flow rate.
 - 4. Sound power levels in eight octave bands for operation with fans off, fans at minimum, and design speed.
 - 5. Performance curves for the following:
 - a. Varying entering-water temperatures from design to minimum.
 - b. Varying ambient wet-bulb temperatures from design to minimum.
 - c. Varying water flow rates from design to minimum.
 - d. Varying fan operation (off, minimum, and design speed).
 - 6. Fan airflow, brake horsepower, and drive losses
 - 7. Motor amperage, efficiency, and power factor at 100, 75, 50, and 25 percent of nameplate horsepower.
 - 8. Electrical power requirements for each cooling tower component requiring power.
- B. Shop Drawings: Submit manufacturer's shop drawings of assemblies, control panels, sections and elevations, unit isolation, valves, alarms, methods of assembly of components, and location and size of each field connection. Include the following:

- a Assembled unit dimensions.
 - b Weight (shipping and operating) and load distribution
 - c Required clearances for maintenance and operation.
 - d Sizes and locations of piping and wiring connections.
 - e Wiring Diagrams: For power, signal, and control wiring.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.
 - D. Wiring Diagrams: Submit manufacturer's ladder-type wiring diagrams for power and control wiring required. Differentiate between factory-installed and field-installed wiring.
 - E. Seismic Qualification Certificates: For cooling towers, accessories, and components, from manufacturers.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.
- C. Rigging: Comply with the manufacturer's rigging and installation instructions.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.
- C. Motor/Drive System: Provide five (5) year comprehensive warranty against basin leaks, materials and workmanship including motor, fan, bearings, mechanical support, sheaves, bushing and belts.

PART 2 PRODUCTS

2.01 INDUCED-DRAFT, COUNTERFLOW COOLING TOWERS

- A. Description: Induced-draft, counterflow cooling tower that is factory fabricated and assembled. Refer to equipment schedule on drawings for additional requirements.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Evapco, Inc., #AT and #UT Series
 2. Baltimore Aircoil Co., #PT2 Series
 3. Marley Cooling Tower Co.
- C. Casing: Structural steel frame constructed of heavy-gage steel angles and channels. Casing panels shall be constructed of the following:
1. Galvanized steel complying with ASTM A653/A653M, G235 (Z600) coating designation, or,
 2. 304 Stainless Steel, or,
 3. 316 Stainless Steel, or,
 4. Fiberglass-reinforced polyester with UV inhibitors, or,
 5. Galvanized steel panels protected with a thermosetting hybrid polymer or epoxy.
- D. Casing features:
1. Panels: Shall totally encase the fill media to protect the fill from damage due to direct atmospheric contact.
 2. Fasteners: Corrosion resistance equal to or better than the materials being fastened.
 3. Joints: Sealed watertight.
 4. Welded Connections: Continuous and watertight.
 5. Rigging Supports: For handling cooling towers at construction site.
 6. Access Doors: Access doors shall be provided and located throughout the tower, to allow easy access and maintenance to the bottom pan section, motor, and media. Access doors shall provide a watertight seal.
- E. Basin:
1. Makeup water connection.
 2. Overflow connection.
 3. Sloped basin to low drain connection in sump. Outlet connection shall be beveled for welding, grooved for mechanical coupling or bolt hole circle for flat face flange.
 4. Removable strainer with openings smaller than nozzle orifices.
 5. Removable anti-vortexing device to prevent air entrainment
 6. Collection Basin: 304 or 316 Stainless steel panels and structural members.
- F. Fan:
1. Axial propeller, individually adjustable wide chord blade extruded aluminum installed in a closely fitter cowl with venture air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
 2. Axial propeller, one piece heavy duty FRP hub and blade construction. Galvanized steel closely fitter fan cowl with venture air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.

- G. Water Distribution System: Main header and lateral branch piping designed for even distribution over fill throughout the flow range without the need for balancing valves and for connecting individual, non-clogging spray nozzles.
1. Pipe Material: Schedule 40 PVC or stainless steel.
 2. Nozzles: Removable plastic, brass, or ceramic nozzles. Confirm pressure-drop information.
- H. Fill material:
1. Fill Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84; and fabricated, formed, and installed by manufacturer to ensure that water breaks up into droplets.
- I. Drift Eliminator: Reduced allowed maximum drift rate of 0.001% of circulated water volume.
1. Drift-Eliminator Material: PVC; resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84.
- J. Louver material: Frames shall be constructed of G-235 galvanized steel or Type 316 stainless steel with easy removal of screens. Louvers shall be "sight tight" to completely block direct sunlight from entering and water from splashing out of the tower
1. Louver Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84 mounted in removable (galvanized or stainless frames or the same material as the basin).
- K. Makeup Water Control: (Note to Editor: Select one of the water level control options below based on project requirements. Mechanical float is typical, simple and acceptable.)
1. Mechanical Water-Level Control: Manufacturer's standard brass mechanical makeup water valve, and plastic or bronze float with an adjustable linkage, or
 2. Electronic Water-Level Control: Electric float switch; characteristics coordinated with solenoid-operated, makeup water valve.

2.02 INDUCED-DRAFT, CROSS-FLOW COOLING TOWERS

- A. Description: Induced-draft, cross-flow cooling tower that is factory fabricated and assembled.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Baltimore Aircoil Co., #1500 and #3000 Series
 2. Marley Cooling Tower Co.
- C. Casing: Structural steel frame constructed of heavy-gage steel angles and channels. Casing panels shall be constructed of the following:
1. Galvanized steel complying with ASTM A653/A653M, G235 (Z600) coating designation, or,
 2. 304 Stainless Steel, or
 3. 316 Stainless Steel, or,
 4. Fiberglass-reinforced polyester with UV inhibitors, or,
 5. Galvanized steel panels protected with a thermosetting hybrid polymer or epoxy.
- D. Casing features:

1. Panels: Shall totally encase the fill media to protect the fill from damage due to direct atmospheric contact.
 2. Fasteners: Corrosion resistance equal to or better than the materials being fastened.
 3. Joints: Sealed watertight.
 4. Welded Connections: Continuous and watertight.
 5. Rigging Supports: For handling cooling towers at construction site.
 6. Access Doors: Access doors shall be provided and located throughout the tower, to allow easy access and maintenance to the bottom pan section, motor, and media. Access doors shall provide a watertight seal.
- E. Basin:
1. Makeup water connection.
 2. Overflow connection.
 3. Sloped basin to low drain connection in sump. Outlet connection shall be beveled for welding, grooved for mechanical coupling or bolt hole circle for flat face flange.
 4. Removable strainer with openings smaller than nozzle orifices.
 5. Removable anti-vortexing device to prevent air entrainment
 6. Collection Basin: 304 or 316 Stainless steel panels and structural members.
- F. Fan:
1. Axial propeller, individually adjustable wide chord blade extruded aluminum installed in a closely fitted cowl with venturi air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
 2. Axial propeller, one piece heavy duty FRP hub and blade construction. Galvanized steel closely fitted fan cowl with venturi air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
- G. Water Distribution System: Main header and lateral branch piping designed for even distribution over fill throughout the flow range without the need for balancing valves and for connecting individual, non-clogging spray nozzles.
1. Pipe Material: Schedule 40 PVC or stainless steel.
 2. Nozzles: Removable plastic, brass, or ceramic nozzles. Confirm pressure-drop information.
- H. Fill material:
1. Fill Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84; and fabricated, formed, and installed by manufacturer to ensure that water breaks up into droplets.
- I. Drift Eliminator: Reduced allowed maximum drift rate of 0.001% of circulated water volume.
1. Drift-Eliminator Material: PVC; resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84.
- J. Louver material: Frames shall be constructed of G-235 galvanized steel or Type 316 stainless steel with easy removal of screens. Louvers shall be "sight tight" to completely block direct sunlight from entering and water from splashing out of the tower.

1. Louver Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84 mounted in removable (galvanized or stainless frames or the same material as the basin).

K. Makeup Water Control:

1. Mechanical Water-Level Control: Manufacturer's standard brass mechanical makeup water valve, and plastic or bronze float with an adjustable linkage, or
2. Electronic Water-Level Control: Electric float switch; characteristics coordinated with solenoid-operated, makeup water valve.

2.03 FORCED-DRAFT, CROSS-FLOW COOLING TOWERS

A. Description: Forced-draft, cross-flow cooling tower that is factory fabricated and assembled.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Baltimore Aircoil Co., #FXT Series
2. Marley Cooling Tower Co.

C. Casing: Structural steel frame constructed of heavy-gage steel angles and channels. Casing panels shall be constructed of the following:

1. Galvanized steel complying with ASTM A653/A653M, G235 (Z600) coating designation, or,
2. 304 Stainless Steel, or,
3. 316 Stainless Steel, or,
4. Fiberglass-reinforced polyester with UV inhibitors, or,
5. Galvanized steel panels protected with a thermosetting hybrid polymer or epoxy.

D. Casing features:

1. Panels: Shall totally encase the fill media to protect the fill from damage due to direct atmospheric contact.
2. Fasteners: Corrosion resistance equal to or better than the materials being fastened.
3. Joints: Sealed watertight.
4. Welded Connections: Continuous and watertight.
5. Rigging Supports: For handling cooling towers at construction site.
6. Access Doors: Access doors shall be provided and located throughout the tower, to allow easy access and maintenance to the bottom pan section, motor, and media. Access doors shall provide a watertight seal.

E. Basin:

1. Makeup water connection.
2. Overflow connection.
3. Sloped basin to low drain connection in sump. Outlet connection shall be beveled for welding, grooved for mechanical coupling or bolt hole circle for flat face flange.
4. Removable strainer with openings smaller than nozzle orifices.
5. Removable anti-vortexing device to prevent air entrainment

6. Collection Basin: 304 or 316 Stainless steel panels and structural members.
- F. Fan:
1. Axial propeller, individually adjustable wide chord blade extruded aluminum. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
 2. Axial propeller, one piece heavy duty FRP hub and blade construction. Galvanized steel closely fitter fan cowl with venture air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
- G. Water Distribution System: Main header and lateral branch piping designed for even distribution over fill throughout the flow range without the need for balancing valves and for connecting individual, non-clogging spray nozzles.
1. Pipe Material: Schedule 40 PVC or stainless steel.
 2. Nozzles: Removable plastic, brass, or ceramic nozzles. Confirm pressure-drop information.
- H. Fill material:
1. Fill Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84; and fabricated, formed, and installed by manufacturer to ensure that water breaks up into droplets.
- I. Drift Eliminator: Reduced allowed maximum drift rate of 0.001% of circulated water volume.
1. Drift-Eliminator Material: PVC; resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84.
- J. Louver material: Frames shall be constructed of G-235 galvanized steel or Type 316 stainless steel with easy removal of screens. Louvers shall be "sight tight" to completely block direct sunlight from entering and water from splashing out of the tower.
1. Louver Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84 mounted in removable (galvanized or stainless frames or the same material as the basin).
- K. Makeup Water Control:
1. Mechanical Water-Level Control: Manufacturer's standard brass mechanical makeup water valve, and plastic or bronze float with an adjustable linkage, or
 2. Electronic Water-Level Control: Electric float switch; characteristics coordinated with solenoid-operated, makeup water valve.

2.04 FORCED-DRAFT, COUNTERFLOW COOLING TOWERS

- A. Description: Forced-draft, counterflow cooling tower that is factory fabricated and assembled.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Baltimore Aircoil Co., #VT0 or #VT1 Series
 2. Evapco Inc., #LSTE or #LPY Series
 3. Marley
- C. Casing: Structural steel frame constructed of heavy-gage steel angles and channels. Casing panels shall be constructed of the following:

1. Galvanized steel complying with ASTM A653/A653M, G235 (Z600) coating designation, or,
 2. 304 or 316 Stainless Steel, or,
 3. Fiberglass-reinforced polyester with UV inhibitors, or,
 4. Galvanized steel panels protected with a thermosetting hybrid polymer or epoxy.
- D. Casing features:
1. Panels: Shall totally encase the fill media to protect the fill from damage due to direct atmospheric contact.
 2. Fasteners: Corrosion resistance equal to or better than the materials being fastened.
 3. Joints: Sealed watertight.
 4. Welded Connections: Continuous and watertight.
 5. Rigging Supports: For handling cooling towers at construction site.
 6. Access Doors: Access doors shall be provided and located throughout the tower, to allow easy access and maintenance to the bottom pan section, motor, and media. Access doors shall provide a watertight seal.
- E. Basin:
1. Makeup water connection.
 2. Overflow connection.
 3. Sloped basin to low drain connection in sump. Outlet connection shall be beveled for welding, grooved for mechanical coupling or bolt hole circle for flat face flange.
 4. Removable strainer with openings smaller than nozzle orifices.
 5. Removable anti-vortexing device to prevent air entrainment
 6. Collection Basin: 304 or 316 Stainless steel panels and structural members.
- F. Fan:
1. Belt-driven, hot-dip galvanized steel, forward-curved centrifugal fan; statically and dynamically balanced.
- G. Water Distribution System: Main header and lateral branch piping designed for even distribution over fill throughout the flow range without the need for balancing valves and for connecting individual, non-clogging spray nozzles.
1. Pipe Material: Schedule 40 PVC or stainless steel.
 2. Nozzles: Removable plastic, brass, or ceramic nozzles. Confirm pressure-drop information.
- H. Fill material:
1. Fill Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84; and fabricated, formed, and installed by manufacturer to ensure that water breaks up into droplets.
- I. Drift Eliminator: Reduced allowed maximum drift rate of 0.001% of circulated water volume.
1. Drift-Eliminator Material: PVC; resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84.

- J. Louver material: Frames shall be constructed of G-235 galvanized steel or Type 316 stainless steel with easy removal of screens. Louvers shall be "sight tight" to completely block direct sunlight from entering and water from splashing out of the tower.
1. Louver Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84 mounted in removable (galvanized or stainless frames or the same material as the basin).
- K. Makeup Water Control:
1. Mechanical Water-Level Control: Manufacturer's standard brass mechanical makeup water valve, and plastic or bronze float with an adjustable linkage, or
 2. Electronic Water-Level Control: Electric float switch; characteristics coordinated with solenoid-operated, makeup water valve.
- L. Inlet Screen Material:
1. Galvanized steel mesh mounted in removable frames, or,
 2. Hot-dip galvanized steel mesh with polymer coating mounted in removable frames, or,
 3. Stainless-steel mesh mounted in removable frames.
- M. Discharge Hood Material:
1. Galvanized steel according to ASTM A653/A653M, G235 (Z600) coating designation, or,
 2. Hot-dip galvanized steel, or,
 3. Stainless steel.

2.05 EVAPORATIVE FLUID COOLER

- A. Description: Evaporative closed circuit fluid cooler that is factory fabricated and assembled.
1. Closed-circuit fluid cooler, induced-draft, vertical counterflow with axial fan at discharge.
 2. Closed-circuit fluid cooler, forced-draft with centrifugal fan in the dry airstream.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Evapco, Inc, #ATW or #ESW Series
 2. Recold
 3. Baltimore Aircoil Co.
- C. Casing: Structural steel frame constructed of heavy-gage steel angles and channels. Casing panels shall be constructed of the following:
1. Galvanized steel complying with ASTM A653/A653M, G235 (Z600) coating designation, or,
 2. 304 or 316 Stainless Steel, or,
 3. Fiberglass-reinforced polyester with UV inhibitors, or,
 4. Galvanized steel panels protected with a thermosetting hybrid polymer or epoxy.
- D. Casing features:
1. Panels: Shall totally encase the fill media to protect the fill from damage due to direct atmospheric contact.

2. Fasteners: Corrosion resistance equal to or better than the materials being fastened.
 3. Joints: Sealed watertight.
 4. Welded Connections: Continuous and watertight.
 5. Rigging Supports: For handling cooling towers at construction site.
 6. Access Doors: Access doors shall be provided and located throughout the tower, to allow easy access and maintenance to both the bottom pan section and the upper coil and spray section. Access doors shall provide a watertight seal.
- E. Basin:
1. Makeup water connection.
 2. Overflow connection.
 3. Sloped basin to low drain connection in sump. Outlet connection shall be beveled for welding, grooved for mechanical coupling or bolt hole circle for flat face flange.
 4. Removable strainer with openings smaller than nozzle orifices.
 5. Collection Basin: 304 or 316 Stainless steel panels and structural members.
- F. Fan:
1. Axial propeller, individually adjustable wide chord blade extruded aluminum installed in a closely fitted cowl with venturi air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
 2. Axial propeller, one piece heavy duty FRP hub and blade construction. Galvanized steel closely fitted fan cowl with venturi air inlet. Fan guard shall be heavy gauge hot dip galvanized steel or 304 stainless steel.
- G. Water Distribution System: Main header and lateral branch piping designed for even distribution over fill throughout the flow range without the need for balancing valves and for connecting individual, non-clogging spray nozzles.
1. Pipe Material: Schedule 40 PVC or stainless steel.
 2. Nozzles: Removable plastic, brass, or ceramic nozzles. Confirm pressure-drop information.
- H. Fill material:
1. Fill Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84; and fabricated, formed, and installed by manufacturer to ensure that water breaks up into droplets.
- I. Drift Eliminator: Reduced allowed maximum drift rate of 0.001% of circulated water volume.
1. Drift-Eliminator Material: PVC; resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84.
- J. Louver material: Frames shall be constructed of G-235 galvanized steel or Type 316 stainless steel with easy removal of screens. Louvers shall be "sight tight" to completely block direct sunlight from entering and water from splashing out of the tower.
1. Louver Material: PVC or FRP, resistant to rot, decay, and biological attack; with maximum flame-spread rating of five according to ASTM E84 mounted in removable (galvanized or stainless frames or the same material as the basin).
- K. Makeup Water Control:

1. Mechanical Water-Level Control: Manufacturer's standard brass mechanical makeup water valve, and plastic or bronze float with an adjustable linkage, or
 2. Electronic Water-Level Control: Electric float switch; characteristics coordinated with solenoid-operated, makeup water valve.
- L. Heat Transfer Coil:
1. Coil(s) shall be fabricated as a complete assembly. The tubes shall be arranged in a self-spacing, staggered pattern in the direction of airflow for maximum heat transfer efficiency and minimum pressure drop, without the use of additional spacers between the coil tubes. The coil(s) shall be sloped for draining.
 2. Material shall be:
 - a. Prime-coated steel tube and sheet with outer surface of tubes and sheets hot-dip galvanized after fabrication, or,
 - b. Copper tube with stainless-steel sheet, or,
 - c. Stainless-steel tube and sheet.
- M. Circulation Pump: Close-coupled, single-stage, bronze-fitted centrifugal pump; with suction strainer and flow balancing valve, and mechanical seal suitable for outdoor service. Motor shall be TEFC style with epoxy or polyurethane coating.
- N. Control Package: Factory installed and wired, and functionally tested at factory before shipment.
1. NEMA 250 Type 4 enclosure with removable internally mount backplate.
 2. Control-circuit transformer with primary and secondary side fuses.
 3. Terminal blocks with numbered and color-coded wiring to match wiring diagram. Spare wiring terminal block for connection to external controls or equipment.
 4. Microprocessor-based controller for automatic control of fan and spray pump based on cooling tower leaving-water temperature with control features to improve operating efficiency based on outdoor ambient wet-bulb temperature by using adaptive logic.
 5. Fan motor sequencer for multiple-cell and two-speed applications with automatic lead stage rotation.
 6. Provide basin electric/electronic level controller, as option to mechanical makeup.
 7. Electric basin heaters with temperature control and low-water-level safety switch for each cell.
 8. Single-point, field-power connection to a fused disconnect switch for each cell.
 - a. Branch power circuit to each motor and electric basin heater and to controls.
 - b. NEMA-rated motor controller, hand-off-auto switch, and overcurrent protection for each motor. Provide variable frequency controller with manual bypass and line reactors for each variable-speed motor indicated.
 9. Factory-installed wiring outside of enclosures shall be in metal raceway, except make connections to each motor and electric basin heater with liquid tight conduit.
 10. Visual indication of status and alarm for each motor.
 11. Audible alarm and silence switch.
 12. Visual indication of elapsed run time, graduated in hours for each motor.
 13. Cooling tower shall have hardware to enable BAS to remotely monitor and display the following:

- a. Operational status of each motor.
- b. Cooling tower leaving-fluid temperature.
- c. Fan vibration alarm.
- d. Collection basin water-level alarms.

O. Dampers:

1. Closure Dampers: Many times, during unit shutdown with fan and pump off, it is desirable to conserve the amount of heat loss from the process fluid. For those applications, closure dampers are available for this installation at the air discharge of the closed circuit cooler. The damper package is designed to prevent convective air flow through the idle unit thus minimizing the heat loss. Installation of the closure dampers requires all wiring to be completed in the field. Electric actuator is factory mounted. Controls and wiring are to be supplied by others. The damper actuator should be wired into the field control system to allow the dampers to fully open when the fan cycles on and close when the fan cycles off. The actuator requires a 115 volt power supply.

2.06 MOTORS

- A. Refer to Section 230500 Basic HVAC Materials and Methods for general requirements for factory-installed motors.
- B. Motor Construction: NEMA MG 1, general purpose, 1.15 service factor, continuous duty, Design B.
- C. Use motor below for operation in dry, moist or corrosive atmosphere.
 1. Enclosure Type: Totally enclosed, fan cooled (TEFC) inverter ready premium efficiency.
- D. Use motor below when located in cooling-tower discharge airstream.
 1. Enclosure Type: Totally enclosed, air over (TEAO) inverter ready premium efficiency.
- E. Motor speed: inverter ready controlled by variable frequency drive (VFD).
- F. Direct Drive: The fan drive shall be mounted on the motor in a direct drive configuration.
- G. Belt Drive: Power Band Belt designed for 150% of the motor nameplate HP.
 1. Belt: Multi-groove, solid back V-belt type neoprene reinforced with polyester cord.
 2. Sheaves: Aluminum alloy if located inside the airstream.
 3. Bearings: Heavy duty, self-aligning pillow block bearings with lubrication lines extended to side access door. Minimum L10 life for bearings shall be 75,000 hours. Provide extended grease lines and fittings.

2.07 VIBRATION SWITCH

- A. Provide one mechanical vibration switch for each drive to de-energize fan motors if excessive vibration occurs per mechanical code. All electrical wiring and conduit to be provided by Division 26, coordinate accordingly. Manufacturers: Metrix #5550 or #5550G Series.
- B. Cast aluminum enclosure with epoxy coating with the following features:
 1. NEMA 250, Type 4 or 4X, depending on manufacturer mounting location.
 2. Amplitude Range: 0 to 16 g peak with 1 g resolution adjustment setpoints.

3. Frequency Range: 0 – 60 Hz (0 – 3600 rpm).
 4. Manual local reset.
 5. Temperature operating range of -40°F to 158°F.
 6. Voltage and amperage as required by motor requirements.
- C. Mount the vibration switch to be easily accessible for manual resetting.
- D. Cooling tower manufacturer shall recommend switch set point for proper operation and protection. Adjust the switch so that during full speed start-up and under normal conditions the contacts do not trip.

2.08 FLOW METERS

- A. Provide one flow meter to measure the total makeup water quantity to the cooling tower system. Only one meter required to totalize system volume. Individual meters may be installed in makeup water pipe to each cell, if desired, at contractor's option.
- B. Provide one flow meter to measure the total blowdown water quantity from the cooling tower system. Only one meter is required to totalize system volume. Individual meters may be installed in each blowdown pipe from each cell, if desired, at contractor's option. Provide strainer with hose bibb connection on inlet side of meter. Blowdown meter is used for reconciling cycles of concentration and water treatment efficiency.
- C. Bronze body, multi-jet design, with epoxy powder coating. Accuracy +/- 1.5%. Synthetic polymer measuring chambers. Non-wear measurement surfaces. AWWA Standard C-708 compliant. Meter shall be provided with dry contact and 24 volt or 100 mA output signal.
- D. Meter Manufacturer: Carlon Meter #MRS Series, Seametrics #MJ Series

2.09 ELECTRIC WATER LEVEL CONTROLLER AND MAKEUP WATER VALVE

- A. Provide an electric water level controller with five (5) conductivity actuated liquid level probes and normally closed (NC) makeup water solenoid valve. Controller shall be hermetically sealed with an LED status code light when water and/or probes are dirty. All electrical wiring and conduit to be provided by Division 26, coordinate accordingly.
- B. Manufacturer: as provided by cooling tower or equal by Waterline Controls. Mount controller on tower casing as required by manufacturer. Mount near a door or access way for easy adjustment and cleaning.
- C. Features:
1. Enclosure: 2" PVC Schedule 40.
 2. Contact rating: 3 amps, 120 VAC resistive
 3. Temperature rating: -40°F to +150°F ambient
 4. Time delay: 6 seconds +/-
 5. Probes: 1/4" stainless steel
 6. Stilling chamber: 2" PVC pipe.
- D. Controller shall have the following probe levels mounted inside an open PVC stilling chamber:
1. Bottom of stilling chamber shall be mounted within 1" of bottom of basin.

2. Lowest probe #1: Ground. Mounted 1" from bottom of stilling chamber basin.
 3. Second lower probe #2: Low water alarm, connect to BAS
 4. Middle probe #3: Makeup water valve on
 5. Fourth probe #4: Makeup water valve off
 6. Highest probe #5: High water alarm, connect to BAS. Mount 1/2" to 1" below overflow outlet.
- E. Solenoid makeup water valve: Normally closed (NC), 120 VAC slow closing solenoid valve to minimize water hammer. Provide strainer upstream of valve. Connected to controller to open and close based on makeup water probe levels.

2.10 MECHANICAL HIGH WATER LEVEL ALARM AND FLOAT VALVE

- A. Water level control: Brass mechanical makeup water valve and plastic/brass float with an adjustable linkage. Size as required for tower makeup water capacity. Provide integral with cooling tower.
- B. High water level alarm: single level float switch mounted on side of water basin above the overflow water line. Adjust float to close the contact at water level 1/2" (minimum) below overflow outlet invert with signal monitor by building automation system (BAS). Provide watertight sealant at cooling tower penetration.
- C. The high water level switch shall have the following features:
1. 316 Stainless Steel float
 2. 316 Stainless Steel stem
 3. Water slosh shield
 4. Angled support stem with threaded coupling nuts for attachment to side of tower.
 5. 30 VA nominal rating, minimum
 6. 22-gauge lead wires, minimum 24" long
 7. 10 second (adjustable) delay via the BAS
- D. High level water switch manufacturer: Madison #MS5010.

2.11 BASIN HEATERS

- A. Revise ambient conditions as required.
1. Basin-Heater Capacity: Maintain basin water temperature at 40°F (4.4°C) when ambient temperature is 0°F (minus 18°C) and wind velocity is 10 mph (16 km/h).
- B. Select heater type from below.
1. Heater Type: Electric immersion heaters with thermostat and low-water cutout switch, enclosed in weatherproof housing suitable for field wiring.

2.12 MAINTENANCE ACCESS

- A. Internal Working / Service Platforms: Provide a complete internal working platform and ladder system for service of all motor and drive components.
- B. Handrails/Grabrails: Galvanized steel pipe complying with 29 CFR 1910.23. If access to fan deck is required, supply a perimeter handrail with ladder from grade to fan deck.

- C. Ladders: Aluminum, sloped "ships type" with grabrail or vertical complying with 29 CFR 1910.27.

PART 3 EXECUTION

3.01 INSTALLATION

- A. All equipment, unless otherwise shown or noted on the Drawings, is to be installed in accordance with industry standards and manufacturer's recommended installation instructions. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Mount cooling tower on support structure using required anchor bolts. Isolate tower from support structure using rubber or fiberglass isolation pads. Where cooling towers are mounted on a roof provide housed spring vibration isolators to minimize vibration into the building structure. The cooling tower support and anchorage shall be designed and manufactured to withstand, within allowable material stress ranges, both seismic and wind forces as prescribed by the governing building codes. Seismic forces shall be based on the project specific data and height above ground. Wind pressure loads shall be assumed to be as defined in Section 230548 Vibration Isolation for Piping, Ductwork and Equipment and 230549 Seismic Restraint for Piping, Ductwork and Equipment. The unit's anchorage and foundation shall withstand the design forces. Alternately, the contractor may design the support to carry the forces completely independent of the building structure. The tower support and anchoring design shall be certified as in conformance with these requirements by a structural engineer licensed in the jurisdiction having authority.
- C. Connect to condensing water and makeup water piping. Arrange piping for easy dismantling and maintenance. Connect bypass piping as required for startup. Connect equalizer line for multiple cooling tower cells and provide hose bibb drain valve at low point. Provide shutoff valves, balancing valves, and drain valves. Provide multiple mechanical grooved couplings or braided stainless steel flexible connections as required and as shown on drawings to minimize vibration through piping system.
- D. Coordinate with plumbing service for makeup water piping with strainer, makeup water flow totalizing meter, and reduced pressure principal backflow prevention device to makeup water valve sized for peak flow.
- E. Coordinate with plumbing service for blowdown water flow totalizing meter in drain pipe from cooling tower sumps. Provide manual shutoff valve upstream of meter for future maintenance without draining sump. Provide manual balancing valve, with locking position setting, downstream of shutoff valve to allow for setting blowdown flow rate to a flow rate less than the makeup water flow rate to prevent tower sump from draining faster than filling.
- F. Coordinate with controls system for monitoring high water alarm and other control signals to the building automation system.
- G. Install water treatment system.
- H. Connect to electrical service for fan power, vibration switch and electrical valves as scheduled. Refer to Division 26.
- I. Install basin or side stream water filtration system on support structure adjacent to cooling tower/fluid cooler. Install distribution piping and nozzles throughout basin. Provide distribution and nozzle layout drawings for review and approval prior to installation.

- J. Provide a tempered eyewash adjacent to the chemical treatment system, if installed. If the installation is a non-portable type, provide provisions to prevent scalding should the tempering valve fail.
- K. Adjust the vibration switch trip setting. Cooling tower manufacturer shall recommend switch set point for proper operation and protection. Adjust the switch so that during full speed start-up and under normal conditions the contacts do not trip.
- L. Flush and clean equipment, in accordance with manufacturer's start-up instructions, and in presence of manufacturer's representative. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls.

3.02 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify piping installation, verify control wiring, verify power wiring, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.
- B. Start-up services shall include:
 - 1. Coordinate with controls installers to verify that a 30 second, or greater, time delay is provided for speed changes or for switching between motor operation in multiple fan systems.
 - 2. For systems with variable frequency drives make sure that the minimum speed requirements have been set per the VFD manufacturer.
 - 3. Verify that the condenser water temperature sensor is placed in the proper location to sense the mixed water temperature for fan sequence control and bypass valve operation.
 - 4. Confirm if control programming included fan cycling on a daily basis for 10 minutes, twice a day, as required by manufacturer for local ambient conditions and operational schedule.
 - 5. Verify that water treatment system is installed and operational
 - 6. Verify a water treatment plan has been implemented for passivation of galvanized steel units.
 - a. White rust is a premature failure of the protective zinc layer on hot dip or mill galvanized steel due to improper water treatment control during the start-up of new galvanized equipment.
 - b. Perform local water analysis including water treatment system operation and visual inspections during the first six (6) to twelve (12) weeks of operation. During this passivation period the pH should be maintained between 7 and 8 at all times.
 - c. Changes in water chemistry control may be considered after the passivation process is complete as evidenced by the galvanized surfaces taking on a dull gray color.
 - d. Any changes in the water treatment program or control limits should be made slowly while documenting the impact of changes to the passivated zinc surfaces.

END OF SECTION

SECTION 23 73 12

CUSTOM FACTORY AIR HANDLING UNITS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SUMMARY

- 1. Section Includes:
 - a. Variable-air-volume, single-zone air-handling units.
 - b. Variable-air-volume, dual-duct air-handling units.
 - c. Constant-air-volume, single-zone air-handling units.
 - d. Constant-air-volume, multizone air-handling units.
 - e. Constant-air-volume, dual-duct air-handling units.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00: Basic HVAC Materials and Methods
- B. Section 23 05 93: Testing, Adjusting and Balancing
- C. Section 23 09 02: Variable Frequency Drives (VFD)
- D. Section 23 31 13: Air Distribution
- E. Section 23 41 00: Air Filtration
- F. Division 26: Electrical

1.04 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Design vibration isolation and seismic-restraint details, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- B. Structural Performance: Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of $L/100$, minimum, where "L" is the unsupported span length within completed casings.
- C. Seismic Performance: Air-handling units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.05 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide air handling units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Certifications: Provide certified ratings of units based on tests performed in accordance with ARI 430, "Central-Station Air Handling Units."
- C. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:
 - 1. Air Movement and Control Association (AMCA):
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans [Unit shall bear AMCA Certified Rating Seal]
 - c. 300 - Reverberant Room Method for Sound Testing of Fans [Unit shall bear AMCA Certified Rating Seal]
 - d. 320 - Laboratory Methods of Sound Testing of Fans Using Sound Intensity
 - e. 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - f. 500 - Test Method for Louvers, Dampers, and Shutters
 - 2. American National Standards Institute (ANSI):
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 - Test Performance of Air Filter Units
 - 3. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 410 - Forced-Circulation Air-Cooling and Air-Heating Coils
 - b. 430 - Central-Station Air-Handling Units
 - 4. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 15 - Safety Code for Mechanical Refrigeration
 - 5. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
 - 6. National Fire Protection Association (NFPA): Provide air handling unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
 - 7. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
 - 8. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of air handling units, which have been listed and labeled by UL.
 - 9. Units shall be listed and labeled by either UL or ETL for air handler construction.

1.06 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 - 1. The proposed substitution does not affect dimensions shown on drawings.
 - 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 - 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 - 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.07 ACTION SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for air handling units showing
 - 1. Dimensions and weights
 - 2. Cabinet material, metal thickness, finishes, insulation, and accessories.
 - 3. Fan including:
 - a. Certified fan-performance curves with system operating conditions indicated.
 - b. Certified fan-sound power ratings.
 - c. Fan construction and accessories.
 - d. Motor ratings, electrical characteristics, and motor accessories.
 - e. Fan assembly vibration and balance test report.
 - 4. Certified coil-performance ratings with system operating conditions indicated.
 - 5. Retain both subparagraphs below if items are furnished as parts of air-handling units.
 - 6. Dampers, including housings, linkages, and operators.
 - 7. Filters with performance characteristics.
- B. Shop Drawings: Submit shop drawings showing unit dimensions, weight loadings, required clearances, field connection details and methods of support. Draw to a scale of one half inch to one foot. Include field fabricated mixing boxes, dampers and duct connections.
- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.

1.08 INFORMATIONAL SUBMITTALS

- A. Seismic Qualification Certificates: For air-handling units, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Source quality-control reports.

C. Field quality-control reports.

1.09 ENVIRONMENTAL REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.010 DELIVERY, STORAGE, AND HANDLING

A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.

B. Store and protect unit against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.011 WARRANTY

A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.

B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Energy Labs, Temtrol, Daikin, Trane, Season 4, United Metal Products, Carrier, or Team Air.

B. By listing various manufacturers does imply that their standard construction is approved or that they are equal. All manufacturers must meet, or exceed, minimum requirements of these specifications and all other standard or optional features provided by the scheduled basis of design air handler.

2.02 GENERAL

A. Any exceptions to the specifications must be clearly defined in the submittal process. The contractor shall be responsible for any additional expenses that may occur due to any exception made.

B. Fabricate draw-thru or blow-thru type air handling units suitable for the scheduled air pressure operation as indicated.

C. Fabricate units with the following features: fan sections as noted; coil section(s); heat recovery sections, mixing section; filter section(s); access section(s); discharge plenum; bell mouth duct connections; variable frequency drives; dampers; lights and vestibules. Fabricate unit in split sections for field assembly if necessary.

- D. Vestibule piping requirements: If shown on plans all piping located within the air handler vestibule is to be supported as specified. Mechanical Contractor to coordinate with air handler supplier to insure that all supports are provided and that adequate structural reinforcement is provided within the air handler to accommodate the operational weight of the pipe supported. The Mechanical Contractor is to provide the air handler manufacturer with an approved shop drawing indicating the location and weight of all equipment and the location of all piping and pipe penetrations located in the air handler vestibule prior to the design of the air handler by the manufacturer.
- E. Fans shall be selected for variable volume operation. The scheduled fan arrangement and unit configuration is the basis of selection. Alternate configurations which are equal or smaller in size and weight, energy and acoustic performance will be considered. Include information indicating pertinent differences, either positive or negative, to base design indicated on documents. Unit component face velocity to remain as designed to conserve motor horsepower. The mechanical contractor and supplier shall bear all costs for redesign of mechanical, plumbing, electrical, structural, architectural and controls that may be associated with the revised configuration. Provide analysis of unit power consumption for code compliance.
- F. Factory fabricate and test air handling units of sizes, capacities, and configuration as indicated and specified.
- G. All major components used to assemble air handling units with the exception of electrical devices, drives, bearings and controls shall be manufactured by the air handler manufacturer.
- H. Motors shall be inverter duty NEMA MG-1 premium efficiency TEFC type. All wiring shall be routed to a single external junction box for each fan section.
- I. Filter section shall include space for face load or side access slide-in filters with 2" or 4" pre-filters and 22" bag type final filters with an average efficiency of 85% per ASHRAE Standard 52-76 test.
- J. Provide measurement arrays as described below.

2.03 UNIT CASING

- A. Walls and roofs shall be constructed of 16-gauge, G90 galvanized steel 4" thick panels. The inner wall shall be a minimum of 22-gauge, solid galvanized steel in all sections except fan inlet and fan section which may be perforated metal if the insulation is faced with foil or plastic scrim for future cleaning. The wall panels shall be insulated with 4", 3.0 lbs/cu. ft rigid neoprene coated insulation. All permanently joined flanged panel surfaces shall be sealed with an individual strip of 1/8" x 3/8" tape sealer. Wall seams shall be turned inward to provide a clean flush exterior finish. All panel seams shall be sealed during assembly to produce an airtight unit.
- B. All panels shall be joined using bolts rather than sheet metal screws.
- C. All insulation edges shall be protected with metal lagging. Insulation systems using stickpins or adhesives are not acceptable.
- D. Stiffeners of angle steel shall be supplied as required to maintain casing deflection criteria of 1/200 at 1.5 times the working pressure. If panels cannot meet this deflection, additional internal reinforcing shall be added.

E. Provide duct bellmouth fittings where dimensions allow. Provide walk able grates over all duct floor penetrations, maximum pressure loss not to exceed 0.10-inches WC.

F. Acoustical Performance:

1. The housing shall have been tested for acoustical performance by an independent laboratory that is accredited.
2. Test methods and facilities used to establish sound transmission loss values shall conform explicitly with the ASTM designation E90-85 and E413-73.
 - a. Sound Transmission Loss DB ASTM E-90 & E413-73.

	1	2	3	4	5	6	7	8	
4" Walls	20	20	28	41	51	56	55	57	STC=40

- b. Test methods and facilities used to establish sound absorption values shall conform explicitly with the requirements of the ASTM Standard Test Method for Sound Absorption Coefficients by the Reverberation Method: ASTM C423-84A and E795-83.

	1	2	3	4	5	6	7	8	
4" Walls	.40	.65	1.38	1.28	1.09	1.05	1.02	1.02	NRC=1.20

- d. Submit lab report for approval.

2.04 BASE CONSTRUCTION

A. Units shall be constructed from structural steel C-channel around the perimeter of the unit with intermediate channel, angle or tube supports.

1. Channel bases shall be sized as a function of air handling length as follows:
- 2.

<u>AHU LENGTH</u>	<u>MINIMUM CHANNEL SIZE</u>	
UP to 10	4" x 1-5/8"	(5.4 lbs/Lin.Ft.)
11' to 20'	6" x 2"	(8.2 lbs/Lin.Ft.)
21' to 30'	8" x 2-1/2"	(11.5 lbs/Lin.Ft.)
41' to 50'	12" x 3"	(20.7 lbs/Lin.Ft.)

B. Floor shall be flat, reinforced from below, with all seams continuously welded or floor shall be 0.12" checker plate installed on the base. Drive screw attachment and caulking are not acceptable. The base shall be provided with lifting lugs, a minimum four per unit section. The base shall be insulated tight to the floor with 4", 3.0 lbs/cu. ft fiberglass insulation. The insulation is to be protected with 22-gauge solid galvanized steel liner if the unit floor is exposed in a suspended application. Floors that "oil can" are not acceptable.

C. Floor insulation shall be installed beneath the floor panels in the same manner as the wall and ceiling insulation.

D. Condensate Drain Pans:

1. Fabricated with two percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and from humidifiers and to direct water toward drain connection.
2. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
3. Depth: A minimum of 2 inches (50 mm) deep.
4. Integral part of floor plating
5. Single-wall 16-gauge, 304 stainless-steel sheet.
6. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on pan. Outlet diameter shall meet minimum sizing requirement of applicable mechanical code.
7. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.
8. The manufacturer shall provide a 1.5" perimeter collar around the entire unit and around each floor opening to ensure the unit is internally watertight. The entire base shall act as an auxiliary drain pan and hold up to 1.5" of water.
9. The manufacturer shall provide auxiliary drains in mixing and OSA intake sections.
10. All drain connections on floor mounted air handling units shall terminate at the side of the unit.

E. Maximum base deflection shall be 1/4" on 20-foot unsupported span.

F. Maintenance Rails: Provide overhead lifting rails in sections where motor service will be required.

2.05 INSPECTION AND ACCESS PANELS AND ACCESS DOORS

A. Panel and Door Fabrication: Formed and reinforced, single- or double-wall and insulated panels of same materials and thicknesses as casing.

B. Inspection and Access Panels:

1. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against air-pressure differential.
2. Gasket: Neoprene, applied around entire perimeters of panel frames.
3. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.

C. Access Doors:

1. Hinges: A minimum of two ball-bearing hinges and two roller cam-type latches, operable from inside and outside. Arrange doors to be opened against air-pressure differential.
2. Gasket: Neoprene, applied around entire perimeters of panel frames.
3. Fabricate windows in fan section doors of double-glazed, wire-reinforced safety glass with an air space between panes and sealed with interior and exterior rubber seals.
4. Size: The minimum door clearance shall not be less than 19"x 70" (where unit height permits) and shall be large enough to allow the largest assembled internal component to be removed through the doorway. Internal components must have a door of minimum width to remove the assembled components. Vestibule doors to the exterior shall be 42"x70" (where unit height permits).

D. Locations and Applications:

1. Verify that the sections listed below are large enough for panels and doors. Verify applicability with listed manufacturers.
2. Fan Section: Doors and inspection and access panels.
3. Access Section: Doors.
4. Coil Section: Inspection and access panel.
5. Damper Section: Doors.
6. Filter Section: Doors large enough to allow periodic removal and installation of filters.
7. Mixing Section: Doors.
8. Humidifier Section: Doors.

2.06 FAN, DRIVE, AND MOTOR SECTION

- A. All fans shall be tested in accordance with AMCA Standard 210-70 Test Code for Air Moving Devices. Fans shall bear the AMCA sticker for both air and sound performance.
- B. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.
 1. Shafts: Designed for continuous operation at maximum-rated fan speed and motor horsepower, and with field-adjustable alignment.
 - a. Turned, ground, and polished hot-rolled steel with keyway. Ship with a protective coating of lubricating oil. Hollow shafts are unacceptable.
 - b. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range. The critical speed will be based on the top of the speed range for the fans' AMCA class. The lateral static deflection shall not exceed 0.003" per foot of the length of the shaft.
 2. Fan assembly shall be balanced per ISO standard G6.3 with a copy of the balance test data for this project with deflection and critical speed of the shaft and wheel submitted to the engineer
- C. Centrifugal Fan Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.
 1. Bracing: Steel angle or channel supports for mounting and supporting fan scroll, wheel, motor, and accessories.
 2. Horizontal-Flanged, Split Housing: Bolted construction.
 3. Housing for Supply Fan: Attach housing to fan-section casing with metal-edged flexible duct connector.
 4. Flexible Connector: Factory fabricated with a fabric strip [3-1/2 inches (89 mm)] [5-3/4 inches (146 mm)] wide attached to 2 strips of 2-3/4-inch- (70-mm-) wide, 0.028-inch- (0.7-mm-) thick, galvanized-steel sheet or 0.032-inch- (0.8-mm-) thick aluminum sheets; select metal compatible with casing.
 - a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.
 - 1) Fabric Minimum Weight: 26 oz./sq. yd. (880 g/sq.m).
 - 2) Fabric Tensile Strength: 480 lbf/inch (84 N/mm) in the warp and 360 lbf/inch (63 N/mm) in the filling.
 - 3) Fabric Service Temperature: Minus 40 to plus 200°F (Minus 40 to plus 93°C).
- D. Plenum Fan Housings: Steel frame and panel; fabricated without fan scroll and volute housing.

1. Arrangement #4 direct drive fans or AMCA Arrangement #1 either horizontal or vertical as shown on plans and drawings. There shall be no obstructions (i.e., bearings or bearing supports, etc.) at the inlet of the fan. Fan wheel shall be aluminum with aluminum extruded airfoil blades. The fan inlet on plenum fans shall be isolated from the cabinet by means of a neoprene-coated flexible connection. Plenum fans shall be provided with spring-style thrust restraints.
 2. Each fan shall be sized to perform as indicated on the equipment schedule. The wheel diameter shall not be less than that shown on the equipment schedule. The fan shall be constructed to AMCA Standards for the Class Rating as indicated on the Equipment Schedule.
- E. Airfoil, Centrifugal Fan Wheels: Smooth-curved inlet flange, backplate, and hollow die-formed airfoil-shaped blades continuously welded at tip flange and backplate; cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws. Aluminum wheel.
- F. Axial Fans: Fan wheel and housing, straightening-vane section, factory-mounted motor with belt drive or direct drive, an inlet cone section, and accessories.
- G. Housings: Steel, galvanized steel, or aluminum.
1. Inlet and Outlet Connections: Flanges.
 2. Guide Vane Section: Integral guide vanes downstream from fan wheel designed to straighten airflow.
- H. Fan Array Installation:
1. Provide individual fan back draft dampers and acoustical treatment.
 2. Each fan and motor shall be mounted on an all welded, structural steel, prime coated, internal isolation base with springs selected to provide 99% isolation efficiency with minimum 1" deflection. The inlet of the fan shall be separated from the unit casing by means of a factory installed flexible fabric connection. Provide unit mounted red LED indicator lights to monitor status of all fan array fans, one light per fan. LED to light up indicating loss of respective fan operation. Label lights "FAN FAILURE LIGHTS".
- I. Fan Shaft Bearings:
1. Pre-lubricated and Sealed, Ball Bearings: Self-aligning, pillow-block type with an L10 rated life of 200,000 hours according to ABMA 9. Bearings are to be mounted on the fan structural bracing. Provide extended bearing lubrication lines and zerk fittings to assure accessibility of all lubrication points without disassembly of unit access.
- J. Internal Vibration Isolation and Seismic Control:
1. Fans shall be factory mounted with manufacturer's standard restrained vibration isolation mounting devices having a minimum static deflection as stated on the drawings.
 2. Seismic Fabrication Requirements: Fabricate fan section, internal mounting frame and attachment to fans, fan housings, motors, casings, accessories, and other fan section components with reinforcement strong enough to withstand seismic forces when fan-mounting frame and air-handling-unit mounting frame are anchored to building structure.
 3. Fan Assembly Testing:
 - a. Following assembly, the fan balance shall be tested using an electronic balance analyzer with tunable filter and stroboscope.

- b. Direct drive fan wheels shall be factory dynamically balanced and shall meet or exceed guidelines in AMCA 204-96 for Balance Quality and Vibration Levels for Fan Application Category BV-5. Following fan assembly, the complete spring isolated fan assembly shall be tested using an electronic balance analyzer with tunable filter and stroboscope. Vibration measurements shall be taken on each motor bearing housing in the vertical, horizontal, and axial planes (5 total measurements, 2 each motor bearing and 1 Axial). The maximum allowable velocity shall not exceed 0.125 inches per second peak amplitude (filter in) on any of 5 readings and shall not exceed .5 mils @ 1170 rpm.
 - c. A copy of the Vibration test report (Vibration Nomograph) shall be provided with the Operation and Maintenance Manual upon request. The fan assembly shall also be vibration tested at design RPM with the spring isolators at the specified deflection, with the tunable filter utilized and frequencies from 500 cpm to 50,000 cpm shall be scanned to detect misalignment, bearing defects, mechanical looseness or foundation weakness. A copy of the balance test data for this project showing calculations for deflection and critical speed of the shaft and wheel assembly shall be submitted for review.
- K. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors.
- 1. Enclosure Type: Totally enclosed, fan cooled.
 - 2. NEMA Premium (TM) efficient motors as defined in NEMA MG1.
 - 3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - 4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
 - 5. Mount unit-mounted disconnect switches on exterior of unit.

2.07 COILS

- A. Coils shall be designed with counter flow design.
- B. Fins shall have collars drawn, belled and firmly bonded to the tubes by means of mechanical expansion of the tubes. No soldering or tinning shall be used in the bonding process. Coils shall be mounted in the unit casing to be accessible for service and can be removed from the unit through the side. Capacities, pressure drops and selection procedure shall be certified in accordance with ARI Standard 410-81.
- C. Coils shall be fully enclosed within casing and mounted on primed and painted angle iron racks manufactured to allow coils to slide out individually. Cooling coil racks shall be primed with zinc rich chromate primer. Racks to be designed to allow coil removal from the face of the coil rack. All coils to be removable from either side of the unit by easily removable end panels. End panels that open to coil header and return bend section shall be installed with drive screws and nut-serts to allow access to header and return bend sections for coil inspection without disruption to unit air seal. Individual end panels to be supplied for each coil on the supply and return side of the cabinet to allow single coil piping breakdown for coil removal.
- D. Coil penetrations through cabinet shall be grommeted, sealed airtight by a double escutcheon plate on the exterior of the casing. The escutcheon plate shall have a rolled collar around the pipe opening to protect the pipe and be equipped with an "O" ring rubber gasket between the collar and the pipe to prevent chaffing and provide an air tight seal around the opening. All supply and return connections shall be plainly and permanently marked

- E. Both ends of the coil to be sealed off from the main air stream by full height blank-offs on both the entering-air and leaving-air sides. Blank-offs to be the same material as the coil casing. Headers and return bends to be further insulated with a closed cell neoprene gasket the full height and width of the coil casing to reduce condensation.
- F. Drain pans shall be continuously welded type 304 stainless steel. Intermediate drain pans shall be interconnected with 1 in. stainless steel drain lines. Drain pans shall be sloped and fully drainable.
- G. All coils shall be fabricated of 5/8" O.D. seamless copper tubing of 0.020 wall thickness minimum mechanically expanded into aluminum fins of 0.008 minimum thickness. All return bends shall be 0.035 copper minimum. Headers shall be of seamless copper. Supply and return connections on each coil shall be raised/lowered a minimum 6" from the bottom/top of the coil to allow room for piping connection hookup between stacked coils, coils near floors and coils near roofs. Each coil shall be provided with capped vent and drain connections extended to the exterior of the cabinet. All coils shall be fully drained with no trapped tubes. Coil casing to be 304 stainless steel for cooling coils and 16-gauge galvanized for heating coils.
- H. Coils shall be hydrostatically tested at 400 psi, and shall be suitable for working pressures and temperature up to 200 psi and 22°F.
- I. Pipe connections shall be on the same end, and shall be threaded. On units with split coils, extend coil pipe connections from coil header through unit side casing using specified pipe material.
- J. Water coils handling recently mixed air, or direct outside air, shall be fully drainable by removing a single threaded plug for each coil row.
- K. Coils indicated as being cleanable shall have either a cleanout plug for each tube or shall have a gasketed removable header cover.
- L. On cooling coils and heat recovery coils using vertically corrugated fins or spiral wound fins, provide moisture eliminators on the downstream side of cooling coils and heat recovery coils when the face velocity exceeds 550 fpm. On cooling coils and heat recovery coils using horizontally corrugated fins, provide moisture eliminators when the face velocity exceeds 525 fpm. Moisture eliminators shall be 304 stainless steel, 3-break type draining directly into the cooling coil drain.
- M. Coils for direct expansion refrigerant applications connected to multiple compressors shall be full face intertwined type.
- N. All coils installed in geographical locations where freezing air temperatures will enter the coil provide relief freeze caps on each coil. Freeze cap fittings shall be brazed construction with screw-on, screw-off removable cap. Install on all return bends on both sides of coil, on applicable headers and tube ends as required. Manufacturer: USA Coil & Air Sentry-Guard.

2.08 FILTERS

- A. Provide pre-filters and front loading final filters.
- B. Filter Gauges
 1. The manufacturer shall provide a DWYER (0-2 inch, 0-500 Pa) magnehelic gauge.
 2. Magnehelic gauges shall be accurate to +/- 2% of full range.
 3. One gauge shall be provided for each type of filter in filter bank.

4. Gauges shall be recessed into the cabinet casing with a weather cover.

2.09 FINISH

A. Factory Applied Finish for Steel and Galvanized-Steel Casings:

1. Standard Two-coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, ASTM 2000-hour enamel finish, consisting of prime coat and thermosetting topcoat.
2. Casing Coating: Epoxy, Phenolic, Hot-dip galvanized, or Powder-baked enamel.

2.010 ALUMINUM AIRFOIL DAMPERS

- A. General Requirements for Dampers: Leakage rate, according to AMCA 500, "Laboratory Methods for Testing Dampers for Rating," shall not exceed 5 percent of air quantity at 2000 fpm face velocity through damper and 3" wg (1000 Pa) pressure differential.
- B. Aluminum airfoil frames and blades shall be a minimum of 12 gauge extruded aluminum. Blades shall be of a single unit airfoil design 6" wide.
- C. Frames shall be extruded aluminum channel with grooved inserts for vinyl seals. Standard frames shall be 2" x 4" x 5/8" on the linkage side, 1" x 4" x 1" on the other 3 sides.
- D. Pivot rods shall be 7/8" hexagon extruded aluminum interlocking into the blade section. Bearings shall be of a double sealed type with a Celcon inner bearing on a rod within a Polycarbonate outer bearing inserted into the frame to prevent the outer bearing from rotating.
- E. The bearing shall be designed so there are no metal-to-metal or metal-to-bearing riding surfaces. The interconnecting linkage shall have a separate Celcon bearing to eliminate friction inside the linkage.
- F. Blade linkage hardware shall be installed in a frame outside the airstream. All hardware shall be of non-corrosive, reinforced cadmium plated steel.
- G. Multiple damper motors are to be used rather than jack shaft assemblies.
- H. Dampers shall be Ruskin #CD50, T.A. Morrison #1000, or equivalent.

2.011 VARIABLE FREQUENCY DRIVES

- A. Both supply and return fans are to be powered by drives complete with bypass starter section. See Section 230902 for additional requirements.

2.012 FLOW MEASURING PROVISIONS

A. Air flow measurement - General

1. Provide one thermal dispersion airflow/temperature measurement device (ATMD) at each location indicated on the plans, schedules and/or control schematics.
2. Each ATMD shall consist of one to four sensor probes and a single, remote transmitter. Each sensor probe shall consist of one to eight independent sensor nodes in a gold anodized, aluminum 6063 alloy tube with 304 stainless steel mounting brackets.
3. Each sensor node shall consist of two hermetically sealed bead-in-glass thermistors. Chip thermistors of any type or packaging are not acceptable.

4. The velocity-weighted average temperature output performance of the ATMD is preferred to that of the specified temperature measuring device (TMD), when the location of the ATMD and TMD are effectively the same.
- B. Supply and/or Return Fan Measurement:
1. Measurement device to be mounted in either the fan inlet or the AHU duct opening.
 - a. Fan inlet air measuring devices shall not obstruct the inlet cone to the fan, nor add any pressure losses or sound level increases to the fan performance.
 - b. Air measuring devices mounted in the AHU opening to be mounted upstream of the damper and spaced a minimum of 6" from the damper (if damper).
- C. Outside Air Flow Measurement
1. Air measuring devices to be mounted in the AHU opening upstream of the damper and spaced a minimum of 6" from the damper.
 - a. If the outside air intake dampers are sized for 100% fresh air capability configure the dampers to enable separate control and measurement of the minimum outside air required for the project area served by the AHU.
 - b. If the AHU is installed on the interior with ducted fresh air, install the measuring station in a straight duct section upstream from the minimum outside air dampers and interfacing control for providing an electronic signal for use by the control contractor in controlling a minimum outside airflow and temperature.
 - c. If the AHU is an outdoor mounted unit, the minimum outside airflow measurement station is to be factory mounted on the exterior side of the outside air intake in a protective weatherhood.
- D. Sensor Performance:
1. The ATMD shall be capable of measuring airflow rates over the full calibrated range of 0 to 5,000 FPM (25.4 m/s) between -20°F to 160°F (-28.9°C to 71°C).
 2. Each sensing node shall have an airflow accuracy of $\pm 2\%$ of reading throughout the entire calibrated operating range.
 3. Each sensing node shall have a temperature accuracy of $\pm 0.14^\circ\text{F}$ (0.08°C) over the entire operating temperature range of -20°F to 160°F (-28.9°C to 71°C).
 4. Fan Airflow Installation:
 - a. Installed airflow accuracy: $\pm 3\%$ to 10% of reading with $\pm 0.25\%$ repeatability.
 - b. Sensor probe performance: $\pm 2\%$ of reading, 0-5000 fpm, 0.15°F temperature accuracy \pm .
 5. Outside Air Installation:
 - a. Installed airflow accuracy: $\pm 2\%$ of reading with $\pm 0.25\%$ repeatability.
 - b. Sensor probe performance: $\pm 2\%$ of reading, 0-5000 fpm, 0.15°F temperature accuracy \pm .
- E. Transmitter:
1. Flow measuring array to include a transmitter for flow and temperature analog output signal for the building energy management system to be user selectable in either 4-20 mA or 0-10VDC, or BACnet digital compatible. Coordinate signal output with controls installer.
 2. Transmitter to include an airflow gauge to provide direct readout in cfm. Mount on the outside of the air handler if air handler is located in a mechanical room. Mount in a NEMA 3R control cabinet if located outside.

3. Device to provide switch selectable Modbus or Johnson N2 outputs. Device to be UL listed.
4. The transmitter shall be powered by 24 VAC, shall include over-voltage and over-current protection, and shall include watchdog circuitry to ensure continuous operation following power failures and/or brown- outs.
5. The transmitter shall determine the airflow rate and temperature of each sensing node prior to averaging.
6. The transmitter shall include self-diagnostics and other features to ensure reliability and continued operation despite a limited failure. The transmitter shall automatically detect sensor damage and correctly calculate the average using the remaining functional sensor nodes, while reporting a system fault over the network and by local visual indication.
7. All integrated circuits shall be industrial rated for operation down to -40°F (-40°C).
8. The environmental operating temperature limits for the transmitter shall be -20°F to 120°F (-28.8°C to 48.8°C).
9. The system shall be factory tested prior to shipment and not require calibration or adjustment over the life of the equipment when installed in accordance to manufacturer's guidelines.
10. The Sensors shall be calibrated to NIST traceable standards.

- F. Airflow measuring station shall be manufactured by Ebtron, KURZ, Fluid Components and Sierra Instruments are acceptable with temperature readout and UL listing.

2.013 ELECTRICAL

- A. Each fan motor shall be wired to its respective VFD provided by fan manufacturer integral to unit. See Section 230902 and 2.1, G above for requirements.
- B. All wiring shall be 6600 volt rated type XLPE, RW90 stranded copper, enclosed in conduit run internal to the unit. All junction boxes shall be CSA approved. Three phase loads to be color coded for phase matching.
- C. All unit VFD's shall be wired to a surface or recessed mounted vestibule electrical panel for a single point three phase power connection provided by Division 26. Control panel shall be NEMA Type 3R enclosure with a single hinged access door. The control panel shall include:
1. Non-fused main disconnect switch, lockable in the off position
 2. Dual element fuses
 3. Distribution block
- D. All wiring shall be numbered, and all remote connection terminals and components in the control panel shall be identified by tag suitable attached. Wiring diagram shall be provided for each unit showing all components, wire number and remote connection terminals.
- E. Electrical wiring for lighting and power supply to fan motors shall be run in separate conduits internal to the unit. No external conduit runs are permitted. If the unit requires section splits, junction boxes shall be furnished at each section to allow the electrical contractor to make final connections in the field. Wiring to be clearly labeled at junction points to facilitate reconnection. Air handler manufacturer shall allow a minimum 1.5" clearance above the entire width of each interior bulk headers (coils, filters, fan blank-off, etc.) for field-wiring of any 110v or 24v runs internally to the unit as required by the controls contractor and reduce the number penetrations of the exterior panels.
- F. All electrical wiring and components shall be installed to conform to NEC and UL listing requirements. Provide a UL or ETL listing and label for the entire air handler.

2.014 LIGHTS

- A. Provide vapor-proof marine grade lights with protective metal cage, sealed glass enclosure and 150-watt compact florescent light for each section containing an access door and for unit vestibule. Duplex receptacles shall be installed at the light switch at each fan section and unit vestibule.
- B. A switch with an indicator light shall be installed on the unit controlling both lights and receptacles. Electrical power shall be 120V/1/60 and wired by fan manufacturer to a junction box in the unit vestibule for a single point one phase connection by Division 26.

2.015 AIR-TO-AIR HEAT RECOVERY

- A. The air-to-air plate exchanger shall transfer heat between outgoing and incoming air streams in cross flow arrangement. The sensible plate exchanger shall bear the AHRI Certified Product Seal and rated per AHRI Standard 1060 testing procedures.
- B. The exchanger plates shall be 99.9% per aluminum. Plates made from aluminum alloy, plastic, steel or other materials are not acceptable.
- C. The plates shall be die formed with the patented positive/negative dimple stamping that provides the Hoval Series exclusive plates profile and discontinuous channel design. Plate profile of the laminar flow design type are unacceptable.
- D. Aluminum plate thickness shall be 0.005" (0.127 mm) for the best possible effectiveness. Thicker aluminum plates shall not be acceptable.
- E. The connecting plate edges shall be multiple folded. The double fold shall provide a six fold material thickness on the leading and trailing edges of the plate exchanger and provide protection from the cutting edge of the exchanger plates within the double fold. Construction methods that use a single fold or glue at the leading and trailing edges of the exchanger are not acceptable.
- F. The air-to-air plate exchanger core shall be assembled into a strong self-supporting frame made of aluminum corner extrusions and 20-gauge galvanized steel end plates.
- G. The aluminum corner extrusions shall be hollow to accept mounting screws and shall provide a 45 degree corner support angle.
- H. The Hoval "V" Series construction: the air-to-air plate exchanger package with synthetic resin sealed corners shall be resistant to temperatures up to 194°F (90°C).
- I. The Hoval "G" Series construction option the air-to-air plate exchanger plates shall have an epoxy coated, providing protection for installation in corrosive environment. The heat exchanger package with synthetic resin sealed corners is to be resistant to temperatures up to 194°F (90°C).
- J. The air-to-air exchanger shall withstand without significant change in its performances and pressure drops, a pressure differential of at least 6" wg. It shall withstand a pressure differential at 10" wg without permanent deformation.

2.016 HUMIDIFIERS

- A. Steam Grid Humidifier:

1. Manifold:
 - a. ASTM A666, Type 304 stainless steel.
 - b. Steam jacketed.
 - c. Insulated with 1/2-inch (13-mm) fiberglass and stainless-steel jacket.
 - d. Manifold shall extend the full width of unit with mounting brackets at ends.
2. Steam Separator: ASTM A666, Type 304 stainless steel, with separate humidifier control valve.
3. Humidifier Control Valve: Actuator: Electric modulating with spring return.
4. Steam Trap: Inverted-bucket type, sized for a minimum of three times the maximum rated condensate flow of humidifier at 1/2-psig (3.4-kPa) inlet pressure.
5. Aquastat: For separate mounting on steam condensate, return piping to prevent cold operation of humidifier.
6. Strainer: In-line type.
7. Airflow Switch: To prevent humidifier operation in the absence of airflow.

B. Wet Glass Cell Washer Section:

1. 3-inch- (75-mm-) deep cells with random packed, glass-fiber media in stainless-steel frames.
2. Access Door: Watertight with brass fittings, wire glass window, and locking handles.
3. Spray Tree Assembly: Stainless-steel nozzles and stainless-steel piping.
4. Eliminator: Stainless-steel plates.
5. Tank:
 - a. Welded stainless steel, with interior and exterior surfaces blasted and painted with zinc-chromate paint.
 - b. Copper suction screen.
 - c. Drain, overflow, and suction connections.
 - d. Makeup connection with brass float valve, and with quick-fill connection.
6. Insulate exterior with duct insulation and mount on 2-inch (50-mm) thick, rigid insulation board.

C. Evaporative Humidifier Section:

1. Access Door: Watertight with brass fittings, wire glass window, and locking handles.
2. Spray Tree Assembly: Brass nozzles and galvanized piping.
3. Tank:
 - a. Welded steel tank with interior and exterior surfaces blasted and painted with zinc-chromate paint.
 - b. Copper suction screen, drain, overflow, and suction connections.
 - c. Makeup connection with brass float valve, and with quick-fill connection.
4. Insulation: Insulate with duct insulation on exterior and mount on 2-inch (50-mm) thick, rigid insulation board.

2.017 AIR-TO-AIR ENERGY RECOVERY

A. Heat Wheels:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Airxchange.
 - b. American Energy Exchange, Inc.

- c. Loren Cook Company.
 - d. SEMCO Incorporated.
 - e. Trane; American Standard Inc.
 - f. Heatex
2. Casing:
 - a. Steel, with manufacturer's standard paint coating.
 - b. Integral purge section limiting carryover of exhaust air to between 0.05 percent at 1.6-inch wg and 0.20 percent at 4-inch wg (0.05 percent at 400-Pa and 0.20 percent at 1000-Pa) differential pressure.
 - c. Casing seals on periphery of rotor, on duct divider, and on purge section.
 - d. Support rotor on grease-lubricated ball bearings with extended grease fittings. Mount horizontal wheels on tapered roller bearing.
 3. Rotor: Aluminum, segmented wheel, strengthened with radial spokes, with nontoxic, noncorrosive, silica-gel desiccant coating. Construct media for passing maximum 500, 800 or 1200-micrometer solids.
 4. Rotor: Glass-fiber Polymer segmented wheel, strengthened with radial spokes impregnated with non-migrating, water-selective, molecular-sieve desiccant coating. Construct media for passing maximum 800 or 1200-micrometer solids.
 5. Drive: Fractional horsepower motor and gear reducer, with speed changed by variable frequency controller, and self-adjusting multilink belt around outside of rotor.
 6. Controls:
 - a. Starting relay, factory mounted and wired, and manual motor starter for field wiring.
 - b. Retain one of first three subparagraphs below.
 - c. Variable frequency controller, factory mounted and wired, permitting input of field connected 4-20 mA or 1-10-V control signal.
 - d. Variable frequency controller, factory mounted and wired, with exhaust-air sensor to vary rotor speed and maintain exhaust temperature above freezing.
 - e. Variable frequency controller, factory mounted and wired, with exhaust- and outdoor-air sensors, automatic changeover thermostat and set-point adjuster, to vary rotor speed and maintain [exhaust temperature above freezing and] air differential temperature above set point. Provide maximum rotor speed when exhaust-air temperature is less than outdoor-air temperature.
 - f. Pilot-Light Indicator: Display rotor rotation and speed.
 - g. Speed Settings: Adjustable settings for maximum and minimum rotor speed limits.
- B. Fixed-Plate Sensible Heat Exchangers:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 2. Basis-of-Design Product: Subject to compliance with requirements, provide [product indicated on Drawings] <Insert manufacturer's name; product name or designation> or comparable product by one of the following:
 - a. American Energy Exchange, Inc.
 - b. Des Champs Technologies.
 - c. Exothermics Inc.; a brand of Eclipse, Inc.
 - d. Nutech Brands Inc.
 - e. RenewAire LLC.
 - f. Heatex.
 3. Casing: [Aluminum] [Galvanized steel] [Enameled steel, with galvanized-steel liner] [Enameled steel].
 4. Plates: Evenly spaced and sealed and arranged for counter airflow.

5. Plate Material: [Embossed aluminum] [Stainless steel] [Polypropylene copolymer (high-density plastic)].
 - a. Coatings are available for aluminum plates in corrosive atmospheres.
 - b. Plate Coating: [Epoxy] [Air-dried phenolic].
6. Bypass: Plenum within casing, with gasketed face-and-bypass dampers that have operating rods extended outside casing.
7. Water wash and detergent injection are available optional features.
8. Water Wash: Automatic system, with spray manifold to individual spray tubes or traversing type with stainless-steel-screw operating mechanism and electric motor drive; activated by time clock[, with detergent injection].
9. Heat-Exchanger Prefilters: [1 inch (25 mm) thick, disposable] [2 inches (50 mm) thick, disposable] [Medium efficiency] [Electrostatic].

C. Fixed-Plate Enthalpy Heat Exchangers:

1. Heat Exchanger Performance Requirements
 - a. The enthalpy plate exchanger shall transfer both sensible and latent energy between the incoming fresh air stream and the exhaust stale air stream.
 - b. The ERV core shall be in either a cross-flow or counter cross-flow orientation and have no moving parts.
 - c. The ERV core shall be certified by AHRI under its Standard 1060 for Energy Recovery Ventilators. Products not currently AHRI certified will not be accepted.
 - d. The ERV core shall achieve a minimum of 50 % total energy recovery effectiveness tested at rated flows in heating conditions to AHRI 1060-2018 standards.
 - e. The ERV Core shall have a maximum pressure drop of 0.8" wg. as tested at the rated flow to AHRI 1060-2018.
 - f. The fresh air stream must have complete separation from the stale air stream to prevent cross contamination.
 - g. The ERV core shall have a 0% Exhaust Air Transport Ratio as tested to AHRI 1060-2018 (EATR) to prevent cross-over of gases, contaminants or odors.
 - h. The ERV core shall inhibit mold and bacteria growth as tested to Standard AATCC 30 with 100% surface inhibition on the Aspergillus mold test and 100% surface inhibition the Kirby Bauer Staphylococcus bacteria test.
 - i. The ERV core must be able to tolerate freezing temperatures of -30°C and not have an increase in EATR or decrease in performance after being frozen.
 - j. The ERV core must be able to tolerate high temperatures of +60°C and not have an increase in EATR or decrease in performance at these elevated temperatures.
 - k. The ERV core must be water washable to remove dust and contaminants.
 - l. The ERV core must be flame proof and comply with UL 723 with a flame spread index that shall not be over 25 and a smoke index that shall not be over 50
2. Frame and Inspection Requirements
 - a. The ERV shall have a frame consisting of 5052 series aluminum end plates and aluminum alloy 6063 extruded side rails.
 - b. Provide removable panels for inspection and cleaning of the heat transfer surface on the dirty air side without dismantling the system.
3. Heat-Exchanger Prefilters: 2 inches (50 mm) thick, disposable Medium efficiency
4. Manufacturer: dPoint Technology.

2.018 ELECTRICAL HEATING COIL

- A. Testing Agency Listing and Labeling: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. Refer to schedule on drawings for voltage, capacity and staging.
- B. Coil Assembly: Comply with UL 1995.
- C. Heating Elements: Type A coiled resistance wire of 80 percent nickel and 20 percent chromium.
 - 1. Open Coil: Coils shall be machine crimped into stainless steel terminals extending at least 1" into the air stream and all terminal hardware shall be stainless steel. Coils shall be supported by ceramic bushings staked into supporting brackets. Maximum brackets spacing not to exceed 4-1/2" apart.
 - 2. Finned Tubular: Heating elements shall be finned tubular Type A resistance wire, precisely centered in a stainless steel tube and filled with granular magnesium oxide. The entire assembly is to be compacted to maximize both the heat transfer and dielectric properties of the magnesium oxide. After compacting the tube must be a minimum of 0.475" O.D. to provide sufficient insulation for operation up to 600 volts. A corrugated stainless steel fin is to be wrapped around the tube to increase its heat transfer surface. Both straight and U-bent elements are to be furnished with mounting flanges, making them individually removable from the terminal box. Element support brackets are not to be spaced more than 36" apart.
- D. High-Temperature Coil Protection: Disk-type, automatically reset, thermal-cutout, safety device; serviceable through terminal box without removing heater from duct or casing.
- E. Secondary Protection: Load-carrying, manually reset or manually replaceable, thermal cutouts; factory wired in series with each heater stage.
- F. Frames: Galvanized-steel channel frame, minimum 0.052 inch (1.3 mm) thick for flanged mounting.
- G. Control Panel: Unit mounted terminal box shall be NEMA-1, or NEMA-4 type construction when mounted exposed to weather, with disconnecting means and overcurrent protection. Include the following control features:
 - 1. Magnetic contactor.
 - 2. Mercury contactor.
 - 3. Toggle switches; one per step.
 - 4. Step controller.
 - 5. Time-delay relay.
 - 6. Pilot lights; one per step.
 - 7. Airflow proving switch.

H. Manufacturers: Indeeco, Chromalox, Brasch, Dunham-Bush, Trane.

2.019 AIR LEAKAGE TESTING

- A. Before shipment the unit manufacturer shall factory pressure test (positive pressure) each air handling unit to ensure the leakage rate of the casing does not exceed 1.0% of the unit air flow at 1.5 times the rated static pressure. Testing shall be done on one unit of each type.
- B. The test shall be conducted in accordance with SMACNA duct construction manual. A calibrated orifice shall be used to measure leakage airflow.

2.020 SOUND POWER LEVELS

- A. Air handling unit sound power levels shall be submitted for review. Sound power data shall be given at the supply connections, return connections, outside air connections, and exhaust air connections in addition to radiated sound power from the cabinet. Raw fan sound power data shall be derived from testing on the identical fans as used in the units. Data extrapolated from different fans is not acceptable.
- B. Attenuation assumed for cabinet configuration, type of insulation, opening location and sizes shall be verified through actual test measurements. Sound power data is tested at the factory by an acoustical engineer in complete accordance with ARI 260-2001, "Sound Rating of Ducted Air Moving and Conditioning Equipment". These test reports will be submitted to the Architect before units ship from the factory.
- C. When operating at the maximum design capacities, the tested sound power values shall not exceed the values scheduled in the following table.

Table 1: Maximum Allowable Sound Power Values per ARI 260 in dB re 1 picowatt

Unit ID	Source	Test	63	125	250	500	1K	2K	4K	8K
		ARI 260								
		ARI 260								
		ARI 260								
		ARI 260								

- D. Fans to be tested in complete accordance with AMCA 300-1996, "Reverberant Room Method for Sound Testing of Fans", in a testing laboratory certified by AMCA to perform the test for both 210 performance and 300 sound. When operating at the maximum design capacities, the tested sound power values shall not exceed the values scheduled in the following table.

Table 2: Casing Radiated Maximum Allowable Sound Power Values per AMCA 300 in dB re 1 picowatt

Fan ID	Fan Type	63	125	250	500	1K	2K	4K	8K

PART 3 EXECUTION

3.01 EXAMINATION

- A. Install in accordance with manufacturer's instructions.
- B. Examine site to verify if site is ready to receive work. Provide a layout drawing of air handler and fan locations to electrical installer.

- C. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.
- D. Examine roughing-in for piping systems and electrical services to verify actual locations of connections before installation.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Air Handler Mounting:

1. Base Mounted: Install air-handling units on equipment base as described and specified elsewhere
 - a. Concrete: Comply with requirements for equipment bases and foundations specified in Division 03.
 - b. If return fans are configured to drawing inlet air from a raised curb, curb access must be provided for field installation and service of measuring devices and smoke detectors.
2. Suspended Mounting: Suspend and brace units from structural-steel support frame using threaded steel rods and spring hangers.
3. Vibration Isolators: Comply with requirements of 230548 Vibration Isolation.
4. Seismic Restraints: Comply with requirements for 230549 Seismic Restraint.
5. Arrange installation of units to provide access space around air-handling units for service and maintenance.
6. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.
7. Install filter-gage, static-pressure taps upstream and downstream of filters. Mount filter gages on outside of filter housing or filter plenum in accessible position. Provide filter gages on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

3.03 CONNECTIONS

- A. Coordinate piping installations and specialty arrangements with schematics on Drawings and with requirements specified in piping systems. If Drawings are explicit enough, these requirements may be reduced or omitted.
- B. Comply with requirements for piping specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- C. Install piping adjacent to air-handling unit to allow service and maintenance.
- D. Mount interior unit on vibration isolation springs.
- E. Mount rooftop unit on:
 1. Seismically restrained spring vibration isolation curb. Install with top surface of roof mounting frame level.
 2. Or, factory built roof mounting frame where vibration will not be perceptible to occupants. Install with top surface of roof mounting frame level.
- F. Install 3" flexible duct connection at inlets and outlets of units.

- G. Connect piping with flexible connectors.
 - H. Connect condensate drain pans using ASTM B88, Type M or Type L copper tubing as shown on plumbing drawings and specifications. Extend to nearest roof receptor, floor sink, or floor drain. Construct deep P-trap at connection to drain pan and install cleanouts at changes in direction.
 - 1. Install manufacturer provided condensate “air-trap” where provided with each air handling unit. Install trap per manufacturer’s instructions and install condensate piping as required by local code.
 - I. Hot- and Chilled-Water Piping: Comply with applicable requirements in Section 232113 HVAC Piping, Valves and Specialties. Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.
 - J. Steam and Steam Condensate Piping: Comply with applicable requirements in Section 232213 Steam and Condensate Piping, Valves and Specialties. Install shutoff valve at steam supply connections, float and thermostatic trap, and union or flange at each coil return connection. Install gate valve and inlet strainer at supply connection of dry steam humidifiers, and inverted bucket steam trap to condensate return connection.
 - K. Refrigerant Piping: Comply with applicable requirements in Section 232300 Refrigerant Piping Systems. Install shutoff valve and union or flange at each supply and return connection.
 - L. Coordinate duct installations and specialty arrangements with schematics on Drawings and with requirements specified in Section 233113 Air Distribution.
 - M. Connect duct to air-handling units with flexible connections. Comply with requirements in Section 233113 Air Distribution.
 - N. Control installers shall install all wiring associated with control signals into the air handlers.
 - O. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
 - P. Airflow measuring arrays installed in fan inlet volutes must be designed to withstand velocities encountered in this location. Mounting system is to be warranted against failure and consequent fan damage.
- 3.04 START-UP SERVICES
- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
 - B. Tests and Inspections:
 - 1. Leak Test: After installation, fill coils with water, and test coils and connections for leaks.
 - 2. Charge refrigerant coils with refrigerant and test for leaks.
 - 3. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 4. Automatic-Roll-Filter Operational Test: Operate filters to demonstrate compliance with requirements. Test for leakage of unfiltered air while system is operating.
 - 5. HEPA-Filter Operational Test: Pressurize housing to a minimum of 3-inch wg (750 Pa) or to designed operating pressure, whichever is higher; test housing joints, door seals, and sealing edges of filter with soapy water to check for air leaks.

6. HEPA-Filter Operational Test: Pressurize housing to a minimum of 3-inch wg (750 Pa) or to designed operating pressure, whichever is higher; test housing joints, door seals, and sealing edges of filter for air leaks according to ASME N510, pressure-decay method.
 7. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.
- D. Prepare test and inspection reports.
- 3.05 STARTUP SERVICE
- A. Perform startup service.
1. Complete installation and startup checks according to manufacturer's written instructions.
 2. Verify that shipping, blocking, and bracing are removed.
 3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
 4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
 5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
 6. Verify that zone dampers fully open and close for each zone.
 7. Verify that face-and-bypass dampers provide full face flow.
 8. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
 9. Comb coil fins for parallel orientation.
 10. Verify that proper thermal-overload protection is installed for electric coils.
 11. Install new, clean filters.
 12. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.
- B. Starting procedures for air-handling units include the following:
1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace sheaves, fan pulleys and motor pulleys as required to achieve design conditions.
 2. Measure and record motor electrical values for voltage and amperage.
 3. Manually operate dampers from fully closed to fully open position and record fan performance.
- C. ADJUSTING
1. Adjust damper linkages for proper damper operation.
 2. Comply with requirements in Section 230593 Testing, Adjusting and Balancing.
- D. CLEANING
1. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

E. DEMONSTRATION

1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.

3.06 AIR HANDLING UNIT CONFORMANCE

- A. Manufacturer representative shall complete the following table and provide a copy with each submittal package to assure conformance to specifications:
- B. Air Handler COMPLIANCE Checklist:

AIR HANDLER PERFORMANCE	
Manufacturer	
Dimensions (LxWxH inches)	
Operating Weight (LBS)	
Total Air Flow (CFM)	
System Supply Air Static Pressures (in. wg.)	
External Supply Ductwork	
Discharge Loss	
Cooling Coil	
Clean Filters	
Dirty Filter Allowance	
Damper/Louver/Fitting Loss	
Total Supply Fan Static	
Systems Return Air Static Pressures (in. wg.)	
External Return Air Static Pressure	
Entrance Loss	
Internal Louver/Damper/Fitting Loss	
Total Return Fan Static	
SUPPLY FAN PERFORMANCE	
Supply Fan BHP	
Supply Fan HP	
Supply Fan RPM	
Supply Fan Efficiency	
Direct Drive Plenum Fans	Yes or No
Fan Arrangement	
Pressure Class	
Aluminum Construction	Yes or No
Bearings (L 10/200000 hours)	Yes or No
Fans selected at rated motor RPM	Yes
RETURN FAN PERFORMANCE	
Return Fan BHP	

Return Fan HP	
Return Fan RPM	
Return Fan Efficiency	
Direct Drive Plenum Fans	Yes or No
Fan Arrangement	
Pressure Class	
Aluminum Construction	Yes or No
Bearings (L 10/200000 hours)	Yes or No
Fans selected at rated motor RPM	Yes
COIL PERFORMANCE	
Total Capacity (MBH)	
Sensible Capacity (MBH)	
Face Velocity (FPM)	
GPM	
Water Pressure Drop (ft. H ₂ O)	
Coils/Fins per Inch/Rows	
Tube Size (inches)	
Tube thickness (inches)	
Tube return bend thickness (inches)	
Coils have 16 ga 304 SS	Yes or No
Drain pans are 304 SS	Yes or No
Coil blank offs are 304 SS	Yes or No
CABINET CONSTRUCTION	
Structural Steel Channel base	Yes or No
Tubular steel base	Yes or No
Can vary base height	Yes or No
Structural steel channel cross support	Yes or No
Formed channel cross support	Yes or No
Cross support max spacing	
Thermal break at joints	Yes or No
Outer steel (gauge)	
Solid inner steel (gauge)	
Insulation (wall/floor thickness) (inches)	

Standing seam construction	Yes or No
Welded frame construction	Yes or No
Bolted construction	Yes or No
Sheet metal screw construction	Yes or No
Standing seam roof with seam cleats	Yes or No
Roof attachment external to unit casing	Yes or No
Outdoor-pitched roof	Yes or No
Access door locations as required	Yes or No
Double seals on doors	Yes or No
Latches per door (number)	
Adjustable door hinges	Yes or No
Adjustable door latches	Yes or No
Access doors open against static pressure	Yes or No
Door safety "Kill" switches	Yes or No
Polyurethane paint	Yes or No
Vents and drains extended to outside cabinet	Yes or No
Cabinet Sounds data for inlet & outlet	
Supply connection at 125 & 1000 hz (db)	
Return connection at 125 & 1000 hz (db)	
Economizer has min/max dampers	Yes or No
Dampers sizing (maximum fpm)	
Outside air louver sizing (maximum fpm)	
Exhaust air louver sizing (maximum fpm)	
Exterior hoods	Yes or No
ADDITIONAL UNIT FEATURES	
Marine lights with GFI	Yes or No
Fan screen enclosures	Yes or No
Min OSA air flow station	Yes or No
Airflow stations on each fan	Yes or No
Motor removal rails	Yes or No
Bellmouth outlet	Yes or No
Roof curb	Yes or No
TEFC premium efficiency motors	Yes or No

Shaft grounding factory mounted on motors	Yes or No
Variable Frequency Drive (VFD) manufacturer	
VFD's are factory mounted & wired (UL508)	Yes or No
Data sheets for VFD's	Yes or No
Filters are size and type specified	Yes or No
Filter frames are face load type 8	Yes or No
Two filter gages (one per filter bank)	Yes or No
Weather covers for filter gages	Yes or No
Data sheets for filters	Yes or No
Data sheets for air flow stations	Yes or No
PROVIDE DETAILS	
Base/floor construction	Yes or No
Casing/cabinet construction	Yes or No
Access doors	Yes or No
Door hinges and latches	Yes or No
Fan curves	Yes or No
Pressure losses (including internal/external loss)	Yes or No
Sound data for inlet/outlet	Yes or No
Electrical wiring diagram	Yes or No
Vibration isolation detail	Yes or No
Coil construction	Yes or No
VFD mounting details	Yes or No
MANUFACTURER CAPABILITIES	
Fan Wheel Manufacturer	
Coil Manufacturer	
Dampers Manufacturer	
Louver Manufacturer	
Isolator Manufacturer	
Have a certified UL508 electrical shop	Yes or No
ARI certified for coils	Yes or No
Coil Testing Capabilities	Yes or No

AMCA certified for blowers	Yes or No
UL-508	Yes or No
AMCA 210 accredited lab	Yes or No
AMCA 300 accredited lab	Yes or No
Ability to perform leak tests	Yes or No
UL-508 compliance	Yes or No
Unit ETL or UL listing	Yes or No

SECTION 23 73 13
MODULAR AIR HANDLERS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SUMMARY

- 1. Section Includes:
 - a. Variable-air-volume, single-zone air-handling units.
 - b. Variable-air-volume, dual-duct air-handling units.
 - c. Constant-air-volume, single-zone air-handling units.
 - d. Constant-air-volume, multizone air-handling units.
 - e. Constant-air-volume, dual-duct air-handling units.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00 - Basic HVAC Materials and Methods
- B. Section 23 05 93 - Testing, Adjusting and Balancing
- C. Section 23 09 02 - Variable Frequency Drives (VFD)
- D. Section 23 31 13 - Air Distribution
- E. Section 23 41 00 - Air Filtration
- F. Division 26: Electrical

1.04 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Design vibration isolation and seismic-restraint details, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- B. Structural Performance: Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of $L/100$, minimum, where "L" is the unsupported span length within completed casings.
- C. Seismic Performance: Air-handling units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.05 QUALITY ASSURANCE

- A. **Manufacturer's Qualifications:** Provide air handling units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. **Certifications:** Provide certified ratings of units based on tests performed in accordance with ARI 430, "Central-Station Air Handling Units."
- C. **Codes and Standards:** Provide air handling units conforming to the requirements of the latest addition of the following:
 1. **Air Movement and Control Association (AMCA):**
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans [Unit shall bear AMCA Certified Rating Seal]
 - c. 300 - Reverberant Room Method for Sound Testing of Fans [Unit shall bear AMCA Certified Rating Seal]
 - d. 320 - Laboratory Methods of Sound Testing of Fans Using Sound Intensity
 - e. 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - f. 500 - Test Method for Louvers, Dampers, and Shutters
 2. **American National Standards Institute (ANSI):**
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 - Test Performance of Air Filter Units
 3. **Air-Conditioning, Heating and Refrigeration Institute (AHRI):**
 - a. 410 - Forced-Circulation Air-Cooling and Air-Heating Coils
 - b. 430 - Central-Station Air-Handling Units
 4. **American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):**
 - a. 15 - Safety Code for Mechanical Refrigeration
 5. **National Electrical Manufacturers Association (NEMA):** Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
 6. **National Fire Protection Association (NFPA):** Provide air handling unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems

7. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
8. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of air handling units, which have been listed and labeled by UL.
9. Units shall be listed and labeled by either UL or ETL for air handler construction.

1.06 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 1. The proposed substitution does not affect dimensions shown on drawings.
 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.
- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.07 ACTION SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for air handling units showing
 1. Dimensions and weights
 2. Cabinet material, metal thickness, finishes, insulation, and accessories.
 3. Fan including:
 - a. Certified fan-performance curves with system operating conditions indicated.
 - b. Certified fan-sound power ratings.
 - c. Fan construction and accessories.
 - d. Motor ratings, electrical characteristics, and motor accessories.
 - e. Fan assembly vibration and balance test report.
 4. Certified coil-performance ratings with system operating conditions indicated.
 5. Retain both subparagraphs below if items are furnished as parts of air-handling units.
 6. Dampers, including housings, linkages, and operators.
 7. Filters with performance characteristics.
- B. Shop Drawings: Submit shop drawings showing unit dimensions, weight loadings, required clearances, field connection details and methods of support. Draw to a scale of one half inch to one foot. Include field fabricated mixing boxes, dampers and duct connections.

- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.

1.08 INFORMATIONAL SUBMITTALS

- A. Seismic Qualification Certificates: For air-handling units, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- B. Source quality-control reports.
- C. Field quality-control reports.

1.09 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect unit against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.11 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Energy Labs, Nortek Air Solutions (Governair, Huntair, Venmar, Temtrol, Mammoth), York Solution Custom, or Haakon Industries. By listing various manufacturers does imply that their standard construction is approved or that they are equal. All manufacturers must meet, or exceed, minimum requirements of these specifications and all other standard or optional features provided by the scheduled basis of design air handler.

2.02 GENERAL

- A. Any exceptions to the specifications must be clearly defined in the submittal process. The contractor shall be responsible for any additional expenses that may occur due to any exception made.

- B. Fabricate draw-thru or blow-thru type air handling units suitable for the scheduled air pressure operation as indicated.
- C. Fabricate units with the following features: fan sections as noted; coil section(s); heat recovery sections, mixing section; filter section(s); access section(s); discharge plenum; bell mouth duct connections; variable frequency drives; dampers; lights and vestibules. Fabricate unit in split sections for field assembly if necessary.
- D. Vestibule piping requirements: If shown on plans all piping located within the air handler vestibule is to be supported as specified. Mechanical Contractor to coordinate with air handler supplier to insure that all supports are provided and that adequate structural reinforcement is provided within the air handler to accommodate the operational weight of the pipe supported. The Mechanical Contractor is to provide the air handler manufacturer with an approved shop drawing indicating the location and weight of all equipment and the location of all piping and pipe penetrations located in the air handler vestibule prior to the design of the air handler by the manufacturer.
- E. Fans shall be selected for variable volume operation. The scheduled fan arrangement and unit configuration is the basis of selection. Alternate configurations which are equal or smaller in size and weight, energy and acoustic performance will be considered. Include information indicating pertinent differences, either positive or negative, to base design indicated on documents. Unit component face velocity to remain as designed to conserve motor horsepower. The mechanical contractor and supplier shall bear all costs for redesign of mechanical, plumbing, electrical, structural, architectural and controls that may be associated with the revised configuration. Provide analysis of unit power consumption for code compliance.
- F. Factory fabricate and test air handling units of sizes, capacities, and configuration as indicated and specified.
- G. All major components used to assemble air handling units with the exception of electrical devices, drives, bearings and controls shall be manufactured by the air handler manufacturer.
- H. Motors shall be inverter duty NEMA MG-1 premium efficiency TEFC type. All wiring shall be routed to a single external junction box for each fan section.
- I. Filter section shall include space for face load or side access slide-in filters with 2" or 4" pre-filters and 22" bag type final filters with an average efficiency of 85% per ASHRAE Standard 52-76 test.
- J. Provide measurement arrays as described below.

2.03 UNIT CASING

- A. Walls and roofs shall be constructed of 16-gauge, G90 galvanized steel 4" thick panels. The inner wall shall be a minimum of 22-gauge, solid galvanized steel in all sections except fan inlet and fan section which may be perforated metal. The wall panels shall be insulated with 4", 3.0 lbs/cu. ft rigid neoprene coated insulation. All permanently joined flanged panel surfaces shall be sealed with an individual strip of 1/8" x 3/8" tape sealer. Wall seams shall be turned inward to provide a clean flush exterior finish. All panel seams shall be sealed during assembly to produce an airtight unit.
- B. All panels shall be joined using bolts rather than sheet metal screws.

- C. All insulation edges shall be protected with metal lagging. Insulation systems using stickpins or adhesives are not acceptable.
- D. Stiffeners of angle steel shall be supplied as required to maintain casing deflection criteria of 1/200 at 1.5 times the working pressure. If panels cannot meet this deflection, additional internal reinforcing shall be added.
- E. Provide duct bellmouth fittings where dimensions allow. Provide walk able grates over all duct floor penetrations, maximum pressure loss not to exceed 0.10-inches WC.

F. Acoustical Performance:

- 1. The housing shall have been tested for acoustical performance by an independent laboratory that is accredited.
- 2. Test methods and facilities used to establish sound transmission loss values shall conform explicitly with the ASTM designation E90-85 and E413-73.

a. Sound Transmission Loss DB ASTM E-90 & E413-73.

	1	2	3	4	5	6	7	8	
4" Walls	20	20	28	41	51	56	55	57	STC=40

b. Test methods and facilities used to establish sound absorption values shall conform explicitly with the requirements of the ASTM Standard Test Method for Sound Absorption Coefficients by the Reverberation Method: ASTM C423-84A and E795-83.

c. Sound Absorption ASTM C423-84A & E795-83.

	1	2	3	4	5	6	7	8	
4" Walls	.40	.65	1.38	1.28	1.09	1.05	1.02	1.02	NRC=1.20

d. Submit lab report for approval.

2.04 BASE CONSTRUCTION

- A. Units shall be constructed from structural steel C-channel around the perimeter of the unit with intermediate channel, angle or tube supports.
 - 1. Channel bases shall be sized as a function of air handling length as follows:

<u>AHU LENGTH</u>	<u>MINIMUM CHANNEL SIZE</u>	
UP to 10	4" x 1-5/8"	(5.4 lbs/Lin.Ft.)
11' to 20'	6" x 2"	(8.2 lbs/Lin.Ft.)
21' to 30'	8" x 2-1/2"	(11.5 lbs/Lin.Ft.)
41' to 50'	12" x 3"	(20.7 lbs/Lin.Ft.)

- B. Floor shall be flat, reinforced from below, with all seams continuously welded or floor shall be 0.12" checker plate installed on the base. Drive screw attachment and caulking are not acceptable. The base shall be provided with lifting lugs, a minimum four per unit section. The base shall be insulated tight to the floor with 4", 3.0 lbs/cu. ft fiberglass insulation. The insulation is to be protected with 22-gauge solid galvanized steel liner if the unit floor is exposed in a suspended application. Floors that "oil can" are not acceptable.
- C. Floor insulation shall be installed beneath the floor panels in the same manner as the wall and ceiling insulation.
- D. Condensate Drain Pans:
1. Fabricated with two percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and from humidifiers and to direct water toward drain connection.
 2. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
 3. Depth: A minimum of 2 inches (50 mm) deep.
 4. Integral part of floor plating
 5. Single-wall 16-gauge, 304 stainless-steel sheet.
 6. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on pan. Outlet diameter shall meet minimum sizing requirement of applicable mechanical code.
 7. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.
 8. The manufacturer shall provide a 1.5" perimeter collar around the entire unit and around each floor opening to ensure the unit is internally watertight. The entire base shall act as an auxiliary drain pan and hold up to 1.5" of water.
 9. The manufacturer shall provide auxiliary drains in mixing and OSA intake sections.
 10. All drain connections on floor mounted air handling units shall terminate at the side of the unit.
- E. Maximum base deflection shall be 1/4" on 20-foot unsupported span.
- F. Maintenance Rails: Provide overhead lifting rails in sections where motor service will be required.

2.05 INSPECTION AND ACCESS PANELS AND ACCESS DOORS

- A. Panel and Door Fabrication: Formed and reinforced, single- or double-wall and insulated panels of same materials and thicknesses as casing.
- B. Inspection and Access Panels:
 - 1. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against air-pressure differential.
 - 2. Gasket: Neoprene, applied around entire perimeters of panel frames.
 - 3. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.
- C. Access Doors:
 - 1. Hinges: A minimum of two ball-bearing hinges and two roller cam-type latches, operable from inside and outside. Arrange doors to be opened against air-pressure differential.
 - 2. Gasket: Neoprene, applied around entire perimeters of panel frames.
 - 3. Fabricate windows in fan section doors of double-glazed, wire-reinforced safety glass with an air space between panes and sealed with interior and exterior rubber seals.
 - 4. Size: The minimum door clearance shall not be less than 19"x 70" (where unit height permits) and shall be large enough to allow the largest assembled internal compound to be removed through the doorway. Internal components must have a door of minimum width to remove the assembled components. Vestibule doors to the exterior shall be 42"x70" (where unit height permits).
- D. Locations and Applications:
 - 1. Verify that the sections listed below are large enough for panels and doors. Verify applicability with listed manufacturers.
 - 2. Fan Section: Doors and inspection and access panels.
 - 3. Access Section: Doors.
 - 4. Coil Section: Inspection and access panel.
 - 5. Damper Section: Doors.
 - 6. Filter Section: Doors large enough to allow periodic removal and installation of filters.
 - 7. Mixing Section: Doors.
 - 8. Humidifier Section: Doors.

2.06 FAN, DRIVE, AND MOTOR SECTION

- A. All fans shall be tested in accordance with AMCA Standard 210-70 Test Code for Air Moving Devices. Fans shall bear the AMCA sticker for both air and sound performance.
- B. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.
 - 1. Shafts: Designed for continuous operation at maximum-rated fan speed and motor horsepower, and with field-adjustable alignment.
 - a. Turned, ground, and polished hot-rolled steel with keyway. Ship with a protective coating of lubricating oil. Hollow shafts are unacceptable.

- b. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range. The critical speed will be based on the top of the speed range for the fans' AMCA class. The lateral static deflection shall not exceed 0.003" per foot of the length of the shaft.
 2. Fan assembly shall be balanced per ISO standard G6.3 with a copy of the balance test data for this project with deflection and critical speed of the shaft and wheel submitted to the engineer
- C. Centrifugal Fan Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.
 1. Bracing: Steel angle or channel supports for mounting and supporting fan scroll, wheel, motor, and accessories.
 2. Horizontal-Flanged, Split Housing: Bolted construction.
 3. Housing for Supply Fan: Attach housing to fan-section casing with metal-edged flexible duct connector.
 4. Flexible Connector: Factory fabricated with a fabric strip [3-1/2 inches (89 mm)] [5-3/4 inches (146 mm)] wide attached to 2 strips of 2-3/4-inch- (70-mm-) wide, 0.028-inch- (0.7-mm-) thick, galvanized-steel sheet or 0.032-inch- (0.8-mm-) thick aluminum sheets; select metal compatible with casing.
 - a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.
 - 1) Fabric Minimum Weight: 26 oz./sq. yd. (880 g/sq.m).
 - 2) Fabric Tensile Strength: 480 lbf/inch (84 N/mm) in the warp and 360 lbf/inch (63 N/mm) in the filling.
 - 3) Fabric Service Temperature: Minus 40 to plus 200°F (Minus 40 to plus 93°C).
- D. Plenum Fan Housings: Steel frame and panel; fabricated without fan scroll and volute housing.
 1. Arrangement #4 direct drive fans or AMCA Arrangement #1 either horizontal or vertical as shown on plans and drawings. There shall be no obstructions (i.e., bearings or bearing supports, etc.) at the inlet of the fan. Fan wheel shall be aluminum with aluminum extruded airfoil blades. The fan inlet on plenum fans shall be isolated from the cabinet by means of a neoprene-coated flexible connection. Plenum fans shall be provided with spring-style thrust restraints.
 2. Each fan shall be sized to perform as indicated on the equipment schedule. The wheel diameter shall not be less than that shown on the equipment schedule. The fan shall be constructed to AMCA Standards for the Class Rating as indicated on the Equipment Schedule.
- E. Airfoil, Centrifugal Fan Wheels: Smooth-curved inlet flange, backplate, and hollow die-formed airfoil-shaped blades continuously welded at tip flange and backplate; cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws. Aluminum wheel.
- F. Axial Fans: Fan wheel and housing, straightening-vane section, factory-mounted motor with belt drive or direct drive, an inlet cone section, and accessories.
- G. Housings: Steel, galvanized steel, or aluminum.
 1. Inlet and Outlet Connections: Flanges.

2. Guide Vane Section: Integral guide vanes downstream from fan wheel designed to straighten airflow.
- H. Fan Array Installation:
1. Provide individual fan back draft dampers and acoustical treatment.
 2. Each fan and motor shall be mounted on an all welded, structural steel, prime coated, internal isolation base with springs selected to provide 99% isolation efficiency with minimum 1" deflection. The inlet of the fan shall be separated from the unit casing by means of a factory installed flexible fabric connection. Provide unit mounted red LED indicator lights to monitor status of all fan array fans, one light per fan. LED to light up indicating loss of respective fan operation. Label lights "FAN FAILURE LIGHTS".
- I. Fan Shaft Bearings:
1. Pre-lubricated and Sealed, Ball Bearings: Self-aligning, pillow-block type with an L10 rated life of 200,000 hours according to ABMA 9. Bearings are to be mounted on the fan structural bracing. Provide extended bearing lubrication lines and zerk fittings to assure accessibility of all lubrication points without disassembly of unit access.
- J. Internal Vibration Isolation and Seismic Control:
1. Fans shall be factory mounted with manufacturer's standard restrained vibration isolation mounting devices having a minimum static deflection as stated on the drawings.
 2. Seismic Fabrication Requirements: Fabricate fan section, internal mounting frame and attachment to fans, fan housings, motors, casings, accessories, and other fan section components with reinforcement strong enough to withstand seismic forces when fan-mounting frame and air-handling-unit mounting frame are anchored to building structure.
 3. Fan Assembly Testing:
 - a. Following assembly, the fan balance shall be tested using an electronic balance analyzer with tunable filter and stroboscope.
 - b. Direct drive fan wheels shall be factory dynamically balanced and shall meet or exceed guidelines in AMCA 204-96 for Balance Quality and Vibration Levels for Fan Application Category BV-5. Following fan assembly, the complete spring isolated fan assembly shall be tested using an electronic balance analyzer with tunable filter and stroboscope. Vibration measurements shall be taken on each motor bearing housing in the vertical, horizontal, and axial planes (5 total measurements, 2 each motor bearing and 1 Axial). The maximum allowable velocity shall not exceed 0.125 inches per second peak amplitude (filter in) on any of 5 readings and shall not exceed .5 mils @ 1170 rpm.
 - c. A copy of the Vibration test report (Vibration Nomograph) shall be provided with the Operation and Maintenance Manual upon request. The fan assembly shall also be vibration tested at design RPM with the spring isolators at the specified deflection, with the tunable filter utilized and frequencies from 500 cpm to 50,000 cpm shall be scanned to detect misalignment, bearing defects, mechanical looseness or foundation weakness. A copy of the balance test data for this project showing calculations for deflection and critical speed of the shaft and wheel assembly shall be submitted for review.
- K. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors.
1. Enclosure Type: Totally enclosed, fan cooled.
 2. NEMA Premium (TM) efficient motors as defined in NEMA MG1.

3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
5. Mount unit-mounted disconnect switches on exterior of unit.

2.07 COILS

- A. Coils shall be designed with counter flow design.
- B. Fins shall have collars drawn, belled and firmly bonded to the tubes by means of mechanical expansion of the tubes. No soldering or tinning shall be used in the bonding process. Coils shall be mounted in the unit casing to be accessible for service and can be removed from the unit through the side. Capacities, pressure drops and selection procedure shall be certified in accordance with ARI Standard 410-81.
- C. Coils shall be fully enclosed within casing and mounted on primed and painted angle iron racks manufactured to allow coils to slide out individually. Cooling coil racks shall be primed with zinc rich chromate primer. Racks to be designed to allow coil removal from the face of the coil rack. All coils to be removable from either side of the unit by easily removable end panels. End panels that open to coil header and return bend section shall be installed with drive screws and nut-serts to allow access to header and return bend sections for coil inspection without disruption to unit air seal. Individual end panels to be supplied for each coil on the supply and return side of the cabinet to allow single coil piping breakdown for coil removal.
- D. Coil penetrations through cabinet shall be grommeted, sealed airtight by a double escutcheon plate on the exterior of the casing. The escutcheon plate shall have a rolled collar around the pipe opening to protect the pipe and be equipped with an "O" ring rubber gasket between the collar and the pipe to prevent chaffing and provide an air tight seal around the opening. All supply and return connections shall be plainly and permanently marked
- E. Both ends of the coil to be sealed off from the main air stream by full height blank-offs on both the entering-air and leaving-air sides. Blank-offs to be the same material as the coil casing. Headers and return bends to be further insulated with a closed cell neoprene gasket the full height and width of the coil casing to reduce condensation.
- F. Drain pans shall be continuously welded type 304 stainless steel. Intermediate drain pans shall be interconnected with 1 in. stainless steel drain lines. Drain pans shall be sloped and fully drainable.
- G. All coils shall be fabricated of 5/8" O.D. seamless copper tubing of 0.020 wall thickness minimum mechanically expanded into aluminum fins of 0.008 minimum thickness. All return bends shall be 0.035 copper minimum. Headers shall be of seamless copper. Supply and return connections on each coil shall be raised/lowered a minimum 6" from the bottom/top of the coil to allow room for piping connection hookup between stacked coils, coils near floors and coils near roofs. Each coil shall be provided with capped vent and drain connections extended to the exterior of the cabinet. All coils shall be fully drained with no trapped tubes. Coil casing to be 304 stainless steel for cooling coils and 16-gauge galvanized for heating coils.
- H. Coils shall be hydrostatically tested at 400 psi, and shall be suitable for working pressures and temperature up to 200 psi and 22°F.

- I. Pipe connections shall be on the same end, and shall be threaded. On units with split coils, extend coil pipe connections from coil header through unit side casing using specified pipe material.
- J. Water coils handling recently mixed air, or direct outside air, shall be fully drainable by removing a single threaded plug for each coil row.
- K. Coils indicated as being cleanable shall have either a cleanout plug for each tube or shall have a gasketed removable header cover.
- L. On cooling coils and heat recovery coils using vertically corrugated fins or spiral wound fins, provide moisture eliminators on the downstream side of cooling coils and heat recovery coils when the face velocity exceeds 550 fpm. On cooling coils and heat recovery coils using horizontally corrugated fins, provide moisture eliminators when the face velocity exceeds 525 fpm. Moisture eliminators shall be 304 stainless steel, 3-break type draining directly into the cooling coil drain.
- M. Coils for direct expansion refrigerant applications connected to multiple compressors shall be full face intertwined type.
- N. All coils installed in geographical locations where freezing air temperatures will enter the coil provide relief freeze caps on each coil. Freeze cap fittings shall be brazed construction with screw-on, screw-off removable cap. Install on all return bends on both sides of coil, on applicable headers and tube ends as required. Manufacturer: USA Coil & Air Sentry-Guard or equal.

2.08 FILTERS

- A. Provide pre-filters and front loading final filters.
- B. Filter Gauges
 - 1. The manufacturer shall provide a DWYER (0-2 inch, 0-500 Pa) magnehelic gauge.
 - 2. Magnehelic gauges shall be accurate to +/- 2% of full range.
 - 3. One gauge shall be provided for each type of filter in filter bank.
 - 4. Gauges shall be recessed into the cabinet casing with a weather cover.

2.09 FINISH

- A. Factory Applied Finish for Steel and Galvanized-Steel Casings:
 - 1. Standard Two-coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, ASTM 2000-hour enamel finish, consisting of prime coat and thermosetting topcoat.
 - 2. Casing Coating: Epoxy, Phenolic, Hot-dip galvanized, or Powder-baked enamel.

2.10 ALUMINUM AIRFOIL DAMPERS

- A. General Requirements for Dampers: Leakage rate, according to AMCA 500, "Laboratory Methods for Testing Dampers for Rating," shall not exceed 5 percent of air quantity at 2000 fpm face velocity through damper and 3" wg (1000 Pa) pressure differential.
- B. Aluminum airfoil frames and blades shall be a minimum of 12 gauge extruded aluminum. Blades shall be of a single unit airfoil design 6" wide.

- C. Frames shall be extruded aluminum channel with grooved inserts for vinyl seals. Standard frames shall be 2" x 4" x 5/8" on the linkage side, 1" x 4" x 1" on the other 3 sides.
- D. Pivot rods shall be 7/8" hexagon extruded aluminum interlocking into the blade section. Bearings shall be of a double sealed type with a Celcon inner bearing on a rod within a Polycarbonate outer bearing inserted into the frame to prevent the outer bearing from rotating.
- E. The bearing shall be designed so there are no metal-to-metal or metal-to-bearing riding surfaces. The interconnecting linkage shall have a separate Celcon bearing to eliminate friction inside the linkage.
- F. Blade linkage hardware shall be installed in a frame outside the airstream. All hardware shall be of non-corrosive, reinforced cadmium plated steel.
- G. Multiple damper motors are to be used rather than jack shaft assemblies.
- H. Dampers shall be Ruskin #CD50, T.A. Morrison #1000, or equivalent.

2.11 VARIABLE FREQUENCY DRIVES

- A. Both supply and return fans are to be powered by drives complete with bypass starter section. See Section 23 09 02 for additional requirements.

2.12 FLOW MEASURING PROVISIONS

- A. Air flow measurement - General
 - 1. Provide one thermal dispersion airflow/temperature measurement device (ATMD) at each location indicated on the plans, schedules and/or control schematics.
 - 2. Each ATMD shall consist of one to four sensor probes and a single, remote transmitter. Each sensor probe shall consist of one to eight independent sensor nodes in a gold anodized, aluminum 6063 alloy tube with 304 stainless steel mounting brackets.
 - 3. Each sensor node shall consist of two hermetically sealed bead-in-glass thermistors. Chip thermistors of any type or packaging are not acceptable.
 - 4. The velocity-weighted average temperature output performance of the ATMD is preferred to that of the specified temperature measuring device (TMD), when the location of the ATMD and TMD are effectively the same.
- B. Supply and/or Return Fan Measurement:
 - 1. Measurement device to be mounted in either the fan inlet or the AHU duct opening.
 - a. Fan inlet air measuring devices shall not obstruct the inlet cone to the fan, nor add any pressure losses or sound level increases to the fan performance.
 - b. Air measuring devices mounted in the AHU opening to be mounted upstream of the damper and spaced a minimum of 6" from the damper (if damper).
- C. Outside Air Flow Measurement
 - 1. Air measuring devices to be mounted in the AHU opening upstream of the damper and spaced a minimum of 6" from the damper.
 - a. If the outside air intake dampers are sized for 100% fresh air capability configure the dampers to enable separate control and measurement of the minimum outside air required for the project area served by the AHU.

- b. If the AHU is installed on the interior with ducted fresh air, install the measuring station in a straight duct section upstream from the minimum outside air dampers and interfacing control for providing an electronic signal for use by the control contractor in controlling a minimum outside airflow and temperature.
- c. If the AHU is an outdoor mounted unit, the minimum outside airflow measurement station is to be factory mounted on the exterior side of the outside air intake in a protective weatherhood.

D. Sensor Performance:

1. The ATMD shall be capable of measuring airflow rates over the full calibrated range of 0 to 5,000 FPM (25.4 m/s) between -20°F to 160°F (-28.9°C to 71°C).
2. Each sensing node shall have an airflow accuracy of $\pm 2\%$ of reading throughout the entire calibrated operating range.
3. Each sensing node shall have a temperature accuracy of $\pm 0.14^\circ\text{F}$ (0.08°C) over the entire operating temperature range of -20°F to 160°F (-28.9°C to 71°C).
4. Fan Airflow Installation:
 - a. Installed airflow accuracy: $\pm 3\%$ to 10% of reading with $\pm 0.25\%$ repeatability.
 - b. Sensor probe performance: $\pm 2\%$ of reading, 0-5000 fpm, 0.15°F temperature accuracy \pm .
5. Outside Air Installation:
 - a. Installed airflow accuracy: $\pm 2\%$ of reading with $\pm 0.25\%$ repeatability.
 - b. Sensor probe performance: $\pm 2\%$ of reading, 0-5000 fpm, 0.15°F temperature accuracy \pm .

E. Transmitter:

1. Flow measuring array to include a transmitter for flow and temperature analog output signal for the building energy management system to be user selectable in either 4-20 mA or 0-10VDC, or BACnet digital compatible. Coordinate signal output with controls installer.
2. Transmitter to include an airflow gauge to provide direct readout in cfm. Mount on the outside of the air handler if air handler is located in a mechanical room. Mount in a NEMA 3R control cabinet if located outside.
3. Device to provide switch selectable Modbus or Johnson N2 outputs. Device to be UL listed.
4. The transmitter shall be powered by 24 VAC, shall include over-voltage and over-current protection, and shall include watchdog circuitry to ensure continuous operation following power failures and/or brown-outs.
5. The transmitter shall determine the airflow rate and temperature of each sensing node prior to averaging.
6. The transmitter shall include self-diagnostics and other features to ensure reliability and continued operation despite a limited failure. The transmitter shall automatically detect sensor damage and correctly calculate the average using the remaining functional sensor nodes, while reporting a system fault over the network and by local visual indication.
7. All integrated circuits shall be industrial rated for operation down to -40°F (-40°C).
8. The environmental operating temperature limits for the transmitter shall be -20°F to 120°F (-28.8°C to 48.8°C).

9. The system shall be factory tested prior to shipment and not require calibration or adjustment over the life of the equipment when installed in accordance to manufacturer's guidelines.
10. The Sensors shall be calibrated to NIST traceable standards.

- F. Airflow measuring station shall be manufactured by Ebtron, KURZ, Fluid Components and Sierra Instruments are acceptable with temperature readout and UL listing.

2.13 ELECTRICAL

- A. Each fan motor shall be wired to its respective VFD provided by fan manufacturer integral to unit. See Section 230902 and 2.1, G above for requirements.
- B. All wiring shall be 6600 volt rated type XLPE, RW90 stranded copper, enclosed in conduit run internal to the unit. All junction boxes shall be CSA approved. Three phase loads to be color coded for phase matching.
- C. All unit VFD's shall be wired to a surface or recessed mounted vestibule electrical panel for a single point three phase power connection provided by Division 26. Control panel shall be NEMA Type 3R enclosure with a single hinged access door. The control panel shall include:
1. Non-fused main disconnect switch, lockable in the off position
 2. Dual element fuses
 3. Distribution block
- D. All wiring shall be numbered, and all remote connection terminals and components in the control panel shall be identified by tag suitable attached. Wiring diagram shall be provided for each unit showing all components, wire number and remote connection terminals.
- E. Electrical wiring for lighting and power supply to fan motors shall be run in separate conduits internal to the unit. No external conduit runs are permitted. If the unit requires section splits, junction boxes shall be furnished at each section to allow the electrical contractor to make final connections in the field. Wiring to be clearly labeled at junction points to facilitate reconnection. Air handler manufacturer shall allow a minimum 1.5" clearance above the entire width of each interior bulk headers (coils, filters, fan blank-off, etc.) for field-wiring of any 110v or 24v runs internally to the unit as required by the controls contractor and reduce the number penetrations of the exterior panels.
- F. All electrical wiring and components shall be installed to conform to NEC and UL listing requirements. Provide a UL or ETL listing and label for the entire air handler.

2.14 LIGHTS

- A. Provide vapor-proof marine grade lights with protective metal cage, sealed glass enclosure and 150-watt compact florescent light for each section containing an access door and for unit vestibule. Duplex receptacles shall be installed at the light switch at each fan section and unit vestibule.
- B. A switch with an indicator light shall be installed on the unit controlling both lights and receptacles. Electrical power shall be 120V/1/60 and wired by fan manufacturer to a junction box in the unit vestibule for a single point one phase connection by Division 26.

2.15 AIR-TO-AIR HEAT RECOVERY

- A. The air-to-air plate exchanger shall transfer heat between outgoing and incoming air streams in cross flow arrangement. The sensible plate exchanger shall bear the AHRI Certified Product Seal and rated per AHRI Standard 1060 testing procedures.
- B. The exchanger plates shall be 99.9% per aluminum. Plates made from aluminum alloy, plastic, steel or other materials are not acceptable.
- C. The plates shall be die formed with the patented positive/negative dimple stamping that provides the Hoval Series exclusive plates profile and discontinuous channel design. Plate profile of the laminar flow design type are unacceptable.
- D. Aluminum plate thickness shall be 0.005" (0.127 mm) for the best possible effectiveness. Thicker aluminum plates shall not be acceptable.
- E. The connecting plate edges shall be multiple folded. The double fold shall provide a six fold material thickness on the leading and trailing edges of the plate exchanger and provide protection from the cutting edge of the exchanger plates within the double fold. Construction methods that use a single fold or glue at the leading and trailing edges of the exchanger are not acceptable.
- F. The air-to-air plate exchanger core shall be assembled into a strong self-supporting frame made of aluminum corner extrusions and 20-gauge galvanized steel end plates.
- G. The aluminum corner extrusions shall be hollow to accept mounting screws and shall provide a 45 degree corner support angle.
- H. The Hoval "V" Series construction: the air-to-air plate exchanger package with synthetic resin sealed corners shall be resistant to temperatures up to 194°F (90°C).
- I. The Hoval "G" Series construction option the air-to-air plate exchanger plates shall have an epoxy coated, providing protection for installation in corrosive environment. The heat exchanger package with synthetic resin sealed corners is to be resistant to temperatures up to 194°F (90°C).
- J. The air-to-air exchanger shall withstand without significant change in its performances and pressure drops, a pressure differential of at least 6" wg. It shall withstand a pressure differential at 10" wg without permanent deformation.

2.16 HUMIDIFIERS

- A. Steam Grid Humidifier:
 - 1. Manifold:
 - a. ASTM A666, Type 304 stainless steel.
 - b. Steam jacketed.
 - c. Insulated with 1/2-inch (13-mm) fiberglass and stainless-steel jacket.
 - d. Manifold shall extend the full width of unit with mounting brackets at ends.
 - 2. Steam Separator: ASTM A666, Type 304 stainless steel, with separate humidifier control valve.
 - 3. Humidifier Control Valve: Actuator: Electric modulating with spring return.
 - 4. Steam Trap: Inverted-bucket type, sized for a minimum of three times the maximum rated condensate flow of humidifier at 1/2-psig (3.4-kPa) inlet pressure.

5. Aquastat: For separate mounting on steam condensate, return piping to prevent cold operation of humidifier.
6. Strainer: In-line type.
7. Airflow Switch: To prevent humidifier operation in the absence of airflow.

B. Wet Glass Cell Washer Section:

1. 3-inch- (75-mm-) deep cells with random packed, glass-fiber media in stainless-steel frames.
2. Access Door: Watertight with brass fittings, wire glass window, and locking handles.
3. Spray Tree Assembly: Stainless-steel nozzles and stainless-steel piping.
4. Eliminator: Stainless-steel plates.
5. Tank:
 - a. Welded stainless steel, with interior and exterior surfaces blasted and painted with zinc-chromate paint.
 - b. Copper suction screen.
 - c. Drain, overflow, and suction connections.
 - d. Makeup connection with brass float valve, and with quick-fill connection.
6. Insulate exterior with duct insulation and mount on 2-inch (50-mm) thick, rigid insulation board.

C. Evaporative Humidifier Section:

1. Access Door: Watertight with brass fittings, wire glass window, and locking handles.
2. Spray Tree Assembly: Brass nozzles and galvanized piping.
3. Tank:
 - a. Welded steel tank with interior and exterior surfaces blasted and painted with zinc-chromate paint.
 - b. Copper suction screen, drain, overflow, and suction connections.
 - c. Makeup connection with brass float valve, and with quick-fill connection.
4. Insulation: Insulate with duct insulation on exterior and mount on 2-inch (50-mm) thick, rigid insulation board.

2.17 AIR-TO-AIR ENERGY RECOVERY

A. Heat Wheels:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Airxchange.
 - b. American Energy Exchange, Inc.
 - c. Loren Cook Company.
 - d. SEMCO Incorporated.
 - e. Trane; American Standard Inc.

- f. Heatex
- 2. Casing:
 - a. Steel, with manufacturer's standard paint coating.
 - b. Integral purge section limiting carryover of exhaust air to between 0.05 percent at 1.6-inch wg and 0.20 percent at 4-inch wg (0.05 percent at 400-Pa and 0.20 percent at 1000-Pa) differential pressure.
 - c. Casing seals on periphery of rotor, on duct divider, and on purge section.
 - d. Support rotor on grease-lubricated ball bearings with extended grease fittings. Mount horizontal wheels on tapered roller bearing.
- 3. Rotor: Aluminum, segmented wheel, strengthened with radial spokes, with nontoxic, noncorrosive, silica-gel desiccant coating. Construct media for passing maximum 500, 800 or 1200-micrometer solids.
- 4. Rotor: Glass-fiber Polymer segmented wheel, strengthened with radial spokes impregnated with non-migrating, water-selective, molecular-sieve desiccant coating. Construct media for passing maximum 800 or 1200-micrometer solids.
- 5. Drive: Fractional horsepower motor and gear reducer, with speed changed by variable frequency controller, and self-adjusting multilink belt around outside of rotor.
- 6. Controls:
 - a. Starting relay, factory mounted and wired, and manual motor starter for field wiring.
 - b. Retain one of first three subparagraphs below.
 - c. Variable frequency controller, factory mounted and wired, permitting input of field connected 4-20 mA or 1-10-V control signal.
 - d. Variable frequency controller, factory mounted and wired, with exhaust-air sensor to vary rotor speed and maintain exhaust temperature above freezing.
 - e. Variable frequency controller, factory mounted and wired, with exhaust- and outdoor-air sensors, automatic changeover thermostat and set-point adjuster, to vary rotor speed and maintain [exhaust temperature above freezing and] air differential temperature above set point. Provide maximum rotor speed when exhaust-air temperature is less than outdoor-air temperature.
 - f. Pilot-Light Indicator: Display rotor rotation and speed.
 - g. Speed Settings: Adjustable settings for maximum and minimum rotor speed limits.
- B. Fixed-Plate Sensible Heat Exchangers:
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 2. Basis-of-Design Product: Subject to compliance with requirements, provide [product indicated on Drawings] <Insert manufacturer's name; product name or designation> or comparable product by one of the following:
 - a. American Energy Exchange, Inc.
 - b. Des Champs Technologies.
 - c. Exothermics Inc.; a brand of Eclipse, Inc.
 - d. Nutech Brands Inc.
 - e. RenewAire LLC.

- f. Heatex.
- 3. Casing: [Aluminum] [Galvanized steel] [Enameled steel, with galvanized-steel liner] [Enameled steel].
- 4. Plates: Evenly spaced and sealed and arranged for counter airflow.
- 5. Plate Material: [Embossed aluminum] [Stainless steel] [Polypropylene copolymer (high-density plastic)].
 - a. Coatings are available for aluminum plates in corrosive atmospheres.
 - b. Plate Coating: [Epoxy] [Air-dried phenolic].
- 6. Bypass: Plenum within casing, with gasketed face-and-bypass dampers that have operating rods extended outside casing.
- 7. Water wash and detergent injection are available optional features.
- 8. Water Wash: Automatic system, with spray manifold to individual spray tubes or traversing type with stainless-steel-screw operating mechanism and electric motor drive; activated by time clock[, with detergent injection].
- 9. Heat-Exchanger Prefilters: [1 inch (25 mm) thick, disposable] [2 inches (50 mm) thick, disposable] [Medium efficiency] [Electrostatic].

C. Fixed-Plate Enthalpy Heat Exchangers:

- 1. Heat Exchanger Performance Requirements
 - a. The enthalpy plate exchanger shall transfer both sensible and latent energy between the incoming fresh air stream and the exhaust stale air stream.
 - b. The ERV core shall be in either a cross-flow or counter cross-flow orientation and have no moving parts.
 - c. The ERV core shall be certified by AHRI under its Standard 1060 for Energy Recovery Ventilators. Products not currently AHRI certified will not be accepted.
 - d. The ERV core shall achieve a minimum of 50 % total energy recovery effectiveness tested at rated flows in heating conditions to AHRI 1060-2005 standards.
 - e. The ERV Core shall have a maximum pressure drop of 0.8" wg. as tested at the rated flow to AHRI 1060-2005.
 - f. The fresh air stream must have complete separation from the stale air stream to prevent cross contamination.
 - g. The ERV core shall have a 0% Exhaust Air Transport Ratio as tested to AHRI 1060-2005 (EATR) to prevent cross-over of gases, contaminants or odors.
 - h. The ERV core shall inhibit mold and bacteria growth as tested to Standard AATCC 30 with 100% surface inhibition on the Aspergillus mold test and 100% surface inhibition the Kirby Bauer Staphylococcus bacteria test.
 - i. The ERV core must be able to tolerate freezing temperatures of -30°C and not have an increase in EATR or decrease in performance after being frozen.
 - j. The ERV core must be able to tolerate high temperatures of +60°C and not have an increase in EATR or decrease in performance at these elevated temperatures.
 - k. The ERV core must be water washable to remove dust and contaminants.
 - l. The ERV core must be flame proof and comply with UL 723 with a flame spread index that shall not be over 25 and a smoke index that shall not be over 50

2. Frame and Inspection Requirements
 - a. The ERV shall have a frame consisting of 5052 series aluminum end plates and aluminum alloy 6063 extruded side rails.
 - b. Provide removable panels for inspection and cleaning of the heat transfer surface on the dirty air side without dismantling the system.
3. Heat-Exchanger Prefilters: 2 inches (50 mm) thick, disposable Medium efficiency
4. Manufacturer: dPoint Technology or approved equal.

2.18 ELECTRICAL HEATING COIL

- A. Testing Agency Listing and Labeling: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. Refer to schedule on drawings for voltage, capacity and staging.
- B. Coil Assembly: Comply with UL 1995.
- C. Heating Elements: Type A coiled resistance wire of 80 percent nickel and 20 percent chromium.
 1. Open Coil: Coils shall be machine crimped into stainless steel terminals extending at least 1" into the air stream and all terminal hardware shall be stainless steel. Coils shall be supported by ceramic bushings staked into supporting brackets. Maximum brackets spacing not to exceed 4-1/2" apart.
 2. Finned Tubular: Heating elements shall be finned tubular Type A resistance wire, precisely centered in a stainless steel tube and filled with granular magnesium oxide. The entire assembly is to be compacted to maximize both the heat transfer and dielectric properties of the magnesium oxide. After compacting the tube must be a minimum of 0.475" O.D. to provide sufficient insulation for operation up to 600 volts. A corrugated stainless steel fin is to be wrapped around the tube to increase its heat transfer surface. Both straight and U-bent elements are to be furnished with mounting flanges, making them individually removable from the terminal box. Element support brackets are not to be spaced more than 36" apart.
- D. High-Temperature Coil Protection: Disk-type, automatically reset, thermal-cutout, safety device; serviceable through terminal box without removing heater from duct or casing.
- E. Secondary Protection: Load-carrying, manually reset or manually replaceable, thermal cutouts; factory wired in series with each heater stage.
- F. Frames: Galvanized-steel channel frame, minimum 0.052 inch (1.3 mm) thick for flanged mounting.
- G. Control Panel: Unit mounted terminal box shall be NEMA-1, or NEMA-4 type construction when mounted exposed to weather, with disconnecting means and overcurrent protection. Include the following control features:
 1. Magnetic contactor.
 2. Mercury contactor.
 3. Toggle switches; one per step.
 4. Step controller.
 5. Time-delay relay.
 6. Pilot lights; one per step.

7. Airflow proving switch.

H. Manufacturers: Indeeco, Chromalox, Brasch, Dunham-Bush, Trane or equal.

2.19 AIR LEAKAGE TESTING

A. Before shipment the unit manufacturer shall factory pressure test (positive pressure) each air handling unit to ensure the leakage rate of the casing does not exceed 1.0% of the unit air flow at 1.5 times the rated static pressure. Testing shall be done on one unit of each type.

B. The test shall be conducted in accordance with SMACNA duct construction manual. A calibrated orifice shall be used to measure leakage airflow.

2.20 SOUND POWER LEVELS

A. Air handling unit sound power levels shall be submitted for review. Sound power data shall be given at the supply connections, return connections, outside air connections, and exhaust air connections in addition to radiated sound power from the cabinet. Raw fan sound power data shall be derived from testing on the identical fans as used in the units. Data extrapolated from different fans is not acceptable.

B. Attenuation assumed for cabinet configuration, type of insulation, opening location and sizes shall be verified through actual test measurements. Sound power data is tested at the factory by an acoustical engineer in complete accordance with ARI 260-2001, "Sound Rating of Ducted Air Moving and Conditioning Equipment". These test reports will be submitted to the Architect before units ship from the factory.

C. When operating at the maximum design capacities, the tested sound power values shall not exceed the values scheduled in the following table.

Table 1: Maximum Allowable Sound Power Values per ARI 260 in dB re 1 picowatt

Unit ID	Source	Test	63	125	250	500	1K	2K	4K	8K
		ARI 260								
		ARI 260								
		ARI 260								
		ARI 260								

D. Fans to be tested in complete accordance with AMCA 300-1996, "Reverberant Room Method for Sound Testing of Fans", in a testing laboratory certified by AMCA to perform the test for both 210 performance and 300 sound. When operating at the maximum design capacities, the tested sound power values shall not exceed the values scheduled in the following table.

Table 2: Casing Radiated Maximum Allowable Sound Power Values per AMCA 300 in dB re 1 picowatt

Fan ID	Fan Type	63	125	250	500	1K	2K	4K	8K

PART 3 EXECUTION

3.01 EXAMINATION

- A. Install in accordance with manufacturer's instructions.
- B. Examine site to verify if site is ready to receive work. Provide a layout drawing of air handler and fan locations to electrical installer.
- C. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.
- D. Examine roughing-in for piping systems and electrical services to verify actual locations of connections before installation.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Air Handler Mounting:
 1. Base Mounted: Install air-handling units on equipment base as described and specified elsewhere
 - a. Concrete: Comply with requirements for equipment bases and foundations specified in Division 03.
 - b. If return fans are configured to drawing inlet air from a raised curb, curb access must be provided for field installation and service of measuring devices and smoke detectors.
 2. Suspended Mounting: Suspend and brace units from structural-steel support frame using threaded steel rods and spring hangers.
 3. Vibration Isolators: Comply with requirements of 23 05 48 Vibration Isolation.
 4. Seismic Restraints: Comply with requirements for 23 05 49 Seismic Restraint.
 5. Arrange installation of units to provide access space around air-handling units for service and maintenance.
 6. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.

7. Install filter-gage, static-pressure taps upstream and downstream of filters. Mount filter gages on outside of filter housing or filter plenum in accessible position. Provide filter gages on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

3.03 CONNECTIONS

- A. Coordinate piping installations and specialty arrangements with schematics on Drawings and with requirements specified in piping systems. If Drawings are explicit enough, these requirements may be reduced or omitted.
- B. Comply with requirements for piping specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- C. Install piping adjacent to air-handling unit to allow service and maintenance.
- D. Mount interior unit on vibration isolation springs.
- E. Mount rooftop unit on:
 1. Seismically restrained spring vibration isolation curb. Install with top surface of roof mounting frame level.
 2. Or, factory built roof mounting frame where vibration will not be perceptible to occupants. Install with top surface of roof mounting frame level.
- F. Install 3" flexible duct connection at inlets and outlets of units.
- G. Connect piping with flexible connectors.
- H. Connect condensate drain pans using ASTM B88, Type M or Type L copper tubing as shown on plumbing drawings and specifications. Extend to nearest roof receptor, floor sink, or floor drain. Construct deep trap at connection to drain pan and install cleanouts at changes in direction.
- I. Hot- and Chilled-Water Piping: Comply with applicable requirements in Section 23 21 13 - HVAC Piping, Valves and Specialties. Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.
- J. Steam and Condensate Piping: Comply with applicable requirements in Section 23 21 13 - HVAC Piping, Valves and Specialties. Install shutoff valve at steam supply connections, float and thermostatic trap, and union or flange at each coil return connection. Install gate valve and inlet strainer at supply connection of dry steam humidifiers, and inverted bucket steam trap to condensate return connection.
- K. Refrigerant Piping: Comply with applicable requirements in Section 23 23 00 Refrigerant Piping Systems. Install shutoff valve and union or flange at each supply and return connection.
- L. Coordinate duct installations and specialty arrangements with schematics on Drawings and with requirements specified in Section 23 31 13 - Air Distribution.
- M. Connect duct to air-handling units with flexible connections. Comply with requirements in Section 23 31 13 - Air Distribution.
- N. Control installers shall install all wiring associated with control signals into the air handlers.

- O. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
- P. Airflow measuring arrays installed in fan inlet volutes must be designed to withstand velocities encountered in this location. Mounting system is to be warranted against failure and consequent fan damage.

3.04 START-UP SERVICES

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, fill coils with water, and test coils and connections for leaks.
 - 2. Charge refrigerant coils with refrigerant and test for leaks.
 - 3. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 4. Automatic-Roll-Filter Operational Test: Operate filters to demonstrate compliance with requirements. Test for leakage of unfiltered air while system is operating.
 - 5. HEPA-Filter Operational Test: Pressurize housing to a minimum of 3-inch wg (750 Pa) or to designed operating pressure, whichever is higher; test housing joints, door seals, and sealing edges of filter with soapy water to check for air leaks.
 - 6. HEPA-Filter Operational Test: Pressurize housing to a minimum of 3-inch wg (750 Pa) or to designed operating pressure, whichever is higher; test housing joints, door seals, and sealing edges of filter for air leaks according to ASME N510, pressure-decay method.
 - 7. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.
- D. Prepare test and inspection reports.

3.05 STARTUP SERVICE

- A. Perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Verify that shipping, blocking, and bracing are removed.
 - 3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
 - 4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
 - 5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
 - 6. Verify that zone dampers fully open and close for each zone.
 - 7. Verify that face-and-bypass dampers provide full face flow.

8. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
 9. Comb coil fins for parallel orientation.
 10. Verify that proper thermal-overload protection is installed for electric coils.
 11. Install new, clean filters.
 12. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.
- B. Starting procedures for air-handling units include the following:
1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace sheaves, fan pulleys and motor pulleys as required to achieve design conditions.
 2. Measure and record motor electrical values for voltage and amperage.
 3. Manually operate dampers from fully closed to fully open position and record fan performance.
- C. ADJUSTING
1. Adjust damper linkages for proper damper operation.
 2. Comply with requirements in Section 23 05 93 Testing, Adjusting and Balancing.
- D. CLEANING
1. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.
- E. DEMONSTRATION
1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.
- 3.06 AIR HANDLING UNIT CONFORMANCE
- A. Manufacturer representative shall complete the following table and provide a copy with each submittal package to assure conformance to specifications:
- B. Air Handler COMPLIANCE Checklist:

AIR HANDLER PERFORMANCE	
Manufacturer	
Dimensions (LxWxH inches)	
Operating Weight (LBS)	
Total Air Flow (CFM)	
System Supply Air Static Pressures (in. wg.)	
External Supply Ductwork	
Discharge Loss	
Cooling Coil	
Clean Filters	
Dirty Filter Allowance	
Damper/Louver/Fitting Loss	
Total Supply Fan Static	
Systems Return Air Static Pressures (in. wg.)	
External Return Air Static Pressure	
Entrance Loss	
Internal Louver/Damper/Fitting Loss	
Total Return Fan Static	
SUPPLY FAN PERFORMANCE	
Supply Fan BHP	
Supply Fan HP	
Supply Fan RPM	
Supply Fan Efficiency	
Direct Drive Plenum Fans	Yes or No

Fan Arrangement	
Pressure Class	
Aluminum Construction	Yes or No
Bearings (L 10/200000 hours)	Yes or No
Fans selected at rated motor RPM	Yes
RETURN FAN PERFORMANCE	
Return Fan BHP	
Return Fan HP	
Return Fan RPM	
Return Fan Efficiency	
Direct Drive Plenum Fans	Yes or No
Fan Arrangement	
Pressure Class	
Aluminum Construction	Yes or No
Bearings (L 10/200000 hours)	Yes or No
Fans selected at rated motor RPM	Yes
COIL PERFORMANCE	
Total Capacity (MBH)	
Sensible Capacity (MBH)	
Face Velocity (FPM)	
GPM	
Water Pressure Drop (ft. H ₂ O)	
Coils/Fins per Inch/Rows	
Tube Size (inches)	
Tube thickness (inches)	

Tube return bend thickness (inches)	
Coils have 16 ga 304 SS	Yes or No
Drain pans are 304 SS	Yes or No
Coil blank offs are 304 SS	Yes or No
CABINET CONSTRUCTION	
Structural Steel Channel base	Yes or No
Tubular steel base	Yes or No
Can vary base height	Yes or No
Structural steel channel cross support	Yes or No
Formed channel cross support	Yes or No
Cross support max spacing	
Thermal break at joints	Yes or No
Outer steel (gauge)	
Solid inner steel (gauge)	
Insulation (wall/floor thickness) (inches)	
Standing seam construction	Yes or No
Welded frame construction	Yes or No
Bolted construction	Yes or No
Sheet metal screw construction	Yes or No
Standing seam roof with seam cleats	Yes or No
Roof attachment external to unit casing	Yes or No
Outdoor-pitched roof	Yes or No
Access door locations as required	Yes or No
Double seals on doors	Yes or No
Latches per door (number)	
Adjustable door hinges	Yes or No

Adjustable door latches	Yes or No
Access doors open against static pressure	Yes or No
Door safety "Kill" switches	Yes or No
Polyurethane paint	Yes or No
Vents and drains extended to outside cabinet	Yes or No
Cabinet Sounds data for inlet & outlet	
Supply connection at 125 & 1000 hz (db)	
Return connection at 125 & 1000 hz (db)	
Economizer has min/max dampers	Yes or No
Dampers sizing (maximum fpm)	
Outside air louver sizing (maximum fpm)	
Exhaust air louver sizing (maximum fpm)	
Exterior hoods	Yes or No
ADDITIONAL UNIT FEATURES	
Marine lights with GFI	Yes or No
Fan screen enclosures	Yes or No
Min OSA air flow station	Yes or No
Airflow stations on each fan	Yes or No
Motor removal rails	Yes or No
Bellmouth outlet	Yes or No
Roof curb	Yes or No
TEFC premium efficiency motors	Yes or No
Shaft grounding factory mounted on motors	Yes or No
Variable Frequency Drive (VFD) manufacturer	

VFD's are factory mounted & wired (UL508)	Yes or No
Data sheets for VFD's	Yes or No
Filters are size and type specified	Yes or No
Filter frames are face load type 8	Yes or No
Two filter gages (one per filter bank)	Yes or No
Weather covers for filter gages	Yes or No
Data sheets for filters	Yes or No
Data sheets for air flow stations	Yes or No
PROVIDE DETAILS	
Base/floor construction	Yes or No
Casing/cabinet construction	Yes or No
Access doors	Yes or No
Door hinges and latches	Yes or No
Fan curves	Yes or No
Pressure losses (including internal/external loss)	Yes or No
Sound data for inlet/outlet	Yes or No
Electrical wiring diagram	Yes or No
Vibration isolation detail	Yes or No
Coil construction	Yes or No
VFD mounting details	Yes or No
MANUFACTURER CAPABILITIES	
Fan Wheel Manufacturer	
Coil Manufacturer	
Dampers Manufacturer	

Louver Manufacturer	
Isolator Manufacturer	
Have a certified UL508 electrical shop	Yes or No
ARI certified for coils	Yes or No
Coil Testing Capabilities	Yes or No
AMCA certified for blowers	Yes or No
UL-508	Yes or No
AMCA 210 accredited lab	Yes or No
AMCA 300 accredited lab	Yes or No
Ability to perform leak tests	Yes or No
UL-508 compliance	Yes or No
Unit ETL or UL listing	Yes or No

SECTION 23 74 13

PACKAGED HVAC UNITS (UP TO 25 TONS)

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Packaged unit
 - 2. Controls and control connections
 - 3. Electrical power connections
 - 4. Roof mounting frame and base

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230593: Testing, Adjusting and Balancing
- C. Section 230700: Mechanical Insulation
- D. Section 233113: Air Distribution
- E. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:
 - 1. Air Movement and Control Association (AMCA):
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans
 - c. 300 - Reverberant Room Method for Sound Testing of Fans
 - d. 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data

- e. 500 - Test Method for Louvers, Dampers, and Shutters
- 2. American National Standards Institute (ANSI):
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 - Test Performance of Air Filter Units
- 3. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 210/240 – Performance Rating of Unitary Air Conditioning & Air-Source Heat Pump Equipment
 - b. 270 - Sound Rating of Outdoor Unitary Equipment
 - c. 340/360 – Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment
- 4. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 15 - Safety Code for Mechanical Refrigeration
 - b. 193 – Method of Test for Determining the Air Leakage of HVAC Equipment. All systems that move less than 3,000 cfm shall comply with less than 1.4% cabinet leakage rate.
- 5. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
- 6. National Fire Protection Association (NFPA): Provide unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
- 7. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
- 8. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL.
- 9. Minimum Efficiency: Minimum efficiencies shall meet or exceed the values listed in this specification.

1.05 PRODUCT SUBSTITUTIONS

- A. The Contractor shall certify the following items are correct when using substituted products other than those scheduled or shown on the drawings as a basis of design:
 - 1. The proposed substitution does not affect dimensions shown on drawings.
 - 2. The Contractor shall pay for changes to building design, including engineering design, detailing, structural supports, and construction costs caused by proposed substitution.
 - 3. The proposed substitution has no adverse effect on other trades, construction schedule, or specified warranty requirements.
 - 4. Maintenance and service parts available locally are readily obtainable for the proposed substitute.

- B. The Contractor further certifies function, appearance, and quality of proposed substitution are equivalent or superior to specified item.
- C. The Contractor agrees that the terms and conditions for the substituted product that are found in the contract documents apply to this proposed substitution.

1.06 SUBMITTALS

- A. **Product Data:** Submit manufacturer's technical product data for packaged units showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.
- B. **Maintenance Data:** Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 1.

1.07 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.

1.09 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 PACKAGED ROOFTOP HEATING/COOLING UNIT (UP TO 20 TONS)

- A. **General:**
 1. Outdoor rooftop mounted, electrically controlled heating and cooling unit. Unit shall discharge supply air horizontally as shown on contract drawings. Down-discharge unit are not allowed for poor acoustical performance.
 2. Unit shall be rated in accordance with ARI Standards 210, 240 and 270. Designed in accordance with UL Standard 465.
 3. Unit shall be designed to conform to ANSI/ASHRAE 15.
 4. Unit shall be UL tested and certified in accordance with ANSI Z21.47 Standards and CSA or CGA certified as a total package.
 5. Roof curb shall be designed to conform to NRCA Standards.

6. Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.
- B. Manufacturers: Carrier, Trane, Daikin, York, Lennox, Aeon, Engineered-Air.
- C. Equipment:
1. General:
 - a. Factory assembled, single piece heating and cooling unit. Contained within the unit enclosure shall be all factory wiring, piping, controls, refrigerant charge (R-410A) and special features required prior to field start-up.
 2. Unit Cabinet:
 - a. Unit cabinet shall be constructed of galvanized steel, bonderized and coated with a pre-painted baked enamel finish on all externally exposed surfaces.
 - b. Insulation: See Table below.
 - c. Cabinet panels shall be easily removable for servicing. See Table below.
 - d. Filters will be accessible through a hinged access door, and will require no panel or screw removal.
 - e. Holes shall be provided in the base rails for rigging shackles to facilitate maneuvering and overhead rigging.
 - f. Unit shall have a factory installed internal condensate drain trap made of a non-corrosive material, providing a minimum 3/4" connection.
 3. Fans:
 - a. Indoor blower (evaporator fan):
 - 1) Fan shall be direct or belt driven as specified here (See matrix below). If belt driven the drive shall include an adjustable pitch motor pulley.
 - 2) Bearings shall be sealed, permanently lubricated ball bearing type for longer life and lower maintenance.
 - b. Indoor blower shall be made from steel with a corrosion resistant finish and shall be dynamically balanced.
 - c. Outdoor (condenser) fan shall be of the direct driven propeller type and shall discharge air vertically upward.
 4. Compressor:
 - a. Fully hermetic type, internally protected.
 - b. Factory rubber shock mounted and internally spring mounted for vibration isolation.
 - c. Equipped with a factory installed crankcase heater to minimize liquid refrigerant accumulation in compressor during shutdown and prevent refrigerant dilution of oil.
 5. Coils:
 - a. Evaporator and condenser coils shall have fins mechanically bonded to seamless tubes with all joints brazed.
 - b. Tube sheet openings shall be belled to prevent tube wear.
 - c. Evaporator coil shall be of the full-face active design, degreased at the factory.
 6. Heating Section:
 - a. Gas Heating Section:

- 1) Induced draft combustion type with intermittent direct spark ignition system and redundant main gas valve.
 - 2) Heat exchanger: See matrix below.
 - 3) All gas piping shall enter the unit cabinet at a single location.
- b. Electric Heating Section:
- 1) The rooftop unit shall include an electrical resistance heating coil section. The electric heating coil module shall be factory installed downstream of the supply air fan in the heating section of the rooftop unit.
 - 2) Heating elements shall be constructed of a low watt density, nickel - chromium alloy resistance wire with intermediate supports that include ceramic bushings. The electrical relay contactors shall be of the full line-breaking type with all the electrical power legs being disconnected when the contactors are not energized. All electrical circuit wiring shall be designed with copper conductors, aluminum wires are not acceptable. Heating element branch circuits shall be individually fused to a maximum of 48 Amps per NEC requirements. The rooftop unit shall have a single point power connection. The power supply for the electric heater shall be factory wired into the unit's main power block or disconnect switch.
 - 3) The heating modules shall have an automatic reset, high temperature limit safety protection. A secondary high limit protection shall also be provided that requires a manual reset. An airflow switch shall be provided with the heating module to prevent the electric heater from operating in the event of no airflow.
 - 4) The electric heater elements shall be controlled by the factory installed DDC unit control system. Control shall be per the matrix below.
 - 5) Field installed heating modules shall require a field ETL certification. Duct heaters mounted within the rooftop unit in the field shall not be acceptable. The manufacturer's rooftop unit ETL certification shall cover the complete unit including the electric heating modules.
- c. Heat Pump Heating Section:
- 1) The evaporator coil, condenser coil, compressors and refrigerant circuit shall be designed for heat pump operation. The refrigerant circuit shall contain a 4 way reversing valve for the heat pump operation. The outdoor coil shall have an electronic expansion valve to control the refrigerant flow. The unit controller shall modulate the expansion valve to maintain compressor operation within the compressor operational envelope.
 - 2) The refrigerant system shall have a pump-down cycle.
 - 3) The unit shall have a natural gas furnace for hybrid heating. When the heat pump operation cannot maintain the discharge air temperature setpoint the natural gas furnace shall temper the airstream to the discharge air temperature setpoint.
 - 4) The unit shall have an electric resistance heating coil for auxiliary heating. When the heat pump operation cannot maintain the discharge air temperature setpoint the electric heating coil shall temper the airstream to the discharge air temperature setpoint.
7. Refrigerant Components: Refrigerant circuit components shall include:
- a. Refrigerant feed system.
 - b. Filter drier.

- c. Service gauge connections on suction, discharge and liquid lines.
8. Filter Section:
- a. Standard filter section shall consist of factory installed low velocity, disposable filters of commercially available sizes.
 - b. Filter face velocity shall not exceed 500 fpm at nominal airflows.
9. Controls and Safeties:
- a. Unit Controls: Unit shall be complete with self-contained low voltage control circuit protected by a manually resettable circuit breaker.
 - b. Fault Detection and Diagnostics: Provide an on-board fault detection and diagnostics system capable of identifying specific faults including alarm for low refrigerant charge, failed economizer function.
 - c. Safeties:
 - 1) Unit shall incorporate a solid state compressor protector which provides reset capability at the space thermostat, should any of the following standard safety devices trip and shut off compressor:
 - (a) Compressor over temperature, overcurrent.
 - (b) Loss of charge/low pressure switch.
 - (c) Freezestat, evaporator coil.
 - (d) High-pressure switch.
 - 2) Gas Heating section shall be provided with the following minimum protections:
 - (a) High temperature limit switch.
 - (b) Induced draft motor centrifugal switch.
 - (c) Flame rollout switch (manual reset).
 - (d) Flame proving controls.
10. Operating Characteristics:
- a. Unit shall be capable of starting and running at 115°F ambient outdoor temperature per maximum load criteria of ARI Standard 210/240.
 - b. Compressor with standard controls shall be capable of operation down to 25°F ambient outdoor temperature.
 - c. Unit provided with fan time delay of 55 seconds to prevent cold air delivery before heat exchanger warms up.
11. Electrical Requirements: All unit power wiring shall enter unit cabinet at a single factory predrilled location.
12. Motors:
- a. Compressor motors shall be cooled by suction gas passing through motor windings and shall have line break thermal and current overload protection.
 - b. Indoor blower motor shall have permanently lubricated bearings and inherent automatic reset thermal overload protection.
 - c. Outdoor totally enclosed motor shall have permanently lubricated bearings, and inherent automatic reset thermal overload protection.

- d. Induced draft motor shall have permanently lubricated sealed bearings and inherent automatic reset thermal overload protection.
13. Small Package Rooftop Unit (1-1/2 -5 ton) Equipment Conformance List: The scheduled units within this size category shall be configured with the following selected feature options.

Small Package Rooftop Unit (1-1/2 – 5 ton)			
Equipment Requirements			
Component	Feature	Specification Options	Specified Alternative
Unit Case	Wall Construction	Single wall	X
		Double wall	
	Liner options	Foil faced insulation	X
	Insulation	1/2" Insulation	X
		1" insulation	
	Maintenance Access	Tool required	X
		Tool free	
		Hinged panels	
		Removable panels	X
	Condensate Pan	Plastic	
		Galvanized	X
Stainless			
Supply Fan	Fan Wheel Construction	Fully welded fan wheels	X
		Slot and tab wheel construction	
	Motor Type	ECM motor	
		Conventional	X
	Drive	Belt and sheaves	X
		Direct	
Relief Air	Relief provisions	Barometric damper only	X
		Prop relief fan with damper	
		Return fan	
Economizer		Fixed OSA damper	X

Small Package Rooftop Unit (1-1/2 – 5 ton)			
Equipment Requirements (Continued)			
Component	Feature	Specification Options	Specified Alternative
Compressor	Type of compressor	Scroll	X
		Digital Scroll	
		Variable speed	
Cooling Efficiency		SEER	See schedule
Evaporator	Coil Construction	Copper tubes/Aluminum fins	X
		Copper tubes/Copper fins	
		Epoxy coated Cu/Al coil	
Condenser	Coil Construction	Copper tubes/Aluminum fins	X
		Copper tubes/Copper fins	
		Coated condenser coil	
Reheat	Reheat Coil	Modulating hot gas reheat coil	
		Not required	X
Filters	Filter Type	1" filter	
		2" MERV 8 pleated filter	X
		2" MERV 13 pleated filter	
		4" MERV 13 pleated filter	
Electric Heat	Control	Step controller	
		SCR controller option	
Gas Heat	Type of Heat Exchanger (HEX)	Aluminized steel HEX	X
		Stainless HEX	
		Condensing Stainless HEX	
	Control	Stepped control	X

		Modulating control	
Hybrid Heat Pump/Gas Heat Option			
AFUE	Furnace Efficiency		See schedule

Small Package Rooftop Unit (1-1/2 – 5 ton)				
Equipment Requirements (Continued)				
Component	Feature	Specification Options	Specified Alternative	
Controls	Economizer	Full integrated 100% OSA economizer		
	Single Zone VAV controls			
	24/7 Programmable Thermostat		X	
	CO2 Sensor			
	Factory Digital Controls	Zone control by others		X
		Supply with zone control and interface panel		
	BAS Interface Options	BACnet interface		X
		LON Interface		
Smoke Detector	Provide with unit			
Electrical	Single Point Connection		X	
	Convenience outlet	Receptacle	X	

14. Medium Size Package Rooftop Unit (7-1/2 -25 ton) Equipment Conformance List: The scheduled units within this size category shall be configured with the following selected feature options.

Medium Size Package Rooftop Unit (7-1/2 -25 ton)			
Equipment Requirements			
Component	Feature	Specification Options	Specified Alternative
Unit Cabinet	Wall Construction	Single wall	X
		Double wall	
	Liner Options	Foil faced insulation	X
	Insulation	1/2" Insulation	
		1" insulation	X
	Maintenance Access	Tool required	
		Tool free	X
		Hinged panels	X
		Non-hinged panels	
	Condensate Pan	Plastic	
Galvanized		X	
Stainless			
Supply Fan	Fan Access	Slide out cassette	X
		Non-slide out	
	Fan Wheel Construction	Fully welded fan wheels	X
	Motor type	ECM motor	
		Conventional	X
	Drive	Belt and sheaves	
Direct		X	
OSA Intake	Fixed OSA		
	Economizer	Modulating dampers	X
Relief Air	Relief provisions	Barometric damper only	
		Prop relief fan with damper	X

		Return fan	
Compressor	Type of compressor	Scroll	X
		Digital Scroll	
		Variable Speed	
Cooling Efficiency		EER	See schedule
		IEER or SEER	See schedule
Evaporator	Coil Construction	Copper tubes/Aluminum fins	X
		Epoxy coated coil	
Condenser	Coil Construction	Copper tubes/Aluminum fins	X
		All aluminum coil	
		Copper tubes/Copper fins	
		Epoxy coated coil	
	Condenser fan	ECM type motor	X
		Constant speed motor	
Reheat	Reheat Coil	Modulating hot gas reheat coil	X
		Not required	
Filters	Filter type	2" MERV 8 pleated filter	X
		4" MERV 13 pleated filter	
Electric Heat	Control	Step controller	
		SCR controller option	X

Medium Size Package Rooftop Unit (7-1/2 -25 ton)				
Equipment Requirements (Continued)				
Component	Feature	Specification Options	Specified Alternative	
Gas Heat	Type of Heat Exchanger (HEX)	Aluminized steel HEX		
		Stainless HEX	X	
		Condensing Stainless HEX		
	Control	Stepped control		
		Modulating control	X	
Furnace Efficiency		See schedule		
Hybrid Heat Pump/Gas Heat Option				
HW Coil		Coil with modulating valve		
Heat Recovery		Heat wheel with filters, bypass dampers, and controls		
Controls	Economizer	Fully integrated economizer controls	X	
	Single Zone VAV			
	Full VAV Control		X	
	CO2 Sensor		X	
	OSA Monitor and controller		X	
	Heat recovery control			
	Dehumidification Control			
	Factory digital controls	Zone controls by others		X
		Equip with zone controls and unit programming panel		

	BAS interface options	BACnet interface	X
		LonTalk Interface	
	Smoke Detector	Provide with unit	X
Electrical	Single point connection		X
	Powered convenience outlet	Receptacle	X

15. Other Features and Required Equipment: Provide the following with units.

a. Roof Curb:

- 1) Formed galvanized steel with wood nailer strip and capable of supporting entire unit weight.
- 2) Seismically restrained spring isolating curb (See Section 230548 Vibration Seismic).

b. Head Pressure Control Package: Consists of solid-state control and condenser coil temperature sensor to maintain condensing temperature between 90°F and 110°F at outdoor ambient temperatures down to -20°F by either condenser fan speed modulation or condenser fan cycling.

c. LP Gas Kit: Package shall contain all the necessary hardware and instructions to convert a standard natural gas unit for use with liquefied propane gas.

d. Remote Control Panel: Panel shall be a decorative, indoor, wall mounted panel consisting of:

- 1) Two stage heat/two stage cool thermostat.
- 2) Automatic changeover.
- 3) System switch with HEAT - COOL - AUTO - OFF settings.
- 4) Fan switch with ON - AUTO settings.
- 5) Indicator lights for HEAT - COOL - FAN operation.
- 6) Three unused indicator lights for field use.

2.02 PROGRAMMABLE THERMOSTAT

A. Thermostat with 365-day programmability that allows the building occupants to program the temperature setpoints for at least four periods within 24 hours. A minimum of 5 holidays shall be programmable for up to 5 years. Daylight savings shall be provided as a standard feature in the programming calendar.

1. Manufacturers: Honeywell VisionPRO 8000 Series, Honeywell Prestige THX 9000 Series, Honeywell TB7600 Series, Venstar ColorTouch T6000 Series, EnTouch Pro/One.

B. Minimum thermostat features shall include, but not limited to, the following:

1. The thermostat shall have a touch screen and shall display both room temperature and cooling and heating setpoints simultaneously, and shall indicate when cooling or heating and what stage is energized on the main screen.

2. Programming may be accomplished at the thermostat, or via free software. The program shall have an override mode to provide comfort on demand while in an unoccupied period. The unoccupied override shall be adjustable by pushing an override button and selecting thirty minute increments, up to four hours.
 3. The setback override shall be activated by a single button, and deactivated on demand.
 4. Setpoints shall be adjustable from 35°F to 99°F, with a minimum 5°F adjustable deadband available.
 5. Dual setpoints shall be provided with the ability to individually set heating and cooling temperatures with adjustable heating and cooling setpoint limits. Initial occupied mode cooling setpoint of 75°F and heating setpoint of 70°F. Initial unoccupied mode cooling setpoint of 85°F and heating setpoint of 55°F
- C. The thermostat shall be capable of independently controlling an individual system, with up to three stages of heating and two stages of cooling, fan, and reversing valve.
1. For heat pumps an adjustable auxiliary heat lockout temperature based on outdoor temperatures shall be provided.
 2. An Emergency Heat switch will be provided on the touch screen when set in heat pump mode.
- D. The fan shall be programmable to operate continuously during occupied periods and in auto mode during unoccupied periods.
- E. Controls shall be capable of alternating compressor starting sequence with a built in lead-lag operating logic.
1. Equipment protection options shall be provided to prevent compressor short-cycling, and to limit the number of cycles per hour. These options shall be overridden for use with zoning systems.
- F. Pre-Occupancy purge cycle that energizes the fan before the programmed occupancy time, adjustable up to three (3) hours in 15-minute increments.
1. Configurable terminals shall be provided for remote indoor, remote outdoor or remote supply air temperature sensing.
- G. Multiple security levels to limit access to programming and configuration and will allow for a custom passcode. The various security levels will allow controlled access to programming, unoccupied override, and thermostat mode.
- H. All programming information, except time of day, shall reside in nonvolatile memory. During a power failure, the thermostat shall maintain its program indefinitely without the use of batteries.
- I. Wi-Fi capable and controlled through local wireless internet routers. The thermostat shall be capable of receiving an automated demand response signal from the local electrical utility, and automatically reset the cooling and heating setpoints during the demand event. When the demand event is terminated by the local electrical power utility, the thermostat will reset to normal occupied and unoccupied setpoints.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that mounting surface, e.g. roof, is ready to receive work.

- B. Verify that proper power supply is available.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Provide layout drawings of units, locations and power requirements to electrical installer.
- C. Install minimum 30% efficiency air filters in unit during installation phase. Do not operate the unit without filters in place.
- D. Mount rooftop unit on:
 - 1. Seismically restrained spring vibration isolation curb. Install with top surface of roof mounting frame level.
 - 2. Or, factory built roof mounting frame where vibration will not be perceptible to occupants. Install with top surface of roof mounting frame level.
- E. Install 3" flexible duct connection at inlets and outlets of units.
- F. Install condensate drain piping and traps in accordance with manufacturer's instructions, per local code and as shown on the drawings.
 - 1. Install manufacturer provided condensate "air-trap" where provided with each unit. Install trap per manufacturer's instructions and install condensate piping as required by local code.
- G. Control installers shall install thermostat and all wiring associated with control signals into the units.
- H. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
- I. Install a new set of filters prior to final air balance and substantial completion.

3.03 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

END OF SECTION

SECTION 23 81 23

COMPUTER ROOM AIR CONDITIONING UNITS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 GENERAL SUMMARY

- A. These specifications describe requirements for a computer room environmental control system. The system shall be designed to maintain temperature and humidity conditions in the rooms containing electronic equipment.
- B. The manufacturer shall design and furnish all equipment to be fully compatible with heat dissipation requirements of the room
- C. Section Includes:
 - 1. Floor-mounted computer-room air conditioners.
 - 2. Ceiling-mounted computer-room air conditioners.
 - 3. Console computer-room air conditioners.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Section 230500: Basic HVAC Materials and Methods
- C. Section 230900: Building Automation System (BAS) Controls
- D. Division 26: Electrical

1.04 DEFINITION

- A. BAS: Building automation system.

1.05 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Computer-room air conditioners shall withstand the effects of earthquake motions determined according to **[ASCE/SEI 7] <Insert requirement>**.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified **[and the unit will be fully operational after the seismic event].**"

1.06 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. LEED Submittals:
 - 1. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.
 - 2. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
- C. Shop Drawings: For computer-room air conditioners. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Wiring Diagrams: For power, signal, and control wiring.
- D. Color Samples: For unit cabinet, discharge grille, and exterior louver and for each color and texture specified.

1.07 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans, elevations, and other details, drawn to scale, using input from Installers of the items involved.
- B. Seismic Qualification Certificates: For computer-room air conditioners, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Field quality-control reports.
- D. Warranty: Sample of special warranty.

1.08 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For computer-room air conditioners to include in emergency, operation, and maintenance manuals.

1.09 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fan Belts: **[One]** <Insert number> set(s) for each belt-driven fan.
 - 2. Filters: **[One]** <Insert number> set(s) of filters for each unit.

1.10 QUALITY ASSURANCE

- A. **Manufacturer's Qualifications:** Provide complete computer room air conditioning units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. **Codes and Standards:** Provide air handling units conforming to the requirements of the latest addition of the following:
1. **Air Movement and Control Association (AMCA):**
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans for Rating
 - c. 300 - Reverberant Room Method for Sound Testing of Fans
 - d. 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - e. 500 - Test Method for Louvers, Dampers, and Shutters
 2. **American National Standards Institute (ANSI):**
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 - Test Performance of Air Filter Units
 3. **Air-Conditioning, Heating and Refrigeration Institute (AHRI):**
 - a. 240 - Unitary Air-Source Heat Pump Equipment
 - b. 270 - Sound Rating of Outdoor Unitary Equipment
 4. **American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):**
 - a. 15 - Safety Code for Mechanical Refrigeration
 5. **Electrical Components, Devices, and Accessories:**
 - a. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - b. **National Electrical Manufacturers Association (NEMA):** Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
 6. **National Fire Protection Association (NFPA):** Provide unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
 7. **Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA):** Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
 8. **Underwriters Laboratories, Inc. (UL):** Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL.
 9. **Minimum Efficiency:** Minimum efficiencies shall meet or exceed the values required by the local energy code.

- C. ASHRAE Compliance:
 - 1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."
 - 2. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality," Section 5 - "Systems and Equipment," Section 6 - "Ventilation Rate Procedures," and Section 7 - "Construction and Startup."
- D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.
- E. ASME Compliance: Fabricate and label water-cooled condenser shell to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.

1.11 COORDINATION

- A. Coordinate layout and installation of computer-room air conditioners and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.
- B. Coordinate installation of computer-room air conditioners with computer-room access flooring Installer.
- C. Coordinate sizes and locations of concrete bases with actual equipment provided.
- D. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.12 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 FLOOR-MOUNTED UNITS 6 TONS (21 KW) AND LARGER

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Compu-Aire, Inc.
 - 2. Liebert Corporation.
 - 3. Stulz-ATS.
- B. Description: Packaged, factory assembled, prewired, and prepiped; consisting of cabinet, fans, filters, humidifier, and controls.
- C. Cabinet and Frame: Welded steel, braced for rigidity, and supporting compressors and other mechanical equipment and fittings.
 - 1. Doors and Access Panels: Galvanized steel with polyurethane gaskets, hinges, and concealed fastening devices.

2. Insulation: Thermally and acoustically insulate cabinet interior with 1-inch- (25-mm-) thick duct liner.
 3. Finish of Interior Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
 4. Finish of Exterior Surfaces: Baked-on, textured vinyl enamel; color [**as selected from manufacturer's standard colors**] [**to match computer equipment**].
 5. Floor Stand: Welded tubular steel, <Insert required height> high, with adjustable legs and vibration isolation pads.
- D. Supply-Air Fan(s):
1. Double-inlet, forward-curved centrifugal fan(s); statically and dynamically balanced.
 2. Drive: V-belt, with steel shaft with self-aligning ball bearings and cast-iron or steel sheaves, variable- and adjustable-pitch motor sheave, minimum of two matched belts, with drive rated at a minimum of two times the nameplate rating of motor.
- E. Refrigeration System:
1. Compressors: Semihermetic reciprocating; with suction-gas-cooled, 1750-rpm motors; thermal overloads; oil sight glass; suction-line strainer; and reversible oil pumps; with[**oil strainer, internal motor overload protection,**] resilient suspension system, crankcase heater, manual-reset high-pressure switch, and pump-down low-pressure switch.
 2. Compressors: Hermetic reciprocating; with[**oil strainer, internal motor overload protection,**] resilient suspension system, crankcase heater, manual-reset high-pressure switch, and pump-down low-pressure switch.
 3. Compressors: Hermetic scroll; with[**oil strainer, internal motor overload protection,**] resilient suspension system, crankcase heater, manual-reset high-pressure switch, and pump-down low-pressure switch.
 4. Refrigeration Circuits: Two; each with hot-gas mufflers, thermal-expansion valve with external equalizer, liquid-line solenoid valve, liquid-line filter-dryer, sight glass with moisture indicator, service shutoff valves, charging valves, and charge of refrigerant.
 5. Refrigerant: [R-407C] [R-410A] <Insert type>.
 6. Refrigerant: R-407C or R-410A.
 7. Refrigerant Evaporator Coil: Alternate-row or split-face-circuit, direct-expansion coil of seamless copper tubes expanded into aluminum fins.
 - a. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
 8. Integral, Water-Cooled Refrigerant Condenser: [Shell-and-tube type fabricated and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII] [Coaxial tube-in-tube type] with liquid-line stop valve and head-pressure-actuated, [two] [three]-way regulating valve. Terminate fluid connections outside cabinet.
 - a. Cooling Medium: [**Water**] [**Glycol solution**].
 9. Remote Air-Cooled Refrigerant Condenser: Corrosion-resistant cabinet, copper-tube aluminum-fin coils arranged for two circuits, multiple direct-drive propeller fans with permanently lubricated ball bearings, and single-phase motors with internal overload protection and integral electric control panel[**and disconnect switch**]. Control capacity by [**cycling fans**] [**modulating fan speeds**] [**three-way refrigerant bypass with receiver and isolation valve**].

- F. Hydronic Cooling Coil: Seamless copper tubes expanded into aluminum fins with modulating **[two]** **[three]**-way control valve.
1. Cooling Medium: **[Water]** **[Glycol solution]**.
 2. Control Valve: Class 125 body.
 - a. Maximum Pressure Drop: **[3 psig (21 kPa)] [5 psig (35 kPa)] <Insert value>** at design flow rate.
 - b. Close-Off (Differential) Pressure Rating: 100 percent of pressure differential across valve or 100 percent of total system (pump) head.
 3. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
- G. Remote, Air-Cooled, Glycol-Solution Cooler: Corrosion-resistant cabinet, copper-tube aluminum-fin coil, multiple direct-drive propeller fans with fan guards, and single-phase motors with internal overload protection and integral electric control panel. Control capacity by cycling fans.
1. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- H. Glycol-Solution Pump Package: Weatherproof and vented enclosure of enameled, galvanized steel on structural base frame containing **[one]** **[two]** centrifugal pump(s) with mechanical seals; electrical-control cabinet with starters, lead-lag switch, automatic switchover, and alarm light.
1. Piping: Interconnecting piping, to and from remote, air-cooled, glycol-solution cooler, with shutoff valves, flow switches, check valves in pump discharge, unions, and pressurized expansion tank with air purge vent and system-charging connection.
 2. Glycol: Inhibited ethylene glycol and water solution mixed 50:50, suitable for operating temperature of minus 40 deg F (minus 40 deg C).
 3. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- I. Electric-Resistance Heating Coil: Enclosed finned-tube electric elements arranged for minimum of three stages, with thermal safety switches, manual-reset overload protection, and branch-circuit overcurrent protection.
- J. Refrigerant Heating Coil: Hot-gas coil of seamless copper tubes expanded into aluminum fins with three-way solenoid valve on first-stage refrigerant circuit.
- K. Hot-Water Heating Coil: Seamless copper tubes expanded into aluminum fins with two-way modulating control valve and strainer.
1. Control Valve: Class 125 body.
 - a. Maximum Pressure Drop: **[3 psig (21 kPa)] [5 psig (35 kPa)] <Insert value>** at design flow rate.
 - b. Close-Off (Differential) Pressure Rating: 100 percent of pressure differential across valve or 100 percent of total system (pump) head.
- L. Steam Heating Coil: Seamless copper tubes expanded into aluminum fins with two-way modulating control valve, strainer, and float-and-thermostatic trap.
1. Control Valve: Class 125 body.

- a. Maximum Pressure Drop (15-psig (103-kPa) Steam): 80 percent of inlet steam pressure.
 - b. Close-Off (Differential) Pressure Rating: 150 percent of operating (inlet) pressure.
- M. Extended-Surface, Disposable, Panel Filter: Pleated, lofted, nonwoven, reinforced cotton fabric; supported and bonded to welded-wire grid; enclosed in cardboard frame[**with 2-inch- (50-mm-) thick, disposable, glass-fiber prefilter**].
1. Thickness: [2 inches (50 mm)] [4 inches (100 mm)].
 2. Initial Resistance: **<Insert inches wg (Pa)>**.
 3. Recommended Final Resistance: **<Insert inches wg (Pa)>**.
 4. Arrestance (ASHRAE 52.1): [**90**] **<Insert number>** percent.
 5. Merv (ASHRAE 52.2): [**7**] **<Insert value>**.
- N. Infrared Humidifier: High-intensity quartz lamps mounted above stainless-steel evaporator pan, serviceable without disconnecting water, drain, or electrical connections; prepiped and using condensate water from cooling coils with stainless-steel or brass float-valve mechanism; located in bypass airstream; with flush-cycle timer and solenoid drain valve.
- O. Evaporative Pan Humidifier: Stainless-steel pan and cover, serviceable without disconnecting water, drain, or electrical connections; prepiped with stainless-steel or brass float-valve mechanism; electric-resistance heating coil; low-water-cutoff switch; flush-cycle timer; and solenoid drain valve.
- P. Electrode Steam Humidifier: Self-contained, microprocessor-controlled unit with disposable, polypropylene-plastic cylinders, and having field-adjustable steel electrodes and stainless-steel steam dispersion tube.
1. Plumbing Components and Valve Bodies: Plastic, linked by flexible rubber hosing, with water fill with air gap and solenoid valve incorporating built-in strainer, pressure-reducing and flow-regulating orifice, and drain with integral air gap.
 2. Control: Fully modulating to provide gradual 0 to 100 percent capacity with field-adjustable maximum capacity; with high-water probe.
 3. Drain Cycle: Field-adjustable drain duration and drain interval.
- Q. Integral Electrical Controls: Unit-mounted electrical enclosure with piano-hinged door, grounding lug, combination magnetic starters with overload relays, circuit breakers and cover interlock, and fusible control-circuit transformer.
- R. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- S. Electronic-Control System: Solid state, with start button, stop button, temporary loss of power indicator, manual-reset circuit breakers, temperature control, humidity control, and monitor panel.
1. Monitor Panel: Backlighted, with no visible indicator lights until operating function is activated; indicators include cooling, humidification, loss of airflow, change filters, high temperature, low temperature, high humidity, low humidity, high head pressure (each compressor), and low suction pressure (each compressor).
 2. Temperature- and Humidity-Control Modules: Solid state, plug-in; with adjustable set point, push-to-test calibration check button, and built-in visual indicators to show mode of operation.

3. Location: Behind hinged door in front of unit; isolated from conditioned airstream to allow service while system is operating.
- T. Microprocessor-Control System: Continuously monitors operation of process cooling system; continuously displays room temperature and room relative humidity; sounds alarm on system malfunction and simultaneously displays problem. If more than one malfunction occurs, system displays fault in sequence with room temperature and continues to display fault when malfunction is cleared until system is reset.
1. Malfunctions:
 - a. Power loss.
 - b. Loss of airflow.
 - c. Clogged air filter.
 - d. High room temperature.
 - e. Low room temperature.
 - f. High humidity.
 - g. Low humidity.
 - h. Smoke/fire.
 - i. Water under floor.
 - j. Supply fan overload.
 - k. Compressor No. 1 - Overload.
 - l. Compressor No. 1 - Low Pressure.
 - m. Compressor No. 1 - High Pressure.
 - n. Compressor No. 2 - Overload.
 - o. Compressor No. 2 - Low Pressure.
 - p. Compressor No. 2 - High Pressure.
 2. Digital Display:
 - a. Control power on.
 - b. Humidifying.
 - c. Dehumidifying.
 - d. Compressor No. 1 - Operating.
 - e. Compressor No. 2 - Operating.
 - f. Heat operating.
 - g. Economy cooling.
 3. Push buttons shall stop and start process cooling system, silence audible alarm, test indicators, and display room's relative humidity.
 4. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display unit status and alarms.

Retain first subparagraph below if interface with the BAS is through hardwired points and minimal interface is required.

- a. Hardwired Points:

- 1) Monitoring: On-off status, [common trouble alarm] [space temperature] [space relative humidity] <Insert monitoring point>.
 - 2) Control: On-off operation, [space temperature set-point adjustment] [space relative humidity set-point adjustment] <Insert control point>.
- b. **[ASHRAE 135 (BACnet)] [LonTalk] [Modbus] [Industry-accepted, open-protocol] <Insert type of interface>** communication interface with the BAS shall enable the BAS operator to remotely control and monitor the unit from an operator workstation. Control features and monitoring points displayed locally at unit control panel shall be available through the BAS.

2.02 FLOOR-MOUNTED UNITS 5 TONS (18 KW) AND SMALLER

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Compu-Aire, Inc.
 2. Liebert Corporation.
 3. Stulz-ATS.
- B. Description: Self-contained, factory assembled, prewired, and prepiped; consisting of cabinet, fan, filters, and controls; for vertical floor mounting in upflow or downflow configuration.
- C. Cabinet and Frame: Welded tubular-steel frame with removable steel panels with baked-enamel finish, insulated with 1-inch- (25-mm-) thick duct liner.
1. Floor Stand: Welded tubular steel, <Insert required height> high, with adjustable legs and vibration isolation pads.
 2. Finish of Interior Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- D. Supply-Air Fan: Forward curved, centrifugal, and with adjustable V-belt drive.
- E. Refrigeration System:
1. Compressor: Hermetic, with oil strainer, internal motor overload protection, resilient suspension system, and crankcase heater.
 2. Refrigeration Circuit: Low-pressure switch, manual-reset high-pressure switch, thermal-expansion valve with external equalizer, sight glass with moisture indicator, service shutoff valves, charging valves, and charge of refrigerant.
 3. Refrigerant: [R-407C] [R-410A] <Insert type>.
 4. Refrigerant: R-407C or R-410A.
 5. Refrigerant Evaporator Coil: Direct-expansion coil of seamless copper tubes expanded into aluminum fins, with two circuits, each with solenoid valve.
 - a. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
 6. Integral, Water-Cooled Refrigerant Condenser: Brazed-plate type with liquid-line stop valve and head-pressure-actuated, two-way regulating valve.
 - a. Cooling Medium: **[Water] [Glycol solution]**.

7. Remote Air-Cooled Refrigerant Condenser: Integral, copper-tube aluminum-fin coil with **[propeller]** **[centrifugal]** fan, **[direct]** **[belt]** driven.
 8. Split system shall have suction- and liquid-line compatible fittings and refrigerant piping for field interconnection.
- F. Hydronic Cooling Coil: Seamless copper tubes expanded into aluminum fins with modulating three-way control valve.
1. Cooling Medium: **[Water]** **[Glycol solution]**.
 2. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
- G. Remote Air-Cooled, Glycol-Solution Cooler: Corrosion-resistant cabinet, copper-tube aluminum-fin coil, direct-drive propeller fan with fan guards, and single-phase motors with internal overload protection.
1. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- H. Glycol-Solution Pump Package: Weatherproof and vented enclosure of enameled, galvanized steel on structural base frame containing centrifugal pump with mechanical seal.
1. Piping: Interconnecting piping, from suction to discharge, with shutoff valves, flow switches, unions, and pressurized expansion tank with air purge vent and system-charging connection.
 2. Glycol: Inhibited ethylene glycol and water solution mixed 50:50, suitable for operating temperature of minus 40 deg F (minus 40 deg C).
 3. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- I. Electric-Resistance Heating Coil: Finned-tube electric elements with contactor and high-temperature-limit switches.
- J. Filter: 2-inch- (50-mm-) thick, disposable, glass-fiber media.
1. Initial Resistance: **<Insert inches wg (Pa)>**.
 2. Recommended Final Resistance: **<Insert inches wg (Pa)>**.
 3. Arrestance (ASHRAE 52.1): **[90]** **<Insert number>** percent.
 4. Merv (ASHRAE 52.2): **[7]** **<Insert value>**.
- K. Infrared Humidifier: High-intensity quartz lamps mounted above stainless-steel evaporator pan, serviceable without disconnecting water, drain, or electrical connections; prepiped and located in bypass airstream; with flush-cycle timer and solenoid drain valve.
- L. Electrode Steam Humidifier: Self-contained, microprocessor-controlled unit with disposable, polypropylene-plastic cylinders and having field-adjustable steel electrodes and stainless-steel steam dispersion tube.
1. Plumbing Components and Valve Bodies: Plastic, linked by flexible rubber hosing, with water fill with air gap and solenoid valve incorporating built-in strainer, pressure-reducing and flow-regulating orifice, and drain with integral air gap.
 2. Control: Fully modulating to provide gradual 0 to 100 percent capacity with field-adjustable maximum capacity; with high-water probe.

3. Drain Cycle: Field-adjustable drain duration and drain interval.

M. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.

N. Control System: Unit-mounted panel with main fan contactor, compressor contactor, compressor start capacitor, control transformer with circuit breaker, solid-state temperature- [**and humidity**]-control modules[, **humidity contactor**], time-delay relay, heating contactor, and high-temperature thermostat. Provide solid-state, wall-mounted control panel with start-stop switch[, **adjustable humidity set point**,] and adjustable temperature set point.

2.03 CEILING-MOUNTED UNITS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Compu-Aire, Inc.
2. Liebert Corporation.
3. Stulz-ATS.

B. Description: Self-contained, factory assembled, prewired, and prepiped; consisting of cabinet, fan, filters, and controls; for horizontal ceiling mounting to fit T-bar ceiling opening of 24 by 48 inches (610 by 1220 mm).

C. Cabinet: Galvanized steel with baked-enamel finish, insulated with 1/2-inch- (13-mm-) thick duct liner.

1. Integral factory-supplied supply and return grille to fit ceiling grid kit of 24 by 48 inches (610 by 1220 mm), with filter.
2. Finish of Interior Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

D. Supply-Air Fan: Forward curved, centrifugal, and directly driven by two-speed motor.

E. Refrigeration System:

1. Compressor: Hermetic, with oil strainer, internal motor overload protection, resilient suspension system, and crankcase heater.
2. Refrigeration Circuit: Low-pressure switch, manual-reset high-pressure switch, thermal-expansion valve with external equalizer, sight glass with moisture indicator, service shutoff valves, charging valves, and charge of refrigerant.
3. Refrigerant: [R-22] [R-407C] [R-410A] <Insert type>.
4. Refrigerant: R-407C or R-410A.
5. Refrigerant Evaporator Coil: Direct-expansion coil of seamless copper tubes expanded into aluminum fins.
 - a. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
6. Integral, Water-Cooled Refrigerant Condenser: [**Coaxial, counterflow, tube-in-tube**] [**Brazed-plate**] type with liquid-line stop valve and head-pressure-actuated, water-regulating valve.

- a. Cooling Medium: **[Water] [Glycol solution]**.
 7. Remote Air-Cooled Refrigerant Condenser: Integral, copper-tube aluminum-fin coil with **[propeller] [centrifugal]** fan, direct driven.
 8. Split system shall have suction- and liquid-line compatible fittings and refrigerant piping for field interconnection.
- F. Hydronic Cooling Coil: Seamless copper tubes expanded into aluminum fins with two-way control valve.
1. Cooling Medium: **[Water] [Glycol solution]**.
 2. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
- G. Remote, Air-Cooled, Glycol-Solution Cooler: Corrosion-resistant cabinet, copper-tube aluminum-fin coil, direct-drive propeller fan with fan guards, and single-phase motors with internal overload protection.
- H. Glycol-Solution Pump Package: Weatherproof and vented enclosure of enameled, galvanized steel on structural base frame containing centrifugal pump with mechanical seal.
1. Piping: Interconnecting piping, to and from remote, air-cooled glycol-solution cooler, with shutoff valves, flow switches, unions, and pressurized expansion tank with air purge vent and system-charging connection.
 2. Glycol: Inhibited ethylene glycol and water solution mixed 50:50, suitable for operating temperature of minus 40 deg F (minus 40 deg C).
- I. Electric-Resistance Heating Coil: Finned-tube electric elements with contactor, dehumidification relay, and high-temperature-limit switches.
- J. Filter: 1-inch- (25-mm-) thick, disposable, glass-fiber media.
1. Initial Resistance: **<Insert inches wg (Pa)>**.
 2. Recommended Final Resistance: **<Insert inches wg (Pa)>**.
 3. Arrestance (ASHRAE 52.1): **[90] <Insert number>** percent.
 4. Merv (ASHRAE 52.2): **[7] <Insert value>**.
- K. Atomizing Humidifier: Centrifugal atomizer with stainless-steel pan, demister pad, and solenoid valve.
- L. Electrode Steam Humidifier: Self-contained, microprocessor-controlled unit with disposable, polypropylene-plastic cylinders, and having field-adjustable steel electrodes and stainless-steel steam dispersion tube.
1. Plumbing Components and Valve Bodies: Plastic, linked by flexible rubber hosing, with water fill with air gap and solenoid valve incorporating built-in strainer, pressure-reducing and flow-regulating orifice, and drain with integral air gap.
 2. Control: Fully modulating to provide gradual 0 to 100 percent capacity with field-adjustable maximum capacity; with high-water probe.
 3. Drain Cycle: Field-adjustable drain duration and drain interval.
- M. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.

- N. Control System: Unit-mounted panel with main fan contactor, compressor contactor, compressor start capacitor, control transformer with circuit breaker, solid-state temperature- [**and humidity**]-control modules[, **humidity contactor**], time-delay relay, heating contactor, and high-temperature thermostat. Provide solid-state, wall-mounted control panel with start-stop switch[, **adjustable humidity set point**,] and adjustable temperature set point.

2.04 CONSOLE UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Compu-Aire, Inc.
 2. Liebert Corporation.
 3. Stulz-ATS.
- B. Description: Split system consisting of evaporator section for floor or wall mounting and remote condensing section.
- C. Evaporator Cabinet: Furniture-grade steel with baked-enamel finish; with front access and containing direct-drive centrifugal fans and two-speed motor.
1. Finish of Interior Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- D. Condenser Cabinet: Steel with baked-enamel finish and containing compressor and condenser.
- E. Refrigeration System:
1. Compressor: Hermetic, with oil strainer, internal motor overload protection, resilient suspension system, and crankcase heater.
 2. Refrigeration Circuit: Filter/dryer, manual-reset high-pressure switch, thermal-expansion valve with external equalizer, sight glass with moisture indicator, service shutoff valves, charging valves, and charge of refrigerant.
 3. Refrigerant: [R-407C] [R-410A] <Insert type>.
 4. Refrigerant: R-407C or R-410A.
 5. Refrigerant Evaporator Coil: Direct-expansion coil of seamless copper tubes expanded into aluminum fins.
 - a. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].
 6. Integral, Water-Cooled Refrigerant Condenser: [**Coaxial, counterflow, tube-in-tube**] [**Brazed-plate**] type with liquid-line stop valve and head-pressure-actuated, water-regulating valve.
 7. Remote Air-Cooled Refrigerant Condenser: Integral, copper-tube aluminum-fin coil with [**propeller**] [**centrifugal**] fan, direct driven.
 8. Split system shall have suction- and liquid-line compatible fittings and refrigerant piping for field interconnection.
- F. Hydronic Cooling Coil: Seamless copper tubes expanded into aluminum fins with modulating control valve.

1. Cooling Medium: [**Water**] [**Glycol solution**].
2. Mount coil assembly over stainless-steel drain pan[complying with ASHRAE 62.1] [and] [having a condensate pump unit with integral float switch, pump-motor assembly, and condensate reservoir].

Remote, Air-Cooled, Glycol-Solution Cooler: Corrosion-resistant cabinet, copper-tube aluminum-fin coil, direct-drive propeller fan with fan guards, and single-phase motor with internal overload protection.

- G. Glycol-Solution Pump Package: Weatherproof and vented enclosure of enameled, galvanized steel on structural base frame containing centrifugal pump with mechanical seal.
1. Piping: Interconnecting piping, to and from remote, air-cooled, glycol-solution cooler, with shutoff valves, flow switches, unions, and pressurized expansion tank with air purge vent and system-charging connection.
 2. Glycol: Inhibited ethylene glycol and water solution mixed 50:50, suitable for operating temperature of minus 40 deg F (minus 40 deg C).
- H. Electric-Resistance Heating Coil: Finned-tube electric elements with contactor and high-temperature-limit switches.
- I. Filter: Cleanable.
- J. Filter: 1-inch- (25-mm-) thick, disposable, glass-fiber media.
1. Initial Resistance: <Insert inches wg (Pa)>.
 2. Recommended Final Resistance: <Insert inches wg (Pa)>.
 3. Arrestance (ASHRAE 52.1): [90] <Insert number> percent.
 4. Merv (ASHRAE 52.2): [7] <Insert value>.
- K. Electrode Steam Humidifier: Self-contained and microprocessor controlled; with replaceable cylinder.
- L. Disconnect Switch: Nonautomatic, molded-case circuit breaker with handle accessible when panel is closed and capable of preventing access until switched to off position.
- M. Control System: Unit-mounted panel with contactors, control transformer with circuit breaker, and solid-state temperature-[and humidity-]control modules. Provide solid-state, unit-mounted control panel with start-stop switch[, adjustable humidity set point,] and adjustable temperature set point.

2.05 FAN MOTORS

- A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
- B. <Insert unique motor characteristics>.

2.06 REQUIRED OPTIONS

- A. Firestat
 - 1. The firestat shall immediately shut down the environmental control system when activated. The firestat shall be mounted in the electrical panel with the sensing element in the return air.
- B. Automatic Shut-off Valve
 - 1. Provide an automatic two-position valve on the chilled water return line.
- C. Leak Detection
 - 1. Local sensing at units: (Max of two per unit)
 - 2. Cable leak detection for underfloor plenum.
 - a. Provide 45 ft long leak detection cable. Upon detection of a leak, both the chilled water control valve (supply line) and shut-off valve (return line) shall close.
- D. Seismic Floor Stand
 - 1. The seismic floor stand shall be constructed of a heliarc welded tubular steel frame. The floor stand shall have adjustable legs with vibration isolation pads. The floor stand shall be ___ inches high.
- E. Floor Stand Turning Vane
 - 1. A factory supplied, field mounted turning vane shall be provided.
- F. Temperature and humidity Recorder
 - 1. Provide a 7 day/24 hour temperature and humidity recorder of the full scope, two pen, surface mounted type with 100 recording charts, one red and one blue bottle of recording ink. Recorder shall be a 110 volt, single phase, 60 Hz (50 Hz) power supply.
- G. Lock-Out Relays
 - 1. Provide lock-out relays for the humidifier and reheat. Relays shall lock-out humidifier and reheat upon loss of the primary power feed to the air conditioning unit.
- H. Smoke Detector
 - 1. The smoke detector shall immediately shut down the environmental control system and active the alarm system when activated. The smoke detector shall be mounted in the electrical panel with the sensing element in the return air compartment.
- I. Remote Shutdown.
 - 1. Provide contacts for remote shutdown of unit by area smoke detection system.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for hydronic piping systems to verify actual locations of piping connections before equipment installation.

- C. Examine walls, floors, and roofs for suitable conditions where computer-room air conditioners will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install computer-room air conditioners level and plumb, maintaining manufacturer's recommended clearances. [**Install according to ARI Guideline B.**]
- B. Computer-Room Air-Conditioner Mounting: Install using [**elastomeric pads**] [**elastomeric mounts**] [**restrained spring isolators**] <Insert device>. Comply with requirements for vibration isolation devices specified in [**Section 230548 "Vibration and Seismic Controls for HVAC."**] [**Section 230548.13 "Vibration Controls for HVAC."**]
 - 1. Minimum Deflection: [**1/4 inch (6 mm)**] [**1 inch (25 mm)**] <Insert dimension>.
- C. Suspended Computer-Room Air Conditioners: Install using continuous-thread hanger rods and [**elastomeric hangers**] [**spring hangers**] [**spring hangers with vertical-limit stop**] of size required to support weight of computer-room air conditioner.
 - 1. Comply with requirements for vibration isolation devices specified in [**Section 230548 "Vibration and Seismic Controls for HVAC."**] [**Section 230548.13 "Vibration Controls for HVAC."**] Fabricate brackets or supports as required.
 - 2. Comply with requirements for hangers and supports specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."
- D. Air-Cooled Refrigerant Condenser Mounting: Install using [**elastomeric pads**] [**elastomeric mounts**] [**restrained spring isolators**] <Insert device>. Comply with requirements for vibration isolation devices specified in [**Section 230548 "Vibration and Seismic Controls for HVAC."**] [**Section 230548.13 "Vibration Controls for HVAC."**]
 - 1. Minimum Deflection: [**1/4 inch (6 mm)**] [**1 inch (25 mm)**] <Insert dimension>.
- E. Remote, Air-Cooled, Glycol-Solution Cooler Mounting: Install using [**elastomeric pads**] [**elastomeric mounts**] [**restrained spring isolators**] <Insert device>. Comply with requirements for vibration isolation devices specified in [**Section 230548 "Vibration and Seismic Controls for HVAC."**] [**Section 230548.13 "Vibration Controls for HVAC."**]
 - 1. Minimum Deflection: [**1/4 inch (6 mm)**] [**1 inch (25 mm)**] <Insert dimension>.
- F. Glycol-Solution Pump Package Mounting: Install using [**elastomeric pads**] [**elastomeric mounts**] <Insert device>. Comply with requirements for vibration isolation devices specified in [**Section 230548 "Vibration and Seismic Controls for HVAC."**] [**Section 230548.13 "Vibration Controls for HVAC."**]

3.03 CONNECTIONS

- A. Piping installation requirements are specified in other heating, ventilating, and air-conditioning Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to machine to allow service and maintenance.
- C. Water and Drainage Connections: Comply with applicable requirements in Section 221116 "Domestic Water Piping." Provide adequate connections for water-cooled units, condensate drain, and humidifier flushing system.

- D. Hot-Water Heating Piping: Comply with applicable requirements in Section 232113 "Hydronic Piping" and Section 232116 Hydronic Piping Specialties." Provide shutoff valves in inlet and outlet piping to heating coils.
- E. Steam and Condensate Piping: Comply with applicable requirements in Section 232213 "Steam and Condensate Heating Piping" and Section 232216 Steam and Condensate Piping Specialties." Provide shutoff valves in steam inlet and steam trap in condensate outlet piping to heating coils.
- F. Install condensate drain piping and traps in accordance with manufacturer's instructions, per local code and as shown on the drawings.
 - 1. Install manufacturer provided condensate "air-trap" where provided with each unit. Install trap per manufacturer's instructions and install condensate piping as required by local code.
- G. Condenser-Water Piping: Comply with applicable requirements in Section 232113 "Hydronic Piping" and Section 232116 Hydronic Piping Specialties." Provide shutoff valves in water inlet and outlet piping on water-cooled units.
- H. Refrigerant Piping: Comply with applicable requirements in Section 232300 "Refrigerant Piping." Provide shutoff valves and piping.

3.04 FIELD QUALITY CONTROL

Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Inspect for and remove shipping bolts, blocks, and tie-down straps.
 - 2. After installing computer-room air conditioners and after electrical circuitry has been energized, test for compliance with requirements.
 - 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Computer-room air conditioners will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports.
- E. After startup service and performance test, change filters and flush humidifier.

3.05 ADJUSTING

- A. Adjust initial temperature[**and humidity**] set points.
- B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

- C. Occupancy Adjustments: When requested within **[12] <Insert number>** months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to **[two] <Insert number>** visits to Project during other-than-normal occupancy hours for this purpose.

3.06 DEMONSTRATION

- A. **[Engage a factory-authorized service representative to train] [Train]** Owner's maintenance personnel to adjust, operate, and maintain computer-room air conditioners.

END OF SECTION

SECTION 23 81 30
SPLIT AIR CONDITIONING UNITS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
 - 1. Split air conditioning unit.
 - 2. Controls and control connections.
 - 3. Electrical power connections.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00 - Basic HVAC Materials and Methods
- B. Section 23 05 93 - Testing, Adjusting and Balancing
- C. Section 23 07 16 - Equipment Insulation
- D. Section 23 09 00 - Building Automation System (BAS) Controls
- E. Section 23 23 00 - Refrigerant Piping Systems
- F. Section 23 31 13 - Air Distribution
- G. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:
 - 1. Air Movement and Control Association (AMCA):
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans for Rating

2. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 210 - Unitary Air-Conditioning Equipment
 - b. 270 - Sound Rating of Outdoor Unitary Equipment
3. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
4. National Fire Protection Association (NFPA): Provide unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
5. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
6. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL.
7. Minimum Efficiency: Minimum efficiencies shall meet or exceed the values required by the local energy code.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for systems with air handler units, evaporator coils, and outdoor condensing units showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.
- B. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.

- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.
- C. Provide five (5) year warranty on compressors.

PART 2 PRODUCTS

2.01 SPLIT SYSTEM AIR CONDITIONING SYSTEM WITH INDOOR FAN COIL

- A. Manufacturers: Mitsubishi, Samsung, or Daikin.
- B. Indoor Fan Coil Unit
 - 1. General:
 - a. Factory fabricated wall or ceiling mounted fan coil units designed for ductless application of the size, type configuration and capacity as scheduled on the drawings.
 - b. Units shall be self-contained, factory assembled and pre-wired.
 - c. All pressure drops, motor horsepower and dimensions shown are maximum allowable. All capacities shown are minimum allowable. All units must have AMCA certified performance data for fans tested in the unit casings. Bare fan certification without casing is not acceptable.
 - d. Manufacturers unable to meet this criterion will only be considered as an alternate to specified and as a deduct to base bid. Manufacturers listed by name does not imply that their standard construction meets the specifications nor that they are approved. All manufacturers are required to meet all details of this specification without exception.
 - e. Units shall be provided with factory welded mounting clips for mounting of units.
 - 2. Unit Casing: Cabinet and grilles shall be zinc-coated bonderized steel finished with baked enamel paint or powdered coated finish. Grilles may be high-impact plastic.
 - 3. Fan Assembly: Fan shall be direct drive with forward-curved blades, and be statically and dynamically balanced, with scrolls and fans constructed of galvanized steel. Rotating assembly shall provide a rigid support for motor and fan assembly. Assembly shall be accessible and entire assembly shall be removable for maintenance.
 - 4. Motors: Motors shall be open drip-proof, permanently lubricated ball bearing with inherent overload protection or electrically commutated (EC). Fan motor to be multi-speed as specified on Drawings.
 - 5. Coils: Coils shall be copper tube with ARI certified and of the same manufacturer as the unit to insure proper fit and quality mechanical bond. No exposed copper shall show between fins. Coils drip pan shall be galvanized steel coated with closed cell fire retardant foam insulation. A secondary drip pan shall be included under the coil header.
 - 6. Filter Section: Filters shall be factory supplied cleanable filter or one-inch thick pleated.
 - 7. Electrical: Unit electrical power shall be 115 volts, 1 phase, 60 hertz, or as specified on Drawings.
- C. Outdoor Condensing Unit:
 - 1. General: Provide remote outdoor air conditioning compressor units consisting of hermetic compressor with overload protection, direct drive condenser fan, aluminum fin/seamless copper tube coil, strainer, high and low pressure switches, accumulator, and thermostatic expansion valve.

2. Unit Cabinet: Galvanized steel, bonderized, and coated with powder coat paint.
3. Condenser Fans: Direct drive propeller type, discharging upward. Motors to be totally enclosed, single phase, with Class B insulation and permanently lubricated bearings. Condenser fan openings to be equipped with PVC-coated steel wire safety guards. Fan blades to be statically and dynamically balanced.
4. Coil: Aluminum fins mechanically bonded to copper tubes.
5. Refrigerant Components: Liquid tube shutoff valve with sweat connection, suction tube shutoff valves with sweat connection, refrigerant, accumulator, and reversing valve. An internal pressure relief valve to provide high-pressure protection to the refrigerant system.
6. Compressor: Hermetically sealed two-speed compressor mounted on rubber mountings. Protection to include internal PTC-type overloads. An internal pressure relief valve to provide high-pressure protection to the refrigerant system. Provide external service valves for the refrigerant circuit. A crankcase heater shall be factory mounted on the outside of the compressor.
7. Electrical: Unit electrical power shall be 208/230 volts, 1 phase, 60 hertz, or as specified on Drawings. The outdoor unit shall be controlled by the microprocessor located in the indoor unit. The control voltage between the indoor unit and the outdoor unit shall be 12 volts, DC.

D. Controls:

1. Unit shall have a factory wired temperature controller to perform input functions necessary to operate the system.
2. The controller shall consist of an on/off switch, thermostat setting, timer mode, high/medium/low fan speed, test run switching and check mode switching. Provide with 365-day programmability that allows the building occupants to program the temperature setpoints for at least four periods within 24 hours. A minimum of 5 holidays shall be programmable for up to 5 years. Daylight savings shall be provided as a standard feature in the programming calendar.
3. Temperature changes shall be by 2°F increments with a range of 65 - 87°F (minimum).
4. The control system shall consist of two (2) microprocessors interconnected by a single non-polar two wire cable.
5. Wiring shall run direct from the indoor unit to the controller with no splices.
6. The microprocessor located in the indoor unit shall have the capability of sensing return air temperature and indoor coil temperature, receiving and processing commands from the wired controller, providing emergency operation and controlling the outdoor unit.
7. Normal operation of the remote controller provides individual system control in which one remote controller and one indoor unit are installed in the same room.
8. The control voltage from the controller to the indoor unit shall be 12 volts, DC.
9. The control voltage between the indoor unit and the outdoor unit shall be 12 volts, DC.
10. The system shall be capable of automatic restart when power is restored after power interruption.
11. The system shall include self-diagnostics including total hours of compressor run time.
12. The microprocessor within the wall mounted remote controller shall provide automatic cooling, display set point and room temperature, 24 hour on/off timer so that automatic operation function display, check mode for memory of most recent problem.

13. Fan only operation shall be provided to permit room circulation when no cooling is required.
14. Compressor time delay to limit cycling.

E. Special Features:

1. Provide an internal condensate pump with interlock to unit operation in the event of malfunction.
2. Provide external electronic programmable thermostat.
3. Low ambient control capable of operating at 0°F ambient temperature.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that mounting surfaces are ready to receive work.
- B. Verify that proper power supply is available.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Provide layout drawings of units, locations and power requirements to electrical installer.
- C. Install air filters in unit during installation phase. Do not operate the unit without filters in place.
- D. In the case of suspended units, mount the fan coil units on springs or from spring hangers as required and as shown on Drawings. Provide Mason #DNHS combination isolator hangers to fully support horizontal units hung from building framing.
- E. Provide 4" high concrete pad extending 6" beyond edge of condensing unit on all sides. Attach condensing unit to concrete pad with concrete anchors and angle brackets.
- F. Install condensate drain piping and traps in accordance with manufacturer's instructions and as shown on the Drawings.
- G. Install copper refrigerant piping and insulate lines.
- H. Install controller and all wiring associated with control signals between air handling unit and condensing unit. Conceal low voltage wiring in building structure, or inside the refrigerant pipe insulation, or in conduit.
- I. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
- J. Install a new set of filters prior to final air balance and substantial completion.

3.03 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

END OF SECTION

SECTION 23 81 46

WATER SOURCE HEAT PUMP UNITS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall include, but not necessarily be limited to, the following:
 - 1. Water source heat pump unit
 - 2. Controls and control connections
 - 3. Electrical power connections

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods
- B. Section 230593: Testing, Adjusting and Balancing
- C. Section 230716: Equipment Insulation
- D. Section 230900: Building Automation System (BAS) Controls
- E. Section 232113: Hydronic Piping, Valves, and Specialties
- F. Section 232133: Ground-Source Heat-Pump Piping
- G. Section 233113: Air Distribution
- H. Division 26: Electrical

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Ground Source Application: If the heat pump is to be used in a ground coupled system, the heat pump must meet the standards of the IGSHPA.
- C. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:

1. Air Movement and Control Association (AMCA):
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans for Rating
 - c. 300 - Reverberant Room Method for Sound Testing of Fans
 - d. 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - e. 500 - Test Method for Louvers, Dampers, and Shutters
2. American National Standards Institute (ANSI):
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 - Test Performance of Air Filter Units
3. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 320 - Water Source Heat Pump Equipment operating between 60-85°F.
 - b. 325 - Water Source Heat Pump Equipment operating between 45-85°F.
 - c. 330 - Water Source Heat Pump Equipment operating between 25-115°F.
4. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 15 - Safety Code for Mechanical Refrigeration
 - b. 193 – Method of Test for Determining the Air Leakage of HVAC Equipment. All systems that move less than 3,000 cfm shall comply with less than 1.4% cabinet leakage rate.
5. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
6. National Fire Protection Association (NFPA): Provide unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
7. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL.
8. Minimum Efficiency: Minimum efficiencies shall meet or exceed the values required by the local energy code.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for systems with air handler units, evaporator coils, and outdoor condensing units showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.

- B. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.
- B. Store/protect products under provisions of Division 01. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.
- C. Provide with five (5) year warranty on compressors.

PART 2 PRODUCTS

2.01 GENERAL

- A. The heating/cooling units shall be suspended (vertical) type with horizontal (bottom discharge) air inlet and (top) discharge. Units shall be AHRI Standard performance certified for the operating temperature ranges scheduled and listed by a nationally recognized safety-testing laboratory or agency, such as ETL Testing Laboratory or Canadian Standards Association (CSA). Each unit shall be computer run tested at the factory.
- B. The units shall be designed to operate with entering liquid temperature between 25°F and 110°F
- C. The units shall be connected to the building automation system (BAS). The controls contractor shall review the sequence of operation identified below and coordinate with each approved equipment manufacturer to provide the designated points either through the interface or a hard wire connection (at no additional cost) where capability is not available through the interface.
- D. Manufacturers: Carrier, Trane, Daikin, ClimateMaster, WaterFurnace, or Florida Heat Pump.

2.02 CASING AND CABINET

- A. The cabinet shall be fabricated from heavy-gauge galvanized steel and finished with corrosion-resistant electrostatic powder coating. The interior shall be insulated with a minimum of ½" thick, multi-density, coated glass fiber with edges sealed or tucked under flanges to prevent the introduction of glass fibers into the discharge air. One or two blower compartments and three compressor compartment access panels shall be provided and shall be removable with supply and return ductwork in place. The internal component layout shall provide for major service with the unit in-place for restricted access installations.
- B. A duct collar shall be provided on the supply air opening. The units shall have an insulated divider panel between the air handling section and the compressor section to minimize the transmission of compressor noise, and to permit operational service testing without air bypass. Horizontal units shall be supplied with left or right air inlet, and side or end air discharge.

2.03 REFRIGERANT CIRCUIT

- A. LEED Project Refrigerant Requirements: Provide charged with a refrigerant meeting one or both of the following options:
 - 1. Non-HCFC Refrigerant: Provide equipment designed and charged for operation at scheduled and specified stated efficiencies using a non-HCFC refrigerant.
 - 2. Provide documentation that the refrigerant/equipment combination will meet the LEED □ Technical and Scientific Advisory Committee HCFC Task Group requirements as described in their report, The Treatment by LEED of the Environmental Impact of HVAC Refrigerants. This means that the equipment falls into the "acceptable region" of global warming vs. ozone depletion performance as defined in the report.
- B. All units shall contain a scaled refrigerant circuit including a hermetic motor-compressor, bidirectional thermal expansion valve, finned tube air-to-refrigerant exchanger, reversing valve, coaxial tube water-to-refrigerant heat exchanger, and service ports.
- C. Compressors shall be high-efficiency designed for heat pump duty and mounted on vibration isolators. Compressor motors shall be single-phase PSC with external overload protection.
- D. The finned tube coil shall be sized for low face velocity and constructed of lanced aluminum fins bonded to rifled copper tubes in a staggered pattern not less than three rows deep.
- E. The coaxial water-to-refrigerant heat exchanger and refrigerant suction lines shall be insulated to prevent condensation at low liquid temperatures.
- F. Optional: Provide a domestic hot water desuperheater for preheating of domestic water. Unit shall include double-wall vented refrigerant-to-water heat exchanger, water pump powered by a sealed magnetic drive motor, water line thermostat, secondary safety thermostat to prevent scalding, internal fuse, internally mounted disconnect switch, air bleed port, and refrigerant ports. Units shall be UL listed.

2.04 FAN MOTOR AND ASSEMBLY

- A. The fan shall be a direct drive centrifugal type with a dynamically balanced wheel. The housing and wheel shall be designed for quiet low outlet velocity operation. Tight fan housing geometry shall not be permitted. The fan housing shall be removable from the unit without disconnecting the supply air ductwork for servicing of the fan motor. The fan motor shall be a variable-speed ECM2 type. The ECM2 fan motor shall be soft-starting, shall automatically maintain constant CFM over its operating static range, and shall provide 12 field selectable CFM settings. The fan motor shall be isolated from the housing by rubber grommets. The motor shall be a permanently lubricated long-life ball bearing type and have thermal overload protection.

2.05 FILTERS

- A. Provide 2" thick replaceable filter with a mean efficiency of 35% tested in accordance with ASHRAE 52.1. Mount filters in filter frames and provide access panels or doors for removal and replacement.

2.06 ELECTRICAL

- A. A microprocessor-based controller shall be provided that interfaces with a multistage electronic thermostat to monitor and control unit operation. The control shall provide operational sequencing, fan and compressor speed control, high and low pressure switch monitoring, high compressor temperature sensing, freeze protection and hot water limit thermistor sensing, fan failure, condensate overflow sensing, auxiliary heat staging, lockout mode control, hot water and staged loop pump control, LED status and fault indicators, fault memory, field selectable options and accessory output.
- B. A removable terminal block with screw terminals shall be provided for field low-voltage wiring. A circuit breaker protected 75VA low-voltage transformer shall be provided.
- C. Line voltage terminal blocks or connection lugs shall be provided for unit and loop pump wiring. Units shall have knockouts for entrance of low and line voltage wiring. The fan motor and control box shall be harness plug-connected for easy removal.
- D. The unit is to be supplied with a unit mounted fused disconnect switch.

2.07 PIPING

- A. Supply and return water connections shall be brass swivel fittings which provide a union and eliminate the need for pipe wrenches and sealants when making field connections. All water piping shall be insulated to prevent condensation at low liquid temperatures. The condensate connection shall be a 3/4" PVC socket with internally-trapped hose (vertical units only) which can be routed to front or side locations.

2.08 HANGER KIT

- A. The hanger kit shall consist of galvanized steel brackets, bolts, lock washers, and isolators and shall be designed to fasten to the unit bottom panel for suspension from 3/8" threaded rods.

2.09 REQUIRED ACCESSORIES AND OPTIONS

- A. Proof of Operation contacts to be used by the control contractor for proof and/or interlock to associated relief fan.
- B. Thermostat: Thermostat shall be 7 day programmable, multi-stage (3H/2C), manual or automatic change over with HEAT-OFF-COOL-AUTO system settings and fan ON-AUTO settings. Thermostat shall have an LCD display with temperature, setpoints, mode, and status indication. The temperature indication shall be selectable for °F or °C. A System Test feature shall be provided to simplify troubleshooting. The thermostat shall provide permanent memory of setpoints and program without batteries. A fault LED shall be provided. Thermostat shall provide optional extended end of cycle fan operation, heating setpoint range limit, cooling setpoint range limit, temperature display offset, temperature display disable, keypad lockout, dead-band range setting, and inter-stage differential settings. Thermostat shall provide capability to average from 1 to 9 remote sensors.

- C. The unit will be supplied with internally factory mounted motorized two-way water valve interlocked with compressor operation for variable speed pumping requirements.
- D. A Low noise package consisting of high technology sound attenuating materials that are strategically applied to the cabinet, in addition to the standard insulation system, to further dampen sound.
- E. Provide heat pump with extended range capability and electric resistance heat to permit the unit to provide heating at low condenser water temperatures.
- F. Controls shall prevent the operation of supplemental electric resistance heating when the heating load can be served by the heat pump alone.

2.10 PROGRAMMABLE THERMOSTAT

- A. Thermostat with 365 day programmability that allows the building occupants to program the temperature setpoints for at least four periods within 24 hours. A minimum of 5 holidays shall be programmable for up to 5 years. Daylight savings shall be provided as a standard feature in the programming calendar.
 - 1. Manufacturers: Honeywell VisionPRO 8000 Series, Honeywell Prestige THX 9000 Series, Honeywell TB7600 Series, Venstar ColorTouch T6000 Series, EnTouch Pro/One.
- B. Minimum thermostat features shall include, but not limited to, the following:
 - 1. The thermostat shall have a touch screen and shall display both room temperature and cooling and heating setpoints simultaneously, and shall indicate when cooling or heating and what stage is energized on the main screen.
 - 2. Programming may be accomplished at the thermostat, or via free software. The program shall have an override mode to provide comfort on demand while in an unoccupied period. The unoccupied override shall be adjustable by pushing an override button and selecting thirty minute increments, up to four hours.
 - 3. The setback override shall be activated by a single button, and deactivated on demand.
 - 4. Setpoints shall be adjustable from 35°F to 99°F, with a minimum 5°F adjustable deadband available.
 - 5. Dual setpoints shall be provided with the ability to individually set heating and cooling temperatures with adjustable heating and cooling setpoint limits. Initial occupied mode cooling setpoint of 75°F and heating setpoint of 70°F. Initial unoccupied mode cooling setpoint of 85°F and heating setpoint of 55°F
- C. The thermostat shall be capable of independently controlling an individual system, with up to three stages of heating and two stages of cooling, fan, and reversing valve.
 - 1. For heat pumps an adjustable auxiliary heat lockout temperature based on outdoor temperatures shall be provided.
 - 2. An Emergency Heat switch will be provided on the touch screen when set in heat pump mode.
- D. The fan shall be programmable to operate continuously during occupied periods and in auto mode during unoccupied periods.
- E. Controls shall be capable of alternating compressor starting sequence with a built in lead-lag operating logic.

1. Equipment protection options shall be provided to prevent compressor short-cycling, and to limit the number of cycles per hour. These options shall be overridden for use with zoning systems.
- F. Pre-Occupancy purge cycle that energizes the fan before the programmed occupancy time, adjustable up to three (3) hours in 15-minute increments.
1. Configurable terminals shall be provided for remote indoor, remote outdoor or remote supply air temperature sensing.
- G. Multiple security levels to limit access to programming and configuration and will allow for a custom passcode. The various security levels will allow controlled access to programming, unoccupied override, and thermostat mode.
- H. All programming information, except time of day, shall reside in nonvolatile memory. During a power failure, the thermostat shall maintain its program indefinitely without the use of batteries. Wi-Fi capable and controlled through local wireless internet routers. The thermostat shall be capable of receiving an automated demand response signal from the local electrical utility, and automatically reset the cooling and heating setpoints during the demand event. When the demand event is terminated by the local electrical power utility, the thermostat will reset to normal occupied and unoccupied setpoints.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that mounting surfaces are ready to receive work.
- B. Verify that proper power supply is available.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Provide layout drawings of units, locations and power requirements to electrical installer.
- C. Install air filters in unit during installation phase. Do not operate the unit without filters in place.
- D. In the case of suspended units, mount the fan coil units on springs or from spring hangers as required and as shown on Drawings. Provide Mason #DNHS combination isolator hangers to fully support horizontal units hung from building framing.
- E. Install 2" flexible duct connection at inlets and outlets of ducted units.
- F. Install condensate drain piping and traps in accordance with manufacturer's instructions, per local code and as shown on the drawings.
 1. Install manufacturer provided condensate "air-trap" where provided with each unit. Install trap per manufacturer's instructions and install condensate piping as required by local code.
- G. Control installers shall install thermostat and all wiring associated with control signals into the units.

- H. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
- I. Install a new set of filters prior to final air balance and substantial completion.

3.03 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

END OF SECTION

SECTION 23 81 58

VARIABLE REFRIGERANT FLOW HEAT PUMP SYSTEMS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, and Section 23 05 00 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 01, and shall include, but not necessarily be limited to, the following:
1. Condensing Units
 - a. Air Cooled Condensing Unit – Heat Pump (heat or cool model)
 - b. Air Cooled Condensing Unit – Heat Recovery (heat and cool model)
 - c. Water Cooled Condensing Unit – Heat Pump/Heat Recovery
 2. Branch Selector (BS) Units or Branch Circuit (BC) Terminal for Heat Recovery systems.
 3. Indoor Fan Coil Units:
 - a. Non-ducted Recessed Ceiling Cassette Units
 - b. Ducted Concealed Ceiling Fan Coil Units
 - c. Ceiling Suspended Unit
 - d. Wall Mounted Unit
 - e. Floor Console Unit
 - f. Floor Console Concealed Unit
 - g. Vertical/horizontal Air Handling Unit
 4. 100% OSA Makeup Air Units – 100% OSA Processing Unit
 5. Controls
 6. Refrigerant gas monitors

1.03 SYSTEM DESCRIPTION

- A. Heat Pump (heat or cool model)
1. The variable capacity heat pump air conditioning system shall be a VRV/VRF series heat or cool model. The system shall consist of multiple evaporators, heat pump condensing unit with variable speed inverter driven compressors, and PID DDC (direct digital controls). All zones are each capable of operating separately with individual temperature control.

2. Operation of the system shall permit either cooling or heating of all of the indoor units simultaneously. Each indoor unit or group of indoor units shall be able to provide set temperature independently via a local remote controller, an Intelligent Controller, an Intelligent Manager or a BAS interface.

B. Heat Recovery (heat and cool model)

1. The variable capacity heat pump air conditioning system shall be a VRV/VRF series heat and cool model. The system shall consist of multiple evaporators, Branch Selector Units or Branch Circuit Terminals, heat recovery condensing unit with variable speed inverter driven compressors, and PID DDC (direct digital controls). All zones are each capable of operating separately with individual temperature control.
2. Operation of the system shall permit either individual cooling or heating of each indoor unit simultaneously or all of the indoor units associated with each branch of the cool/heat selector box. Each indoor unit or group of indoor units shall be able to provide set temperature independently via a local remote controller, an Intelligent Controller, an Intelligent Manager or a BAS interface.

1.04 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 23 05 00: Basic HVAC Materials and Methods
- B. Section 23 05 93: Testing, Adjusting and Balancing
- C. Section 23 07 16: Equipment Insulation
- D. Section 23 23 00: Refrigerant Piping Systems
- E. Section 23 31 13: Air Distribution
- F. Division 26: Electrical

1.05 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide packaged units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:
 1. Air Movement and Control Association (AMCA):
 - a. 99 - Standards Handbook
 - b. 210 - Laboratory Methods of Testing Fans
 - c. 300 - Reverberant Room Method for Sound Testing of Fans
 - d. 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - e. 500 - Test Method for Louvers, Dampers, and Shutters
 2. American National Standards Institute (ANSI):
 - a. 9 - Load Ratings and Fatigue Life for Ball Bearings
 - b. 11 - Load Ratings and Fatigue Life for Roller Bearings
 - c. 900 - Test Performance of Air Filter Units

3. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 1230 - Variable Refrigerant Flow Multi-Split Air –conditioners and Heat Pumps
4. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 15 - Safety Code for Mechanical Refrigeration
 - b. 193 – Method of Test for Determining the Air Leakage of HVAC Equipment. All systems that move less than 3,000 cfm shall comply with less than 1.4% cabinet leakage rate.
5. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
6. National Fire Protection Association (NFPA): Provide unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems
7. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
8. Underwriters Laboratories, Inc. (UL): Except for motors, provide electrical components required as part of units, which have been listed and labeled by UL. This includes condensate pumps and other ancillary devices required for operation.
9. Electrical Laboratories (ETL): The units shall be listed by ETL and bear the ETL label.
10. Minimum Efficiency: Minimum efficiencies shall meet or exceed the values required by the local energy code.

1.06 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for systems with air handler units, evaporator coils, and outdoor condensing units showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.
- B. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals; in accordance with requirements of Division 01.

1.07 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Division 01. Deliver units to the site in containers with manufacturer's stamp or label affixed.

- B. Store/protect products under provisions of Division 01 and according to manufacturer's recommendation. Protect units against dirt, water, chemical, and mechanical damage. Do not install damaged units - remove from project site.

1.09 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 23 05 00 for additional warranty and Substantial Completion requirements.
- C. Provide extended warranty for compressors for a six (6) year period.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Daikin VRV III and IV, Mitsubishi City Multi, or equal.

2.02 CONDENSING UNIT

- A. General:
 1. The outdoor unit shall be designed for used with an integrated variable refrigerant flow zone system.
 2. The condensing unit shall be factory assembled and pre-wired with all necessary electronic and refrigerant controls. The refrigeration circuit of the condensing unit shall consist of scroll compressors, motors, fans, condenser coil, electronic expansion valves, solenoid valves, 4-way valve, distribution headers, capillaries, filters, shut off valves, oil separators, service ports and refrigerant regulator.
 3. The outdoor unit shall have a high efficiency oil separator plus additional logic controls to ensure adequate oil volume in the compressor is maintained.
 4. (Heat Recovery Only) Refrigerant lines from the outdoor unit to the BS or BC unit shall be individually insulated between the condensing and fan coil units.
 5. The condensing unit can be wired and piped with access from the left, right, rear or bottom.
 6. The connection ratio of fan coil units to condensing unit shall be permitted up to 150% of outdoor rated capacity.
 7. Each condensing system shall be able to support the connection of up to 50 indoor units dependent on the model of the condensing unit.
 8. The sound pressure level standard shall no greater than 65 dBA at 3 feet from the front of the unit. The condensing unit shall be capable of operating automatically at further reduced noise during night time.
 9. The system will automatically restart operation after a power failure and will not cause any settings to be lost, thus eliminating the need for reprogramming.
 10. Water-cooled only:
 - a. Each condensing unit shall have a 240VAC, 0.3mA-0.5A control circuit output for water pump or isolation valve operation. This circuit shall be configured at commissioning to operate based on system or compressor operation.

- b. Each condensing unit shall incorporate normally open, 15VDC and 1.0mA rated contacts for integration of a mandatory flow proving device.
11. The unit shall incorporate an auto-charging feature.
 12. The condensing unit shall be modular in design and should allow for side-by-side installation with minimum spacing.
 13. The following safety devices shall be included on the condensing unit; high pressure sensor and switch, low pressure sensor, control circuit fuses, crankcase heaters, fusible plug, overload relay, inverter overload protector, thermal protectors for compressor and fan motors, over current protection for the inverter and anti-recycling timers.
 14. To ensure the liquid refrigerant does not flash when supplying to the various indoor units, the circuit shall be provided with a sub-cooling feature.
 15. Each system shall maintain continuous heating during oil return operation.
 16. The condensing unit shall be capable of heating operation at 0°F dry bulb ambient temperature without additional low ambient controls or an auxiliary heat source.
 17. (Heat Recovery only) The system shall continue to provide heat to the indoor units in heating operation while in the defrost mode.
- B. Unit Cabinet:
1. Air Cooled: The condensing unit shall be completely weatherproof and corrosion resistant. The unit shall be constructed from rust-proofed mild steel panels coated with a baked enamel finish.
 2. Water Cooled: The condensing unit shall be corrosion resistant. The unit shall be constructed from rust-proofed, mild steel panels coated with a baked enamel finish.
- C. Fan (air-cooled models only):
1. The condensing unit shall consist of one or more propeller type, direct-drive fan motors that have multiple speed operation via a DC (digitally commutating) inverter.
 2. The condensing unit fan motor shall have multiple speed operation of the DC (digitally commutating) inverter type, and be of high external static pressure and shall be factory set as standard at 0.12 in. WG. A field setting switch to a maximum 0.24 in. WG pressure is available to accommodate field applied duct for indoor mounting of condensing units.
 3. The fan shall be a vertical discharge configuration.
 4. The fan motor shall have inherent protection and permanently lubricated bearings and be mounted.
 5. The fan motor shall be provided with a fan guard to prevent contact with moving parts.
 6. Night setback control of the fan motor for low noise operation by way of automatically limiting the maximum speed shall be a standard feature.
- D. Condenser Coil (air-cooled):
1. The condenser coil shall be manufactured from copper tubes expanded into aluminum fins to form a mechanical bond.
 2. The heat exchanger coil shall be of a waffle louver fin and rifled bore tube design to ensure high efficiency performance.
 3. The fins are to be covered with an anti-corrosion finish.

- E. Condenser Heat Exchanger (water-cooled):
1. The condenser heat exchanger shall be a stainless brazed plate type designed for closed loop/dry cooler applications.
 2. The heat exchanger shall have a maximum system water pressure of 285 psi (equivalent to 640ft of head).
- F. Compressor:
1. The inverter driven scroll hermetic compressors shall be variable speed controlled capable of changing the speed to follow the variations in total cooling and heating load as determined by the suction gas pressure as measured in the condensing unit. In addition, samplings of evaporator and condenser temperatures shall be made so that the high/low pressures detected are read and calculated. With each reading, the compressor capacity shall be controlled to eliminate deviation from target value.
 2. The inverter driven compressor in each condensing unit shall be of highly efficient reluctance DC (digitally commutating), hermetically sealed scroll type
 3. The capacity control range shall be as low as 4% to 100%.
 4. Each non-inverter compressor shall also be of the hermetically sealed scroll type.
 5. Each compressor shall be equipped with a crankcase heater, high pressure safety switch, and internal thermal overload protector.
 6. Oil separators shall be standard in the equipment together with an intelligent oil management system.
 7. The compressor shall be spring mounted to avoid the transmission of vibration.
- G. Electrical:
1. The power supply to the condensing unit shall be as shown on the drawings.
 2. The control voltage between the indoor and condensing unit shall be 16VDC non-shielded, stranded 2-conductor cable.
 3. The control wiring shall be a two-wire multiplex transmission system, making it possible to connect multiple indoor units to one condensing unit with one 2-cable wire, thus simplifying the wiring installation.

2.03 BRANCH SELECTOR (BS) BOX/ BRANCH CIRCUIT (BC) CONTROLLER FOR HEAT RECOVERY SYSTEM

- A. General: Branch selector boxes/ Branch circuit controllers are designed specifically for use with heat recovery system components.
1. Selector boxes / circuit controllers shall be factory assembled, wired, piped and run tested at the factory.
 2. Selector boxes / circuit controllers must be mounted indoors.
 3. When simultaneously heating and cooling, the units in heating mode shall energize their sub-cooling electronic expansion valve.
- B. Unit Cabinet:
1. These units shall have a galvanized steel plate casing.
 2. Each cabinet shall house multiple electronic expansion valves for refrigerant control per branch.

3. The unit shall have sound absorption thermal insulation material made of flame and heat resistant foamed polyethylene.

C. Refrigerant Valves:

1. The refrigerant connections must be of the braze type.
2. Multiple indoor units may be connected to a branch selector box / branch circuit controller.

D. Condensate Removal:

1. Provide integral condensate pan if required for condensate removal.

E. Electrical:

1. The unit electrical power shall be 208/230 volts, 1 phase, 60 hertz.
2. The unit shall be capable of operation within the limits of 187 volts to 228 volts.
3. The minimum circuit amps (MCA) shall be 0.1 and the maximum
4. The control voltage between the indoor and condensing unit shall be 16VDC non-shielded 2 conductor cable.

2.04 INDOOR FAN COIL UNITS

A. Non-Ducted Recessed Ceiling Cassette Units

1. General: Indoor unit shall be a ceiling cassette fan coil unit, operable with R-410A refrigerant, equipped with an electronic expansion valve, for installation into the ceiling cavity equipped with an air panel grill. It shall be a four-way air distribution type, white, impact resistant with a washable decoration panel. The supply air is distributed via motorized louvers which can be horizontally and vertically adjusted from 0° to 90°. Computerized PID control shall be used to control superheat to deliver a comfortable room temperature condition. The indoor units sound pressure shall range from 28 dB(A) to 34 dB(A) at low speed measured at 5 feet below the unit.
2. Indoor Unit:
 - a. The indoor unit shall be completely factory assembled and tested. Included in the unit is factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, flare connections, condensate drain pan, condensate drain pump, condensate safety shutoff and alarm, self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch.
 - b. Indoor unit and refrigerant pipes will be charged with dehydrated air prior to shipment from the factory.
 - c. Both refrigerant lines shall be insulated from the outdoor unit.
 - d. The 4-way supply air flow can be field modified to 3-way and 2-way airflow to accommodate various installation configurations including corner installations.
 - e. Return air shall be through the concentric panel, which includes a resin net mold resistant filter.
 - f. The indoor units shall be equipped with a condensate pan and condensate pump. The condensate pump provides up to 21" of lift and has a built in safety shutoff and alarm.
 - g. The indoor units shall be equipped with a return air thermistor.

3. Unit Cabinet:
 - a. The cabinet shall be space saving and shall be located into the ceiling.
 - b. Three auto-swing positions shall be available to choose, which include standard, draft prevention and ceiling stain prevention.
 - c. The airflow of the unit shall have the ability to shut down one or two sides allowing for simpler corner installation.
 - d. Fresh air intake shall be possible by way of optional fresh air intake kit. (3'x 3' model only). Fresh air intake shall be possible by way of direct duct installation to the side of the indoor unit cabinet. (2'x 2' model only')
 - e. A branch duct knockout shall exist for branch ducting supply air.
 - f. The cabinet shall be constructed with sound absorbing foamed polystyrene and polyethylene insulation.
 - g. Optional high efficiency MERV 8 and 13 air filters are available for each model unit. (3'x 3' model only)
4. Fan:
 - a. The fan shall be direct-drive fan type with statically and dynamically balanced impeller with high and low fan speeds available.
 - b. The fan motor shall operate on 208/230 volts, 1 phase, 60 hertz with a motor output range from 0.06 to 0.12 HP.
 - c. The airflow rate shall be available in high and low settings.
 - d. The fan motor shall be equipped as standard with adjustable external static pressure (ESP) settings to allow operation with the MERV 8 and 13 filter options (3'x 3' model only).
 - e. The fan motor shall be thermally protected.
5. Filter:
 - a. The return air shall be filtered by means of a washable long-life filter with mildew proof resin.
 - b. Optional high efficiency disposable MERV 8 and 13 filters shall be available. (3'x 3' model only)
6. Coil:
 - a. Coils shall be of the direct expansion type constructed from copper tubes expanded into aluminum fins to form a mechanical bond.
 - b. The coil shall be of a waffle louver fin and high heat exchange, rifled bore tube design to ensure highly efficient performance.
 - c. The coil shall be a 2-row cross fin copper evaporator coil completely factory tested.
 - d. The refrigerant connections shall be flare connections.
 - e. A condensate pan shall be located under the coil.
 - f. A condensate pump, with minimum 21-inch lift, shall be located below the coil in the condensate pan with a built in safety alarm.
 - g. A thermistor will be located on the liquid and gas line.
7. Electrical:

- a. A separate power supply will be required of 208/230 volts, 1 phase, 60 hertz. The acceptable voltage range shall be 187 to 253 volts.
 - b. Transmission (control) wiring between the indoor and outdoor unit shall be a maximum of 3,280 feet (total 6,560 feet).
 - c. Transmission (control) wiring between the indoor unit and remote controller shall be a maximum distance of 1,640 feet.
8. Control:
- a. The unit shall have on board controls to perform input functions necessary to operate the system.
 - b. The unit shall include all devices necessary to be compatible with interfacing with a BAS system via optional LonWorks or BACnet gateways.
9. Optional Accessories Available:
- a. A high efficiency disposable MERV 8 air filter kit. (3' x 3')
 - b. A high efficiency disposable MERV 13 air filter kit. (3' x 3')
 - c. Fresh air intake kit.
 - d. Supply air branch duct connections.
 - e. Remote "in-room" sensor kit.
 - f. The wall mounted, hard wired remote sensor kit is recommended for ceiling-embedded type fan coils, which often result in a difference between set temperature and actual temperature. The sensor for detecting the temperature can be placed away from the indoor unit (branch wiring is included in the kit).

B. Ducted Concealed Ceiling Fan Coil Units

1. General:
 - a. Indoor unit shall be a built-in ceiling concealed fan coil unit, operable with refrigerant R-410A, equipped with an electronic expansion valve, for installation in a ceiling cavity. It is constructed of a galvanized steel casing. It shall be a horizontal discharge air with horizontal return air configuration. Computerized PID control shall be used to control superheat to deliver a comfortable room temperature condition. Included as standard equipment, a condensate drain pan and drain pump kit that pumps up to 18-3/8" from the drain pipe opening.
 - b. All pressure drops, horsepowers and dimensions shown on drawing schedules are maximum allowable. All capacities shown are minimum allowable. All units must have AMCA certified performance data for fans tested in the unit casings. Bare fan certification without casing is not acceptable.
 - c. Manufacturers unable to meet these criteria will only be considered as an alternate to specified and as a deduct to base bid. Manufacturers listed by name does not imply that their standard construction meets the specifications nor that they are approved. All manufacturers are required to meet all details of this specification without exception.
2. Sound Pressure Level:
 - a. Large capacity, medium static units: 48 dB(A) at low speed measured 5 feet below the ducted unit.
 - b. Small capacity, medium static units: 29 dB(A) to 40 dB(A) at low speed measured 5 feet below the ducted unit.

- c. Shallow depth fan coils: 29 dB(A) to 32 dB(A) at low speed and 33 dB(A) to 36 dB(A) at high speed 5 feet below the suction grille.
3. Indoor Unit: The indoor unit shall be completely factory assembled and tested. Included in the unit is factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, flare connections, self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch. The unit shall have an adjustable external static pressure switch (Large models). The unit shall be equipped with automatically adjusting external static pressure logic selectable during commissioning. This adjusts the airflow based on the installed external static pressure. (Small models)
 - a. Indoor unit and refrigerant pipes will be charged with dehydrated air prior to shipment from the factory.
 - b. Both refrigerant lines shall be insulated from the outdoor unit.
 - c. The indoor units shall be equipped with a return air thermistor.
 - d. The indoor units shall be equipped with a condensate pan and condensate pump. The condensate pump provides up to 18-3/8" of lift from the center of the drain outlet (Small and slim model only)
 - e. Return air shall be through a resin net mold resistant filter (slim model only)
4. Unit Cabinet:
 - a. The cabinet shall be located within the ceiling and ducted to the supply and return openings.
 - b. The cabinet shall be constructed with minimum 1/2" 1.5 lbs. internal insulation. Insulation shall be attached with adhesive with all exposed edges coated to prevent erosion or of an insulation type not requiring protection.
5. Fan:
 - a. (Large models and slim duct):
 - 1) The fan shall be direct-drive type fan, statically and dynamically balanced impeller with high and low fan speeds available.
 - 2) The fan motor shall operate on 208/230 volts, 1 phase, 60 hertz, with a motor output of 0.51 HP.
 - 3) The airflow rate shall be available in high and low settings.
 - 4) The fan motor shall be thermally protected.
 - 5) The fan motor shall be equipped as standard with adjustable external static pressure (ESP) settings.
 - b. Fan (Small models):
 - 1) The fan shall be direct-drive DC (ECM) type fan, statically and dynamically balanced impeller with three fan speeds available.
 - 2) The unit shall be equipment with automatically adjusting external static pressure logic selectable during commissioning.
 - 3) The fan motor shall operate on 208/230 volts, 1 phase, 60 hertz with a motor output range of 0.12 to 0.47 HP respectively.
 - 4) The airflow rate shall be available in three settings.
 - 5) The fan motor shall be thermally protected.

- 6) The fan motor shall be equipped as standard with adjustable external static pressure (ESP) settings.
 6. Coil:
 - a. Coils shall be ARI certified of the direct expansion type.
 - b. All coil casings shall be galvanized steel minimum or stainless steel.
 - c. Copper tubes shall be a minimum thickness of 0.020 and return bends of minimum 0.035. Headers shall be non-ferrous seamless copper. Aluminum fins shall have a minimum thickness of 0.0080 and tubes shall be mechanically expanded into fin collars to provide permanent mechanical bond.
 - d. The coils shall be pressure tested at the factory.
 - e. The refrigerant connections shall be flare connections.
 - f. A thermistor will be located on the liquid and gas line.
 - g. A condensate pan shall be located under the coil
 - h. The condensate shall be capable of being gravity drained from the fan coil.
 - i. Where scheduled, a condensate pump with an 18" minimum lift shall be located below the coil in the condensate pan with a built in safety alarm.
 7. Electrical:
 - a. A separate power supply will be required of 208/230 volts, 1 phase, 60 hertz. The acceptable voltage range shall be 187 to 253 volts.
 - b. Transmission (control) wiring between the indoor and outdoor unit shall be a maximum of 3,280 feet (total 6,560 feet).
 - c. Transmission (control) wiring between the indoor unit and remote controller shall be a maximum distance of 1,640 feet.
 8. Control:
 - a. The unit shall have on board controls to perform input functions necessary to operate the system.
 - b. The unit shall include all devices necessary to be compatible with interfacing with a BAS system via optional LonWorks or BACnet gateways.
 9. Optional Accessories Available:
 - a. Remote "in-room" sensor kit (recommended).
 - b. The wall mounted, hard wired remote sensor kit is recommended for ceiling-embedded type fan coils, which often result in a difference between set temperature and actual temperature. The sensor for detecting the temperature can be placed away from the indoor unit (branch wiring is included in the kit).
- C. Non-Ducted Wall or Ceiling Fan Coil Units
1. General: Indoor unit shall be a fan coil unit, operable with refrigerant R-410A, equipped with an electronic expansion valve, for installation onto a wall or ceiling within a conditioned space. Computerized PID control shall be used to control superheat to deliver a comfortable room temperature condition.
 2. Condensate drain pan:
 - a. Ceiling Suspended Cassette Unit: A mildew-proof, polystyrene condensate drain pan and resin net mold resistant filter shall be included as standard equipment.

- b. Wall Mounted Unit: A mildew-proof, polystyrene condensate drain pan and resin net mold resistant filter shall be included as standard equipment.
 - c. Floor Console Unit: A mold-resistant, resin net air filter shall be included as standard equipment.
3. Sound Pressure:
- a. Ceiling Suspended Cassette Unit: The indoor units sound pressure shall range from 32 dB(A) to 38 dB(A) at low speed measured at 3.3 feet below and from the unit.
 - b. Wall Mounted Unit: The indoor units sound pressure shall range from 31 dB(A) to 40 dB(A) at low speed measured at 3.3 feet below and from the unit.
 - c. Floor Console Units (Surface mount and concealed types): The indoor units sound pressure shall range from 35 dB(A) to 40 dB(A) at high speed measured at 5 feet away and 5 feet high.
4. Indoor Unit:
- a. The indoor unit shall be completely factory assembled and tested. Included in the unit is factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, flare connections, condensate drain pan, self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch. The unit shall have an auto-swing louver which ensures efficient air distribution, which closes automatically when the unit stops
 - b. Indoor unit and refrigerant pipes will be charged with dehydrated air prior to shipment from the factory.
 - c. Both refrigerant lines shall be insulated from the outdoor unit.
 - d. Return air shall be through a resin net mold resistant filter.
 - e. The indoor units shall be equipped with a condensate pan.
 - f. The indoor units shall be equipped with a return air thermistor.
5. Unit Cabinet:
- a. The cabinet shall be affixed to a factory supplied wall/ceiling hanging brackets and located in the conditioned space.
 - b. The cabinet shall be constructed with sound absorbing foamed polystyrene and polyethylene insulation.
6. Fan:
- a. The fan shall be a direct-drive cross-flow fan, statically and dynamically balanced impeller with high and low fan speeds available.
 - b. The fan motor shall operate on 208/230 volts, 1 phase, 60 hertz.
 - c. The airflow rate shall be available in high and low settings.
 - d. The fan motor shall be thermally protected.
7. Filter:
- a. The return air shall be filtered by means of a washable long-life filter with mildew proof resin (Floor console only).
8. Coil:
- a. Coils shall be of the direct expansion type constructed from copper tubes expanded into aluminum fins to form a mechanical bond.

- b. The coil shall be of a waffle louver fin and high heat exchange, rifled bore tube design to ensure highly efficient performance.
 - c. The coil shall be a 2-row (3-row floor console only) cross fin copper evaporator coil completely factory tested.
 - d. The refrigerant connections shall be flare connections.
 - e. A thermistor will be located on the liquid and gas line.
 - f. A condensate pan shall be located in the unit.
9. Electrical:
- a. A separate power supply will be required of 208/230 volts, 1 phase, 60 hertz. The acceptable voltage range shall be 187 to 253 volts.
 - b. Transmission (control) wiring between the indoor and outdoor unit shall be a maximum of 3,280 feet (total 6,560 feet).
 - c. Transmission (control) wiring between the indoor unit and remote controller shall be a maximum distance of 1,640 feet.
10. Control:
- a. The unit shall have on board controls perform input functions necessary to operate the system.
 - b. The unit shall include all devices necessary to be compatible with interfacing with a BAS system via optional LonWorks or BACnet gateways.
11. Optional Accessories Available:
- a. Remote "in-room" sensor kit.
 - b. A condensate pump.

2.05 CONTROLS

A. General:

1. Provide control devices necessary to support a fully operating system including but not limited to
 - a. Local remote controllers,
 - b. Centralized/multi-zone controllers,
 - c. Open protocol network devices that transmit information via the communication bus and graphical user workstations.
2. The network shall have the capability to support
 - a. Operation monitoring and scheduling,
 - b. Error email distribution
 - c. General user software, tenant billing, maintenance support, and integration with Building Automation Systems (BAS) using open protocol via BACnet or Lonworks interfaces.

3. General Electrical Requirements: The control wiring shall be terminated in a daisy chain design at the outdoor unit, which is then daisy chained to the branch circuit selector/controller (Heat Recovery System), then daisy chained to each indoor unit in the system and terminating at the farthest indoor unit. Wiring shall be non-shielded, 2-conductor sheathed vinyl core or cable, AWG stranded copper wire installed per manufacturer's written instructions.

B. Local Remote Controllers

1. The local remote controllers shall be capable of controlling up to 16 indoor units (referred to as a group). The local remote controllers shall maintain the optimal operation of the connected indoor units. Local remote controllers consist of deluxe, simplified and wireless models. No more than two of these controllers can be placed in the same group. No addressing shall be required with the local remote controllers.
2. Basic Operation: Local remote controller shall control the following group of operations:
 - a. On/off, operation mode (cool, heat, fan, dry and Auto)
 - b. Independent cooling and heating setpoints in the occupied mode
 - c. Independent cooling setup and heating setback setpoint in the unoccupied mode.
 - d. Fan speed
 - e. Airflow direction
 - f. The controller shall be able to limit the user adjustable setpoint ranges individually for cooling and heating in the occupied period
 - g. Function key lockout
3. Programmability:
 - a. Controller shall support 7-day programmable scheduling,
 - b. The controller shall support auto-changeover mode for both heat pump and heat recovery systems allowing the optimal room temperature to be maintained by automatically switching the indoors unit's mode between cool and heat according to the room temperature and temperature setpoint.
 - c. The controller shall support an auto off timer for temporarily enabling indoor unit operation using unoccupied period.
 - d. The room temperature shall be capable of being sensed at either, the remote controller, the indoor unit return air temperature sensor (default), or a remote temperature sensor.
4. Display Features
 - a. LED display
 - b. The controller shall display Operations Mode, Setpoint, and Fan Speed.
 - c. System Status icons in large font.
 - d. Room temperature display
 - e. On/Off status
 - f. Error codes displayed in the event of a system abnormality/error
 - g. Optional: The following system temperatures can be displayed to assist service personnel in troubleshooting:
 - 1) Return air temperature

- 2) Liquid line temperature
- 3) Gas line Temperature
- 4) Discharge Air Temperature (depending on fan coil)
- 5) Temperature used for indoor unit control.

C. Centralized/Multizone Controllers

- a. The Centralized/Multizone controllers shall be capable of controlling up to 64 indoor unit groups and 128 indoor units connected to up to 10 outdoor units. The Centralized/Multizone Controllers shall be complete with power supply. The Centralized/Multizone Controllers can be used in conjunction with local remote controllers, BACnet and Lonworks interfaces to control the same indoor unit groups. Centralized/Multizone controllers shall be available with the option of interconnection with a network PC via the internet or Local Area Network (LAN).
 - b. Basic Operation: The Centralized/Multizone controller shall control the following group operations:
 - 1) On/off, operation mode (cool, heat, fan, dry and Auto)
 - 2) Independent cooling and heating setpoints in the occupied mode
 - 3) Independent cooling setup and heating setback setpoint in the unoccupied mode.
 - 4) Fan speed
 - 5) Airflow direction
 - 6) The controller shall be able to limit the user adjustable setpoint ranges individually for cooling and heating in the occupied period
 - 7) Remote controller permit/prohibit of ON/Off, Mode, and Setpoint.
 - 8) Lockout setting for touch display.
 - 9) Indoor unit Group/Zone assignment.
2. Programmability:
- a. Controller shall support weekly schedule settings.
 - b. Scheduling shall support unit On/Off.
 - c. The controller shall support multiple auto-changeover methods for both Heat Pump and Heat Recovery systems based upon the Zone configurations. This will allow for the optimal room temperature to be maintained by automatically switching the indoors unit's mode between cool and heat according to the room temperature and temperature setpoint.
 - d. Controller shall support Interlock for use with 3rd party equipment to automatically control groups or zones corresponding to the change of the operation states or On/Off states of any group.
 - e. Optional Digital Input/Output unit shall be available to allow On/Off based monitoring and control of 3rd party equipment.
 - f. The controller shall support force shutdown of associated indoor unit.
3. Display Features:
- a. Backlit LCD display.
 - b. Multi-language availability.

- c. The controller shall display On/Off, Operations Mode, Setpoint, space Temperature, Louver Position, Fan Speed for Group/Zone.
 - d. Date, day of week and time of day.
 - e. Daylight savings automatic adjustment.
 - f. Display update every 3 seconds.
 - g. System status icons shall display On/Off (color coded), Malfunction/Error (color coded), Forced Stop, Set Schedule/Setback/Auto-changeover, Filter, and Screen Lock.
 - h. The controller shall display the temperature setpoint in one degree increments.
 - i. Zone configuration shall display Setpoint Range Limitation, Setback Temperature setting, and Auto-changeover for each Zone.
 - j. Indoor units shall be capable of being displayed by Zone or Group.
 - k. Error status shall be displayed in the event of system abnormality/error with one of two color coded icons placed over the indoor unit icon.
4. Software Options: All PC's shall be field supplied
 - a. Web/Email software: Each Controller shall be capable of monitoring, operating, and scheduling a maximum of 64 indoor unit groups (128 indoor unit groups with the addition of an option adapter) from a networked PC's web browser. It shall also be capable of creating general user access and sending detailed error emails to a customized distribution list (up to 3 email addresses).
 - b. Power Proportional Distribution (PPD): The tenant billing option shall be capable of calculating VRV Controls Network equipment energy usage in kWh based on the energy consumption of the outdoor unit(s) divided among the associated indoor units. This software is used in conjunction with the Watt Hour Meter (WHM). A maximum of 3 Watt Hour Meters can be connected to the Controller. The use of the optional adapter will add an additional 3 Watt Hour Meters.
 - c. HTTP Interface: This option shall be capable of creating a software interface between the VRV Controls Network and Home Automation control systems.
- D. System BAS Integration
1. The VRV/VRF system shall support integration with Building Management Systems (BAS) via a BACnet® or LonWorks interface.
 2. BAS to have capability to monitor and control of VRV indoor units.
 3. The VRV/VRF systems supplier shall cooperate fully with BAS supplier to enable them to map points into the BAS.
 4. The BAS supplier shall provide all labor and programming necessary to map VRF system points into BAS. At a minimum, through the BAS, the operator shall be enabled to monitor space temperature of all zones change space temperature setpoint of all zones, monitor fan, heating and cooling status of all zones, monitor indoor fan coil alarm, monitor status and alarms of outdoor units and schedule each zone.
 5. Operation and monitoring points include but are not limited to:
 - a. On/Off (setting)
 - b. On/Off (status)
 - c. Alarm Sign

- d. Error Code
- e. Operation Mode (setting)
- f. Operation Mode (status)
- g. Fan Speed (setting)
- h. Fan Speed (status)
- i. Measured Room Temperature
- j. Set Room Temperature
- k. Filter Limit Sign
- l. Filter Limit sign reset
- m. Remote Control Operation (On/Off)
- n. Remote control Operation (Operation Mode).
- o. Remote Control Operation (Set Temperature)
- p. Electrical Total Power
- q. Communication Status
- r. System Forced Off
- s. Forced Thermostat off (setting)
- t. Forced Thermostat off (status)
- u. Compressor Status
- v. Indoor Fan Status
- w. Heater operation Status

2.06 REFRIGERANT GAS MONITOR

- A. Where indicated on drawings provide a standalone refrigerant gas monitor and sensor to monitor and alarm for refrigerant gas leaks in the space.
- B. Sensor to be coordinated with the refrigerant used in the VRF or VRV system and mounted remotely from unit at the level of the floor in the indicated space.
- C. Alarm to be a red LED and siren with mute button. Relays are to be provided for remote monitoring or control.

2.07 ISOLATION VALVE

- A. Bi-directional full-port full-flow manual service valve with refrigerant Schrader valve.
- B. Brass body with flared extended copper tails for brazing. Indicator on stem shows valve position-open or closed with quarter-turn of the valve stem. Blow-out proof stem design with cap seal and solid cap.
- C. Operating pressure: 0 to 700 psig (4.8 MPa/48 bar).
- D. Temperature range: -40°F to 300°F (-40°C to 150°C).
- E. Manufacturers: Henry Group #937613, Wilspec #Frontline Series, or equal.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that mounting surfaces are ready to receive work.
- B. Verify that proper power supply is available.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Provide layout drawings of units, locations and power requirements to electrical installer.
- C. Install air filters in unit during installation phase. Do not operate the unit without filters in place.
- D. In the case of suspended units, mount the fan coil units on springs or from spring hangers as required and as shown on Drawings. Provide Mason #DNHS combination isolator hangers to fully support horizontal units hung from building framing.
- E. Provide 4" high concrete pad extending 6" beyond edge of condensing unit on all sides. Attach condensing unit to concrete pad with concrete anchors and angle brackets.
- F. Install 2" flexible duct connection at inlets and outlets of ducted units.
- G. Install condensate drain piping and traps in accordance with manufacturer's instructions, per local code and as shown on the drawings. Where drainage to gravity waste is not possible provide condensate pumps.
 - 1. Install manufacturer provided condensate "air-trap" where provided with each unit. Install trap per manufacturer's instructions and install condensate piping as required by local code.
- H. Install copper refrigerant piping and insulate lines.
- I. Install branch isolation valve at each fan coil and branch refrigerant selector to allow for future maintenance refrigerant recovery without the need to recover entire system charge. Valves must be full port with Schrader valve on the fan coil or branch selector side of valve. Provide quantity of valves as required to provide complete isolation of each unit. Each fan coil will require a minimum of two valves for each circuit and each branch selector may require a minimum of three valves for each circuit, and as required to serve the quantity of refrigerant circuits. Coordinate with manufacturer's installation instructions for placement of valves for full isolation and to avoid warranty violation.
- J. Control wiring: Communication wiring shall be terminated in a daisy chain design at the outdoor unit, which is then daisy chained to branch selector/controller (Heat Recovery system), then daisy chained to each indoor unit in the system and terminating at the farthest indoor unit. The termination of the wiring shall be non-polar. The remote control wiring shall run from the indoor unit control terminal block to the remote controller connected with that indoor unit. Wiring shall be non-shielded, 2-conductor sheathed vinyl cord or cable, AWG stranded copper installed per manufacturer's written directions.
- K. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.

- L. Install a new set of air filters prior to final air balance and substantial completion.
- M. Provide support to BAS supplier for mapping of VRV/VRF systems points into the BAS.

3.03 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours travel from the job site.

SECTION 23 82 19

FAN COIL UNITS

PART 1 GENERAL

1.01 APPLICABLE REQUIREMENTS

- A. All work to be furnished and installed under this section shall comply with all the requirements of General Conditions, Supplemental Conditions, Division 01 - General Requirements, Section 230500 - Basic HVAC Materials and Methods, and other Sections in Division 23 specified herein. Division 01 shall not be included in these standards and shall be included as part of each projects contractual documentation as required.

1.02 SCOPE

- A. All work to be furnished and installed under this Section shall comply with all the requirements of Division 1, and shall include, but not necessarily be limited to, the following:
 - 1. Fan Coils.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 230500: Basic HVAC Materials and Methods.
- B. Section 230593: Testing, Adjusting and Balancing.
- C. Section 230900: Building Automation System (BAS) Controls.
- D. Section 230716: Equipment Insulation.
- E. Section 232113: Hydronic Piping, Valves and Specialties.
- F. Section 233113: Air Distribution.
- G. Division 26: Electrical.

1.04 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Provide air handling units that are the standard product of an equipment manufacturer regularly engaged in the production of such units who issues complete catalog information on such products. Units shall not be fabricated by the Contractor.
- B. Certifications: Provide certified ratings of units based on tests performed in accordance with ARI 430, "Central-Station Air Handling Units."
- C. Codes and Standards: Provide air handling units conforming to the requirements of the latest addition of the following:
 - 1. Air Movement and Control Association (AMCA)/American National Standards Institute (ANSI):
 - a. 99: Standards Handbook.
 - b. 210: Laboratory Methods of Testing Fans

- c. 230: Laboratory Methods of Testing Air Circulating Fans for Rating and Certification
 - d. 300: Reverberant Room Method for Sound Testing of Fans
 - e. 301: Methods for Calculating Fan Sound Ratings from Laboratory Test Data
 - f. 500-D: Laboratory Methods of Testing Dampers for Rating
2. American National Standards Institute (ANSI)/Anti-Friction Bearing Manufacturers Association (ABMA):
 - a. 9: Load Ratings and Fatigue Life for Ball Bearings.
 - b. 11: Load Ratings and Fatigue Life for Roller Bearings.
 - c. 900: Test Performance of Air Filter Units.
 3. Air-Conditioning, Heating and Refrigeration Institute (AHRI):
 - a. 410: Forced-Circulation Air-Cooling and Air-Heating Coils.
 - b. 430: Central-Station Air-Handling Units.
 4. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - a. 193: Method of Test for Determining the Air Tightness of HVAC Equipment. All systems that move less than 3,000 cfm shall comply with less than 1.4% cabinet leakage rate.
 5. National Electrical Manufacturers Association (NEMA): Except for motors, provide electrical components required as part of air handling units, which comply with NEMA Standards.
 6. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Comply with applicable SMACNA standards including "HVAC Duct Construction Standards - Metal and Flexible."
 7. ANSI/AHRI-850: Performance Rating of Commercial and Industrial Air Filter Equipment.
 8. Underwriters Laboratories, Inc. (UL), Except for motors, provide electrical components required as part of air handling units, which have been listed and labeled by UL:
 - a. 900: Standard for Air Filter Units.
 9. National Fire Protection Association (NFPA): Provide air handling unit internal insulation having flame spread rating not higher than 25 and smoke developed rating not higher than 50:
 - a. 70 - National Electrical Code.
 - b. 90A - Standard for the Installation of Air Conditioning and Ventilating Systems.
 - c. 90B - Standard for the Installation of Warm Air Heating and Air Conditioning Systems.

1.05 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for air handling units showing dimensions, weights, capacities, ratings, fan performance with operating point clearly indicated, motor electrical characteristics, and finishes of materials, installation instructions, sound and vibration test report, and bearing life calculations.
- B. Shop Drawings: Submit shop drawings showing unit dimensions, weight loadings, required clearances, field connection details and methods of support. Draw to a scale of one half inch to one foot. Include field fabricated mixing boxes, dampers and duct connections.

- C. Maintenance Data: Submit maintenance instructions, including instructions for lubrication, filter replacement, motor and drive replacement, and spare parts lists. Include this data, product data, shop drawings, and wiring diagrams in operating and maintenance manuals.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver unit to the site in containers with manufacturer's stamp or label affixed.
- B. Store and protect unit against dirt, water, chemical, and mechanical damage. Do not install damaged unit - remove from project site.

1.08 WARRANTY

- A. Provide minimum one-year warranty from date of Substantial Completion, including all parts, material, labor and travel.
- B. Refer to Section 230500 for additional warranty and Substantial Completion requirements.

PART 2 PRODUCTS

2.01 FAN COIL UNIT – FOR COMMERCIAL APPLICATION

- A. Manufacturers:
 - 1. Enviro-Tec, Carrier, Trane, Energy Labs, or equal.
- B. General:
 - 1. Factory fabricated fan coil units of the size, type configuration and capacity as scheduled on the drawings.
 - 2. All pressure drops, motor horsepowers and dimensions shown are maximum allowable. All capacities shown are minimum allowable. All units must have AMCA certified performance data for fans tested in the unit casings. Bare fan certification without casing is not acceptable.
 - 3. Manufacturers unable to meet these criteria will only be considered as an alternate to the specified unit and as a deduct to the base bid. Manufacturer listed by name does not imply that their standard construction meets the specifications nor that they are approved. All manufacturers are required to meet all details of this specification without exception.
- C. Unit Casing:
 - 1. Unit shall be constructed of no less than 16 gauge formed cold-rolled steel with minimum 1" 1.5 lb. density internal insulation. Insulation shall be attached with adhesive with all exposed edges coated to prevent erosion. All exposed metal inside and out shall be finished with at least one coat of gray enamel. Bottom access doors shall be aluminum construction 0.063 thickness painted to match unit.
- D. Fan Assembly:

1. Bearings shall be ball or roller type. Sleeve bearings are not acceptable. Bearings shall have replaceable inserts so entire housing need not be replaced. Bearings shall be self-aligning to assist in shaft alignment. Self-locking collars shall be provided to secure bearing to the shaft. Bearing housing shall be cast iron for strength and long life. Each bearing shall have pressure relief fittings to assure bearing seal life. Bearing life shall be minimum L-10 100,000 hour. Calculations shall be made on the basis of load ratings based on the AFBMA "Method of evaluating load ratings for ball bearings", and are the steady, radial loads that bearings can endure at various speeds for 1,500 hours with 90% of the group surviving. Calculations shall be submitted for engineer review upon request. Bearing operation shall be checked under load at the design speed. Bearing pass/fail criteria shall be based on 1987 ASHRAE Handbook, chapter 52, table 26.
2. Rotating assembly shall be steel channel type construction to provide rigid support for motor, drive, bearings, shaft and wheel. Entire assembly to be mounted on open coil type springs with seismic restraint. Assembly shall have bottom access and entire assembly shall swing down for maintenance. Assembly shall also be completely removable without disassembling unit casing.
3. Shafting shall be carbon steel, turned, ground and polished to close tolerance and oversized to insure vibration free operation. Shafts shall be selected not to exceed 75% of first critical speed. Shaft shall be cleaned and coated to protect against condensation and/or airborne contamination. The cleaning procedure shall include removing any surface rust, loose mill scale, weld spattering and sharp prominences by scraping, sanding and wire brushing to the degree specified by SSPC-SP-1 & 2. The removal of all oil, grease, dirt, salts, soil and contaminants shall be accomplished by cleaning with solvent. After cleaning, shaft shall be coated all over exposed surfaces with a lacquer based shaft protectant. Bluing pigment shall be added to facilitate visual conformation of total coverage. Removal of coating for wheel and hub service shall be achieved with the use of only a lacquer thinner.
4. Fans may be direct drive or belt drive as shown on the drawings. Belt drive units shall utilize a V-belt with cast iron sheaves. Motor sheaves shall be of the adjustable pitch diameter type. Drives shall be rated at no less than 150% of nameplate horsepower.
5. Motors shall be standard NEMA frame type. All motors shall be premium efficiency type. No others are acceptable.
6. Fractional horsepower motors to be resilient mounted and integral horsepower motors to be rigid mounted to spring isolated rotating assembly frame. Power leads from motors to be field installed with flex connection to field supplied junction box allowing enough length for rotating assembly swing down.

E. Coils:

1. Coils shall be ARI certified and of the same manufacturer as the unit to insure proper fit and quality. All coil casings shall be 16-gauge galvanized steel minimum or stainless steel. Copper tubes shall be minimum 5/8" diameter with a minimum thickness of 0.020 and return bends of minimum 0.035. Headers shall be non-ferrous seamless copper. Aluminum fins shall have a minimum thickness of 0.0080 and tubes shall be mechanically expanded into fin collars to provide permanent mechanical bond. No exposed copper shall show between fins.
2. Coils shall be mounted in stainless steel drain pans.

F. Filter Section:

1. Filters shall be minimum MERV-13 efficiency and velocity shall be less than 500 FPM.
2. Filter access is bottom removal unless shown otherwise on plans and schedule.

- G. Unit Suspension:
1. Manufacturer to provide factory welded mounting clips for suspension of units. Clips to be capable of accepting 1/2" rod or isolators. Weights shown on plans are maximum allowable operating weights including water in coils.
- H. Side Access:
1. Where shown on plans provide side access to unit components. Access panel is to be hinged and large enough to provide full access to internal components. Door latch to be CAD plated spring steel manual quick release "Ludwig" latch with pressure closure mechanism. Door to be painted galvanized 16-gauge steel with pin break edge reinforcement. Door to be sealed on all four edges with gasket adhesively attached to the door panel.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Examine site to verify if site is ready to receive work. Provide a layout drawing of fan locations to electrical installer.
- C. Install minimum MERV-13 efficiency air filters in unit during installation phase. Do not operate the unit without filters in place.
- D. Install unit supported by vibration isolation springs.
- E. Install 3" flexible duct connection at inlets and outlets of units.
- F. Install condensate drain piping and traps in accordance with manufacturer's instructions, per local code and as shown on the drawings.
1. Install manufacturer provided condensate "air-trap" where provided with each unit. Install trap per manufacturer's instructions and install condensate piping as required by local code.
- G. Provide and install condensate pump as required and as shown on the Drawings. Coordinate with plumbing design and electrical design as necessary.
- H. Control installers shall install all control conduit and wiring associated with control functions required as shown on the drawings.
- I. Electrical installer shall install all line voltage power wiring and conduit. Coordinate with Division 26 work.
- J. Install a new set of filters prior to final air balance. If these filters become dirty due to ongoing construction or fans were operational for more than thirty days following the final air balance, provide and install an additional new set of filters prior to Certificate of Occupancy. The Owner's Representative shall determine if filters are acceptable.

3.02 MANUFACTURER'S START-UP SERVICES

- A. The manufacturer shall provide start-up service in the form of a factory trained service technician. The service technician shall verify correct installation, verify unit mounting, verify fan rotation, verify spring isolator adjustments, verify control wiring, verify power wiring, start-up the fans, and check for proper operation. The service technician shall provide final adjustments to meet the specified performance requirements. Fully staffed parts and service personnel shall be within four hours of travel from the job site.

END OF SECTION

DIVISION 25

INTEGRATED AUTOMATION

This page intentionally left blank

SECTION 25 05 00
INTEGRATED AUTOMATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01, apply to this Section, except as specifically noted in this Section.
- B. Product and installation requirements for electrical, communications, and building automation wiring and devices in Division 23, Division 26, and Division 27 apply to this Section, except as specifically noted in this document.
- C. Related Specifications
 - 1. Division 23
 - 2. Division 26
 - 3. Division 27

1.2 SUMMARY

- A. This specification section is merely a starting point to provide the Designer and/or Design Build Entity a high-level requirement for the Integration Automation and Direct Digital Controls (DDC) systems required by the District. It is the responsibility of the Designer to develop detailed specifications for Division 25 and related divisions as a part of the design process inclusive of hardware components, sequence of operations, submittals, applicable testing procedures, and other typical specification sections. As part of the Work performed under Division 25 "Integrated Automation", the DDC Contractor shall furnish control devices, instruments, meters, and sensors in accordance with this Section and Division 23. Provide all control devices, instruments, meters, and sensors required for a fully functional DDC System capable of fully executing the specified Sequences of Operations
- B. All networked control devices shall be ANSI/ASHRAE 135 native BACnet devices.
 - 1. All DDC devices shall be tested, certified, clearly stamped and listed by the BACnet Testing Laboratories (BTL) prior to the bid date for this Project.
 - 2. The BACnet operating stack must be embedded directly in each individual DDC device at the media access controller level and in all operator interface and configuration applications.
 - 3. Communication gateways, bridges, and protocol translators are permitted only under the following conditions:
 - a. Protocol translators as required to communicate to existing building systems or legacy control systems.
 - b. Equipment-specific gateways and dedicated controllers that are supplied, recommended or endorsed by the manufacturer of the equipment they are to control.
 - c. Gateways shall allow the DDC System to read all readable object properties and write to all writeable object properties using standard BACnet services.
 - d. Gateways shall provide all BACnet communication services and features described in "BACnet Gateways" under Network Communication Devices in Part 2 of Section 25 50 00

- C. DDC System shall monitor and/or control the following systems:
1. HVAC Systems
 2. Plumbing Systems
 3. Lighting Control Systems
 4. Power Metering Systems
- D. The DDC System shall have the future capability to monitor and/or control the following systems:
1. Fire Alarm
 2. Access Control
 3. Video Surveillance
 4. Power Management
 5. Photovoltaic Systems

1.3 CODES AND STANDARDS

- A. Workmanship, materials, and equipment together with the resultant complete and operational DDC System shall be in compliance with the Authorities Having Jurisdiction (AHJ) for the project and the most restrictive of applicable local, state, and federal codes and ordinances in cooperation with these plans and specifications.
- B. At a minimum, the installation shall comply with the applicable sections of the current editions in effect thirty (30) days prior to receipt of bids of the following codes:
1. ANSI/ASHRAE Standard 135: Data Communication Protocol for Building Automation and Control Networks (BACnet)
 2. Building Industry Consulting Services International (BICSI): Telecommunications Distribution Methods Manual (TDMM)
 3. Title 24 Part 6: California Energy Code
 4. International Building Code (IBC), for Projects outside of California
 5. International Mechanical Code (IMC), for Projects outside of California
 6. National Electric Code (NEC) with all state and local amendments
 7. Telecommunications Industry Association (TIA):
 - a. ANSI/TIA-568-C.0: Generic Telecommunications Cabling for Customer Premises
 - b. ANSI/TIA-568-C.1: Commercial Building Telecommunications Cabling Standards
 - c. ANSI/TIA-568-C.2: Balanced Twisted Pair Telecommunications Cabling and Components
 - d. ANSI-TIA-607-B: Generic Telecommunications Bonding and Grounding for Customer Premises

1.4 QUALIFICATIONS AND QUALITY ASSURANCE

- A. DDC System Manufacturer Qualifications:
1. Nationally recognized manufacturer of DDC systems
 2. Has produced DDC systems with similar requirements to those specified for a continuous period of five years within time of bid.

3. Has produced DDC systems and products that have been successfully tested and in use on at least ten past Projects of comparative size and complexity.
 4. Has complete published catalog literature, installation, operation, and maintenance manuals for all products intended for use.
 5. Has full-time in-house employees for the following:
 - a. Product research and development.
 - b. Product and application engineering.
 - c. Product manufacturing, testing and quality control.
 - d. Technical support for DDC system installation training, commissioning, and troubleshooting of installations.
 - e. Owner operator training.
 6. All products used in this installation shall be new and currently under manufacture. Spare parts shall be available for at least five years after completion of this contract.
 7. All products shall have been available from the manufacturer for a minimum of 6 months prior to date of proposal and previously installed and proven effective in installations of similar nature, not including test sites. This installation shall not be used as a test site for any new products unless explicitly approved by the Owner in writing.
 8. All BACnet devices must either be certified as compliant with the BACnet standard through a listing by the BACnet Testing Laboratory (BTL) or the vendor must supply proof of having submitted the device for testing by BTL.
 9. The DDC system and components shall be listed by Underwriters Laboratories UL 916 as an Energy Management System.
 10. Manufacturer shall be ISO 9001 registered.
- B. DDC Contractor Qualifications:
1. Authorized representative of, and trained by, the specified DDC System manufacturer.
 2. Contractor's Project Manager Qualifications: Individual shall specialize in and be experienced with direct digital control system installation for not less than 3 years. Project Manager shall have experience with the installation of the proposed direct digital control equipment product line for not less than 2 Projects of similar size and complexity.
 3. Contractor's Programmer Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system programming for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Programmers must show proof of having successfully completed the most advanced programming training offered by the vendor of the programming application on the proposed product line.
 4. Contractor's Service Qualifications: The installer must be experienced in control system operation, maintenance, and service. Contractor must document a minimum 5-year history of servicing installations of similar size and complexity. Installer must also document at least a 1-year history of servicing the proposed product line.
 5. Contractor's Response Time and Proximity
 - a. Installer must maintain a fully capable service facility within 50 miles of the subject Project. Service facility shall manage the emergency service dispatches and maintain the inventory of spare parts.
 - b. Installer must demonstrate the ability to meet the emergency response times listed.
 6. Electrical installation shall be by manufacturer-trained electricians
 - a. Exception: Roughing in wiring and conduit and mounting panels may be subcontracted to any licensed electrician.
 - b. Exception: Installation of low voltage power and signal wiring may be performed

by contractors who are not licensed electricians, if permitted by local code, the General Contractor, and the AHJ.

7. Staffing resources of competent and experienced full-time employees that are assigned to execute work according to schedule.
8. Service and maintenance staff assigned to support Project during warranty period.
9. Product parts inventory to support on-going DDC system operation for a period of not less than five years after completion of Work.

PART 2 – PRODUCTS

- A. Global Controller – Tridium Niagara Platform, JACE 9000 Compliant
- B. Field Controllers –
 1. ABB Controls
 2. Honeywell CIPer
 3. Johnson Controls FX
 4. ALC (LAVC campus only)
- C. The Tridium Niagara platform is to be used for all buildings at all Colleges and shall be open license. Station Compatibility In/Out and Tool Compatibility In/Out shall be “All.” No compatibility restrictions are acceptable.
- D. Operator Workstation – The DDC systems shall be set up on a virtual network and as such a dedicated operator workstation is not required.

PART 3 – SYSTEM ARCHITECTURE

- A. General
 1. The system shall be configured as a distributed processing internetwork capable of expansion as specified herein.
 2. All control products provided for this Project shall comprise an interoperable Native BACnet System. All control products provided for this Project shall conform to ASHRAE Standard 135.
 3. Provide hardware and software resources sufficient to meet the functional requirements specified in this Section. Include all items not specifically described in this Section that are necessary to implement, maintain, and operate the system in compliance with the functional intent of this Specification.
- B. Networking Requirements
 1. The DDC internetwork shall be open and non-proprietary, and available to other companies for use in making future modifications to DDC system.
 2. The ASHRAE 135 BACnet communication protocol shall be sole and native networking protocol used throughout the entire DDC system. Only native BACnet control devices shall be used without explicit written permission by the Engineer of Record.
 3. Communication gateways, bridges, protocol translators or any other device that translates any proprietary communication protocol to BACnet are not acceptable as a part of the Work under this Section, with specific exceptions.

4. DDC System shall communicate via a dedicated control internetwork that is not shared with other building systems or tenant data and communication networks.
 - a. The Owner's IT network shall not be used for control purposes.
 - 1) Exception: Supervisory Network may utilize existing Wide Area Network (WAN) if DDC System spans multiple buildings, with permission of Owner.
 - b. If permitted by Owners, control internetwork may share router hardware and physical network infrastructure if there is sufficient capacity. Control internetwork must be logically separated from IT network (e.g. by vLAN).
 - c. Any use of Owner's IT infrastructure requires written permission from Owner. DDC Contractor shall coordinate with Owner and Owner's IT staff.
5. DDC System as provided under this Section shall implement the following BACnet data links only:
 - a. BACnet/IP
 - b. BACnet Master-Slave/Token-Passing (MS/TP)
 - 1) MS/TP network backbone speeds shall be 76,800 bps if possible, and no less than 38,400 bps in any case.
 - 2) Speeds of 9,600 bps or 19,200 bps shall be permitted to connect with specific devices that cannot support higher speeds.
 - 3) No other speeds shall be acceptable.
 - c. Point-to-Point (PTP), for dial-up access, only if required.
 - d. BACnet Ethernet (ISO 8802.3).
 - e. All other BACnet data links shall be excluded from this Project. Other non-BACnet data links and protocols such as TCP/IP, SMTP, and HTTP, are permitted as required elsewhere in this Section.
6. MS/TP networks are limited as follows:
 - a. No single MS/TP network shall exceed a wire run length of 2,000 feet.
 - b. Repeaters/amplifiers shall not be used.
 - c. Only MS/TP Master devices are permitted. MS/TP slave devices shall not be used.
 - d. No single MS/TP network shall exceed 32 full-load nodes.
 - 1) For the purposes of this Specification, any devices that do not support both the Read Property Multiple (RPM) service and Data Segmentation for both Transmit and Receive, shall be considered full-load nodes.
 - e. No single MS/TP network shall exceed 64 devices total, regardless of load level.
7. Irrespective of other network connectivity requirements or lack thereof, the DDC System shall be configured such that devices supporting MS/TP can send (but not receive) email over the public internet. This capability shall be used to notify operators of events and alarms as detailed elsewhere in this Section.
8. Wireless communication in any control LAN is not acceptable without review and approval by the LACCD Facilities, Planning, and Development department. DDC Contractors who wish to use wireless devices or networking are required to use the pre-submittal

process for approval.

- C. Network Architecture: The DDC network shall consist of no more than three levels of networks.
1. A Supervisory Control Network may be used to connect building controllers, servers, and operator workstations.
 - a. Supervisory Network may be a Local Area Network, or it may span multiple buildings or locations as a Wide Area Network (WAN).
 - b. Supervisory Network link layer shall be Ethernet (IEEE802.3).
 - c. Supervisory Network networking layer shall be BACnet/IP and shall share a common network number for the Ethernet backbone, as defined in ASHRAE Standard 135.
 - d. Supervisory Network, including all routers and switches, shall support no less than 100 Mbps.
 - e. Powerline communications is not acceptable.
 2. A Primary Control LAN shall connect advanced application controllers to building controllers and to other advanced application controllers. The Primary LAN communicates exclusively with control information.
 - a. Each Primary LAN shall be contained within a single building. A single Primary LAN shall not span multiple buildings.
 - b. Primary LAN link layer shall be Ethernet (IEEE802.3) or MS/TP.
 - c. Primary LAN networking layer shall be BACnet/IP, BACnetEthernet, or MS/TP as defined in ASHRAE Standard 135.
 - d. If a Primary LAN communications trunk is severed, the network shall reconfigure itself into separate LANs and continue operations without interruption or requiring operator intervention.
 - e. Primary LAN, including all routers and switches, shall support no less than 100 Mbps.
 - f. Powerline communications is not acceptable.
 3. Secondary Control LANs shall connect application specific controllers to other application specific controllers and to terminal control devices such as networked thermostats. Each Secondary Control LAN shall connect to a Primary Control LAN via a BACnet router, or via an advanced application controller or building controller.
 - a. Each Secondary LAN shall be contained within a single building. A single Secondary LAN shall not span multiple buildings.
 - b. Secondary LAN link layer shall be Ethernet (IEEE802.3) or MS/TP.
 - c. Secondary LAN networking layer shall be BACnet/IP or BACnet MS/TP as defined in ASHRAE Standard 135.
 - d. Secondary LAN speed and bandwidth shall be dictated by the number of controllers on the LAN, response time and trending requirements, but shall be no less than 38.4 kbps (BACnet MS/TP) or 10 Mbps (BACnet/IP).
 4. The network architecture, and number and type of LANs shall be transparent to operator. All I/O points residing on any LAN shall be capable of global sharing between all DDC System networks.
 5. To the extent feasible, Secondary Control LANs shall be configured so that the control network architecture parallels the mechanical system architecture. For example, a Secondary LAN of VAV controllers should connect directly to the advanced application controller or building controller which controls the air handler that serves the VAV boxes.

D. System Software

1. DDC System Software shall include a BTL-listed BACnet Advanced Workstation (B-AWS) that supports full-featured supervision, configuration, programming, and control of the DDC System. See Paragraph 2.4C.
 - a. DDC Contractor shall configure laptops, desktops and servers running B-AWS software to connect to the control internetwork. Portable devices running B-AWS shall be able to connect at any Ethernet port on the control internetwork.
2. DDC System Software shall include an Operator's Web Interface (OWI) that supports complete supervisory access to DDC system and limited control functions via a web browser, without additional software requirements. See Paragraph 2.4B.
3. DDC System Software may include applications to store, manage, retrieve and/or analyze long-term trend data, if required in Article 2.4.
4. All actions shall be performed over the DDC System internetwork. Systems that require direct connection to DDC field devices or controllers for any of these services are not acceptable.
5. All System Software shall be provided and licensed to the Owner per Paragraphs 1.3B.2 and 1.10B.

PART 4 – TRAINING

- A. Coordinate schedule and materials with Owner and Commissioning Authority.
- B. Provide preliminary training as required such that operating staff can respond to occupant needs and other operating requirements during start-up and commissioning phase.
- C. Formal Training
 1. Training shall be conducted after all commissioning is complete and the systems are fully operational. Training shall not start until Functional Testing is complete and the Functional Test Report has been submitted and accepted.
 2. Provide training sessions for personnel as required by Owner.
 3. Training Schedule
 - a. Schedule training to provide Owner with at least 10 business days advance notice.
 - b. Training shall occur within normal business hours at a mutually agreed on time. Unless otherwise agreed to, training shall occur Monday through Friday, except on U.S. Federal holidays.
 - c. Training shall be scheduled within 30 days of the completion (including acceptance) of Functional testing, unless otherwise authorized by the Owner.
 - d. All training sessions shall occur within a four-week period.
 - e. Each complete training session shall occur on a different day, to facilitate maximum attendance. Schedule training sessions as required to accommodate Owner's needs.
 4. Attendance Tracking
 - a. Request from Owner in advance of training a proposed

- attendee list with name, phone number and e-mail address.
- b. Provide a preprinted sign-in sheet for each training session with proposed attendees listed and blank spaces to add additional attendees. Participant tracking can also be performed electronically.
 - 1) Include training session number, date and time, instructor name, phone number and e-mail address, and brief description of content to be covered during session.
 - 2) List attendees with columns for name, phone number, e-mail address and a column for attendee signature or initials.
 - c. Circulate sign-in sheet at beginning of each session and solicit attendees to sign/initial.
 - d. At end of each training day, send Owner and Commissioning Authority e-mail with an attachment of scanned copy (PDF) of circulated sign-in sheet or equivalent digital participant record for each session.
5. Off-Site Primary System Training
- a. Primary training on DDC System functions and operations shall be provided off-site by the DDC Manufacturer's training staff, either at the factory or at a permanent training facility.
 - b. Primary training by DDC Contractor staff is not acceptable.
 - c. The length of each training period will depend on the complexity of the system and the audience. Minimum training time shall be 24 hours, but the period shall be longer if required to complete the training tasks described herein.
 - d. Expenses for transportation to and from the training facility, hotel, and meals shall be provided by the Owner and excluded from the DDC System bid. Cost for books, manuals and any other type of training equipment or material shall be included in the DDC System bid.
 - e. The training shall accommodate up to 12 District personnel.
6. On-Site Training
- a. Include an additional 40 hours total of on-site training to assist personnel in becoming familiar with site-specific issues, systems, Sequences of Operations, etc.
 - b. Owner will provide conditioned classroom or workspace with ample desks or tables, chairs, power and data connectivity for instructor and each attendee.
 - c. Instructor shall provide training materials, Projector and other audiovisual equipment used in training.
 - d. Training shall be provided by factory-trained instructors experienced in presenting this material. DDC Contractor staff may provide training, if so qualified.
 - e. Training may be in non-contiguous days at the request of the Owner.
7. Training Content and Levels
- a. Operators are divided into three levels of expertise and shall receive training including but not limited to the tasks listed for each training

- level.
- b. DDC Contractor shall provide training for personnel in numbers and at levels requested by the Owner. Coordinate with Owner and Commissioning Authority.
 - 1) At a minimum plan to train 2 Regular Operators, 1 Advanced Operator, and 1 System Administrator.
 - c. Regular Operators shall be trained to perform the following tasks:
 - 1) Proficiently operate the system
 - 2) Understand control system architecture and configuration
 - 3) Understand BAS system components
 - 4) Understand system operation and Sequences of Operations
 - 5) Operate the workstation and peripherals
 - 6) Log on and off the system
 - 7) Access graphics, point reports, and logs
 - 8) Adjust and change system set points, time schedules, and holiday schedules
 - 9) Recognize malfunctions of the system by observation of the printed copy and graphical visual signals
 - 10) Understand and acknowledge alarms
 - 11) Understand system drawings, and Operation and Maintenance manual
 - 12) Understand the Project layout and location of control components
 - 13) Print point and predefined reports
 - d. Advanced Operators shall be trained as Regular Operators plus the following tasks:
 - 1) Make and change graphics on the workstation
 - 2) Create, delete, and modify alarms, including annunciation and routing
 - 3) Create, delete, and modify point trend logs, and graph or print these both on an ad- hoc basis and at user-definable time intervals
 - 4) Create, delete, and modify reports
 - 5) Add, remove, and modify system's physical points
 - 6) Create, modify, and delete programming
 - 7) Add control panels
 - 8) Add Operator Workstations
 - 9) Create, delete, and modify system displays — both graphical and otherwise
 - 10) Perform BAS system field checkout procedures
 - 11) Perform BAS controller unit operation and maintenance procedures
 - 12) Perform workstation and peripheral operation and maintenance procedures
 - 13) Perform BAS system diagnostic procedures
 - 14) Configure hardware including PC boards, switches, communication, and I/O points
 - 15) Maintain, calibrate, troubleshoot, diagnose, and repair hardware
 - 16) Adjust, calibrate, and replace system components
 - 17) Maintain software and prepare backups
8. System Administrators shall be trained as Regular Operators plus the following tasks:
- a. Maintain software and prepare backups

- b. Create and print custom reports, including tenant billing summaries
 - c. Interface with Project-specific, third-party operator software
 - d. Add new users and understand password security procedures
- D. Training Materials
- 1. Provide each attendee with a color hard copy of all training materials and visual presentations.
 - 2. Hard-copy materials shall be organized in a three-ring binder with table of contents and individual divider tabs marked for each logical grouping of subject matter. Organize material to provide space for attendees to take handwritten notes within training manuals.
 - 3. In addition to hard-copy materials included in training manual, provide each binder with a sleeve or pocket that includes a DVD or flash drive with PDF copy of all hard-copy materials.
 - 4. Additionally, store an electronic copy of training materials and training videos (if applicable) on Data Archive Server (if provided) and Operators Portable Workstation.
 - 5. Training materials shall include step-by-step instructions (including illustrations, screen captures, etc.) for how to perform all task identified in Paragraph 3.16D such that a new operator, who has not attended the training in person and has minimal familiarity with this DDC System, can easily follow the instructions and successfully perform all of the identified tasks.
- E. Video of Training Sessions:
- 1. Trainer shall provide or arrange for a digital video and audio recording of each training session. Create a separate recording file for each session.
 - 2. Stamp each recording file with training session number, session name and date.
 - 3. Provide Owner with two copies of digital files on DVDs or flash drives for later reference and for use in future training.
 - 4. Owner retains right to make additional copies for intended training purposes without having to pay royalties.
- F. During the warranty period, provide unlimited live support for all trained operators. DDC Contractor or DDC System Manufacturer shall provide a direct customer support channel for user questions and feedback, preferably as a message or chat application native to the Operator's Interface.

SECTION 26 05 00

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 GENERAL

1.01 DESIGN CRITERIA

A. CODES AND STANDARDS

B. National Electrical Code

C. California Building Code

D. California Electrical Code

1. International Building Code
2. California Building Energy Efficiency Standards (Title-24).
3. Americans with Disability Act (ADA)
4. NFPA – National Fire Protection Association
5. International Fire Code with California Amendments
6. IESNA Standards
7. UTILIZATION VOLTAGES
8. Primary Voltages 4.16KV, 3-Phase, 3-Wire
9. Secondary Voltages 480Y/277V, 3-Phase, 4-Wire
208Y/120V, 3-Phase, 4-Wire
10. Emergency/ Standby 480Y/277V, 3-Phase, 4-Wire
208Y/120V, 3-Phase, 4-Wire

1.2 BRANCH CIRCUITS

A. Special Purpose Receptacles 208V, 1-phase and 208V, 3-Phase

B. Lighting 277V

C. Special Purpose Lighting 120V

D. Motors 1/3HP and smaller 120V

E. General Use Receptacles 120V

F. Motors 1/2HP and larger 480V, 3-Phase

G. ELECTRICAL SERVICE

1. Normal Power
 - a. Each building shall be served from the campus medium voltage power distribution through a pad-mounted transformer located adjacent to the building. Incoming

service shall be rated 480Y/277V, 3-phase, 4-wire, 60 Hz. Main service feeders shall be routed underground.

- b. A load interrupter switch with current limiting fuse shall be provided at the service entrance to feed the medium voltage transformer.
- c. The medium voltage transformer shall be dry type, step down from current existing primary voltage to 480V, 3-phase, 3-wire or 277/480V, 3-phase, 4-wire.
- d. The unit substation comprising of the load interrupter switch, medium voltage transformer and the secondary disconnect circuit breaker shall be in NEMA 1 enclosure indoor type located inside the main electrical room. If there is no space for the unit substation, the load interrupter switch and the medium voltage transformer shall be in NEMA 3R enclosure located outdoor with a secondary circuit breaker disconnect. Incoming service to the building shall be fed underground in duct banks.
- e. Emergency Power
- f. The emergency generator shall be provided to provide power to the egress lighting, life safety equipment (fire alarm system, fire protection equipment), elevators, fire pumps and other selected equipment in case of normal power failure. The emergency power to a building shall be from an outdoor rated diesel generator with an enclosure rated for the exterior.
- g. The generator shall be sized to carry future loads and 20% spare capacity. The emergency generator shall consist of engine generator and controls, sound attenuation enclosure, UL listed fuel tank, exhaust system, radiator, batteries, starting system and generator output circuit breaker.
- h. Fuel storage shall be provided by base-mounted fuel tank located at the bottom of the generator. Tank size shall be enough for 24 hours of emergency operation at full load.
- i. Separate ATS switches will be provided for life safety loads, legally required loads, and optional standby loads (normal).
- j. Provide an MTS at building exterior to allow for a temporary generator to be connected to buildings that are designed with only a single emergency power source.

1.03 METERING

- A. Utility meters shall be located on the main service switchboard for standalone buildings. For campus wide power distribution metering shall be at the primary side.
- B. All LACCD Buildings including Central Utility Plant in any size structure or configuration shall have sub-meters installed.

- C. Building level sub meters shall be configured to interface and exchange data with the District's existing metering software.
- D. Building level sub meters shall include an Ethernet communication port or wireless communication capability or other networking capability.
- E. Building level sub meters shall be installed to capture the following data at a minimum of 15-minute intervals:
 - 1. Electricity consumption (kWH)
 - 2. Power demand (kW)
 - 3. Power Factor
 - 4. Natural gas consumption (therms) (if applicable)
 - 5. Building level utility sub meters may be installed to capture the following data at a minimum of 15 minute intervals:
 - a. Chilled water (if applicable)
 - b. Hot water (if applicable)
 - c. Domestic water
 - d. Sewer discharge
 - 6. Building level sub meters shall include an Ethernet communication port or wireless communication capability or other networking capability.
 - 7. Individual meters shall retain data for a period of no less than 12 months.
 - 8. Photovoltaic installed in or on a building shall have a dedicated meter to track PV production, in addition to the building sub-meter as outlined in the Standards.

1.04 SWITCHBOARDS/PANELBOARDS

- 1. Switchboards and panelboards shall be specified with copper bus bar only. Aluminum bussing is not allowed. Main switchboard and distribution boards shall be provided with power monitoring. This monitoring shall be connected to the BMS system for the building. This to be confirmed for each project.
- 2. The main electrical service switchboard for the building shall be rated 480Y/277V, 3-phase, 4-wire, 60Hz and shall be in the main electrical room on the ground floor. The main switchboard shall have fully rated main circuit breaker with ground fault interrupter for all service rated 1000A and above at 277/480V, 3-phase and shall have power monitoring capabilities.
- 3. All switchboards and distribution panelboards shall be provided with minimum 20% spare capacity for future use.

4. All lighting and power panelboards shall be sized with minimum 20% spare capacity for future use.
5. The distribution switchboards and panelboards shall have main circuit breakers and utilize copper bussing for phases, neutral and ground. All main circuit breakers in switchboards, distribution boards and panelboards shall be fully rated for fault current. Series rated equipment is not allowed.
6. Surge Protection Devices (SPS's) shall be installed on switchboards and panelboards serving IT equipment rooms for two-stage level protection. All emergency switchboards/panelboards shall have SPD's installed to comply with code.
7. All panelboards shall be in dedicated electrical spaces.

1.05 TRANSFORMERS

1. Dry type step-down transformers shall utilize copper coils with 115 degree Celsius rise insulation class. Aluminum wires for transformer coils are not allowed.
2. All dry type transformers shall be loaded up to 70% nameplate rating so that a 30% of connected load may be added in the future.
3. Outdoor transformers are not allowed.

1.06 EQUIPMENT WIRING TO MECHANICAL AND PLUMBING EQUIPMENT

1. Provide a fused disconnect switch at all powered HVAC and elevator equipment, including heat pumps and packaged units.
2. Provide control wiring and interlocking for single or simultaneous operation of motor loads per mechanical engineering requirements.

1.07 FEEDER CONDUCTORS

1. All secondary feeders shall consist of conduit and copper wire. Aluminum wire is not allowed.
2. Power conductors shall be copper single conductors rated 600 volts with Type THWN-2, rated 600V, 90 degrees C dry for damp locations. For equipment wiring, conductors shall be THNN (dry locations) or THWN-2 (wet locations).
3. Conductors must be marked with the manufacturer's name, date of manufacture, voltage, and classification letters and shall be inspected and approved before use. Insulated wire conductors, 600V or less, must be copper, with wire gauge, insulation type, temperature rating, and manufacturer clearly printed on insulation.
4. Mark each phase or leg in each panelboard with identifying tape. The insulation of all conductors is to be color coded throughout the length of the circuit.

5. Conductor color coding shall adhere to table below:

208/120 Volts	Phase	480/277 Volts
Black	A	Brown
Red	B	Orange
Blue	C	Yellow
White	Neutral	Gray
Green	Ground	Green
Purple	Switch leg	Pink

6. Wires shall not change colors between the breaker and the final termination. Aluminum conductors are not allowed.

1.08 WIRING DEVICES

- The receptacles shall be 20 Amp, 125v volt, 3 pole grounding type NEMA 5-20R with screw-type terminals. Ground-fault circuit interrupter outlets for wet area or sink counter locations shall be "feed-thru" type duplex receptacles with test reset buttons.
- Switches shall be minimum 20 Amp 277V, heavy duty toggle, single pole, with screw-type terminals. When multiple switches are installed, and voltage potential is 150V, approved isolation barriers shall be installed between switches.
- All device plates shall be labeled with originating panel and circuit numbers.

1.09 LIGHTING SYSTEMS

- Electrical lighting system shall be based on the latest version of the Illumination Engineering Society of North America (IESNA) guidelines for application and task-based lux targets. The lighting power density shall exceed California Title 24 as well as ASHRAE standards by at least 20% for energy efficiency and maximum power density.
- All lighting to be installed at any facilities shall use LED technology, except in case to case basis and only in cases where a new lighting technology is available that is more efficient than LED.
- LED luminaires shall conform to the following standards:
 - A minimum efficacy (lumens per watt) of 100
 - A coloring rendering index (CRI) of 90 or above.
 - Power factor of 0.9 or above
 - Total Harmonic Distortion (THD) of 20% or lower
 - A minimum of five years manufacturer's warranty
 - Luminaires that are dimmable
 - Color temperature (CCTC) of 3500Kelvin (exceptions may be granted on color temperature on a case to case basis in accordance with specific requirements for a given space with school representative's approval)

- D. Warranty period shall be minimum five years. The project team shall investigate the feasibility and practicality of purchasing longer warranty periods if manufacturer offers that option.
- E. Luminaires shall conform to Title 24 lighting and lighting control standards with the current edition of the applicable Code.
- F. All luminaires throughout the buildings shall be LED and shall be dimmable. Linear direct indirect pendants shall be provided in classrooms. Recessed volumetric shall be provide in labs. Recessed 2x2s shall be provided in corridors.
- G. All classroom lighting shall be dimmable with each row controlled independently and maximum foot candle level to be limited at 80%. Lights can be configured to automatic on to 50% or 70%. These levels may be adjusted based on the use of AV equipment usage within the classrooms.
- H. The preferred lighting solution for classroom lighting includes the specification of dimmable LED drivers.
- I. Exterior lighting in the parking lot shall be comprised of area luminaires. Pedestrian scale columns, bollards, illuminated benches, step lights, or other more decorative luminaires in the plaza. Direct, direct indirect, and decorative lighting shall be provided to illuminate the façade. All luminaires on the exterior shall meet the mandatory BUG rating requirements of Cal Green. All exterior light fixtures shall be installed to minimize glare and avoid spillage to adjacent properties.
- J. All emergency egress lighting and exit signs shall be served from standby emergency generator. Photometric studies shall be prepared for egress pathway on each floor with minimum design emergency lighting per CBC.
- K. Emergency lighting shall be provided in all IDF, MDF, and electrical rooms.
- L. All LED light fixtures for emergency lighting shall have LED drivers with emergency back-up using a centralized inverter system if an emergency generator is not provided.
- M. All emergency lighting shall override dimming mode and turn to full brightness during loss of normal power.

1.10 LIGHTING CONTROL SYSTEM

- A. The Building lighting control system shall comprise of a network relay control system.
- B. Classroom lighting fixtures and controls shall be specified from manufacturer as an integrated system.
 - 1. Classroom lighting shall be turned on manually and area control to be accessible to occupants to turn on the lighting. Lighting to operate automatically off when room becomes vacant.
 - 2. Light fixtures within 15'-0" of window shall be separately controlled (dimmed preferred or switched) with integrated daylight photo sensor to automatically reduce or eliminate energy waste.

3. A manual master on/off and raise/lower shall be provided to control the entire room with an option of a 4-scene control.
 4. The lighting control of classrooms shall be connected to a Central Lighting Control System
 5. Classroom shall have single gang wall mounted manual entrance control and single gang multi push button wall mounted teacher controller preset to achieve proper light levels for classroom functions (i.e., AV presentations). An option is to have a second control at teaching wall.
 - a. For other spaces a central lighting control system shall be provided.
 - b. Central lighting control system should provide on-off inputs from time clock.
 - c. Provide ceiling or wall mounted occupancy sensor with auto off as well as manual override for private room applications.
- C. The control system shall meet all Title 24 requirements including but not limited to dimming daylight harvesting in both primary and secondary daylight zones as well as vacancy, partial on, or partial off occupancy sensors. Dimming control shall be provided for all luminaires where dimming or multi-step is required. Demand response shall be provided as required for delivering a minimum of 15% reduction in lighting load in a uniform method.
- D. All exterior lighting shall be controlled by a photo-cell and the programmable network lighting control system. The control system shall meet all Title 24 requirements including part-night based control comprising of dimming and occupancy sensors. The control shall be available to combine set points between building occupation and site occupation. For example, the exterior lighting after dusk may be 100% when both building is open, and the exterior area is occupied, dropping back to 70% when the building is open, but the exterior area is unoccupied. Past building close and until dawn the setting may change such that the when the exterior area is occupied the lighting may be at 70% and reduce back to 50% when unoccupied.
- E. Sports lighting shall have independent lighting control and monitoring system that will control, monitor and manage the recreational lighting system.
- F. Theatrical lighting control system shall control the auditorium architectural house lighting, lobby lighting and selected work lighting through interface with low voltage relay panels.
- G. Theatrical lighting control system shall comprise of control panels, control electronics and data network, dimmers and circuit wiring devices.
- 1.11 POWER
- A. Classroom shall be provided with a separate branch circuit for general-purpose duplex receptacles, with a minimum of two (2) outlets in each wall maximum 15ft on center. Classroom shall be provided with separate outlets and circuit for other electrical equipment.
 - B. Computer classrooms shall have recessed floor-mounted outlet boxes with flush steel covers, in a 6ft by 6ft grid pattern for maximum workstation layout flexibility.
 - C. In corridors, receptacles shall be provided at maximum 50 feet intervals.
 - D. GFCI receptacles shall be provided on each exterior building wall and each restroom. Receptacles installed outdoors shall be in lockable boxes or cabinets.

- E. For East LA College and Southgate Environmental Center, provide three dedicated lockable electrical receptacles. Outdoor locations shall be coordinated with university.
- F. Receptacles in corridors, restrooms and on exterior walls shall be switched with a locked type switch installed in a Janitor's closet.
- G. Receptacles that automatically shut-off and controlled by occupancy sensors shall be provided in private offices, open offices, lobbies, copy rooms, and conference rooms.

1.12 SERVER ROOM ELECTRICAL EQUIPMENT

- A. A technical power system shall be provided consisting of an isolation transformer and dedicated 120/208V power panel with isolation ground bus, and transient voltage surge suppression (SPD) for server room equipment loads.
- B. Convenience outlets shall be provided at the server room perimeter, spaced 8 feet on center.
- C. Server room walls shall be outfitted with $\frac{3}{4}$ " thick fire-retardant treated plywood backboards from floor level to 8 feet above finished floor.
- D. Suspended or recessed LED with 50 LUX space illumination shall be provided.
- E. The server room wall shall be provided with a supplemental ground system with mounted copper bar for double lug connections.
- F. The server room permanent Uninterruptible Power Systems (UPS) integral to the electrical distribution system shall be provided.

1.13 ELECTRIC VEHICLE CHARGING STATIONS AND CLEAN AIR FUTURE CHARGING STATIONS

- A. Electric vehicle (EV) charging stations shall be commercial type and will include the following features:
 - 1. Software that will allow District staff to program hours of operation, rates, usage rules and the ability for staff to adjust each as needed, from a web-based interface and without having to contact a third party.
 - 2. Charger or software shall notify customers/users when their cars are charges and/or when charging time for which they pay has expired.
 - 3. Chargers shall accept payment from common credit cards and mobile devices such as smartphones. Chargers may also use third party pre-paid accounts through vendor's proprietary smart phone application or other vendor-approved payment system.
 - 4. Metering capability at each charger to allow operators to track times when chargers are in use, revenue produced by each charger, and other metrics.
- B. EV chargers shall be pole mounted or wall mounted with proper protection from traffic damage (bollards, curbs, etc.)

- C. EV chargers shall be level 2 which shall be installed on a dedicated 40 amp circuit. Provide dedicated Cat 6A cable from the charging stations to the nearest IDF room. Option: Level 3 chargers which require dedicated power source shall be considered if requested by the College and with adequate funding.
- D. EV chargers shall have minimum 25-foot length charging cord with automatic retract capability.
- E. Provide at least (1) charging station at the ADA compliant parking space.
- F. Equipment shall have a minimum 5-year warranty.
- G. For Clean Air Future Electrical Charging Stations (CAF ECS)
 - 1. Underground or overhead conduits between CAF ECS and electrical room shall have minimum two (2) inches diameter. Provide electrical circuit breaker per item #3 to satisfy the power need of all CAF ECS.
 - 2. All conduits must be terminated in weatherproofed concrete steel pull boxes near CAF ECS locations. Pull strings and identification tag must be installed in every empty conduit.
 - 3. The pull boxes shall be installed with easy access at following preferences locations.
 - 4. Landscape Area
 - 5. Hardscape Area
 - 6. Concrete Sidewalk
 - 7. Center Parking Space with 5 ft. clearance, if possible, to the nearest potential charging station.
 - 8. Parking Structure or building wall.
 - 9. Provide minimum of one (1) 2 inches diameter conduit from each CAF ECS to IT room for future communication need. Provide adequate data switch ports and/or router ports for meeting the data needs of all CAF ECS. Pull strings and identification tag shall be installed in all empty conduits.

1.14 SUSTAINABLE MEASURES

- A. Energy efficient lighting comprising of LED Lighting and LED exit signs.
- B. Occupancy sensor controls in offices, conference rooms, restrooms, etc. shall be configured to require manual activation of the lighting with the wall mounted switch. The vacancy sensor shall keep the luminaires energized while the space is occupied. The sensor shall turn the luminaires off after 15 minutes of vacancy but will reenergize the luminaires to their previous setting if occupancy is detected within 30 seconds of the "Off" event.

- C. The manual controls described above shall not override the daylight harvesting sensor(s) where present.
- D. Photo sensors or day lighting sensors where natural light is available.
- E. Use high efficiency motors and transformers.

1.02 INSTALLATION OF EQUIPMENT

- A. Install electrical equipment as specified in individual specification sections, and in accordance with the manufacturer's instructions, code requirements, and required access clearances.
- B. Rough-in locations for fixtures and equipment shall be determined from the unit itself or from the approved shop drawings.
- C. Arrange for necessary openings to allow for admittance of equipment. Where equipment cannot be installed as structure is being erected, provide and arrange for building-in of boxes, sleeves, or other devices to allow later installation.
- D. Install equipment to permit easy access for normal maintenance.
 - 1. Maintain easy access to switches, motors, drives, pull boxes, receptacles, etc.
 - 2. Notify the Owner's Representative in writing of relocation items which interfere with access.
 - 3. Suspended raceways and equipment shall be installed in accordance with the Applicable local, state, and national Building Codes.
 - 4. Provide all necessary anchoring devices and supports as required and stated elsewhere.
 - 5. Use structural supports suitable for equipment, or as indicated.
 - 6. Check loadings and dimensions of equipment with shop drawings.
 - 7. Do not cut or weld to building structural members.
 - 8. No material, device or equipment shall be shipped to site unless shop drawings have been approved for such, prior to shipment.

1.03 CONCRETE

- A. General: All concrete required shall be provided as specified in Division 03, Concrete.
- B. Housekeeping Pads and Isolation Bases:
 - 1. Provide all required dimensional drawings for bases and pads and location thereof.
 - 2. Provide all embedded anchor bolts and sleeving and ensure installation of same.

3. Provide seismic calculations.

C. Provide housekeeping concrete pads with minimum 3-inch (or larger per equipment anchorage requirement) wide edges and 3-inch high for indoor or 4-inch high for outdoor equipment, unless otherwise noted or required.

1.04 SEISMIC RESTRAINTS

A. Provide seismic restraints and supports for equipment and work as specified in the Specification Section 26 0548, this and other specification sections, and as shown on drawings.

1. Seismic restraints and supports shall be installed directly after installation of any work requiring them, to avoid concealment or difficulty of access.

2. Contractor shall be responsible for any costs and delays associated with gaining access to any installation needing restraints or supports.

1.05 PENETRATIONS

A. All penetrations through fire and smoke rated walls shall be sealed with fire-stopping material.

B. All penetrations through exterior walls and beneath slabs-on-grade shall be sealed with weatherproofing material.

C. All penetrations through acoustically treated walls shall be sealed with non-hardening resilient acoustic sealant.

D. All below grade conduit penetrations through the walls shall be individually sealed with Link-Seal or equal.

1.06 FIRESTOPPING

A. Provide sealing or stuffing material or assembly in spaces between and penetrations through building materials to arrest movement of fire, smoke, heat and hot gases through fire rated construction.

B. Materials and Products:

1. Provide material listed in the UL Fire Resistance Directory for the UL system involved to achieve fire ratings of adjacent construction.

2. Materials shall have been tested to provide fire rating at least equal to that of the construction.

3. All firestopping products shall be from a single manufacturer.

C. Environmental Requirements:

1. Comply with manufacturer's recommendations for temperature and humidity conditions before, during and after installation of firestopping.
2. Provide masking and drop cloths to prevent contamination of adjacent surfaces by firestopping materials.
3. Provide ventilation in areas to receive solvent cured materials and as required by manufacturer.

1.07 IDENTIFICATION

- A. The Contractor shall identify all conduit, cabling, devices, and equipment in accordance with Section 26 0553 – Identification for Electrical Systems.
- B. The Contractor shall submit a schedule for equipment identification.

1.08 SETTING OF PROTECTIVE DEVICES

- A. Prior to completion of the Project, set all protective device relays and internal settings to provide adjustment between upstream and downstream protective devices. Settings shall be based on the accepted coordination study.

PART 2 - FIRE ALARM SYSTEM

2.01 Design criteria CODES AND STANDARDS

- A. NEMA – National Electrical Manufacturers' Association
- B. UL – Underwriters' Laboratory
- C. California Building Code
- D. California Electrical Code
- E. California Fire Code
- F. CEC - California Electrical Code
- G. NEC - National Electrical Code
- H. NFPA - National Fire Protection Association
- I. IEEE – Institute of Electrical and Electronic Engineers
- J. ANSI – American National Standards Institute
- K. NETA – National Electrical Testing Association
- L. Americans with Disabilities Act

1.15 FIRE ALARM SYSTEM

- A. The fire alarm system shall be consistent with the DSA Fire and Life Safety and other applicable codes and shall be approved by DSA. The system shall be combination manual and automatic detection through complete area coverage as defined in NFPA 72. It shall also provide ADA compliant audible and/or visual alarm notification devices inside buildings and areas of assemblies within the site. The system shall be remotely monitored by UL listed central monitoring station. Each College Campus shall not have more than one fire alarm system if possible.
- B. The fire alarm system shall consist of but not limited to the following basic elements and components to be included in the design and installation:
1. Intelligent Fire Alarm Control Panel(s), network capable and expandable. Main Fire Alarm Control Panel shall be in the Main Electrical Room.
 2. No stand-alone systems. All systems and stations must register on the main fire alarm control panel.
 3. No Fire Alarm Control Panel shall be installed outdoor.
 4. Remote LCD display or FA annunciator in the Building Lobby.
 5. Remote power supplies and batteries for secondary power, 90-minute run-time.
 6. Manual pull stations selected areas.
 7. Addressable smoke and heat detectors necessary for complete area coverage, elevator recall / shut down and fan shut down.
 8. Addressable duct smoke detectors in HVAC supply and return ducts where required by code.
 9. Addressable beam smoke detectors in high ceiling areas such as gymnasiums and auditorium.
 10. Addressable devices to monitor fire sprinkler system tamper and flow switches including fire pump operational status and other fire protection/ suppression systems.
 11. Addressable control relays to initiate elevator recall / shutdown, fan shutdown, door holder power shutoff, unlock secured egress doors.
 12. Audible and visual alarm devices such as speakers and/or strobes to notify occupants of the school campus when under fire alarm condition.
 13. All fire alarm system components shall be CSFM and UL listed.
 14. Fire alarm system shall be installed with fiber network and to be installed in conduit.

15. The fire alarm system shall have emergency battery back-up if back-up generator is not available.
16. The fire alarm system must pass commissioning prior to acceptance.
17. All fire alarm devices shall be tested to NFPA 72E and results provided to the Facilities Director prior to acceptance of the system.
18. New buildings must be integrated into the existing main campus fire alarm system.
19. No manual pull stations in public hallways.
20. The fire alarm system shall be designed only for the space required. Oversizing the fire alarm control panel is not allowed.

END OF SECTION

SECTION 26 05 09
EQUIPMENT WIRING SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Electrical connections to equipment specified under other Sections or furnished by the Owner.

1.02 REFERENCES

- B. NEMA WD 1 - General Purpose Wiring Devices
- C. NEMA WD 6 - Wiring Device Configurations
- D. ANSI/NFPA 70 - National Electrical Code
- E. CEC – California Electrical Code

PART 2 PRODUCTS

2.01 CORDS AND CAPS

- A. Straight-blade Attachment Plug: NEMA WD 1.
- B. Locking-blade Attachment Plug: NEMA WD 5.
- C. Attachment Plug Configuration: Match receptacle configuration at outlet provided for equipment.
- D. Cord Construction: Oil-resistant thermoset insulated Type SO multi-conductor flexible cord with identified equipment grounding conductor, suitable for hard usage in damp locations.
- E. Cord Size: Suitable for connected load of equipment and rating of branch circuit over-current protection.

PART 3 EXECUTION

3.01 INSPECTION

- A. Verify that equipment is ready for electrical connection, wiring, and energization.

3.02 PREPARATION

- A. Review equipment submittals prior to installation and electrical rough-in. Verify location, size, and type of connections. Coordinate details of equipment connections with supplier and installer.

3.03 INSTALLATION

- A. Use wire and cable with insulation suitable for temperatures encountered in heat-producing equipment.

- B. Make cord connections to equipment using flexible conduit. Use liquidtight flexible conduit in damp or wet locations.
- C. Install pre-finished cord set where connection with attachment plug is indicated or specified, or use attachment plug with suitable strain-relief clamps.
- D. Provide suitable strain-relief clamps for cord connections to outlet boxes and equipment connection boxes.
- E. Make wiring connections in control panel or in wiring compartment of pre-wired equipment in accordance with manufacturer's instructions. Provide interconnecting wiring where indicated.
- F. Install disconnect switches, controllers, control stations, and control devices such as limit switches and temperature switches as indicated. Connect with conduit and wiring as indicated.
- G. Coolers and Freezers: Cut and seal conduit openings in freezer and cooler walls, floor, and ceilings.

END OF SECTION

SECTION 26 05 13

MEDIUM VOLTAGE CABLE AND ACCESSORIES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Medium Voltage Cables and Accessories.

1.02 DEFINITIONS

- A. NETA ATS: Acceptance Testing Specification.
- B. Cable splice: Where the joining of two or more cable ends is accomplished by using field installed non-separable connector assembly that joins another cable end.
- C. Cable connector: Where a cable end is field joined to a factory-made separable connector assembly that can be attached and unattached to a mating termination fitting on a piece of equipment. 600A connectors are dead break rated and require the system to be shutdown prior to disconnection. 200A elbows shall be load-break rated.
- D. Cable termination: Where a cable end is field joined to a factory-made assembly with compression type lug bolted to a bus bar on the piece of equipment.
- E. Termination assembly(ies): Refers to all components associated with cable splices, cable connectors and cable terminations.
- F. Separable connector: A cable is terminated in a factory-made assembly unit that can be attached and unattached to another similar unit without damage to the connection or the cable ends.

1.03 SYSTEM DESCRIPTION

- A. Quality Standards: IEEE C2 and NFPA 70.

PART 2 PRODUCTS

2.01 COMPONENTS

- A. Cables:
 - 1. Type: MV105.
 - 2. Conductor: Copper.
 - 3. Conductor Stranding: Compact round, concentric lay.
 - 4. Strand Filling: Conductor interstices are filled with impermeable compound.
 - 5. Conductor Insulation: Crosslinked polyethylene.
 - a. Voltage Rating: 5kv or 15 kV as required.
 - b. Insulation Thickness: 133 percent.

6. Shielding: Copper tape.
7. Shielding and Jacket: Corrugated copper drain wires embedded in extruded, chlorinated, polyethylene jacket.
8. Three-conductor cable assembly with ground conductors.
9. Cable Sheath: Interlocked aluminum.
10. Cable Jacket: Sunlight-resistant PVC.

B. Connectors:

1. Copper-Conductor Connectors: Copper barrel crimped.

C. Solid Terminations:

1. Multiconductor Cable Sheath Seals: Compound-filled, cast-metal body and heat-shrink sheath seal kit.
2. Shielded-Cable Terminations: Class 1, modular, heat shrink, Class 2, indoors, kit with stress-relief tube, or Class 3 with stress cone as required.

D. Separable insulated connectors with load-break cable terminators and test-point fault indicators.

E. Splice Kits: Premolded EPDM splicing body and separable multiway splice system.

F. Fault indicators.

2.02 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters.

END OF SECTION

SECTION 26 05 19

LOW VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Building wire
- B. Remote control and signal cable

1.02 REFERENCES

- A. NEMA WC 70 - Power Cables Rated 2,000V or Less for the Distribution of Electrical Energy
- B. NFPA 70 - National Electrical Code (NEC)
- C. CEC – California Electrical Code
- D. UL 44 – Thermoset-Insulated Wires and Cables
- E. UL 83 – Thermoplastic-Insulated Wires and Cables
- F. UL 854 – Service-Entrance Cables
- G. UL 1581 – Standard for Electrical Wires, Cables, and Flexible Cords
- H. UL 2196 – Fire Resistive, Fire Resistant and Circuit Integrity Cables
- I. California Division of State Architect (DSA) Interpretation of Regulations

PART 2 PRODUCTS

2.01 BUILDING WIRE

- A. Feeders and Branch Circuits Larger Than 6 AWG: Copper, stranded conductor, 600-volt insulation, THHN/THWN or XHHW-2.
- B. Feeders and Branch Circuits Larger Than 6 AWG in Underground Conduit: Copper, stranded conductor, 600-volt insulation, THWN or XHHW-2.
- C. Feeders and Branch Circuits 6 AWG and Smaller: Copper conductor, 600-volt insulation, THHN/THWN. 6 and 8 AWG, stranded conductor; smaller than 8 AWG, solid or stranded conductor, unless otherwise noted on the drawings.
- D. Motor Feeder from Variable Frequency Drives: Copper conductor, 600-volt XHHW-2 insulation, stranded conductor, unless otherwise noted on the drawings.
- E. Campus Standards
- F. LA Harbor College – Copper conductors only, THHN/THWN

1. LA Trade Tech College – Copper conductors only, THHN/THWN
- G. Control Circuits: Copper, stranded conductor 600-volt insulation, THHN/THWN.
- H. Each 120 and 277-volt branch circuit shall have a dedicated neutral conductor. Neutral conductors shall be considered current-carrying conductors for wire derating.
1. Color must be factory applied or field applied for sizes larger than 6.
 - a. Colors for 208Y/120 V Circuits:
 - b. Phase A: Black.
 - c. Phase B: Red.
 - d. Phase C: Blue.
 2. Colors for 480Y/277 V Circuits:
 - a. Phase A: Brown.
 - b. Phase B: Orange.
 - c. Phase C: Yellow.
 - d. Color for Neutral (Grounded Conductor): White or gray.
 - e. Color for Equipment Ground: Green.
 - f. Color for Isolated Ground: Green with two or more yellow stripes.

2.02 REMOTE CONTROL AND SIGNAL CABLE

- A. Control Cable for Class 1 Remote Control and Signal Circuits: Copper conductor, 600-volt insulation, rated 60°C, individual conductors twisted together, shielded, and covered with a PVC jacket.
- B. Control Cable for Class 2 or Class 3 Remote Control and Signal Circuits: Copper conductor, 300-volt insulation, rated 60°C, individual conductors twisted together, shielded, and covered with a PVC jacket; UL listed.
- C. Plenum Cable for Class 2 or Class 3 Remote Control and Signal Circuits: Copper conductor, 300-volt insulation, rated 60°C, individual conductors twisted together, shielded, and covered with a nonmetallic jacket; UL listed for use in air handling ducts, hollow spaces used as ducts, and plenums.

2.03 MINERAL-INSULATED CABLE, TYPE MI

- A. Description: Solid copper conductors encased in compressed metal oxide with an outer metallic sheath, rated 600v or less.
- B. Standards:
- C. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
 1. UL 2196 for fire resistance.
 2. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."
- D. Conductors: Copper, complying with ASTM B3 for bare annealed copper.

- E. Insulation: Compressed magnesium oxide
- F. Sheath: Copper

END OF SECTION

SECTION 26 05 26

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Equipment grounding system
- B. Bonding system
- C. Grounding electrode system
- D. Grounding of systems over 1kV

PART 2 PRODUCTS

2.01 GROUNDING CONDUCTORS

- A. For insulated conductors, comply with Division 26 Section 26 05 13 "Medium Voltage Cable and Accessories".
- B. Material: Copper.
- C. Equipment Grounding Conductors: Insulated. Refer to Section 26 05 53 for insulation color.
- D. Isolated Ground Conductors: Insulated. Refer to Section 26 05 53 for insulation color.
- E. Grounding Electrode Conductors: Stranded cable.
- F. Underground Conductors: Bare, tinned, stranded, unless otherwise indicated.
- G. Copper Bonding Conductors: As follows:
 - 1. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG copper conductor, 1/4 inch in diameter.
 - 2. Bonding Conductor: No. 4 or No. 6 AWG, stranded copper conductor.
 - 3. Bonding Jumper: Bare copper tape, braided bare copper conductors, terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
 - 4. Tinned Bonding Jumper: Tinned-copper tape, braided copper conductors, terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
- H. Grounding Bus:
 - 1. Provide grounding buses in all electrical and telecommunication rooms,
 - 2. Bare, annealed copper bars of rectangular cross section, with insulators. 1/4" thick x 2" high x 24" length minimum or longer as required for all bonding connections.
- I. Intersystem Bonding Termination:

1. Copper bar, 1/4" x 2" x 24". Provide with wall mounting brackets, insulators, and pre-tapped holes.
2. Approved Manufacturers: Harger, Erico.

2.02 CONNECTOR PRODUCTS

- A. Comply with UL 467; listed for use for specific types, sizes, and combinations of conductors and connected items.
- B. Connectors Exothermic-welded type, in kit form, and selected per manufacturer's written instructions.
- C. Bolted Connectors: Bolted-pressure-type connectors.
- D. Substation connectors shall comply with IEEE 837 listed for use for specific types, sizes, and combinations of conductors and connected items.

2.03 GROUNDING ELECTRODES

- A. Ground Rods: Copper-clad steel Stainless steel.
- B. Concrete-Encased Grounding Electrode (Ufer): Fabricate according to CEC/NFPA 70 using a minimum of 20 feet of bare copper conductor not smaller than No. 4 AWG or 20 feet (6.0 m) of 1/2" (13mm) steel reinforcing bar.
- C. Building Steel
- D. Metal water piping at the water service entrance to the building

2.04 GROUNDING AT SERVICE:

- A. Equipment grounding conductors and grounding electrode conductors must be connected to ground busbar. Install main bonding jumper between neutral and ground buses.
- B. Grounding Separately Derived Systems-Permanent Generators: Install grounding electrode(s) at location of permanent generators having switched neutral connections. Electrode must be connected to equipment grounding conductor and to frame of generator.
- C. Grounding system to be tested to show compliance with 25 ohm requirement per the CEC and any lower ohm requirement required for specific project requirements to be lower.

END OF SECTION

SECTION 26 05 29

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Hangers and Supports for Electrical Systems

PART 2 GENERAL

2.01 PRODUCTS

- A. Performance Requirements:
 - 1. Delegated Design: Engage a qualified structural professional engineer.
- B. Support, Anchorage, and Attachment Components:
 - 1. Galvanized-steel slotted support systems with metallic coatings.
 - 2. Aluminum slotted support systems with painted coatings.
 - 3. Nonmetallic slotted support systems.
 - 4. Raceways and cable supports.
 - 5. Steel conduits and cable hangers, clamps, and associated accessories.
 - 6. Support for nonarmored conductors and cables in vertical conduit risers.
 - 7. Structural steel for fabricated supports and restraints.
 - 8. Mounting, Anchoring, and Attachment Components:
 - a. Powder-actuated fasteners.
 - b. Mechanical-expansion anchors.
 - c. Concrete inserts.
 - d. Clamps for attachment to steel structural elements.
 - e. Steel springhead toggle bolts.
 - f. Threaded hanger rods.
- C. Fabricated Metal Equipment Support Assemblies:
 - 1. Welded or bolted steel shapes.

2.02 SELECTION

- A. Maximum Support Spacing and Minimum Hanger Rod Size for Raceways: Space supports for EMT, IMC, and ERMC as required by CEC. Minimum rod size must be 1/4 inch (6 mm) in diameter.

PART 3 EXECUTION

3.01 CONCRETE BASES

- A. 3000 psi, 28-day compressive-strength concrete.

END OF SECTION

SECTION 26 05 33

RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Rigid metallic conduit and fittings (RMC)
- B. Electrical metallic tubing and fittings (EMT)
- C. Flexible metallic conduit and fittings (FMC)
- D. Liquid tight flexible metallic conduit and fittings (LFMC)
- E. Rigid polyvinyl chloride conduit and fittings (PVC)
- F. Wall and ceiling outlet boxes
- G. Electrical connection
- H. Pull and junction boxes
- I. Rough-ins
- J. Handholes
- K. Accessories

PART 2 PRODUCTS

2.01 RIGID METALLIC CONDUIT (RMC) AND FITTINGS

- A. Acceptable Manufacturers:
 - 1. Acceptable Manufacturers: Allied, LTV, Steelduct, Calbond Calpipe, Wheatland Tube Co, O-Z Gedney, or approved equal.
 - 2. Acceptable Manufacturers of RMC Conduit Fittings: Appleton Electric, O-Z/Gedney Co., Electroline, Raco, Bridgeport, Midwest, Regal, Thomas & Betts, Crouse-Hinds, Killark, or approved equal.
- B. Minimum Size Galvanized Steel: 3/4 inch (19mm), unless otherwise noted.
- C. Fittings and Conduit Bodies:
 - 1. End Bell Fittings: Malleable iron, hot dip galvanized, threaded flare type with provisions for mounting to form.
 - 2. Expansion Joints: Malleable iron and hot dip galvanized providing a minimum of 4 inches of movement. Fitting shall be watertight with an insulating bushing and a bonding jumper.

3. Expansion Joint for Concrete Encased Conduit: Neoprene sleeve with bronze end coupling, stainless steel bands and tinned copper braid bonding jumper. Fittings shall be watertight and concrete tight.
 4. Conduit End Bushings: Malleable iron type with molded-on high impact phenolic thermosetting insulation. Where required elsewhere in the contract documents, bushing shall be complete with ground conductor saddle and clamp.
 5. All other fittings and conduit bodies shall be of malleable iron construction and hot dip galvanized.
- D. PVC Externally Coated Conduit: Compliant with UL 6, ANSI C80.1 and NEMA RN 1; rigid galvanized steel conduit with external 40 mil PVC coating and internal 2 mil urethane coating surface. All fittings and conduit bodies shall be complete with coating. Threads shall be hot galvanized and coated with a clear coat of urethane. The PVC coated system shall include necessary PVC coated fittings, boxes and covers to form a complete encapsulated system. Acceptable Manufacturers: Calbond Calpipe, Robroy, T&B Ocal or approved equal.

2.02 ELECTRICAL METALLIC TUBING (EMT) AND FITTINGS

- A. Minimum Size Electrical Metallic Tubing: 3/4 inch, unless otherwise noted.
- B. Acceptable Manufacturers of EMT Conduit: Allied, Calbond Calpipe, LTV, Steelduct, Wheatland Tube Co, or approved equal.
- C. Fittings and Conduit Bodies:
1. 2" Diameter or Smaller: Compression or steel set screw type of steel designed for their specific application.
 2. 1/2" and 3/4" Conduit: Push-on connectors and couplers with locking ring and washer of zinc plated steel, listed for use in dry locations.
 3. Larger than 2": Compression type of steel designed for their specific application.
 4. Acceptable Manufacturers of EMT Conduit Fittings: Appleton Electric, O-Z/Gedney Co., Electroline, Raco, Bridgeport, Midwest, Regal, Thomas & Betts, or approved equal.

2.03 FLEXIBLE METALLIC CONDUIT (FMC) AND FITTINGS

- A. Minimum Size Galvanized Steel: 3/4 inch, unless otherwise noted. Lighting branch circuit wiring to an individual luminaire may be a manufactured, UL listed 3/8" flexible metal conduit and fittings with #14 AWG THHN conductors and an insulated ground wire. Maximum length of 3/8" FMC shall be six (6) feet.
- B. Acceptable Manufacturers: American Flex, Alflex, Electri-Flex Co, or approved equal.
- C. Construction: Flexible steel, approved for conduit ground, zinc coated, threadless type formed from a continuous length of spirally wound, interlocked zinc coated strip steel. Provide a separate equipment grounding conductor when used for equipment where flexibility is required.
- D. Fittings and Conduit Bodies:
1. Threadless hinged clamp type, galvanized zinc coated cadmium plated malleable cast iron or screw-in type, die-cast zinc.
 2. Fittings and conduit bodies shall include plastic or cast metal inserts supplied by the manufacturer to protect conductors from sharp edges.

3. Acceptable Manufacturers: O-Z/Gedney Co., Thomas & Betts, Appleton Electric, Electroline, Bridgeport, Midwest, Regal, or approved equal.

2.04 LIQUIDTIGHT FLEXIBLE METALLIC CONDUIT (LFMC) AND FITTINGS

- A. Acceptable Manufacturers: Anaconda Type UA, Electri-Flex Type LA, Alflex, Carlon (Lamson & Sessions), or approved equal.
- B. Construction: Flexible steel, approved for conduit ground, zinc coated, threadless type formed from a continuous length of spirally wound, interlocked zinc coated strip steel and an extruded PVC cover.
- C. Fittings and Conduit Bodies:
 1. Watertight, compression type, galvanized zinc coated cadmium plated malleable cast iron, UL listed.
 2. Fittings and conduit bodies shall include plastic or cast metal inserts supplied by the manufacturer to protect conductors from sharp edges.
 3. Acceptable Manufacturers: Appleton Electric, O-Z/Gedney Co., Electroline, Bridgeport, Thomas & Betts, Midwest, Regal, Carlon (Lamson & Sessions), or approved equal.

2.05 RIGID NON-METALLIC CONDUIT (PVC) AND FITTINGS

- A. Minimum Size Rigid Smooth-Wall Nonmetallic Conduit: 3/4 inch, unless otherwise noted.
- B. Acceptable Manufacturers: Carlon (Lamson & Sessions) Type 40, Cantex, J.M. Mfg., or approved equal.
- C. Construction: Schedule 40 and Schedule 80 rigid polyvinyl chloride (PVC), UL labeled for 90°C.
- D. Fittings and Conduit Bodies: NEMA TC 3; sleeve type suitable for and manufactured especially for use with the conduit by the conduit manufacturer.
- E. Plastic cement for joining conduit and fittings shall be provided as recommended by the manufacturer.

2.06 OUTLET BOXES

- A. Sheet Metal Outlet Boxes: ANSI/NEMA OS 1; galvanized steel, minimum of 14 gauge, with 1/2-inch male fixture studs where required.
- B. Nonmetallic Outlet Boxes: ANSI/NEMA OS 2.
- C. Cast Boxes: NEMA FB1, Type FD, Aluminum, cast ferroalloy, or stainless steel deep type, gasketed cover, threaded hubs.
- D. Outlet boxes for luminaires to be not less than 1-1/2" deep, deeper if required by the number of wires or construction. The box shall be coordinated with surface luminaires to conceal the box from view or provide a finished trim plate.

- E. Switch outlet boxes for local light control switches, dimmers and occupancy sensors shall be 4 inches square by 2-1/8 inches deep, with raised cover to fit flush with finish wall line. Multiple gang switch outlets shall consist of the required number of gang boxes appropriate to the quantity of switches comprising the gang. Where walls are plastered, provide a plaster raised cover. Where switch outlet boxes occur in exposed concrete block walls, boxes shall be installed in the block cavity with a raised square edge tile cover of sufficient depth to extend out to face of block or masonry boxes.
- F. Outlet boxes for telephone substations in walls and columns shall be 4 inches square and 2-1/8 inches deep with single gang raised cover to fit flush with finished wall line equipped with flush telephone plate.
- G. Wall or column receptacle outlet boxes shall be 4 inches square with raised cover to fit flush with finished wall line. Boxes in concrete block walls shall be installed the same as for switch boxes in block walls.

2.07 ELECTRICAL CONNECTION

- A. Electrical connection to equipment and motors, sized per NEC. Coordinate requirements with contractor furnishing equipment or motor. Refer to specifications and general installation notes for terminations to motors.

2.08 PULL AND JUNCTION BOXES

- A. Sheet Metal Boxes: ANSI/NEMA OS 1; galvanized steel.
- B. Sheet metal boxes larger than 12 inches in any dimension that contain terminations or components: Continuous hinged enclosure with 1/4 turn latch and white back panel for mounting terminal blocks and electrical components.
- C. Cast Metal Boxes for Outdoor and Wet Location Installations: NEMA 250; Type 4 and Type 6, flat-flanged, surface-mounted junction box, UL listed as raintight. Galvanized cast iron box and cover with ground flange, neoprene gasket, and stainless-steel cover screws.
- D. Cast Metal Boxes for Underground Installations: NEMA 250; Type 4, inside flanged, recessed cover box for flush mounting, UL listed as raintight. Galvanized cast iron box and plain cover with neoprene gasket and stainless-steel cover screws.
- E. Flanged type boxes shall be used where installed flush in wall.

2.09 ROUGH-IN

- A. Provide with one (1) flush mount double gang box with single gang plaster ring and appropriate cover plate with conduit stubbed to above the lay-in ceiling routed to the corridor cable tray.
- B. Technology Rough-in:
 - 1. Rough-in shall have one (1) 1" conduit.
- C. Technology Rough-in - Wall Phone:
 - 1. Mount on wall +54" or as noted in plans. Rough-in shall have one (1) 1" conduit.
- D. Technology Rough-in - Ceiling Flush Mounted:
 - 1. Mount flush in finished ceiling or as noted in plans. Rough-in shall have one (1) 1" conduit.

- E. Television Antenna Outlet Box Rough-in:
 - 1. Rough-in shall have one (1) 3/4" conduit.

2.10 HANDHOLES

- A. Handhole, composite polymer concrete body and cover. Stainless steel hardware. Bolted non-skid cover rated for 10,000 pounds. Design load occasional non-deliberate vehicular traffic. Stack units to achieve depth shown on plans. Units in landscaped areas shall be green in color. Dimensions as shown on plans.
 - 1. Approved Manufacturers:
 - a. Hubbell/Quazite
 - b. Carson Industries
 - c. Armorcast
 - d. Highline Products
 - e. Synertech
- B. Handhole, cast iron, hot dipped galvanized with checkered cover sidewalk weatherproof box, flat neoprene cover gasket. Stainless steel screw hardware. Mounted flush in concrete. 12"W, 18"L, 12"D or dimensions as shown on plans.
 - 1. Approved Manufacturers:
 - a. Appleton Electric
 - b. OZ Gedney
 - c. Crouse Hinds
- C. Handhole, concrete traffic box and galvanized steel checkered cover. Stainless steel hardware. Bolted cover and box rated for H/20 vehicular traffic. Reinforced concrete slab for bottom. 11"W, 18"L, 24"D or dimensions as shown on plans.
 - 1. Approved Manufacturer: Oldcastle Precast

2.11 ACCESSORIES

- A. Fire Rated Moldable Pads: UL #9700, moldable sheet putty at required thickness on all five sides of back boxes. Kinetics Noise Control – Pad, Spec Seal, 3M or equal.
- B. Sound Barrier Insulation Pads: Mastic, non-hardening, sheet material, minimum 1/8" thickness applied to all five sides of back boxes. Kinetics Noise Control – Seal Tight Backer Pad, L.H. DOTTIE Co., #68 or equal.

SECTION 26 05 43

UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Underground Ducts and Raceways.
- B. Handholes and Manholes

PART 2 PRODUCTS

2.01 TYPE ERMC-S RACEWAYS, ELBOWS, COUPLINGS, AND NIPPLES

- A. General Characteristics: UL 6 and UL CCN DYIX.
- B. Galvanized-Steel Electrical Rigid Metal Conduit (ERMC-S-G), Elbows, Couplings, and Nipples:
 - 1. Interior Coating: Zinc.
 - 2. Minimum Trade Size: Trade size 3/4".
- C. PVC-Coated-Steel Electrical Rigid Metal Conduit (ERMC-S-PVC), Elbows, Couplings, and Nipples:
 - 1. Exterior Coating: PVC complying with NEMA RN 1.
 - 2. Interior Coating: Zinc.
 - 3. Minimum Trade Size: Trade size 3/4".

2.02 TYPE PVC RACEWAYS AND FITTINGS

- A. General Characteristics: UL 651 and UL CCN DZYR.
- B. Schedule 40 Rigid PVC Conduit (PVC-40) and Fittings:
 - 1. Minimum Trade Size: Trade size 3/4".
 - 2. Markings: For use with maximum 90 deg C wire.
- C. Schedule 80 Rigid PVC Conduit (PVC-80) and Fittings:
 - 1. Minimum Trade Size: Trade size 3/4".
 - 2. Markings: For use with maximum 90 deg C wire.
- D. Type A Rigid PVC Concrete-Encased Conduit (PVC-A) and Fittings:
 - 1. Minimum Trade Size: Trade size 2".
- E. Type EB Rigid PVC Concrete-Encased Underground Conduit (PVC-EB) and Fittings:

1. Minimum Trade Size: Trade size 2".

2.03 FITTINGS FOR CONDUIT, TUBING, AND CABLE

A. Metallic Fittings for Type ERMC, Type IMC, Type PVC, Type EPEC, and Type RTRC Raceways:

1. General Characteristics: UL 514B and UL CCN DWTT.
2. Options:
 - a. Material: Steel.
 - b. Coupling Method: Compression coupling.
 - c. Expansion and Deflection Fittings: UL 651 with flexible external bonding jumper.

2.04 DUCT ACCESSORIES

A. Duct spacers.

2.05 HANDHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

A. General Characteristics:

1. ASTM C858 for design and manufacturing processes.
2. SCTE 77.

B. Precast Concrete Handholes and Boxes:

1. Configuration: Units must be designed for flush burial and have closed bottom.
2. Frame and Cover:
 - a. Weatherproof cast-iron frame, with cast-iron cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
 - b. Cover Finish: Nonskid finish must have minimum coefficient of friction of 0.50.
 - c. Cover Legend: Molded lettering, as indicated for each service.
3. Knockout panels.
4. Duct entrances in handhole walls.
5. Handholes 12 inch wide by 24 inch long and larger must have inserts for cable racks and pulling-in irons installed before concrete is poured.

C. Fiberglass Handholes and Boxes with Polymer Concrete Frame and Cover:

1. Configuration: Units must be designed for flush burial and have closed bottom unless otherwise indicated.
2. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
 - a. Cover Finish: Nonskid finish must have minimum coefficient of friction of 0.50.
 - b. Cover Legend: Molded lettering, as indicated for each service.
3. Direct-buried wiring entrance provisions.

4. Duct entrance provisions.
5. Handholes 12 inch wide by 24 inch long and larger must have factory-installed inserts for cable racks and pulling-in irons.

2.06 MANHOLES FOR EXTERIOR UNDERGROUND WIRING

A. General Characteristics:

1. ASTM C858 for design and manufacturing processes.
2. SCTE 77.

B. Precast Concrete Manholes:

1. Knockout panels.
2. Duct entrances in manhole walls.
3. Ground rod sleeve.
4. Source quality control.

C. Cast-in-place concrete manholes.

2.07 UTILITY STRUCTURE ACCESSORIES

A. Description: Utility equipment and accessory items used for utility structure access and utility support, listed, and labeled for intended use and application, and complying with the following local utility company requirements:

- B. Manhole frames, covers, and chimney components.
- C. Manhole sump frame and grate.
- D. Pulling eyes in concrete walls. Pulling eyes in nonconcrete walls.
- E. Pulling-in and lifting irons in concrete floors.
- F. Bolting inserts for concrete utility structure cable racks and other attachments.
- G. Ground rod sleeve.
- H. Expansion anchors for installation after concrete is cast.
- I. Steel cable rack assembly. Nonmetallic cable rack assembly.
- J. Fixed manhole ladders. Portable manhole ladders.
- K. Cover hooks.

2.08 DUCT SEALING

- A. Duct-sealing compound.
- B. Inflatable duct-sealing system.

2.09 EARTHWORK

- A. Restoration: Restore area immediately after backfilling is completed.
- B. Restore surface features at areas disturbed by excavation and re-establish original grades unless otherwise indicated. Replace removed sod immediately after backfilling is completed.
- C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Section 329200 "Turf and Grasses" and Section 329300 "Plants."
- D. Cut and patch existing pavement in path of underground duct, duct bank, and underground structures in accordance with "Cutting and Patching" Article in Section 017300 "Execution."

END OF SECTION

SECTION 26 05 53

IDENTIFICATION OF ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Adhesive labels, markings, nameplates, and signs
- B. Wire and cable markers
- C. Raceway, box, and wire identification
- D. Equipment short circuit current rating (SCCR) labeling
- E. Electrical equipment labeling

PART 2 PRODUCTS

2.01 ADHESIVE MARKINGS AND FIELD LABELS

- A. Adhesive Marking Labels for Raceway: Pre-printed, flexible, self-adhesive vinyl labels with legend indicating voltage and service (Emergency, Lighting, Power, HVAC, Communications, Control, Fire).
 - 1. Label Size as follows:
 - a. Raceways: Kroy or Brother labels 1-inch (25mm) high by 12-inches (305mm) long (minimum).
 - 2. Color: As specified for various systems.
- B. Colored Adhesive Marking Tape for banding Raceways, Wires, and Cables: Self-adhesive vinyl tape not less than 3 mils thick by 1 inch (25mm) to 2 inches (50mm) in width.
- C. Pretensioned Flexible Wraparound Colored Plastic Sleeves for Cable Identification: flexible acrylic bands sized to suit the cable diameter and arranged to stay in place by pre-tensioned gripping action when coiled around the cable.
- D. Wire/Cable Designation Tape Markers: Vinyl or vinyl-cloth, self-adhesive, wraparound, cable/conductor markers with preprinted numbers and letter.
- E. Cable Ties: Fungus-inert, self-extinguishing, one-piece, self-locking nylon cable ties, 0.18-inch (5mm) minimum width, 50-lb minimum tensile strength, and suitable for a temperature range from minus 50°F to 350°F (10°C to 176°C). Provide ties in specified colors when used for color coding.
- F. Underground Plastic Markers: Bright colored continuously printed plastic ribbon tape of not less than 6 inches wide by 4 mil thick, printed legend indicating type of underground line, manufactured for direct burial service. Tape shall contain a continuous metallic wire to allow location with a metal detector.

- G. Aluminum, Wraparound Marker Bands: 1-inch (25mm) width, 0.014 (5mm) inch thick aluminum bands with stamped or embossed legend and fitted with slots or ears for permanently securing around wire or cable jacket or around groups of conductors.
- H. Brass or aluminum Tags: 2" (50mm) by 2" (50mm) by .05-inch (2mm) metal tags with stamped legend, punched for fastener.
- I. Indoor/Outdoor Number and Letters: Outdoor grade vinyl label with acrylic adhesive designed for permanent application in severe indoor and outdoor environments.
- J. Text Sizes:
 - 1. The following information shall be used for text heights, fonts, and size, unless otherwise noted.
 - a. Font: Normal 721 Swiss Bold
 - b. Adhesive Labels: 3/16 inch (5mm) minimum text height
 - c. Vinyl / Plastic Laminate Labels: 3/4" inch (19mm) minimum text height

2.02 NAMEPLATES AND SIGNS

- A. Engraved, Plastic-Laminated Labels, Signs and Instruction Plates: Engraving stock melamine plastic laminate, 1/16-inch (2mm) minimum thick for signs up to 20 square inches (13 square cm), or 8 inches (200mm) in length; 1/8 inch (3mm) thick for larger sizes. Labels shall be punched for mechanical fasteners.
- B. Text Sizes:
 - 1. The following information shall be used for text heights, fonts, and size, unless otherwise noted.
 - a. Text Height: 3/8 inch (10mm) minimum
- C. Baked–Enamel Signs for interior Use: Preprinted aluminum signs, punched, or drilled for fasteners, with colors, legend, and size required for application. Mounting 1/4" grommets in corners.
- D. Exterior, Metal-Backed, Butyrate Signs: Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396 inch (10mm) galvanized-steel backing; and with colors, legend, and size required for application. Mounting 1/4" grommets in corners.
- E. Safety Signs: Comply with 29 CFR, Chapter XVII, Part 1910.145.
- F. Fasteners for Plastic-Laminated Signs; Self-tapping stainless steel screws or number 10/32 stainless steel machine screws with nuts and flat and lock washers.

2.03 PRODUCT COLORS

- A. Adhesive Markings and Field Labels:
 - 1. All Labels: Black letters on white face
 - 2. Normal Power and General Labels: Black letters on white face
 - 3. Medium Voltage (greater than 100 volts): Black letters on white
 - 4. Fire Alarm: Red letters on white face

5. Emergency: Red letters on white face
- B. Nameplates and Signs:
1. NORMAL POWER: Black letters on white face
 2. EMERGENCY: White letters on red face
 3. GROUNDING: White letters on green face.
 4. CAUTION or UPS: Black letters on yellow face
- C. Raceways and Conduit:
1. Provide color coded conduit as indicated below. Conduit shall be colored by the manufacturer:
 - a. Normal Power and General Distribution: Silver
 - b. Emergency Power Distribution System:
 - 1) All Emergency: Orange
 - 2) Legally Required Standby: Yellow
 - c. Fire Alarm System: Red
 - d. Temperature Controls: Blue
 - e. Ground: Green
 - f. Low Voltage and Telephone: Purple
- D. Equipment Labeling:
- a. Label all equipment as required by this section.
 - b. Provide Equipment short circuit current rating (SCCR) and Arc Flash labels on all equipment based on Electrical distribution Studies.

END OF SECTION

SECTION 26 05 73

ELECTRICAL DISTRIBUTION SYSTEM STUDIES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. This specification sets forth requirements for both Design-Bid -Build and Design- Build projects of any size, which include any electrical scope of work. This specifications requires for the inclusion/implementation of an Arc Flash Hazard Analysis Study and the furnishing of Arc Flash Hazard Equipment Labels including the specification of the appropriate PPE level.
- B. This specification will outline the requirements for the A/E consultants, Contractors and Design-Builders for subject projects. This speciation is organized by delivery type for Design-Bid-Build (A/E Consultants and Contractors) and Design-Build (Design-Builders] project procurements
- C. All Studies to include:
 - 1. Short-circuit analysis and report.
 - 2. Selective coordination analysis and report.
 - 3. Arc-flash hazard analysis and report.

1.02 SCOPE

- A. Provide a power system study of the electrical system shown on the plans. The study shall include arc-fault analysis, selective coordination analysis and arc flash hazard analysis.
- B. Contractor is required to provide a fully coordinated system for the normal and essential electrical system and all other locations indicated on the one-line diagram. Contractor shall provide overcurrent protective devices with the appropriate models, frame sizes, trip units, etc. as required to provide a selectively coordinated system.

PART 2 PROJECT TYPES

2.01 DESIGN-BUILD-BID PROJECTS

- A. Designers — Consultants, as part of their professional services agreement, will be required to provide the work scope described per 3.01 of this specification. This work scope outlines the requirements for the Arc Flash Hazard Analysis Study (and other requirements as indicated) to be provided by the subject consultant and the associated Arc Flash Hazard Equipment Labeling requirements to be incorporated into the project plans and specifications.
- B. Contractors — Contractors as part of their construction contract will be required to furnish Arc Flash Hazard Equipment Labels as indicated/required per the project plans and specifications and per part 3.02 of this specification.

2.02 DESIGN - BUILD PROJECTS

- A. Design-Build — Design-Builders, as part of their Design-Build contract agreement, will be required to provide the work scope described per part 3.03 of this specification. This work scope outlines the requirements for the Arc Flash Hazard Analysis Study (and other requirements as indicated) and the associated Arc Flash Hazard Equipment Labeling to be provided.

PART 3 SCOPES

3.01 SCOPE OF SERVICES FOR ARC FLASH HAZARD ANALYSIS STUDY AND ARC FLASH HAZARD EQUIPMENT LABELS

- A. The following analysis/studies/reports are to be performed for all required electrical equipment as indicated below:
 - 1. The District shall be furnished a Short-Circuit Study in accordance with ANSI Standard C37 and IEEE Standard 141-1993.
 - a. The calculated short circuit currents levels shall be compared with the rated withstand ratings of equipment and interrupting ratings for overcurrent protective devices and a tabulation of all equipment devices shall state a status of either "pass" or "fail" based upon the above criteria.
 - b. A comprehensive report shall be prepared describing methodology and containing the results of the study in tabular form.
 - c. An engineering analysis of the results shall be provided along with recommendations for mitigation of any issues that are of concern.
 - 2. The District shall be furnished a Protective Device Coordination Study in accordance with IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems — IEEE Standard 242-2001 (Buff Book).
 - a. A comprehensive report shall be prepared describing methodology and containing device settings in tabular form and time-current graphs of selected representative portions of each system including a simplified one-line diagram of the portion of the system included in the graph.
 - b. The report shall evaluate whether devices are selectively coordinated, and new settings shall be proposed where necessary to improve coordination.
 - c. Where necessary to improve arc flash hazard conditions, new settings shall be proposed. Where selective coordination shall be compromised by these proposed settings, the report shall so state.
 - d. An engineering analysis of the results shall be provided along with recommendations for mitigation of any issues that are of concern.
 - 3. The District shall be furnished an Arc Flash Hazard Analysis Study per the requirements set forth in the current issue of NFPA 70E Standard for Electrical Safety in the Workplace. The Arc Flash Hazard Analysis shall be performed according to the IEEE Standard 1584 - 2002 and IEEE Standard 1584a - 2004 (Amendment 1).

- a. The study shall include all buses in the system where personnel may be exposed to the hazard, including :
 - 1) All system buses rated 240 V and higher and all system buses rated less than 240V where served by a transformer 12.5kVA and larger.
 - 2) Buses rated less than 240 V which are served by transformers rated less than 12.5kVA shall be labeled in accordance with NFPA 70E, Table 130.7(C)(9).
 - 3) System buses shall include, but not be limited to, switchgear, switchboards, transformer primary termination, transformer secondary termination, automatic transfer switches, manual transfer switches, motor starters, fused and non-fused disconnect switches, motor control centers, variable frequency drive input terminals, and sectionalizing switches.
 - 4) System buses shall include, but not be limited to, switchgear, switchboards, transformer primary termination, transformer secondary termination, automatic transfer switches, manual transfer switches, motor starters, fused and non-fused disconnect switches, motor control centers, variable frequency drive input terminals, and sectionalizing switches.
 - b. A comprehensive report shall be prepared describing methodology and containing worst- case arc flash information for each bus in tabular form.
 - c. The report shall identify locations where the calculated arc flash hazard presents a particular danger to members of the public, including students and others who may be exposed.
 - d. The report shall identify locations where physical changes to the system or added protective equipment can be applied to reduce the hazard.
 - e. An engineering analysis of the results shall be provided along with recommendations for mitigation of any issues that are of concern.
4. The District shall be furnished a report on the observed condition of the electrical equipment and distribution systems based upon visual analysis and documentation and shall include :
 - a. The age of the equipment
 - b. The type of equipment
 - c. An engineering evaluation of the typical life expectancy for the type of equipment
 - d. Observed physical condition, including presence of corrosion, cleanliness, documentation of maintenance.
 - e. Presence of hazardous chemicals such as PCB oils.
 5. In the event new construction ties into as-built campus distribution or existing building distribution systems, determination of actual field conditions of the existing system shall be based upon the following methodology:
 - a. Review of available background information

- 1) Consultant shall review the available drawings for each system including existing one-line diagrams, cable schedules, plan and elevation drawings, equipment submittals and available short-circuit studies, protective device coordination studies and arc flash hazard analysis studies.
 - 2) Information from the above sources shall be used as a basis for modeling and as a starting point for site assessment and data gathering activities.
- b. Site assessment and data gathering
- 1) It is important that system impedances and protective device clearing times be modeled as accurately as possible to ensure that the results are representative of actual hazards, so Consultant is responsible for collecting actual system data.
 - 2) It is imperative that the data gathering be accomplished in a safe manner, and therefore it is desirable that equipment be de-energized while it is being examined if at all possible. This will require careful coordination with each campus Facility Director and electrical staff to schedule outages.
 - 3) All switching required to deenergize equipment and work required to open equipment for inspection by Consultant will be performed by a District approved electrician furnished by Consultant, or by a District electrician.
 - 4) If equipment must be examined hot, Consultant and electrician shall wear appropriate Personal Protective Equipment (PPE) based upon available information and the tables in NFPA 70E.
 - 5) Examine all electrical equipment and installations in the field to verify data on existing one-line diagrams and to collect data needed to model the facilities.
 - 6) The following types of data must be collected :
 - 7) Nameplate data from transformers, reactors, generators, circuit breakers and fuses.
 - 8) Relay and circuit breaker settings
 - 9) Fuse rating, type and speed
 - 10) Conductor sizes, types and approximate lengths
 - 11) Grounding configurations
 - 12) Utility source data including minimum and maximum fault values and X/R ratios
 - 13) System operating states
- c. System modeling and analysts
- 1) Systems for each building and for each campus medium-voltage distribution system shall be modeled in SKM Powertools for Windows™ most current version using system one-line diagrams, equipment manufacturer information, and data collected during site assessments.
 - 2) Key assumptions shall be stated in the report, and shall include the following:
 - 3) Working distance for buses with a nominal voltage of 1000 volts or greater shall be assumed to be 36 inches.

- 4) Working distance for buses with a nominal voltage of less than 1000 volts shall be assumed to be 18 inches.
 - 5) Clearing times for circuit breakers shall be based upon the equipment manufacturer's data under the assumption that these devices will operate according to specification. The report shall state that *poor* maintenance or age may adversely affect the performance and reliability of the protective devices.
 - 6) AJI faults shall be assumed to be three-phase faults. Single-phase equipment that meets the study criteria shall be analyzed as a three-phase equivalent.
 - 7) Maximum fault clearing time shall be capped at two seconds based upon IEEE 1584-2002 Annex B.1.2 and the assumption that an arc will self-extinguish, or personnel will move outside of the flash protection boundary within two seconds time. Should egress be from the fault hazard zone be unusually restricted, a longer maximum fault clearing time may be assumed provided an engineering case is presented for the longer clearing time with the report.
 - 8) Modes of operation
 - 9) Should alternate modes of operation exist, including operation of transfer switches and standby generators and alternate switching configurations within the medium-voltage distribution system each alternate configuration shall be studied and the worst-case results from among the modeled scenarios shall be reported and utilized for preparation of the arc flash labels.
6. Deliverables shall include the following :
- a. Bound printed copies and CDs or DVDs with electronic copies in Microsoft Word and PDF formats of each of the following reports:
 - 1) Short-Circuit Analysis
 - 2) Coordination Study
 - 3) Arc Flash Study
 - b. Full-sized one-line diagrams (electronic PDF and CAD file formats) and hard copy) for each building or other electrical system on a standard LACCD border in AutoCAD format per the District's CAD and BIM standards.
 - c. Incorporate Arc Flash Hazard Labels requirements/specifications into the project plans/specification to be furnished and installed by Contractor.
 - d. PDF files for Arc Flash Hazard labels suitable for use by Installing Contractor to prepare actual labels shall be provided for each bus as follows:
 - 1) Each label shall state the Arc Flash Hazard for the bus based upon the
 - e. worst case scenario for that bus.
 - 1) Labels shall comply with NFPA and OSHA requirements for Arc Flash Hazard labels.
 - 2) Label to be vinyl tape material with adhesive and be printed with indelible ink. The vinyl material should be 3 mil thick, and the material, adhesive, and ink should meet the latest version of ANSI Z535.4. The manufacturer should be DuraLabel or equal.

- 3) Labels shall identify the bus name, the equipment type, whether the bus is grounded or ungrounded, the working distance, the available 3-phase bolted fault current, the flash protection boundary, the incident energy at the working distance, the PPE level, the arc flash boundary, the limited approach boundary, the restricted approach boundary, the prohibited approach boundary, and the name and phone number of the Contractor.
- 4) Consultant shall include requirements for printing and installation of Arc Flash Hazard Labels by the Installing Contractor. Installing Contractor shall be required to print the labels from the Consultant provided PDF files and install the labels on the enclosure for each bus in a location where they are visible to the personnel before examining, adjusting, servicing, or maintaining the equipment.
- 5) CD with an electronic copy of the SKM PowerTools for Windows data files for all systems studies, including all scenarios, to be provided to District and Installing Contractor.

3.02 SCOPE OF SERVICES FOR ARC FLASH HAZARD EQUIPMENT LABELS

- A. Arc Flash Hazard labels shall be printed from District provided PDF files (via Design Consultant) and installed on each bus as follows:
 1. Each label shall state the Arc Flash Hazard for the bus based upon the worst case scenario for that bus.
 2. Labels shall comply with NFPA and OSHA requirements for Arc Flash Hazard labels
 3. Label to be vinyl tape material with adhesive, and be printed with indelible ink. The vinyl material should be 3 mil thick, and the material, adhesive, and ink should meet the latest version of ANSI Z535.4. The manufacturer should be DuraLabel or equal.
 4. Labels shall identify the bus name, the equipment type, whether the bus is grounded or ungrounded, the working distance, the available 3 -phase bolted fault current, the flash protection boundary, the incident energy at the working distance, the PPE level, the arc flash boundary, the limited approach boundary, the restricted approach boundary, the prohibited approach boundary, and the name and phone number of the Consultant.
 5. Contractor shall install the labels on the enclosure for each bus in a location where they are visible to the personnel before examining, adjusting, servicing, or maintaining the equipment.
- B. SCOPE OF SERVICES FOR ARC FLASH HAZARD ANALYSIS STUDY AND ARC FLASH HAZARD EQUIPMENT LABELS
 1. The following analysis/studies/reports are to be performed for all required electrical equipment as indicated below:
 - A. The District shall be furnished a Short-Circuit Study in accordance with ANSI Standard C37 and IEEE Standard 141-1993.

1. The calculated short circuit currents levels shall be compared with the rated withstand ratings of equipment and interrupting ratings for overcurrent protective devices and a tabulation of all equipment devices shall state a status of either "pass" or "fail" based upon the above criteria.
 2. A comprehensive report shall be prepared describing methodology and containing the results of the study in tabular form.
 3. An engineering analysis of the results shall be provided along with recommendations for mitigation of any issues that are of concern.
- B. The District shall be furnished a Protective Device Coordination Study in accordance with IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems - IEEE Standard 242-2001 (Buff Book).
1. A comprehensive report shall be prepared describing methodology and containing device settings in tabular form and time-current graphs of selected representative portions of each system including a simplified one-line diagram of the portion of the system included in the graph.
 2. The report shall evaluate whether devices are selectively coordinated, and new settings shall be proposed where necessary to improve coordination.
 3. Where necessary to improve arc flash hazard conditions, new settings shall be proposed. Where selective coordination shall be compromised by these proposed settings, the report shall so state.
 4. An engineering analysis of the results shall be provided along with recommendations for mitigation of any issues that are of concern.
- C. The District shall be furnished an Arc Flash Hazard Analysis Study per the requirements set forth in the current issue of NFPA 70E Standard for Electrical Safety in the Workplace. The Arc Flash Hazard Analysis shall be performed according to the IEEE Standard 1584 — 2002 and IEEE Standard 1584a - 2004 (Amendment 1).
1. The study shall include all buses in the system where personnel may be exposed to the hazard, including:
 - a. All system buses rated 240 V and higher and all system buses rated less than 240V where served by a transformer 112.5kVA and larger.
 - b. System buses shall include, but not be limited to, switchgear, switchboards, transformer primary termination, transformer secondary termination, automatic transfer switches, manual transfer switches, motor starters, fused and non-fused disconnect switches, motor control centers, variable frequency drive input terminals, and sectionalizing switches.
 - c. Buses rated less than 240 V which are served by transformers rated less than
 - d. 112.5kVA shall be labeled in accordance with NFPA 70E, Table 130.7(C)(9).
 2. A comprehensive report shall be prepared describing methodology and containing worst- case arc flash information for each bus in tabular form.
 3. The report shall identify locations where the calculated arc flash hazard presents a particular danger to members of the public, including students and others who may be exposed
 4. The report shall identify locations where physical changes to the system or added protective equipment can be applied to reduce the hazard.

5. An engineering analysis of the results shall be provided along with recommendations for mitigation of any issues that are of concern.
- D. The District shall be furnished a report on the observed condition of the electrical equipment and distribution systems based upon visual analysis and documentation and shall include:
1. The age of the equipment
 2. The type of equipment
 3. An engineering evaluation of the typical life expectancy for the type of equipment
 4. Observed physical condition, including presence of corrosion, cleanliness, documentation of maintenance.
 5. Presence of hazardous chemicals such as PCB oils.
- E. In the event new construction ties into as-built campus distribution or existing building distribution systems, determination of actual field conditions of the existing system shall be based upon the following methodology:
1. Review of available background information
 - a. Consultant shall review the available drawings for each system including existing one-line diagrams, cable schedules, plan and elevation drawings, equipment submittals and available short-circuit studies, protective device coordination studies and arc flash hazard analysis studies.
 - b. Information from the above sources shall be used as a basis for modeling and as a starting point for site assessment and data gathering activities.
 2. Site assessment and data gathering
 - a. It is important that system impedances and protective device clearing times be modeled as accurately as possible to ensure that the results are representative of actual hazards, so Consultant is responsible for collecting actual system data.
 - b. It is imperative that the data gathering be accomplished in a safe manner, and therefore it is desirable that equipment be de-energized while it is being examined if at all possible. This will require careful coordination with each campus Facility Director and electrical staff to schedule outages.
 - c. All switching required to de-energize equipment and work required to open equipment for inspection by Consultant will be performed by a District approved electrician furnished by Consultant, or by a District electrician.
 - d. If equipment must be examined hot, Consultant and electrician shall wear appropriate Personal Protective Equipment (PPE) based upon available information and the tables in NFPA 70E.
 - e. Examine all electrical equipment and installations in the field to verify data on
 - f. existing one-line diagrams and to collect data needed to model the facilities.
 - g. The following types of data must be collected:
 - h. Nameplate data from transformers, reactors, generators, circuit breakers and fuses
 - 1) Relay and circuit breaker settings
 - 2) Fuse rating, type, and speed

- 3) Conductor sizes, types, and approximate lengths
- 4) Grounding configurations
- 5) Utility source data including minimum and maximum fault values and X/R
- 6) ratios
- 7) System operating states

3. System modeling and analysis

- a. Systems for each building and for each campus medium-voltage distribution system shall be modeled in SKM PowerTools for Windows most recent version using system one-line diagrams, equipment manufacturer information, and data collected during site assessments.
- b. Key assumptions shall be stated in the report, and shall include the following :
 - 1) Working distance for buses with a nominal voltage of 1000 volts or greater shall be assumed to be 36 inches.
 - 2) Working distance for buses with a nominal voltage of less than 1000 volts shall be assumed to be 18 inches.
 - 3) Clearing times for circuit breakers shall be based upon the equipment manufacturer's data under the assumption that these devices will operate according to specification. The report shall state that poor maintenance or age may adversely affect the performance and reliability of the protective devices.
 - 4) All faults shall be assumed to be three-phase faults. Single-phase equipment that meets the study criteria shall be analyzed as a three-phase equivalent.
 - 5) Maximum fault clearing time shall be capped at two seconds based upon IEEE 1584-2002 Annex B. 1.2 and the assumption that an arc will self-extinguish, or personnel will move outside of the flash protection boundary within two seconds time. Should egress be from the fault hazard zone be unusually restricted, a longer maximum fault clearing time may be assumed provided an engineering case is presented for the longer clearing time with the report.
- i. Modes of operation
4. Should alternate modes of operation exist, including operation of transfer switches and standby generators and alternate switching configurations within the medium-voltage distribution system each alternate configuration shall be studied and the worst-case results from among the modeled scenarios shall be reported and utilized for preparation of the arc flash labels.

F. Deliverables shall include the following :

1. Bound printed copies and CDs or DVDs with electronic copies in Microsoft Word and PDF formats of each of the following reports:
 - a. Short-Circuit Analysis
 - b. Coordination Study
 - c. Arc Flash Study

2. Full-sized one-line diagrams (electronic PDF and CAD file formats and hard copy) for each building or other electrical system on a standard LACCD border in AutoCAD format per the District's CAD and BIM standards.
3. Incorporate Arc Flash Hazard Labels requirements/specifications into the project plans/specification to be furnished and installed by Contractor.
4. PDF files for Arc Flash Hazard labels suitable for use by Installing Contractor to prepare actual labels shall be provided for each bus as follows:
 - a. Each label shall state the Arc Flash Hazard for the bus based upon the worst case scenario for that bus.
 - b. Labels shall comply with NFPA and OSHA requirements for Arc Flash Hazard labels.
 - c. Label to be vinyl tape material with adhesive and be printed with indelible ink. The vinyl material should be 3 mil thick, and the material, adhesive, and ink should meet the latest version of ANSI Z535.4. The manufacturer should be DuraLabel or equal.
 - d. Labels shall identify the bus name, the equipment type, whether the bus is grounded or ungrounded, the working distance, the available 3-phase bolted fault current, the flash protection boundary, the incident energy at the working distance, the PPE level, the arc flash boundary, the limited approach boundary, the restricted approach boundary, the prohibited approach boundary, and the name and phone number of the Contractor.
 - e. Consultant shall include requirements for printing and installation of Arc Flash Hazard Labels by the Installing Contractor. Installing Contractor shall be required to print the labels from the Consultant provided PDF files and install the labels on the enclosure for each bus in a location where they are visible to the personnel before examining, adjusting, servicing, or maintaining the equipment.
 - f. CD with an electronic copy of the SKM PowerTools for Windows™ data files for all systems studies, including all scenarios, to be provided to District and Installing Contractor.

END OF SECTION

SECTION 26 08 00

COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

- A. The requirements of this Section apply to all sections of Division 26.
- B. This project will have selected building systems commissioned. The complete list of equipment and systems to be commissioned is specified in Section 01 91 00 GENERAL COMMISSIONING REQUIREMENTS. The commissioning process, which the Contractor is responsible to execute, is defined in Section 01 91 00 GENERAL COMMISSIONING REQUIREMENTS. A Commissioning Agent (CxA) appointed by LACCD will manage the commissioning process.

1.02 RELATED WORK

- A. Section 01 00 00 GENERAL REQUIREMENTS.
- B. Section 01 91 00 GENERAL COMMISSIONING REQUIREMENTS.
- C. Section 01 33 23 SHOP DRAWINGS, PRODUCT DATA, AND SAMPLES.

1.03 SUMMARY

- A. This Section includes requirements for commissioning the Facility electrical systems, related subsystems, and related equipment. This Section supplements the general requirements specified in Section 01 91 00 General Commissioning Requirements.
- B. Refer to Section 01 91 00 GENERAL COMMISSIONING REQUIREMENTS for more details regarding processes and procedures as well as roles and responsibilities for all Commissioning Team members.
- C. Provide all test results and commissioning reports as required by the related sections.

1.04 DEFINITIONS

- A. Refer to Section 01 91 00 GENERAL COMMISSIONING REQUIREMENTS for definitions.

END OF SECTION

This page intentionally left blank

SECTION 26 09 33

LIGHTING CONTROL SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Line and low voltage standalone lighting controls
- B. Emergency transfer devices
- C. Distributed lighting control
- D. Central lighting controls
- E. Digital addressable lighting interface (DALI)
- F. Architectural dimmer rack and accessories
- G. DC dimming systems
- H. Time switches

PART 2 PRODUCTS

2.01 LIGHTING CONTROLS

- A. All items of material having a similar function (e.g., switches, dimmers, sensors, contactors, relays, etc.) shall be of the same manufacturer, unless specifically stated otherwise on drawings or elsewhere in the specifications.
- B. Color of lighting controls and sensors shall match the receptacle wiring devices specified in the space.
- C. The functions described in the lighting sequence of operation shall dictate the actual lighting control device required to accomplish the functions described for the space.

2.02 LIGHTING CONTROL STATION

- A. The lighting control station shall contain the controls required by the lighting sequence of operation in a common cover plate. The controls may consist of switches, dimmers, occupancy sensors, pushbuttons, etc.
 - 1. In spaces where the wall control station is shown in multiple locations, the sequence of operation shall be the same at all locations, unless noted otherwise.
 - 2. The controls supplier shall prepare control station shop drawings showing arrangement of controls, dimensioned elevations, wiring diagram, and recommended backboxes. The shop drawing submittal should be identified with the lighting sequence that the station provides. Submit data sheets on the switches, dimmers, sensors, buttons, etc. contained in the control station.

2.03 DEVICE COLOR

- A. All switch, lighting controls, and cover plate colors shall be the same as wiring devices, unless indicated otherwise.

2.04 COVERPLATES

- A. All switches and lighting controls shall be complete with cover plates that match material and color of the wiring device cover plates in the space.
- B. Where several devices are ganged together, the cover plate shall be of the ganged style for the number of devices used.
- C. Install nameplate identification as indicated in Section 26 05 53.
- D. Plate-securing screws shall be metal with head color matching the wall plate finish.

2.05 WALL SWITCHES

A. Single Pole Switch:

- 1. Single throw, 120/277-volt, 20-amp maintained contact. Toggle handle, side and back wired.
- 2. Approved Manufacturers: Hubbell HBL1221, Leviton 1221-2, Pass & Seymour PS20AC1, Cooper AH1221.
- 3. Single throw, 120/277-volt, 20-amp maintained contact. Rocker handle, side and back wired.
- 4. Approved Manufacturers: Hubbell DS120, Leviton 5621, Pass & Seymour 2621, Cooper 7601.
- 5. Campus Standards
 - a. LA Harbor College – Leviton, Hubbell
 - b. LA Trade Tech College – Leviton, Hubbell

B. Explosion Proof Single Pole Switch:

- 1. 120/277-volt, 20-amp maintained contact. Toggle handle. Suitable for use in Class 1, Division 1 areas.
- 2. Approved Manufacturers: Appleton EDSC175-F2, Crouse Hinds, Killark.

C. Key Lock Single Pole Switch:

- 1. Single throw, 120/277-volt, 20-amp maintained contact. Side and back wired. Provide key to Owner.
- 2. Extra heavy duty industrial locking series, specification grade
- 3. Approved Manufacturers: Hubbell HBL1221L, Leviton 1221-2L, Pass & Seymour PS20AC1-L, Cooper AH1221L.
- 4. Restroom Keyed Lighting switches – Campus Standards
 - a. LA Harbor College – Hubbell HBL extra heavy duty industrial locking series, back and side wired 15A, 120-277VAC or Leviton extra heavy duty specification grade key locking switches.

- b. LA Trade Tech College – Hubbell HBL extra heavy duty industrial locking series, back and side wired 15A, 120-277VAC or Leviton extra heavy duty specification grade key locking switches.
- D. Lighted Handle Single Pole Switch:
1. 120 volt maintained contact. Toggle handle. Light on when contact open (switch off). Side and back wired.
 2. Approved Manufacturers: Hubbell ExtHBL1221ILC, Leviton 1221-LHC, Pass & Seymour PS20AC1-CSL, Cooper 2221LTW.
- E. Weatherproof Single Pole Switch:
1. Single throw, 120/277-volt, 20-amp maintained contact. Toggle handle, side and back wired. Provide with weatherproof cover plate.
 2. Approved Manufacturers: Hubbell1221/HBL1795, Leviton 1221-2, Taymac MM180, Pass & Seymour PS20AC1/CA1-GL, Cooper 2221.
- F. Two Pole Switch:
1. Single throw, 120/277-volt, 20-amp maintained contact. Toggle handle, side and back wired.
 2. Approved Manufacturers: Hubbell HBL 1222, Leviton 1222-2, Pass & Seymour PS20AC2, Cooper 2222.
 3. Single throw, 120/277-volt, 20-amp maintained contact. Rocker handle, side and back wired.
 4. Approved Manufacturers: Hubbell DS220, Leviton 5622, Pass & Seymour 2622.
- G. Three-way Switch:
1. 120/277 volt, 20 amp. Toggle handle, side and back wired.
 2. Approved Manufacturers: Hubbell 1223, Leviton 1223-2, Pass & Seymour PS20AC3, Cooper AH1223.
 3. 120/277-volt, 20-amp maintained contact. Rocker handle, side and back wired.
 4. Approved Manufacturers: Hubbell DS320, Leviton 5623, Pass & Seymour 2623, Cooper 7623.
- H. Key Lock Three Way Switch:
1. Single throw, 120/277-volt, 20-amp maintained contact. Side and back wired. Provide key to Owner.
 2. Approved Manufacturers: Hubbell HBL1223L, Leviton 1223-2L, Pass & Seymour PS20AC3-L, Cooper AH1223L.
- I. Four-way Switch:
1. 120/277 volt, 20 amp. Toggle handle, side and back wired.
 2. Approved Manufacturers: Hubbell 1224, Leviton 1224-2, Pass & Seymour PS20AC4, Cooper AH1224.
- J. Three Position-Center Off Switch:
1. 120/277-volt, 20-amp, 2 pole maintained contact. Toggle handle, side and back wired.

2. Approved Manufacturers: Hubbell HBL1386, Leviton 1286, Pass & Seymour 1226, Cooper 2226.

K. Combination Single Pole Switch and GFCI Receptacle:

1. Single throw switch, 120-volt, 15-amp maintained contact. Toggle handle, side and back wired. NEMA 5-15R GFCI receptacle with test and reset buttons.
2. Approved Manufacturers: Hubbell GFSP15, Leviton 7229, Pass & Seymour 1595-SWTTR, Cooper VGFS15.

2.06 WALL DIMMERS

- A. UL listed with integral air-gap switch for on/off control.
- B. Integral EMI/RFI suppression.
- C. Non-viewable heat sink.
- D. Dimmer compatibility and wiring with the load being controlled shall be verified by Contractor prior to purchase and installation.
- E. Dimmer to match device color.
- F. LED Electronic Driver Dimmer:
 1. 120-277-volt, decora style linear slider operator with positive off. Color to match adjacent devices. Luminaire manufacturer shall list compatible dimmer manufacturers and models. 0-10V dimmers shall comply with IEC 60629 Annex E.
 2. Approved Manufacturers: Compatible with provided LED driver.
- G. LED Electronic Driver Three-Way Dimmer:
 1. 120/277-volt, decora style linear slider operator with positive off. Color to match adjacent devices. Luminaire manufacturer shall list compatible dimmer manufacturers and models. 0-10V dimmers shall comply with IEC 60929 Annex E.
 2. Approved Manufacturers: Compatible with provided LED driver.
- H. Wall 0-10V Dimmer / Occupancy sensor:
 1. Wall switch with manual on/auto off. 120VAC load rating of 0-800 W for electronic ballast, LED. 277VAC load rating of 0-1,800 W for electronic ballast, LED. adjustable OFF delay. 0-10V dimming with up to 30ma sink. Automatic ON/OFF, manual ON/automatic OFF, or occupancy on to predetermined dimming level go to last dimming setting upon occupancy.
 2. Approved Manufacturers: Sensor Switch WSX D Series

2.07 LOCAL DAYLIGHTING CONTROLS

- A. Campus Standards
 1. East LA College and Southgate Environmental Center – Watt Stopper, Leviton, Lutron
 2. LA Mission College - Lutron
- B. Standalone Interior Photo Sensors:
 1. Daylight Level Sensor - On/Off Control - One Zone:

- a. On/Off control. Range of 10-200 FC. Adjustable dead band prevents cycling. Adjustable time delay. 120/277 volt.
 - b. Approved Manufacturers: Watt Stopper LS-102, Sensor Switch CM-PC, Hubbell Automation DLCPC Series, Greengate PPS-4.
2. Daylight Level Sensor and Controller - On/Off Control - Three Zones:
- a. On/off control of up to three 10-amp zones. Range of 10 to 200 FC. Adjustable dead band prevents cycling. Adjustable time delay. 120/277 volt.
 - b. Approved Manufacturers: Watt Stopper LCO-203/LS-290C, Hubbell Automation LUXSTATOCM/LUXSTATLS, LC&D Micro GR/2404 iDH/Pcell, Sensor Switch N-CMPC.
3. Daylight Level Sensor and Controller - 0-10V Dimming - One Zone:
- a. Dimming control of one 0-10V zone. Range of 10 to 200 FC. Adjustable dead band prevents cycling. Adjustable time delay. Coordinated with dimming ballast prior to submittal.
 - b. Approved Manufacturers: Watt Stopper LS-301, Hubble Automation DLC7, Sensor Switch N-CMADC.
4. Daylight Level Sensor and Controller - Dimming - Three Zones:
- a. Dimming control of up to three zones of 0-10V. Range of 10 to 200 FC. Adjustable dead band prevents cycling. Adjustable time delay. Coordinate with dimming ballasts prior to submittal.
 - b. Approved Manufacturers: Watt Stopper LCD-203/LS-290C, Hubbell Automation LUXSTATDCM/LUXSTATLS, LC&D Micro GR/2404 IDIM/Pcell, Sensor Switch N-CMADC.
5. Daylight Level Sensor and Controller - Multilevel/Bi-level On/Off Control - Dual Zones:
- a. Multilevel/bi-level on/off control of up to two 10-amp zones. Range of 10 to 200 FC. Adjustable dead band prevents cycling. Adjustable time delay. 120/277 volt.
 - b. Approved Manufacturers: Watt Stopper LCO-203/LS-290C, Hubbell Automation DLCPCC/DLCPCI, Sensor Switch CM-PC-DZ.
6. Sensor shall detect changes in ambient light level and provide triggering of lighting groups in area based on sequence of operation.
7. Sensor shall be configurable via DIP switches at device or via handheld wireless remote programming unit. Settings shall include:
- a. Ambient sensitivity range between 1 and 1,000 foot-candles.
 - b. Time delay of 5 to 300 seconds.
 - c. Trigger setpoints with dead band adjustment.
8. Sensor shall provide on/off setpoints in quantity as specified on drawings and as shown in the sequence of operation.
9. Sensor shall be ceiling- or wall-mounted for range and viewing angle meeting application requirements as outlined in the sequence of operation.
10. Output signal from sensor shall be linear with light level.
- C. Standalone Exterior Photo Sensors:

1. Sensor shall be within a weatherproof enclosure, with design operation in temperatures of -30°F to +130°F. Sensor shall have threaded stem for box mounting, with knuckle to permit aiming of receptor after installation. Sensor shall be mounted facing north.
2. Sensor shall contain an integral switching contactor rated for 277-volt operation, with loads of up to 1,800 VA. Contacts shall be configured for zero-crossing closure to provide 100,000 cycle minimum operation.
3. Sensor shall detect changes in daylight levels to provide triggering of exterior lighting equipment based on the sequence of operation.
4. Sensor shall be field configurable at the device or via handheld wireless remote controller. Configurable settings shall include:
 - a. Ambient sensitivity range of 5 to 1,500 foot-candles.
 - b. Adjustable setpoint.
 - c. Dead band adjustment by percentage of setpoint.
 - d. Time delay of up to five minutes.
5. Sensor shall be equipped with a lens cover that can be applied for system testing during daylight conditions.
6. Approved Manufacturers: Paragon, Tork, Intermatic.

2.08 INDOOR OCCUPANCY AND VACANCY SENSORS

A. Campus Standards

1. LA Southwest College – Watt Stopper, Lutron, match existing or equal.
2. LA Trade Tech College – Watt Stopper, Leviton

B. General Description: Wall- or ceiling-mounting, solid-state units with a separate power supply/relay unit.

1. Operation: Unless otherwise indicated, turn lights on when covered area is occupied and off when unoccupied, with a time delay for turning lights off, adjustable over a minimum range of 1 to 20 minutes. Vacancy sensors require a manual switch operation to turn lights on and off, with a time delay for turning lights off when unoccupied.
2. Sensor Output: Contacts rated to operate the connected relay, complying with UL 773A. Sensor shall be powered from the relay unit.
3. Relay Unit: Dry contacts rated for 20 A ballast load at 120 and 277 VAC, for 13-amp tungsten at 120 VAC, and for 1 hp at 120 VAC. Power supply to sensor shall be 24 V dc, 150-mA, Class 2 power source as defined by NFPA 70.
4. Mounting:
 - a. Sensor: Suitable for mounting in any position on a standard outlet box.
 - b. Relay: Externally mounted through a 1/2-inch knockout in a standard electrical enclosure. Mount relay above accessible ceiling near entry door to room or area.
 - c. Time Delay and Sensitivity Adjustments: Recessed and concealed.
5. Indicator: LED to show when motion is being detected during testing and normal operation of the sensor.
6. Bypass Switch: Override the on function in case of sensor failure.

7. Power Supply and Slave Packs: Provide as required for sensor quantity and switching scheme. Mount to standard 1/2" knockout on electrical box above accessible ceiling near entry door to room or area. Sensor power shall be from emergency circuit if emergency lighting is in the area.
 8. Detection Coverage (Room): Detect occupancy anywhere in an area based on hand motion.
 9. Detection Coverage (Corridor): Detect occupancy based on a half-step motion.
 10. Warranty: Five (5) year warranty.
- C. Dual-Technology Type: Detect occupancy by using a combination of PIR and ultrasonic detection methods in area of coverage. Particular technology or combination of technologies that controls on and off functions shall be selectable in the field by operating controls on unit.
1. 360 Degree Coverage Pattern:
 - a. Frequency greater than 40 KHz. Dual sensing verifications (requires both technologies to activate), either technology maintains on status. Integrated ambient light level sensor (2 to 200 FC range), adjustable sensitivity and time delay. Sensor shall control all circuits in area, unless noted otherwise. Initial settings: ambient sensor 40 FC.
 - b. Approved Manufacturers: Watt Stopper DT 300 Series, Hubbell OMNI-DT2000 or ATD2000C, Greengate OAC-DT, Leviton OSC##-MOW, Sensor Switch CM PDT 10.
 2. Wall Mounted on Adjustable Swivel Mount:
 - a. Wall or ceiling sensor with adjustable settings to allow manual on/auto off or auto on/auto off. Integrated ambient light level sensor (2 to 100 FC range).
 - b. Approved Manufacturers: Watt Stopper DT-200 Series, Hubbell LODTRP, Leviton OSM12--M series, Sensor Switch WvPDT 16 Series.
 3. Wall Switch:
 - a. Wall switch with manual on/auto off. 120/277 VAC load rating of 0-800 W for ballast, LED or tungsten. 5-, 15-, 30-minute adjustable OFF delay. Coverage of minor motion in 12' x 15' pattern.
 - b. Approved Manufacturers: Watt Stopper DW-100 Series, Hubbell LHMTS, Leviton OSSMT series, Sensor Switch WSD-PDT SA Series.
 4. Wall Switch:
 - a. Multi-relay wall switch with manual on/auto off for two separate loads. 120/277 VAC load relay rating of 0-800 W for ballast, LED or tungsten. 5-, 15-, 30-minute adjustable OFF delay. Coverage of minor motion in 12' x 15' pattern.
 - b. Approved Manufacturers: Watt Stopper DW-200 Series, Hubbell LHMTD, Leviton OSSMD series, Sensor Switch WSD-PDT 2P Series.
 5. Sensitivity Adjustment: Separate for each sensing technology.
 6. Detection Coverage:
 - a. Task Areas: Detect occupancy anywhere in an area based on hand motion.
 - b. Circulation Areas: Detect occupancy anywhere in an area based upon half-step walking motion.
- D. Mask sensors where necessary to prevent nuisance switching from adjacent areas.

- E. PIR Type: Detect occupancy by sensing a combination of heat and movement in area of coverage.
1. High Bay - Aisle Coverage Pattern:
 - a. 20' to 40' mounting height. Minimum 1.3:1 walking motion coverage pattern to height ratio. Adjustable sensitivity and time delay, integral isolated relay contact. Sensor shall control all luminaires in area. Initial settings: Time delay 10 minutes.
 - b. Approved Manufacturers: Watt Stopper HB-300 Series, Hubbell FHB 140 or HMHB series, Leviton OSFHU, Greengate OEF-P.
 2. High Bay - 360 Degree Coverage Pattern:
 - a. 20' to 40' mounting height. Minimum 1.3:1 walking motion coverage pattern to height ratio. Adjustable sensitivity and time delay, integral isolated relay contact. Sensor shall control all luminaires in area.
 - b. Approved Manufacturers: Watt Stopper HB-300 Series, Hubbell FHB 140 or HMHB series, Leviton OSFHU, Greengate OEF-P.
 3. Wall Switch Occupancy Sensor:
 - a. Passive infrared, zero crossing circuitry, integrated ambient light sensor (10 to 150 FC range), adjustable sensitivity and time delay, no minimum load requirements, manual or auto on operation, Initial settings: 10 minutes, ambient sensor 40 FC. Manual ON for vacancy sensing.
 - b. Approved Manufacturers: Watt Stopper PW-100 Series, Sensor Switch WSX, Hubbell LHIRS1 or AP1277, Leviton ODS15, Greengate OSW-P-0451.
 4. Dual Wall Switch Occupancy Sensor:
 - a. Passive infrared, zero crossing circuitry. Switches control two separate circuits or relays. Integrated ambient light sensor (10 to 150 FC range), adjustable sensitivity and time delay, no minimum load requirements, manual or auto on operation, Initial settings: 10 minutes, ambient sensor 40 FC. Manual ON for vacancy sensing.
 - b. Approved Manufacturers: Watt Stopper PW-200 Series, Sensor Switch WSD-2, Hubbell LHIRD2 or AP127712, Leviton ODS, Greengate OSW-P-0451.
 5. Ceiling Mounted - 360 Degree Coverage Pattern:
 - a. Passive infrared, zero crossing circuitry, integrated ambient light sensor (4 to 190 FC Range), adjustable sensitivity and time delay, integral isolated relay contact. Sensor shall control all circuits in the area unless noted otherwise. Initial settings: ambient sensor 40 FC.
 - b. Approved Manufacturers: Watt Stopper CI Series, Sensor Switch CM-9, Hubbell Automation Omni-IR, Leviton OSC Series, Greengate OMR-P Series.
 6. Ceiling Mounted - 100 Degree Coverage Pattern:
 - a. Passive infrared, zero crossing circuitry, integrated ambient light sensor (4 to 190 FC Range), adjustable sensitivity and time delay, integral isolated relay contact. Sensor shall control all circuits in the area unless noted otherwise. Initial settings: ambient sensor 40 FC.
 - b. Approved Manufacturers: Watt Stopper WPIR Series, Sensor Switch CM-9, Hubbell LOIRWV or ATD1600W.
 7. Wall Mounted - 100 Degree Coverage Pattern:

- a. Passive infrared, zero crossing circuitry, integrated ambient light sensor (4 to 190 FC range), adjustable sensitivity and time delay, integral isolated relay contact. Sensor shall control all circuits in the area unless noted otherwise. Initial settings: Ambient sensor 40 FC.
 - b. Approved Manufacturers: Watt Stopper WPIR Series, Sensor Switch CM-9, Hubbell LOIRWV or ATD1600W.
8. With daylight filter and lens to afford coverage applicable to space to be controlled.
- F. Ultrasonic Type: Ceiling mounting. Detect occupancy by sensing a change in pattern of reflected ultrasonic energy in area of coverage.
1. 360 Degree 20' x 20' Hand Motion Coverage Pattern:
 - a. Frequency greater than 32 KHz solid state, adjustable sensitivity and time delay, integral isolated 1-amp relay contact, temperature and humidity resistant receivers. Sensor shall control all circuits in area, unless noted otherwise.
 - b. Approved Manufacturers: Watt Stopper WT-1100 series, Hubbell OMNI-US or ATU series, Leviton OSC series, Greengate ODC-U series.
 2. 35' x 30' Hand Motion Coverage Pattern:
 - a. Frequency greater than 32 KHz solid state, adjustable sensitivity and time delay, integral isolated relay contact, temperature and humidity resistant receivers. Sensor shall control all circuits in area, unless noted otherwise.
 - b. Approved Manufacturers: Watt Stopper WT-2200 series, Hubbell OMNI-US or ATU series, Leviton OSC series, Greengate ODC-U series.
 3. 360 Degree Two-Sided Corridor Coverage Pattern:
 - a. Frequency greater than 32 KHz solid state, adjustable sensitivity and time delay, integral isolated relay contact, temperature and humidity resistant receivers. Sensor shall control all circuits in area, unless noted otherwise.
 - b. Approved Manufacturers: Watt Stopper WT-2250 Series, Hubbell OMNI-US or ATU series, Greengate ODC-U Series.
 4. Wall Mounted:
 - a. Wall switch with adjustable settings to allow manual on/auto off or auto on/auto off.
 - b. Approved Manufacturers: Watt Stopper UW-100 Series, Hubbell AU12771,
 5. Crystal controlled with circuitry that causes no detection interference between adjacent sensors.

2.09 EMERGENCY TRANSFER DEVICES

- A. Loss of power on normal circuit shall switch load to emergency power source.
- B. Provide suitable NEMA 1 enclosure and mounting per manufacturer specification.
- C. Emergency Lighting Control Override - Single Luminaire:
 1. Rated 2 amps at 120 volt incandescent and 10 amps at 277 volt fluorescent.
 2. Approved Manufacturers: Bodine GTD, Iota ETS, Watt Stopper ELCU-100.
- D. Emergency Lighting Control Override - Branch Loads:
 1. Rated 1000 watts at 120 volt incandescent and 20 amp at 277 volt fluorescent.

2. Approved Manufacturers: Bodine GTD20, Chloride Lightstar, Dual-Lite ATSD, Nine24 ELCR, Highlites HEPC.

E. Emergency Lighting Dimming Control Override:

1. Loss of power on normal circuit shall switch luminaires on at 100% rated light output.
2. Approved Manufacturers: Nine24 BLTCv3, nLight nPP16D (ER)

2.10 DISTRIBUTED LIGHTING CONTROL

A. Acceptable manufacturers as listed below meet the qualifications as outlined in this specification. Contractor is responsible for verifying that selected manufacturer can furnish the complete system as specified herein.

1. Acuity Controls nLight Series
2. Legrand Watt Stopper DLM Series
3. Hubbell Automation NX Series
4. Eaton Greengate RC3 Series (room-based system)
5. Osram Encelium Series
6. Lutron
7. Leviton

B. Campus Standards

1. West LA College – Acuity Controls nLight Series, Eaton Greengate, Osram Encelium Series, Watt Stopper, Leviton, Lutron
2. LA Harbor College – Lutron Eco system
3. LA Trade Tech College – LCD GR1400 series, nLight
4. LA Pierce College – Lutron, Leviton
5. LA Valley College – Watt Stopper, Lutron
6. East LA College – Smart System in IoT platform. The lighting controls shall communicate and work with HVAC controls through BACnet. Enlighted, Blue Ridge Technology.

C. System Description: The lighting control system shall be a network of remote modules connected to a digital network via network hubs and controlled through a system server / central station. Lighting control devices connect to the modules and communicate via the digital network with the system server. System includes all associated wiring, relay modules, photocells, switches, dimmers, time clock, occupancy sensors, network interfaces, and hubs. System shall utilize distributed relays modules, allowing these relay modules to be located above accessible ceilings in or adjacent to rooms they are controlling.

D. Control Devices: All occupancy sensors (ultrasonic, IR and dual technology type), photocells, switches, and timers shall be provided with system and designed to operate on system network. Supplemental power packs shall be provided as required for multiple control devices. This equipment shall be identified in shop drawing submission.

- E. Relay Modules: Mounted in NEMA enclosure with physically separate 120/277-volt wiring compartment from low voltage control wiring. Provide low voltage digital communication to control devices as shown on drawings and schedules. Supplemental power packs shall be provided as required for multiple control devices. This equipment shall be identified in shop drawing submission. Dimmable relay modules shall be provided where indicated. Relay modules shall contain up to four (4) relays. Relay modules shall be labeled with room number that relays control lighting within.
- F. Single-Pole Relays: Mechanically held unless otherwise indicated; split-coil, momentary-pulsed type, rated 20 A, 125-volt AC for tungsten filaments and 20 A, 277-volt AC for electronic ballasts, 50,000 cycles at rated capacity.
- G. System shall include server / central station with operating software, data network, and BACnet IP communication with other systems as described. System communication protocol shall be compatible with the building automation system.
- H. System server / central station shall provide programmable operation of lights connected via system relays and controlled with system devices. System software shall provide control of relays and control devices, time and sequence scheduling, timed out and blink light operation, and monitoring and reporting of system events and components. Initial programming shall be as shown on plans and schedules.
- I. Server / Central Control Station: Lighting control system manufacturer shall be responsible to assure coordination between relay modules, network hubs, and control system server/ central station such that system performs as described. Server shall be provided with monitor, keyboard, and mouse, and plugged into a receptacle connected to an equipment emergency circuit as a minimum.
- J. Network Hub: Network Hub shall contain processor and astronomic time clock for control and monitoring of lighting. Network hub shall be fed from an equipment emergency circuit at a minimum.

2.11 CENTRAL LIGHTING CONTROL - RELAY PANEL TYPE (NETWORK)

- A. Acceptable manufacturers listed below meet the qualifications as outlined in this specification. Contractor is responsible for verifying that selected manufacturer is capable of furnishing the complete system as specified herein.
- B. Lighting Control. Refer to schedules for size, rating, and configuration.
 - 1. The lighting control system shall be a network of lighting relay panels connected to a digital network and controlled through a system server / central station. Lighting control devices connect to the relay panels and communicate via the panel controller with the system server. System includes all associated network interfaces and wiring, relay panels, control modules, input modules, panel processors, relays, photocells, switches, dimmers, time clock, and occupancy sensors.
 - 2. System shall include server / central station with operating software, data network, and BACnet IP communication, with other systems as described. System communication protocol shall be compatible with the building automation system (BAS).
 - 3. System server / central station shall provide programmable operation of lights connected via system relays and controlled with system devices. System software shall provide control of relays and control devices, time and sequence scheduling, timed out and blink light operation and monitoring and reporting of system events and components. Initial programming shall be as shown on plans and schedules.

- C. Server / Central Control Station: Lighting control system manufacturer shall be responsible to assure coordination between system devices, network, and control system server/ central station such that system performs as described. Server / central control station shall have a minimum 80 GB hard drive, 2 4 8 GB RAM, 3 GHz speed minimum, three Ethernet ports, 1024 x 768 resolution graphic card, and 3 USB 2.0 ports. Server shall be provided with monitor, keyboard, and mouse, and plugged into a receptacle connected to an equipment emergency circuit as a minimum.
- D. Cabinet: Steel with hinged, locking door. Barriers separate low-voltage and line-voltage components.
1. Typewritten Directory: Identifies each relay as to load controlled.
- E. System Power Supply: Transformer and full-wave rectifier with filtered DC output for panel, controllers, and control devices. Feed from an equipment emergency circuit at a minimum.
- F. Relays: Mechanically latched unless otherwise indicated; split-coil, momentary-pulsed type, rated 20°A, for tungsten filaments and NEMA for electronic ballast rated. Rated for 50,000 ON/OFF cycles at rated capacity.
- G. Controllable Breaker (Option):
1. Solenoid operated thermal magnetic breakers to provide control, overload protection, and short circuit protection.
 2. Ratings of 120/240V AC; 15, 20 and 30-amp; 1- and 2-pole, 277/480V AC, 15, 20 and 30-amp; 1 and 2-Pole. Minimum AIC rating to be 14,000 at 480Y/277 and 65,000 at 120/240.
- H. Control Devices: All occupancy sensors (ultrasonic, IR and dual technology type), photocells, switches, and timers shall be provided with system and designed to operate on system network. Supplemental power packs shall be provided as required for multiple control devices. This equipment shall be identified in shop drawing submission.
- I. Central Lighting Control Features and Functions:
1. Dimming system presets shall be programmable via preset/fader station directly at the control panel, or via network-based workstation software. Dimming presets shall have discrete fade times with 0.1 second resolution, programmable from zero to 24 hours, and shall be selectable via button, fader, clock event, macro or network interface.
 2. Clock events shall be activated by calendar schedule, by day type and/or specific day programming, including every day, weekday, weekend, S, M, T, W, H, F, S, Holiday. Clock events shall also be activated by astronomical events, which will compensate for daylight savings time and will have programmable setback periods relative to sunrise and sunset.
 3. The system shall be capable of implementing On commands, Off commands, Raise (dimming) commands, Lower (dimming) commands for any relay, group or zone by means of digital wall switches, specification grade line voltage type wall switches, photocell, web-based software or other devices connected to programmable inputs in a lighting control panel.
 4. Channels for grouping relays shall be provided, each with an associated pushbutton to toggle the channel ON/OFF and a terminal block for a separate dry contact input. Any number of relays in the panel can be assigned to each channel, with overlapping allowed. Channels shall be set up via communication line communications and networking. Each channel pushbutton shall provide LED status indication. The panel shall also have the ability to assign functions to relays independently of the channels. Panels shall be addressable with DIP switches or other local means to set panel address.
 5. System shall accept any type of switch input, including momentary or maintained.

6. System shall support by relay or zone the "blink warning" function. System shall be capable of flashing lights Off/On prior to the lights being turned Off. The warning interval time between the flash and the final lights off signal shall be definable for each zone. Occupant shall be able to override any scheduled Off sweep using local wall switches within the occupied space. Occupant override time shall be locally and remotely programmable and shall not exceed two (2) hours.
 7. System shall provide temporary override conditions for each relay or dimmer so that lights can always be turned on.
 8. All programming and scheduling shall be able to be done locally at the master lighting control panel and remotely via the Internet. Remote connection to the lighting control system shall provide real-time control and real-time feedback. Lighting control system shall be able to be monitored by and take commands from a remote PC. At any time, should the remote PC go offline, all system programming uploaded to the lighting control system shall continue to operate as intended.
 9. All programs, schedules, time of day, etc., shall be held in non-volatile memory for a minimum of two (2) years at power failure. At restoration of power, lighting control system shall implement programs required by current time and date.
 10. Lighting control shall be configured to allow individual users to turn lighting on and off with their PCs. Software shall be written for Windows operating system, with web page as the display and ActiveX controls that can be accessed through an Internet browser. Include at least three levels of password protection.
- J. BACnet or Facility Management Control System (FMCS) Protocol Interface: Provide BACnet-over-IP interface to building controls system or a Direct Digital Controls native protocol interface to read, control and monitor status of all lighting zones and groups in real time.
- K. Telephone Override Interface: A voice-prompted telephone override interface module shall accept up to three (3) phone lines and allow up to three (3) simultaneous phone calls. Voice-prompted menu and up to 999 unique passcodes shall be standard with each interface module. Override time shall be a maximum of 120 minutes.
- L. Ethernet Connection Port - Interoperability:
1. System shall include an Ethernet port for connection to Owner's TCP/IP network, permitting remote management of system from local or wide area network connection.
 2. Contractor shall coordinate with technology vendor to provide an Ethernet connection to (LCP) panel as specified by manufacturer.
- M. RS232 Interface for Audio/Visual Interface - Control Interface Stations:
1. Control interface stations shall provide an interface for PC and/or A/V connection to lighting control system.
 2. Stations shall utilize RS-232 standard protocol and shall be appropriate DIN-style connector.
- 2.12 CENTRAL LIGHTING CONTROL INTERFACES
- A. Manual Switches, Stations and Plates:
1. Switches: Modular, momentary pushbutton, with addressable capabilities to control the luminaires assigned to that switch. The switch shall be able to actuate the functions based on the described sequence of operation and intended functions.

2. Preset/fader stations shall operate using programmable buttons and/or faders as indicated on drawings.
 3. Integral Pilot Light or LED: Indicate that controls are active or powered by being on continuously when powered or when pushbuttons are actuated.
 4. Labeling of buttons and faders shall be engraved/screened by manufacturer, using approved text returned with shop drawing submittals.
 5. Station control components shall be designed to operate standard default or custom system functions. Components shall operate default functions unless re-assigned via direct or network connection. Function options include: preset selection, manual mode, record mode, station lockout, raise/lower, macro, cue, and room join/separate.
- B. LCD Station:
1. Backlit liquid crystal display (LCD) shall operate using buttons, faders, and other images on separate programmable control pages via touchscreen interface.
 2. LCD station contrast and brightness shall be adjustable. It shall be possible to program the station to dim during periods of inactivity.
 3. LCD stations shall support import of bitmap image files to customizable pages.
 4. Permanently installed stations shall be either fully or semi-recessed in manufacturer-furnished backbox and trim assembly, with no visible fasteners or hardware.
 5. Portable stations shall nest into permanent wall docking station furnished by manufacturer and shall not require user to connect any umbilicals or plugs when inserting or removing the portable device. Docking station shall provide charging and communication with portable device when docked.
- C. Wireless Controls (Infrared):
1. Portable wireless IR transmitter for remote control of lighting control panel. Transmitter shall have at least four (4) eight (8) scene control with engraved names below each button.
 2. Infrared receiver shall be recess mounted with an integral LED to indicate when signal has been received. Receiver shall operate reliably within a 40-foot distance.
- D. Portable Control Console and Connector Station:
1. Portable control console with minimum 10-foot cable and interface plug.
 2. Connector station receptacle, flush mounted, to allow portable console to communicate with lighting control system. Mounts in industry standard backbox.
- F. Network Daylight Level Sensor:
1. Networked sensors shall serve as a measurement device that provides ongoing read-back of sensor settings to lighting control network or daylight controller. Refer to the sequence of operation for actions to be triggered at various read-back values.
 2. Sensor shall be ceiling- or wall-mounted for range and viewing angle, meeting application requirements as outlined in the sequence of operation. Outdoor sensors shall be wet location listed and designed specifically for outdoor use.
 3. Output signal from sensor shall be linear with light level. Network connection permits remote query of sensor status and value via control software. All adjustments, with the exception of sensor range, shall be made via network connection.
 4. Sensor shall have adjustable sensitivity range to permit use as scheduled.

2.13 LIGHTING CONTROL SYSTEM – DIGITAL ADDRESSABLE LIGHTING INTERFACE (DALI)

- A. Acceptable manufacturers listed below meet the qualifications as outlined within this specification. Contractor is responsible for verifying that selected manufacturer can furnish the complete system as specified herein.
1. Starfield Controls, Inc.
 2. Tridonic Inc.
- B. System Description: The lighting control system shall consist of digital lighting control network connecting DALI-compliant digital addressable ballasts, control modules, and lighting control devices directly with a system server / central control station. Individually addressable electronic ballasts, control modules, and control devices are operated from signals received through DALI-compliant bus from a variety of DALI-compliant digital controllers and interfaces and programmed through the system server / central control station. System includes all associated network bus and wiring, DALI controllers and interfaces, panels, photocells, switches, dimmers, time clock, and occupancy sensors. System shall utilize DALI-compliant ballast and dimming modules provided with light fixtures.
- C. Control Devices: All occupancy sensors (ultrasonic, IR, and dual technology type), photocells, switches, and timers shall be provided with system and be DALI compliant. Devices shall be designed to operate on system network. Supplemental DALI-compliant signal repeaters and controllers shall be provided as required. This equipment shall be identified in shop drawing submission.
- D. System shall include server / central station with DALI operating software, data network, and BACnet IP communication with other systems as described. System communication protocol shall be compatible with the building automation system.
- E. System server / central station shall provide programmable operation of lights connected via system bus and controlled with system devices. System software shall provide control of DALI ballast, control modules and control devices, time and sequence scheduling, timed out and blink light operation and monitoring and reporting of system events and components. Initial programming shall be as shown on plans and schedules.
- F. Server / Central Control Station: Lighting control system manufacturer shall be responsible to assure coordination between relay modules, network hubs, and control system server/ central station such that system performs as described.

2.14 ARCHITECTURAL DIMMER RACK AND ACCESSORIES

- A. Dimmer Rack and Control Processor:
1. 12 24 48 dimmer capacity. 120/208 volt, 3-phase, 4-wire, _____-amp main breaker. Refer to Dimmer Rack Schedule on drawings for further information.
 2. Approved Manufacturers: Unison DR Series, Strand DE Series, Lutron Grafik Eye 4000/5000/6000.
- B. Dimmer Control Station
1. _____ buttons, presets, and on/off control.
- C. Dimmer Control Station with Faders
1. _____ buttons, _____ faders.

D. Dimming / Relay Performance Requirements:

1. The component's maximum current rating shall be at least two times the dimmer's/relay's rated operating current.
2. Capable of withstanding repetitive in-rush current of 50 times operating current without impacting lifetime of dimmer/relay. Design and test dimmers/relays to withstand line-side surges without impairment to performance.
3. Utilize air gap off, activated when user selects "off" at any control to disconnect the load from line supply.

E. Dimmers:

1. Each dimmer to incorporate electronic "soft start" default at initial turn-on that smoothly ramps lights up to the appropriate levels within 0.5 seconds.
2. Control all light sources in smooth and continuous manner. Dimmers with visible steps are not acceptable.
3. Each dimmer to be assigned a load type that will provide a proper dimming curve for the specific light source.
4. Possess ability to have load types assigned per circuit, configured in field.
5. Minimum and maximum light levels user adjustable on output-by-output basis.
6. Line Voltage Dimmers: Meet following load-specific requirements:
 - a. Magnetic Low Voltage (MLV) Transformer:
 - 1) Contain circuitry designed to control and provide a symmetrical AC waveform to input of magnetic low voltage transformers per UL 1472, Section 5.11.
 - 2) Dimmers using unipolar load current devices (such as FETs or SCRs) to include DC current protection in the event of a single device failure.
 - b. Electronic Low Voltage (ELV) Transformer:
 - 1) Dimmer to operate electronic low voltage transformers via reverse phase control. Alternately, forward phase control dimming may be used if dimming equipment manufacturer has recommended specific ELV transformers being provided.
 - c. Fluorescent Electronic Dimming Ballast: Refer to Section 26 51 00 for dimming ballast specifications and performance.
7. Low Voltage Dimming Modules: Meet the following requirements:
 - a. Coordination between low voltage dimming module and line voltage relay: Capable of being electronically linked to single zone.
 - b. Single low voltage dimming module; capable of controlling following light sources:
 - 1) 0-10V analog voltage signal
 - 2) DSI digital communication
 - 3) DALI broadcast communication IEC 60929
 - 4) PWM IEC 60929

F. Non-dim circuits to meet the following requirements:

1. Rated life of relay at full load: Minimum 1,000,000 cycles.

2. Load switched in manner that prevents arcing at mechanical contacts when power is applied to and removed from load circuits.
3. Fully rated output continuous duty for inductive, capacitive, and resistive loads.

2.15 TIME SWITCH

- A. Time switch, 7-day, electronic, 30 setpoints available, LCD display, 12 or 24-hour format, minimum 200 hours battery backup, one SPDT 15-amp contact, UL listed.
 1. Approved Manufacturers: Paragon EC71/30S, Tork EW101S, Intermatic ET70115C.
- B. Time switch, 7-day, 2 channel, electronic, two SPDT 15-amp contacts, two separate programs with 16 setpoints available, LCD display, 12 or 24-hour format, minimum 100 hours carry-over, UL listed.
 1. Approved Manufacturers: Paragon EC72, Tork DTS 200A, Intermatic ET70215C.
- C. Astronomical time switch, 7-day, 1 channel, electronic, one SPDT 5-amp contact, LCD display, 12 or 24-hour format, minimum 100 hours carryover, UL listed.
 1. Approved Manufacturers: Paragon EC71ST, Tork DWZ100A, Intermatic ET70115C.
- D. Timer, 24-hour, 20-amp continuous contacts, 1 N.O. and 1 N.C. contacts, spring wound backup, 120 volt, override switch, UL listed.
 1. Approved Manufacturers: Paragon 4213-OS, Tork 7200L, Intermatic T173CR.

2.16 CONDUCTORS AND CABLES

- A. Control Wiring:
 1. Where installed with the line-voltage wiring, control wiring shall be copper conductors not smaller than No. 16 AWG with insulation voltage rating and temperature rating equal to that of the line-voltage wiring, complying with Division 26 Section 26 05 13 "Medium Voltage Cable and Accessories."
 2. Tap conductors to switches or relays: Stranded copper conductors of 16 AWG or solid 16 or 18 AWG with insulation rating equal to that of the line-voltage wiring.
 3. Tap conductors to dimming ballasts: Solid copper conductors of 18 AWG with insulation voltage rating equal to that of the line-voltage wiring and insulation temperature rating not less than 90°C.
 4. Network cabling as required by manufacturer.
- B. Splices and Taps:
 1. Tapping or wire trap connectors shall be used to splice all Class 1 and Class 2 control wiring. Twist-on, wire-nut type connectors are not allowed.

SECTION 26 10 00

MEDIUM VOLTAGE ELECTRICAL DISTRIBUTION

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Medium Voltage Metal-Enclosed Switchgear.

1.02 SYSTEM DESCRIPTION

- A. Indoor and outdoor metal-enclosed interrupter switchgear with solidly grounded neutral system.
- B. Quality Standard: IEEE C37.20.3.

PART 2 PRODUCTS

2.01 SWITCHGEAR ENCLOSURE

- A. Indoor Enclosure: Steel.
- B. Outdoor Enclosure: Weatherproof, galvanized steel; aisleless; with asphaltic undercoating.
 - 1. Features:
 - a. Wind resistant up to 125 mph wind.
 - b. Space heater.
 - c. Louvers with insect screens and filters.
 - d. Weatherproof ground-fault interrupter duplex receptacle.
 - e. Power supply for heater and receptacles.
 - f. Skid mounted.
- C. Finish: Manufacturer's standard color with high-corrosion resistance coating.

2.02 FUSIBLE LOAD INTERRUPTER SWITCHGEAR

- A. Dead front, metal-enclosed, and fixed-mount.
 - 1. Front and rear access.
 - 2. Viewing window to show view of the position of the interrupter.
 - 3. Mechanical door interlock preventing opening when the switch is open.
 - 4. Padlocking and tagging switch in opened or closed position.
 - 5. Switch position indicator.
 - 6. Hinged front and rear vertical section cover.
 - 7. Bus: Tin-plated copper.

8. Auxiliary vertical sections and compartments for utility or owner metering.
9. Surge arresters.
10. Manual load-interrupter-type switches.
11. Accessories:
 - a. Interrupter switchgear test, inspection, maintenance, and operation tools.
 - b. Fuse-handling tool.

2.03 INSTRUMENTS

- A. Instrument Transformers: Comply with IEEE C57.13.
 1. Potential transformers.
 2. Current transformers.
- B. Multifunction digital meter and monitor.

2.04 PROTECTIVE RELAYS

- A. Multifunctional, solid-state microprocessor-based relay systems.
- B. Overcurrent and Ground-Fault Protective Relays:
 1. Device Functions: 51/50 and 51/50N.
 2. Field-selectable relay settings.
 3. Programmable primary current-transformer ratings from 5 to 5000 A.
 4. Field-selectable phase and ground protection.
 5. Field selectable phase instantaneous overcurrent trip pickup point.
 6. Contacts:
 - a. Two Form-A contacts.
 - b. Field selectable into contact pairs.
 7. Alphameric Display:
 8. Relay alarm and trip contacts.

2.05 CONTROL POWER SUPPLY

- A. Control transformer to supply 120 V(ac).
- B. Uninterruptible ac power supply.

2.06 CONTROL NETWORK

- A. Controllers for support of serial MS/TP and Ethernet IP communications and able to communicate directly via TIA-485 serial networks and Ethernet 10Base-T networks as a native device.

2.07 WARNING LABELS AND SIGNS

- A. Engraved, laminated acrylic or melamine equipment identification labels.

END OF SECTION

SECTION 26 12 16

DRY-TYPE, MEDIUM-VOLTAGE TRANSFORMER

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Dry-type, Medium-Voltage Transformers

1.02 SYSTEM DESCRIPTION

- A. Comply with IEEE C2.
- B. Comply with IEEE C57.12.01.

PART 2 PRODUCTS

2.01 GENERAL

- A. Campus Standards
 - 1. LA Harbor College – Standard general dry-type Square D
 - 2. LA Trade Tech College – Standard general dry-type Square D

2.02 PERFORMANCE REQUIREMENTS

- A. Windings Material: Copper. See Editing Instruction No. 1 in the Evaluations for guidance on retaining "Surge Arresters" Paragraph below.
- B. Surge Arresters: Comply with IEEE C62.11, Distribution Class; metal-oxide-varistor type, connected in each phase of incoming circuit and ahead of disconnecting device.
- C. Cooling Systems: Comply with IEEE C57.12.01 for cooling class.
 - 1. Self-Cooled Rating, Class
- D. Coils Insulation Systems:
 - 1. Primary and secondary coil assemblies must be manufactured using polyester VPI system.
 - 2. Primary and secondary coil assemblies must be manufactured using silicone resin VPE system.
- E. Winding Connections: Connection of windings and terminal markings must comply with IEEE C57.12.70.
- F. Efficiency: Comply with 10 CFR 431, Subpart K.

- G. Bushings must comply with IEEE C57.19.01 requirements for impulse and low-frequency insulation levels.
- H. Tap Changer: External, for de-energized operation.
 - 1. Taps: Two 2-1/2 percent, full-capacity taps above and two 2-1/2 percent, full-capacity taps below rated voltage. Comply with IEEE C57.12.36 requirements.
- I. Enclosure:
 - 1. Provide with provisions for lifting and anchoring frame to concrete pad.
 - 2. With integral skid-mounting frame, suitable to allow skidding or rolling of transformer in any direction.
 - 3. Enclosure Finish:
 - a. Outdoor Transformer Enclosure Finish: Factory-applied finish in manufacturer's standard color, corrosion resistant complying with IEEE C57.12.28.
 - b. Indoor Transformer Enclosure Finish: Factory-applied finish in manufacturer's standard gray over rust-inhibiting primer on treated metal surface.
 - c. Special Corrosion-Resistant Enclosure Finish: Factory-applied, corrosion-resistant finish in manufacturer's standard color that withstands 120 hours of exposure to salt-spray test specified in ASTM B117 without loss of paint or release of adhesion of paint primer coat to metal surface in excess of 1/16 inch from test mark. Scribed test mark and test evaluation must be in accordance with ASTM D1654 with rating of not less than 7 in accordance with Table 1 (Procedure A). Cut edges or otherwise damaged surfaces of hot-dip galvanized sheet steel, or mill-galvanized sheet steel must be coated with manufacturer's standard zinc-rich paint.
- J. Sound level must comply with requirements of NEMA TR 1.
- K. Capacities and Characteristics:
 - 1. Enclosure: Ventilated power transformer, NEMA 250 Type 1 enclosure.
 - 2. Additional IEEE Standards: Comply with IEEE C57.12.50.
 - 3. Comply with UL 1562 listing requirements.
 - 4. Connections:
 - a. Primary: Air-filled terminal cabinet for cable connection.
 - b. Secondary: Air-filled terminal cabinet for cable connection.
 - 5. Transformer Ratings.
 - a. Impedance: Not less than 5.75 percent.
 - b. Temperature Rise: 150 deg C.
 - c. Coils Connection:
 - 1) Line-Side Winding: Delta.
 - 2) Load-Side Winding: Wye.
 - d. Voltage and BIL Ratings:
 - 1) Nominal primary phase-to-phase voltage and BIL: 4160 V, 30 kV.

- 2) Nominal secondary voltage and BIL: 480Y/277 V, 10 kV.
- e. K-Factor: , complying with UL 1562.
6. Taps: Two 2-1/2 percent, full-capacity taps above and two 2-1/2 percent, full-capacity taps below rated voltage. Comply with IEEE C57.12.51 requirements.
7. Transformer Accessories:
 - a. Dial-type analog thermometer with alarm contacts.
 - b. At least four stainless steel ground connection pads.
 - c. Provisions for jacking, lifting, and towing.
 - d. Machine-engraved nameplate made of anodized aluminum or stainless steel.
8. Heaters: Where outdoor cast-coil transformers are shown on Drawings, they must include thermostatically controlled space heaters powered from external source that remains energized when transformer is de-energized.

END OF SECTION

SECTION 26 12 19

PAD-MOUNTED, LIQUID-FILLED, MEDIUM-VOLTAGE TRANSFORMERS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Pad-Mounted, Liquid-Filled, Medium-Voltage Transformers

1.02 SYSTEM DESCRIPTION

- A. Comply with IEEE C2.
- B. Comply with IEEE C57.12.00.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Windings Material: Copper.
- B. Surge Arresters: Comply with IEEE C62.11, Distribution Class.
- C. Efficiency: Comply with 10 CFR 431, Subpart K.
- D. Insulation: Average temperature rise 65 deg C and hottest spot 80 deg C.
- E. Tap Changer: External handle, for de-energized operation.
- F. Tank: Sealed, with welded-on cover. Designed to withstand internal pressure of not less than 7 psi without permanent distortion and 15 psig without rupture. Comply with IEEE C57.12.36.
- G. Mounting: Integral skid mounting frame.
- H. Insulating Liquids:
 - 1. Edible-seed-oil-based dielectric.
 - 2. Biodegradable and nontoxic dielectric.
- I. Sound level must comply with NEMA TR 1 requirements.
- J. Corrosion Protection:
 - 1. Transformer coating system must be factory applied, complying with requirements of IEEE C57.12.28, in manufacturer's standard color green.

2. Fabricate front sill, hood, and tank base of single-compartment transformers from stainless steel in accordance with ASTM A167, Type 304 or 304L, not less than No. 13 U.S. gage, complying with requirements of IEEE C57.12.28, standard color green.
3. Base and Cabinets of Two Compartment Transformers: Fabricate from stainless steel in accordance with ASTM A167, Type 304 or 304L, not less than No. 13 U.S. gage. Coat transformer with manufacturer's standard green color coating complying with requirements of IEEE C57.12.28, in manufacturer's standard color green.

2.02 THREE-PHASE TRANSFORMERS

A. Compartment Construction:

1. Single-compartment construction.
2. Double-compartment construction.

B. Line-Side Section: Dead-front design.

1. Bushing inserts and feed-through inserts:
 - a. Rated at 200 A, with voltage class matching connectors. Provide parking stand near bushing wells.
 - b. Provide insulated protective caps for insulating and sealing out moisture from unused bushing inserts and insulated standoff bushings.
2. Bushing wells configured for loop-feed application.
3. Access to liquid-immersed fuses.
4. Dead-front surge arresters.
5. Tap-changer operator.
6. Load-Break Switch:
 - a. Radial-feed, liquid-immersed type with voltage class and BIL matching that of separable connectors, with continuous current rating and load-break rating of 200 A and make-and-latch rating of 12 kA(rms sym.).
 - b. Loop-feed sectionalizing switches, using three two-position, liquid-immersed-type switches for closed transition loop-feed and sectionalizing operation. Voltage class and BIL must match that of separable connectors, with continuous current rating and load-break rating of 300 A Insert amperage and make-and-latch rating of 12 kA(rms sym.). Switch operation must be as follows:
 - 1) Position I: Line A connected to line B and both lines connected to transformer.
 - 2) Position II: Transformer connected to line A only.
 - 3) Position III: Transformer connected to line B only.
 - 4) Position IV: Transformer disconnected, and line A not connected to line B.
 - 5) Position V: Transformer disconnected, and line A connected to line B.

C. Load-Side Section:

1. Metering: Coordinated with and complying with requirements of Section "Electricity Metering." the following:
 - a. Sensors.
 - b. BAS interface.
 - c. Kilowatt-hour meter.
 - d. Kilowatt-hour demand meter.

- D. Capacities and Characteristics:
 1. Power Rating: As load requires, maximum size 2000 KVA.
 2. Voltage Ratings: 12,470 V - 480Y/277 V.
 3. Taps: Comply with IEEE C57.12.26 requirements.
 4. Transformer BIL (kV): Comply with IEEE C57.12.26 requirements.
 5. Minimum Tested Impedance (Percent) at 85 deg C: 2.87.
 6. K-factor: K-1 complying with UL 1562.
 7. Comply with FM Global Class No. 3990.
 8. Comply with UL listing requirements for combination classification and listing for transformer and less-flammable insulating liquid.

- E. Transformer Accessories:
 1. Drain and filter connection.
 2. Filling and top filter press connections.
 3. Pressure-vacuum gauge.
 4. Dial-type analog thermometer with alarm contacts.
 5. Magnetic liquid level indicator with high and low alarm contacts.
 6. Automatically resetting pressure-relief device. Device flow must be as recommended by manufacturer. With alarm contacts and manual bleeder.
 7. Stainless steel ground connection pads.
 8. Machine-engraved nameplate, made of anodized aluminum or stainless steel.
 9. Sudden pressure relay for remote alarm or trip when internal transformer pressure rises at field-set rate. Provide with seal-in delay.

SECTION 26 22 00

LOW VOLTAGE TRANSFORMERS (DRY-TYPE TRANSFORMERS (600 V AND LESS))

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Dry type two winding transformers
- B. Dry type harmonic mitigating transformers

PART 2 PRODUCTS

2.01 DRY TYPE TWO WINDING TRANSFORMERS

- A. Approved Manufacturers:
 - 1. MGM
 - 2. Hammond
 - 3. General Electric
 - 4. Square D
 - 5. Eaton
- B. Campus Standards
 - 1. East LA College and Southgate Environmental Center – Square D, GE, Eaton Cutler Hammer
 - 2. LA Harbor College – Eaton Cutler Hammer, GE, Square D
 - 3. LA Mission College – Square D
 - 4. LA Pierce College – Eaton Cutler Hammer, Square D, GE
 - 5. LA Southwest College – Square D
 - 6. LA Trade Tech College – Eaton Cutler Hammer, Square D
 - 7. LA Valley College – Eaton Cutler Hammer, GE, Square D
 - 8. West LA College – GE, Eaton, Square D
- C. Dry Type Transformers: NEMA ST 20, factory-assembled, air-cooled dry type transformers; ratings as shown on the drawings. Transformers supplied under this project shall meet the US Department of Energy (DOE) 2016 Efficiency requirements or the most current DOE CFR in effect.
- D. Insulation system and average winding temperature rise for rated KVA as follows:

<u>Ratings</u>	<u>Class</u>	<u>Rise (degree C)</u>
Less than 15	185	As shown on the drawings
15 or higher	220	As shown on the drawings

- E. Case temperature shall not exceed 40°C rise above ambient at its warmest point.
- F. Winding Taps, Transformers Less than 15 KVA: Two 5 percent below rated voltage, full capacity taps on primary winding.
- G. Winding Taps, Transformers 15 KVA and Larger: Two (2) 2-1/2% below and two (2) 2-1/2% above rated voltage, full capacity taps on primary winding.
- H. Sound Levels: Average audible sound level shall not exceed the values given below when tested to NEMA ST 20 standards:

	Average Sound Level, Decibels			
	Self-Cooled Ventilated			Self-Cooled Sealed
	K-Factor = 1 K-Factor = 4 K-Factor = 9	K-Factor = 13 K-Factor = 20	Forced Air w/ Fans Running	
0-9	40	40	67	45
9.01-30.00	45	45	67	50
30.01-50.00	45	48	67	50
50.01-150.00	50	53	67	55
150.01-300.00	55	58	67	57
300.01-500.00	60	63	67	59
500.01-700.00	62	65	67	61
700.00-1000.00	64	67	67	63

- I. Ground core and coil assembly to enclosure by means of a visible flexible copper grounding strap.
- J. Mounting: Transformers 75 KVA and less shall be suitable for wall, floor, or trapeze mounting; transformers larger than 75 KVA shall be suitable for floor or trapeze mounting.
- K. Coil Conductors: Continuous windings with terminations brazed or welded.
- L. Enclosure: NEMA ST 20; Type 1. Provide lifting eyes or brackets.
- M. Isolate core and coil from enclosure using vibration-absorbing mounts.
- N. Nameplate: NEMA TP 3; Include transformer connection data and overload capacity based on rated allowable temperature rise.
- O. Ground all transformers as a separately derived system as required by the CEC – California Electrical Code.

END OF SECTION

SECTION 26 24 13

SWITCHBOARDS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Main and distribution switchboards

PART 2 PRODUCTS

2.01 GENERAL

- A. Approved Manufacturers:

- 1. Square D
- 2. General Electric
- 3. Eaton Cutler-Hammer

- B. Campus Standards

- 1. East LA College and Southgate Environmental Center – Square D, GE, Eaton Cutler-Hammer, Selection to match existing
- 2. LA Harbor College – GE, Eaton Cutler-Hammer, Selection to match existing
- 3. LA Mission College – Square D
- 4. LA Pierce College - Square D, GE Eaton Cutler-Hammer
- 5. LA Southwest College – Square D, Selection to match existing
- 6. LA Trade Tech College – GE, Square D, Selection to match existing
- 7. LA Valley College – GE, Square D, Eaton Cutler Hammer, Match existing
- 8. LA West College – Selection to match existing – GE, Eaton, Square D

2.02 RATINGS

- A. Definitions:

- 1. Series rated equipment shall be defined as equipment that can achieve a required UL AIC rating with an upstream device such as a main breaker or a combination of devices to meet or exceed a required UL AIC rating.
- 2. Fully rated equipment shall be defined as equipment where all devices in that equipment shall carry a minimum of the AIC rating that is specified.

- B. The switchboards for this project shall be fully rated unless otherwise specifically noted in the Drawings or Specifications.

2.03 SWITCHBOARD CONSTRUCTION AND RATINGS

- A. Factory-assembled, dead front, metal-enclosed, and self-supporting switchboard assembly conforming to NEMA PB2, and complete from incoming line terminals to load-side terminations.
 - B. Switchboard electrical ratings and configurations as shown on the drawings.
 - C. Line and Load Terminations: Accessible from the front only of the switchboard, suitable for the conductor materials used.
 - D. Main Section Devices: Individually mounted and compartmented.
 - E. Distribution Section Devices: Individually mounted.
 - F. Auxiliary Section Devices: Individually mounted and compartmented.
 - G. Bus Material: Aluminum with tin plating, sized in accordance with NEMA PB 2.
 - H. Bus Connections: Bolted, accessible from front only for maintenance. Plug-on connections may be utilized with Architect/Engineer's pre-approval by addenda.
 - I. Bus bars shall be fully isolated, braced for minimum ampere rms symmetrical rating as indicated on drawings.
 - J. The bus shall extend the full height of the distribution sections to provide space for future breakers.
 - K. Provide a 1 X 1/4-inch copper ground bus through the length of the switchboard.
 - L. Provide metering transformer compartment for Utility Company's use. Compartment size, bus spacing and drilling, door, and locking and sealing requirements shall be in accordance to Section 26 20 00 and Utility Company specifications.
 - M. Enclosure shall be NEMA PB 2; Type 1 - General-Purpose. Sections shall align at front and rear.
 - N. Switchboard Height: NEMA PB 2; 92 inches, excluding floor sills, lifting members and pull boxes.
 - O. Finish: Manufacturer's standard light gray enamel over external surfaces. Coat internal surfaces with minimum one coat corrosion-resisting paint, or plate with cadmium or zinc.
 - P. Pull Box: Same construction as switchboard, size as shown on the drawings. Top and sides shall be removable. Insulating, fire-resistive bottom with separate openings for each circuit to pass into switchboard.
 - Q. Pull Section: Same construction as switchboard, size as shown on the drawings. Depth and height to match switchboard. Arrange as shown on the drawings.
 - R. Future Provisions: In addition to the spare devices shown, provide a minimum of 15 inches of fully equipped space for future devices with bussing and bus connections, suitably insulated and braced for short circuit currents. Continuous current rating as indicated on the drawings.
 - S. Suitable for use as service entrance equipment.
- 2.04 SWITCHING, OVER-CURRENT PROTECTIVE DEVICES, AND ARC ENERGY REDUCTION
- A. Fusible Switch Assemblies (600 Amperes and Smaller): Quick-make, quick-break, load interrupter enclosed knife switch with externally operable handle. Provide interlock to prevent opening front cover with switch in ON position. Handle lockable in OFF position. Fuse Clips: Designed to accommodate Class 'R' fuses, type as specified, with Class 'R' rejection clips.

- B. Fusible Switch Assemblies (800 Amperes and Larger): Bolted pressure contact switches. Fuse Clips: Designed to accommodate Class L fuses.
- C. Molded Case Circuit Breakers: Provide circuit breakers with integral thermal and instantaneous magnetic trip in each pole. Provide breaker interrupting ratings as indicated on the plans. Where necessary to meet interrupting ratings, breakers shall be provided with automatically resetting current limiting elements in each pole.
- D. Solid State Molded Case Circuit Breakers: (All breakers identified on plans as solid-state with 2,500 ampere frame sizes and below.) Provide molded case switch with electronic sensing, timing, and tripping circuits for fully adjustable time current characteristic settings including ground fault trip, instantaneous trip, long time trip, long time delay, short time trip, and short time delay. Trip setting shall be field programmable with a sealable clear cover. Provide stationary mounting. draw-out construction. Ground fault sensing shall be breaker integral with circuit breaker. Provide zero sequence type ground fault sensor. Provide breaker interrupting ratings as indicated on the plans.
- E. Solid-State Insulated Case Circuit Breakers: (All breakers identified on plans as solid state with frame sizes above 2,500 ampere.) Provide insulated case switch with two-step stored energy closing. Provide manual charging handle, and electric charging motor where indicated as electrically operated. Provide with rating plug as required on drawings and electronic circuits for true rms current sensing, timing, and tripping for fully adjustable time current characteristics including ground fault trip, instantaneous trip, long time trip, long time delay, short time trip, and short time delay. Trip settings shall be field programmable with a sealable clear cover. Ground fault sensing shall be summation type integral to breaker. Provide stationary mounting. draw-out construction. Provide breaker interrupted ratings as indicated on the plans.
- F. Arc Energy Reduction:
 - 1. Provide an arc energy reduction system to reduce the clearing time of an arc flash event. The arc energy reduction system shall be provided for overcurrent protection devices rated 1,200 amps or larger.
- G. Arc Energy Reduction with Selective Coordination:
 - 1. Provide an arc energy reduction system to reduce the clearing time of an arc flash event. The arc energy reduction system shall be provided for overcurrent protection devices rated 1,200 amps or larger.
 - 2. Zone-Selective Interlocking System: Provide a zone-selective interlocking system for the electrical equipment. The system shall provide the following functions:
 - a. Selective coordination
 - b. Permanent arc energy reduction
 - 3. The following arc energy reduction system options are acceptable:
 - a. Zone-selective interlocking with permanent arc energy reduction
 - b. Differential relaying with permanent arc energy reduction
 - c. Listed energy-reducing active arch flash mitigating system

2.05 INSTRUMENTS AND SENSORS

- A. Current Transformers: ANSI C57.13; 5 ampere secondary, bar or window type, with single secondary winding, unless otherwise required for application, and secondary shorting device, primary/secondary ratio as required, burden and accuracy consistent with connected metering and relay devices, 60 Hertz.
- B. Potential Transformers: ANSI C57.13; 120-volt single secondary, disconnecting type with integral fuse mountings, primary/secondary ratio as required, burden and accuracy consistent with connected metering and relay devices, 60 Hertz.
- C. Ground Fault Sensor: Zero sequence type.
- D. Ground Fault Relay: Adjustable ground fault sensitivity from 200 to 1200 amperes, time delay adjustable from 0 to 15 seconds. Provide monitor panel with lamp to indicate relay operation, TEST and RESET control switches.
- E. Double-ended Equipment Ground Fault Protection: Provide a modified differential ground fault protection scheme. Adjustable ground fault sensitivity from 200 to 1200 amperes, time delay adjustable from 0 to 15 seconds. Provide monitor panel with lamp to indicate relay operation, TEST and RESET control switches.
- F. Electronic Power Monitor: Refer to Section 26 09 13.
- G. Digital AC Power Monitor. Capable of measuring, calculating and directly displaying; Volts (L-L, L-N), Amps, KW, KWH. Monitor shall be true RMS measurement with programmable set-up parameters. All set-up parameters data shall be stored in non-volatile memory to protect from power outages.

2.06 BUILDING-LEVEL SUB-METERS

- A. LACCD buildings over 10,000 square feet shall have sub-meters installed.
 - 1. All central utility plants in any size structure or any configuration, shall also have sub-meters installed subject to this standard.
- B. Building-level sub-meters shall be configured to interface and exchange data with the district's existing metering software.
- C. Building-level sub-meters shall include an Ethernet communications port or wireless communication capability or other networking capability.
- D. Building level utility sub-meters shall be installed to capture the following data at a minimum of 15-minute intervals:
 - 1. Electricity consumption (kWh)
 - 2. Power demand (kW)
 - 3. Power Factor
- E. Individual Meters shall retain data for a period of no less than 12 months.
- F. Solar photovoltaic arrays installed in or on a building shall have a dedicated meter to track PV productions. This is in addition to the building level sub-meter and must be in compliance with all the requirements outlined in the standards.

END OF SECTION

SECTION 26 24 16

PANELBOARDS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Main and Distribution panelboards
- B. Lighting and appliance branch circuit panelboards

PART 2 PRODUCTS

2.01 RATINGS

- A. Definitions:
 - 1. Series rated equipment shall be defined as equipment that can achieve a required UL AIC rating with an upstream device such as a main breaker or a combination of devices to meet or exceed a required UL AIC rating. All series rated equipment shall have a permanently attached nameplate indicating that device rating must be maintained. See Section 26 05 53 for additional requirements.
 - 2. Fully rated equipment shall be defined as equipment where all devices in that equipment shall carry a minimum of the AIC rating that is specified.
- B. The panelboards for this project shall be fully rated unless otherwise specifically noted in the Drawings or Specifications.

2.02 MAIN AND DISTRIBUTION PANELBOARDS

A. General

- 1. Approved Manufacturers:
 - a. Square D
 - b. ABB GE
 - c. Siemens
- 2. Campus Standards
 - a. East LA College and Southgate Environmental Center – Square D, GE, Eaton Cutler Hammer
 - b. LA Harbor College – GE Eaton Cutler Hammer
 - c. LA Mission College – Square D
 - d. LA Pierce College – Square D
 - e. LA Southwest College – Square D, GE, Eaton Cutler Hammer
 - f. LA Trade Tech College – Square D, GE, Eaton Culter Hammer, Siemens

- g. LA Valley College – GE, Square D, Eaton Cutler Hammer, Siemens
 - h. West LA College – Siemens, Eaton Cutler Hammer, GE, Square D
- B. Panelboards: NEMA PB 1; type as shown on the drawings.
 - C. Enclosure: NEMA PB 1; Type 1 (Indoor type).
 - D. Provide cabinet front with hinged trim on door to allow access to wiring gutters without removal of trim and flush lock. Each door shall be equipped flush lock type, spring latching, Yale lock for metal door keyed to a Yale key. All panelboard locks shall be keyed to operate from one key. Finish in manufacturer's standard gray enamel.
 - E. Provide panelboards with copper bus, ratings as scheduled on the drawings. Provide copper ground bus in all panelboards.
 - F. All spaces shown on the one-line diagram shall be fully prepared spaces for future breakers.
 - G. Minimum Integrated Short Circuit Rating: 100,000 amperes rms symmetrical for 240-volt panelboards; 50,000 amperes rms symmetrical for 480-volt panelboards, or as shown on the drawings.
 - H. Molded Case Circuit Breakers: Provide circuit breakers with integral thermal and instantaneous magnetic trip in each pole.
 - I. Molded Case Circuit Breakers with Current Limiters: Provide circuit breakers with replaceable current limiting elements, in addition to integral thermal and instantaneous magnetic trip in each pole.
 - J. Current Limiting Molded Case Circuit Breakers: Provide circuit breakers with integral thermal and instantaneous magnetic trip in each pole, coordinated with automatically resetting current limiting elements in each pole. Interrupting rating 100,000 symmetrical amperes, let-through current and energy level less than permitted for same size Class RK-5 fuse.
 - K. Solid State Molded Case Circuit Breakers: All breakers identified on plans as solid-state with 1,200 ampere frame sizes and below. Provide molded case switch with electronic sensing, timing, and tripping circuits for fully adjustable time current characteristic settings including ground fault trip, instantaneous trip, long time trip, long time delay, short time trip, and short time s
 - L. Arc Energy Reduction:
 - 1. Provide an arc energy reduction system to reduce the clearing time of an arc flash event. The arc energy reduction system shall be provided for overcurrent protection devices rated 1200 amps or larger.
 - 2. Energy-Reducing Maintenance Switch: Provide an energy-reducing maintenance switch visual status indication when engaged. Install the maintenance switch at the entrance to the electrical room in the first section of the electrical equipment.
 - M. Suitable for use as service entrance equipment.

2.03 BRANCH CIRCUIT PANELBOARDS

- A. General
 - 1. Approved Manufacturers:

- a. Square D
 - b. General Electric
 - c. Siemens
 - d. Eaton
- B. Campus Standards
- 1. LA Pierce College – All panelboard shall be full size panel with 42 circuits, bolt-on type breaker, with main breaker and ground bus. All space fill with 1-pole 20A breaker and come with lock-kit.
- C. Lighting and Appliance Branch Circuit Panelboards: NEMA PB 1; circuit breaker type.
- D. Enclosure: NEMA PB 1; Type 1 (Indoor type).
- E. Provide cabinet front door in door with hinged trim to allow access to wiring gutters without removal of trim and flush lock all keyed alike. Each door shall be equipped flush lock type, spring latching, Yale lock for metal door keyed to a Yale key. All panelboard locks shall be keyed to operate from one key. Hinged trim shall be secured with screws. Finish in manufacturer's standard gray enamel.
- F. Provide panelboards with copper bus, ratings as scheduled on the drawings. Provide copper ground bus in all panelboards.
- G. All unlabeled circuits shown on the panelboard schedule shall be fully prepared spaces for future breakers.
- H. All multiple-section panelboards shall have the same dimensional back box and cabinet front size.
- I. Minimum Integrated Short Circuit Rating: As shown on the drawings.
- J. Provide handle lock-on devices for all breakers serving exit sign and lighting circuits with emergency battery units. Provide handle lock-on devices and red handles for breakers serving fire alarm panels.
- K. Molded Case Circuit Breakers: Bolt-on type thermal magnetic trip circuit breakers, with common trip handle for all poles. Provide circuit breakers UL listed as Type SWD for lighting circuits. Provide UL Class A ground fault interrupter circuit breakers where scheduled on the drawings. Do not use tandem circuit breakers.
- L. Current Limiting Molded Case Circuit Breakers: Provide circuit breakers with integral thermal and instantaneous magnetic trip in each pole, coordinated with automatically resetting current limiting elements in each pole. Interrupting rating 100,000 symmetrical amperes, let-through current and energy level less than permitted for same size Class RK-5 fuse.

SECTION 26 24 19

MOTOR CONTROL

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Manual motor starters
- B. Magnetic motor starters
- C. Combination magnetic motor starters
- D. Solid-state reduced voltage motor starters (soft starters)
- E. Motor control centers

PART 2 PRODUCTS

2.01 MANUAL MOTOR STARTERS

- A. Manual Motor Starter: NEMA ICS 2; AC general-purpose Class A manually operated non-reversing full-voltage controller for induction motors rated in horsepower, with overload relay, and toggle operator.
- B. Fractional Horsepower Manual Starter: NEMA ICS 2; AC general-purpose Class A manually operated, full-voltage controller for fractional horsepower induction motors, with thermal overload unit, and toggle operator.
- C. Motor Starting Switch: NEMA ICS 2; AC general-purpose Class A manually operated, full-voltage controller for fractional horsepower induction motors, without thermal overload unit, and toggle operator.
- D. Enclosure: NEMA ICS 6; Type 1.

2.02 MAGNETIC MOTOR STARTERS

- A. Approved Manufacturers:
 - 1. Allen Bradley
 - 2. Siemens (Furnas)
 - 3. Square D
 - 4. General Electric
- B. Campus Standards
 - 1. East LA College and Southgate Environmental Center – Square D, GE, Eaton Cutler Hammer
 - 2. LA Harbor College – GE, Eaton Cutler Hammer

3. LA Mission College – Square D
 4. LA Pierce College – Square D, GE, Eaton Cutler Hammer
 5. LA Southwest College – Square D
 6. LA Trade Tech College – Square D
 7. LA Valley College – GE, Square D, Eaton Cutler Hammer
 8. West LA College – GE, Eaton , Square D
- C. Magnetic Motor Starters: NEMA ICS 2; AC general-purpose Class A magnetic controller for induction motors rated in horsepower.
- D. Full Voltage Starting: Non-reversing type, unless otherwise indicated.
- E. Reduced Voltage Starting: Closed-circuit transition wye-delta type: NEMA ICS 2, closed transition with adjustable time delay.
- F. Two Speed Starting: Two speed, one winding, variable torque type. NEMA ICS 2, closed transition with separate overload relays for starting and running sequences.
- G. Coil Operating Voltage: 120 volts, 60 Hertz, obtained from integral control power transformer of sufficient capacity to operate connected pilot, indicating, and control devices, plus 100% spare capacity.
- H. Size: NEMA ICS 2; size as shown on the drawings.
- I. Overload Relay:
1. Overload Relay: Ambient-compensated type with inverse-time-current characteristic and NEMA ICS 2, Class 10 20 30 tripping characteristic. Provide with heaters or sensors in each phase matched to nameplate full-load current of specific motor to which they connect and with appropriate adjustment for duty cycle.
 2. Adjustable Overload Relay: Dip switch selectable for motor running overload protection with NEMA ICS 2, Class 10 20 30 tripping characteristic, and selected to protect motor against voltage and current unbalance and single phasing. Provide relay with Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting.
- J. Enclosure: NEMA ICS 6; Type 1.
- K. Combination Motor Starters: Combine motor starters with disconnect switch in common enclosure. Provide with disconnecting means as indicated on drawings.
- L. Auxiliary Contacts: NEMA ICS 2; two normally open, field convertible contacts in addition to seal-in contact.
- M. Pushbuttons: NEMA ICS 2; START/STOP in front cover.
- N. Elapsed Time Meters: Heavy duty with readout in tenths of an hour.
- O. Indicating Lights: NEMA ICS 2; RUN: red in front cover.
- P. Selector Switches: NEMA ICS 2; HAND/OFF/AUTO, in front cover.
- Q. Relays: NEMA ICS 2.

- R. Control Power Transformers: 120 volt fused secondary, fused primary; minimum VA as scheduled:
 - 1. Size 1 - 100 VA
 - 2. Size 2 - 100 VA
 - 3. Size 3 - 150 VA
 - 4. Size 4 - 300 VA
 - 5. Size 5 - 300 VA
 - 6. Size 6 - 300 VA
- S. Provide phase loss protection relay with contacts to de-energize the starter for each starter serving motors 5 HP or greater.

2.03 SOLID-STATE REDUCED VOLTAGE MOTOR STARTERS (SOFT STARTERS)

- A. Approved Manufacturers:
 - 1. Allen Bradley
 - 2. Siemens (Furnas)
 - 3. Square D
 - 4. General Electric
- B. Campus Standards
 - 1. East LA College and Southgate Environmental Center – Square D, GE, Eaton Cutler Hammer
 - 2. LA Harbor College – Eaton Cutler Hammer
 - 3. LA Mission College – Square D
 - 4. LA Pierce College – Square D, GE, Eaton Cutler Hammer, Siemens
 - 5. LA Southwest College – Square D, GE, Eaton Cutler Hammer
 - 6. LA Trade Tech College – GE, Square D, Siemens,
 - 7. LA Valley College – GE, Square D, Cutler Hammer, Siemens
- C. Soft Starters: ANSI/UL Standard 508. Used with NEMA Design B, AC induction motors to reduce in-rush current and mechanical shocks associated with starting and stopping motors.
- D. Operation: The soft starter shall utilize a thyristor (SCR) bridge to control the starting and stopping of the motor. A microprocessor shall monitor the current and control the phasing of the SCRs. The soft starter shall provide torque control for linear acceleration without external feedback independent of motor load or motor application.
- E. Torque ramp: Adjustable (by keypad) from 1 to 60 seconds.
- F. Shorting Contactor: A shorting contactor shall be supplied with all soft starters rated above 40 amps. The shorting contactor shall close after the current is below 130% of motor full-load amps at the nominal voltage. The shorting contactor shall open on a stop command to allow a deceleration ramp, if applicable.
- G. Status & Diagnostics: Door-mounted keypad for display of soft starter, motor, and fault statuses.

- H. Motor Protection against Solid-State Component Failure: Provide an isolation contactor that opens when the motor is stopped or when the controller detects a fault condition such as a shorted thyristor.
- I. Over-Current Protection Device / Power Disconnect: Integral molded case disconnect switch and in-line fuse block for RK type power fuses (up to 600 amps). Short circuit current rating shall be 65,000 AIC minimum or as indicated on drawings.
- J. Overcurrent Condition: The soft starter shall be capable of supplying 300% of rated full load current for 30 seconds at maximum ambient temperature.
- K. Electronic Protective Features: Thermal overload protection, phase reversal protection, stall protection, locked rotor protection, and underload protection. The display shall also indicate a starter thermal fault, phase fault, frequency fault, external fault, maximum start time exceeded, serial link fault, and internal failure.
- L. Controls: The control circuitry shall be fed internally from the line supply, completely independent of the power circuit and separate from the control logic. The control circuitry shall operate at 120 VAC via an integral control power transformer.
- M. Selector Switches: NEMA ICS 2; HAND/OFF/AUTO, in front cover.
- N. Input: Remote control start/stop signal, and one logic input for force to freewheel, indication of external fault, force to local control, or remote overload reset.
- O. Outputs: Isolation contactor status, torque ramp status, overload pre-alarm, fault alarms, and one field convertible auxiliary contact. One analog output shall be available for 4-20mA indication of motor current, torque, thermal state, or power factor.
- P. Current and Horsepower Ratings: As indicated in the Starter/Disconnect Schedule on the drawings.
- Q. Input/Output Voltage: As indicated in the Starter/Disconnect Schedule on the drawings. The controller shall be capable of operating between -15% to +10% of nominal voltage rating.
- R. Environmental Characteristics: Ambient Air Temperature: 0°C to 40°C; Maximum Relative Humidity: 93% (non-condensing); Minimum Elevation without Derating: 3300 feet.
- S. Enclosure: NEMA ICS 6; Type 1, with provisions for padlocking the door.

2.04 CONTROLLER OVER-CURRENT PROTECTION AND DISCONNECTING MEANS

- A. Molded Case Thermal-Magnetic Circuit Breakers: Circuit breakers with integral thermal and instantaneous magnetic trip in each pole. NEMA AB 1, motor-circuit protector with field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
- B. Non-fusible Switch Assemblies: Quick-make, quick-break, load interrupter enclosed knife switch with externally operable handle. Provide interlock to prevent opening front cover with switch in ON position. Handle lockable in OFF position.

Campus Standards

1. LA Harbor College – General Electric (GE)
2. LA Trade Tech College – General Electric (GE), Square D

- C. Fusible Switch Assemblies: NEMA KS 1, quick-make, quick-break, load interrupter enclosed knife switch with externally operable handle. Provide interlock to prevent opening front cover with switch in ON position. Handle lockable in OFF position. Fuse Clips: Provide with Class 'R' rejection clips. Select and size fuses to provide Type 2 protection according to IEC 947-4-1, as certified by a nationally recognized testing laboratory.

2.05 MONITORING AND METERING

- A. The starter shall provide the capability to monitor and calculate power consumption (kWh) of the motor load. Each starter shall display the calculated kW and kWh. Additionally, provide either a pulse output (kWh) or 4-20mA analog signal (kW) to the Facility Management and Control System (FMCS) to monitor the power consumption.
- B. Starter must be capable of communicating over BACnet. At a minimum, reported points shall include starter mode, terminal input status, run/fault status, voltage, current, power factor, kW and kWh.

2.06 MOTOR CONTROL CENTER

- A. Approved Manufacturers:
 - 1. Square D
 - 2. ABB (General Electric)
 - 3. Siemens
- B. Campus Standards
 - 1. East LA College and Southgate Environmental Center – Square D, GE, Eaton Cutler Hammer
 - 2. LA Harbor College – Square D
 - 3. LA Mission College – Square D
 - 4. LA Pierce College – Square D, GE, Eaton Cutler Hammer
 - 5. LA Southwest College – Square D, GE, Eaton Cutler Hammer
 - 6. LA Trade Tech College – Square D
 - 7. LA Valley College – GE, Square D, Eaton Cutler Hammer
 - 8. West LA College – Selection to match existing, GE, Eaton Cutler Hammer Square D
- C. Motor Control Centers: NEMA ICS 2; Class 1, Type B.
- D. Main Overcurrent Protection: As shown on the drawings.
- E. Motor Controllers: As scheduled or indicated on the drawings.
- F. Feeder Tap Units: Circuit Breakers.
- G. Voltage Rating: 480/277 volts, 3-phase, 4-wire, 60 Hertz.
- H. Horizontal Bussing: Copper, with a continuous current rating of 600 amperes. Include copper ground bus entire length of control center.
- I. Vertical Bussing: NEMA ICS 2; copper.

- J. Integrated Equipment Short Circuit Rating: As indicated on the drawings.
- K. Configuration: Units front mounting only, accessible from the front only.
- L. Enclosure: NEMA 250; Type 1, unless noted otherwise.
- M. Finish: Manufacturer's standard gray enamel.
- N. Provide phase loss protection relay with contacts to de-energize each motor starter in control center.
- O. Control Transformers: Provide individual fused control transformers in the motor control center to provide independent 120-volt control source for each motor controller in the control center.

ELECTRICITY METERING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Electricity Meters.

PART 2 PRODUCTS

2.01 UTILITY METERING INFRASTRUCTURE

- A. Install metering accessories furnished by utility company, complying with its requirements.
- B. Utility-furnished meters.
- C. Current-transformer cabinets.
- D. Meter sockets.
- E. Modular Meter Center: Factory-coordinated assembly of main service disconnect device, wireways, meter socket modules, and feeder circuit breakers arranged in adjacent vertical sections complete with interconnecting buses.
 - 1. Housing: UL 50E, Type 3R enclosure.
 - 2. Minimum Short-Circuit Rating: 65 000 A symmetrical at rated voltage.
 - 3. Main Disconnect Device: Circuit breaker.
 - 4. Surge Protection:
 - a. Factory-installed in main disconnect.
- F. Arc-flash warning labels.

2.02 ELECTRICITY METERS

- A. General Requirements for Meters:
 - 1. Billing Meters Accuracy: 0.5 percent of reading, complying with NEMA ANSI C12.20.
 - 2. Meters Certification: Certified by California Type Evaluation Program as complying with 4 CCR 4027, Article 2.2.
 - 3. Enclosure: Supplied by meter manufacturer, UL 50E, Type 3R minimum, with provisions for locking or sealing.
 - 4. Sensors:
 - a. Type: Split and solid core, complying with recommendation of meter manufacturer.

- B. kWh Meter: Electronic single-phase and three-phase meters, measuring electricity use.
 - 1. Display: LCD.
- C. kWhd Meter: Electronic single-phase and three-phase meters, measuring electricity use and demand. Demand must be integrated over 15-minute interval.
- D. KY and KYZ pulse totalizer.
- E. Remote Reading Options:
 - 1. Pulse Output: KYZ, complete with optical sensor and interface devices.
 - 2. TIA-485 serial interface, with Modbus RTU protocol.
 - 3. USB interface.
 - 4. TCP/IP adapter.
- F. Current-transformer cabinet.
- G. Uninterruptible Power Supply: Single phase, 120 V(ac), sized and rated to provide continuous power to meter for operations of 48 hours after interruption of normal power.
- H. Software: PC-based product recommended by meter manufacturer, suitable for calculating utility cost allocation.

END OF SECTION

SECTION 26 27 16

CABINETS AND ENCLOSURES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Hinged cover enclosures
- B. Cabinets
- C. Terminal blocks and accessories

PART 2 PRODUCTS

2.01 HINGED COVER ENCLOSURES

- A. Construction: NEMA 250; Type 1, 3R, 4, 14 gauge steel.
- B. Finish: Manufacturer's standard polyester powder paint finish.
- C. Covers: Continuous hinge with stainless steel hinge pin. Covers longer than 24 inches shall have 3-point latching.
- D. Locks: Flush 1/4 turn cylinder key latch 3-point latch kit with padlock handle quick-release latch.
- E. Provide interior white painted metal panel for mounting terminal blocks and electrical components.

2.02 CABINETS

- A. Cabinet Boxes: Galvanized steel with removable end walls dimensions as indicated on the drawings.
- B. Cabinet Fronts: Steel, flush surface type with screw cover front, concealed hinge and flush lock keyed to match branch circuit panelboard; finish in gray baked enamel.

2.03 TERMINAL BLOCKS AND ACCESSORIES

- A. Terminal Blocks: ANSI/NEMA ICS 4; UL listed.
- B. Power Terminals: Unit construction type, closed-back type, with tubular pressure screw connectors, rated 600 volts.
- C. Signal and Control Terminals: Modular construction type, channel mounted; tubular pressure screw connectors, rated 300 volts.

2.04 FABRICATION

- A. Shop assemble enclosures and cabinets housing terminal blocks or electrical components in accordance with ANSI/NEMA ICS 6.
- B. Provide conduit hubs or knockouts on enclosures.
- C. Provide protective pocket inside front cover with schematic diagram, connection diagram, and layout drawing of control wiring and components within enclosure.

END OF SECTION

SECTION 26 27 26

WIRING DEVICES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Device plates and box covers
- B. Modular connectors
- C. Receptacles
- D. Countertop and furniture receptacle assemblies
- E. Pin and sleeve devices
- F. Floor boxes
- G. Service fitting
- H. Pedestal style box
- I. Poke-through fittings
- J. Pendant cord/connector devices
- K. Cord and plug sets
- L. Cord reel

PART 2 PRODUCTS

2.01 DEVICE COLOR

- A. All switch, receptacle, outlet, and cover plate colors shall be verified with Architect, unless indicated otherwise.

2.02 COVERPLATES

- A. All switches, receptacles, and outlets shall be complete with the following:
 - 1. Campus Standards (Verify for acceptance of other coverplate types for specific spaces noted on item 2 through 5 below.)
 - a. East LA College and Southgate Environmental Center – Stainless finish plates
 - b. LA Harbor College – Stainless finish plates
 - c. LA Mission College – Stainless
 - d. LA Pierce College – Stainless, Permanently etched circuit # and panel #.

- e. LA Southwest College – Stainless finish plates
 - f. LA Valley College - Stainless finish plates (engraved on the front)
 - g. West LA College – Stainless 302
 - h. Stainless steel coverplates shall be Leviton (LACCD standard).
- 2. Unbreakable thermoplastic/thermoset plastic cover plates in finished spaces where walls are finished.
 - 3. Decorator thermoplastic wall plates in public finished spaces where walls are finished. Approved Manufacturer: Leviton Decora, Hubbell Decorator, Cooper Decorator, or approved equal.
 - 4. Decorator Snap-On nylon or polycarbonate wall plates with sub-base in public finished spaces. Approved Manufacturer: Leviton 803##, Hubbell RCW, Cooper PJS, Pass & Seymour SWP or approved equal.
 - 5. Type #302 stainless steel cover plates in unfinished spaces for flush boxes with permanently etched on panel name and circuit number. Approved Manufacturer: Leviton.
 - 6. Galvanized steel cover plates in unfinished spaces for surface mounted boxes.
- B. Where several devices are ganged together, the cover plate shall be of the ganged style for the number of devices used.
 - C. Install nameplate identification as indicated in Section 26 05 53.
 - D. Plate securing screws shall be metal with head color matching the wall plate finish.

2.03 RECEPTACLES

- A. Refer to Electrical Symbols List for device type.
- B. Devices that are shaded on the drawings shall be red.
- C. Devices that are shaded on the drawings shall be red and shall have an illuminated face or indicator light to indicate that there is power to the device.
- D. NEMA 5-20R Duplex Receptacle:
 - 1. 125-volt, 20 amp, 3-wire grounding type with impact resistant thermoplastic face and steel back strap.
 - 2. Approved Manufacturers: Hubbell 5352A, Leviton, 5362-S, Pass & Seymour 5362, Cooper 5352.
 - 3. Provide decorative style duplex receptacles in public spaces where walls are finished.
 - 4. Approved Manufacturers: (Decorative), Hubbell, Leviton, Pass & Seymour, Cooper.
 - 5. 125-volt, 20 amp, 3-wire grounding type with impact resistant thermoplastic face and brass back strap.
 - 6. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.

7. Campus Standards
 - a. LA Harbor College – Leviton, Hubbell
 - b. LA Trade Tech College – Leviton, Hubbell
8. 125-volt, 20 amp, 3-wire grounding type heavy duty industrial grade with impact resistant thermoplastic face and one-piece brass back strap with integral ground contacts.
9. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
10. NEMA 5-20R Ground Fault Duplex Receptacle:
11. 125-volt, 20 amp, 3-wire grounding type with test and reset buttons in impact resistant thermoplastic face.
12. Device shall perform self-test of GFCI circuitry in accordance with UL 943.
13. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- E. NEMA 5-20R Weatherproof Ground Fault Duplex Receptacle:
 1. 125-volt, 20 amp, 3-wire grounding type with test and reset buttons in impact resistant thermoplastic face. Provide NEMA 3R rated while-in-use cast aluminum cover.
 2. Device shall perform self-test of GFCI circuitry in accordance with UL 943.
 3. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- F. NEMA 5-20R Isolated Ground Duplex Receptacle:
 1. 125-volt, 20 amp, 3-wire grounding type with orange impact resistant thermoplastic face. Orange cover plate with 'Isolated Ground' stenciled in black.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- G. NEMA 5-20R Isolated Ground and Surge Suppression Duplex Receptacle:
 1. 125-volt, 20 amp, 3-wire grounding type with orange impact resistance thermoplastic face, light, and alarm. Orange cover plate with 'Isolated Ground' stenciled in black.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- H. NEMA 5-20R Double Duplex Isolated Ground and Surge Suppression Receptacle:
 1. Consists of two duplex isolated ground and surge suppression receptacles, double gang box, plaster ring and faceplate.
 2. Approved Manufacturers: Refer to Isolated Ground and Surge Suppression Receptacle above.
- I. NEMA 5-20R Receptacle with USB Charger:
 1. 125-volt, 20-amp, tamper resistant, 3-wire grounding type with impact resistant thermoplastic face. Type A USB charging rated at 5VDC 2.1A. Mounted in double gang backbox.

2. Approved Manufacturers: Hubbell, Pass & Seymour, Cooper.
 3. 125-volt, 20-amp, tamper resistant, 3-wire grounding type with impact resistant thermoplastic face. One Type A USB charging rated at 5VDC 2.1A. One Two Type C USB charging rated at 5VDC 5.0A. Mounted in double gang backbox.
 4. Approved Manufacturers: Hubbell
- J. NEMA 5-20R Simplex Receptacle:
1. 125-volt, 20 amp, 3-wire grounding type with impact resistant thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, , Pass & Seymour, Cooper.
- K. NEMA 5-30R Simplex Receptacle:
1. 125-volt, 30 amp, 3-wire grounding type, phenolic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper 5716N.
- L. NEMA 5-50R Simplex Receptacle:
1. 125-volt, 50 amp, 3-wire grounding type, phenolic face.
 2. Approved Manufacturers: Hubbell, Cooper.
- M. NEMA 6-20R Simplex Receptacle:
1. 250-volt, 20 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper 5461.
- N. NEMA 6-30R Simplex Receptacle:
1. 250-volt, 30 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- O. NEMA 6-50R Simplex Receptacle:
1. 250-volt, 50 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- P. NEMA 7-20R Simplex Receptacle:
1. 277-volt, 20 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour.
- Q. NEMA 7-30R Simplex Receptacle:
1. 277-volt, 30 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.

- R. NEMA 7-50R Simplex Receptacle:
1. 277-volt, 50 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- S. NEMA 14-20R Simplex Receptacle:
1. 125/250-volt, 20 amp, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Pass & Seymour, Cooper.
- T. NEMA 14-30R Simplex Receptacle:
1. 125/250-volt, 30 amp, 3-pole, 4-wire grounding type with thermoplastic face. Flush mounted at +24 AFF.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- U. NEMA 14-50R Simplex Receptacle:
1. 125/250-volt, 50 amp, 3-pole, 4-wire grounding type with thermoplastic face. Flush mounted at +4" AFF.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- V. NEMA 14-60R Simplex Receptacle:
1. 125/250-volt, 60 amp, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- W. NEMA 15-20R Simplex Receptacle:
1. 250-volt, 20 amp, 3-phase, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- X. NEMA 15-30R Simplex Receptacle:
1. 250-volt, 30 amp, 3-phase, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- Y. NEMA 15-50R Simplex Receptacle:
1. 250-volt, 50 amp, 3-phase, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- Z. NEMA 15-60R Simplex Receptacle:
1. 250-volt, 60 amp, 3-phase, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Pass & Seymour, Cooper.

- AA. NEMA L5-20R Simplex Receptacle, Locking Type:
1. 125-volt, 20 amp, 2-pole, 3-wire grounding type with impact resistant thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- BB. NEMA L5-30R Simplex Receptacle Locking Type:
1. 125-volt, 30 amp, 2-pole, 3-wire grounding type with impact resistant thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- CC. NEMA L6-20R Locking Type Simplex Receptacle:
1. 250-volt, 20 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- DD. NEMA L6-30R Locking Type Simplex Receptacle:
1. 250-volt, 30 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- EE. NEMA L7-20R Locking Type Simplex Receptacle:
1. 277-volt, 20 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- FF. NEMA L7-30R Locking Type Simplex Receptacle:
1. 277-volt, 30 amp, 2-pole, 3-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- GG. NEMA L14-20R Locking Type Simplex Receptacle:
1. 125/250-volt, 20 amp, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Pass & Seymour, Cooper.
- HH. NEMA L14-30R Locking Type Simplex Receptacle:
1. 125/250-volt, 30 amp, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- II. NEMA L15-20R Locking Type Simplex Receptacle:
1. 250-volt, 20 amp, 3-phase, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- JJ. NEMA L15-30R Locking Type Simplex Receptacle:

1. 250-volt, 30 amp, 3-phase, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- KK. NEMA L16-20R Locking Type Simplex Receptacle:
1. 480-volt, 20 amp, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Pass & Seymour, Cooper.
- LL. NEMA L16-30R Locking Type Simplex Receptacle:
1. 480-volt, 30 amp, 3-pole, 4-wire grounding type with thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- MM. NEMA L21-20R Locking Type Simplex Receptacle:
1. 120/208Y 3 phase 20-amp 5 wire grounding type.
 2. Approved Manufacturers: Hubbell, Cooper, Pass & Seymour.
- NN. NEMA L21-30R Locking Type Simplex Receptacle:
1. 120/208Y 3 phase 30-amp 5 wire grounding type.
 2. Approved Manufacturers: Hubbell, Cooper, Pass & Seymour.
- OO. NEMA 5-20R Tamper Resistant Duplex Receptacle:
1. 125-volt, 20 amp, 3-wire grounding type with impact resistant thermoplastic face.
 2. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
 3. Provide decorative style duplex tamper resistant receptacles in public spaces where walls are finished.
 4. Approved Manufacturers: (Decorative), Hubbell, Leviton, Pass & Seymour.
- PP. NEMA 5-20R GFI Tamper Resistant Receptacle:
1. 125-volt, 20 amp, 3-wire grounding type tamper-resistant with test and reset buttons in impact resistant thermoplastic face.
 2. Device shall perform self-test of GFCI circuitry in accordance with UL 943.
 3. Approved Manufacturers: Hubbell, Cooper, Pass & Seymour, Leviton.
- QQ. NEMA 5-20R Double Duplex Tamper Resistant Receptacle:
1. Consists of two duplex tamper resistant receptacles, double gang box, plaster ring and faceplate.
 2. Approved Manufacturers: Refer to Tamper Resistant Receptacle above.

RR. NEMA 5-20R Plug Load Controlled Duplex Receptacle:

1. 125-volt, 20 amp, 3-wire grounding type with impact resistant thermoplastic face and steel back strap. Bottom half of duplex shall be split circuit wired and controlled by remote relay. Controlled receptacle shall have permanent NEMA approved and NEC 2014 compliant marking on face of device.
2. Approved Manufacturers: Pass & Seymour, Leviton, Hubbell, Cooper.

SS. NEMA 5-20R Plug Load Controlled Duplex Receptacle:

1. Consists of two duplex tamper resistant receptacles, double gang box, plaster ring and faceplate.
2. Approved Manufacturers: Refer to Plug Load Controlled Duplex Receptacles above.

TT. NEMA 5-20R Double Duplex Receptacle:

1. Consists of two duplex receptacles, double gang box, plaster ring and faceplate.
2. Approved manufacturers: Refer to Duplex Receptacle above.

UU. NEMA 5-20R Double Duplex GFI Receptacle:

1. Consists of two duplex GFI receptacles, double gang box, plaster ring and faceplate.
2. Approved Manufacturers: Refer to Duplex GFI Receptacle above.

VV. NEMA 5-20R Double Duplex USB Receptacle:

1. Consists of two duplex USB receptacles, double gang box, plaster ring and faceplate.
2. Approved Manufacturers: Refer to USB Receptacle above.

WW. NEMA 5-20R Weatherproof Ground Fault Quad Receptacle:

1. Consists of two duplex, GFI receptacles. Double gang box. Provide NEMA 3R rated while-in-use cast aluminum cover.
2. Approved Manufacturers:
 - a. Receptacle: Refer to GFCI Receptacle above.
 - b. Cover: Intermatic, Pass & Seymour, Thomas & Betts.

XX. 600-volt, 60 amp, 3-pole, 4-wire Locking Type Simplex Receptacle for X-ray Isolated Power Equipment:

1. Black nylon or polycarbonate face. Cast aluminum surface mounted box, 45° angle adapter, weather protective lift cover on receptacle.
2. Approved Manufacturers: Hubbell, Pass & Seymour, Cooper.

YY. Back wired devices shall be complete with eight holes that are screw activated with metal clamps for connection to #12 or #10 copper conductors.

- ZZ. Side wired devices shall have four binding screws that are undercut for positive wire retention.
- AAA. Ground fault circuit interrupter (GFCI) receptacles shall comply with UL 943 requiring increased surge immunity, improved corrosion resistance, improved resistance to false tripping and diagnostic indication for miswiring if the line and load conductors are reversed during installation.
- BBB. Isolated ground receptacles shall have the equipment ground contacts connected only to the green grounding screw terminal of the device with inherent electrical isolation from the mounting strap.
- CCC. Integral surge suppression receptacles with integral surge suppression shall comply with the following:
1. Category A3 listed.
 2. Line to ground, line to neutral, and neutral to ground modes.
 3. Metal-oxide varistors with a nominal clamp level rating of 500 volts and minimum single transient pulse energy dissipation of 210 joules per mode.
 4. Status indication: Light visible in the face of the device and audible alarm to indicate device is no longer active or in service.
 5. Distinctive symbol on device face to denote SPD-type device.
 6. Device shall be blue with stainless cover plate.
 7. NEMA 5-20R duplex receptacle, 125-volt, 20 amp, 3-wire grounding type heavy duty industrial grade with impact resistant thermoplastic face and one-piece brass back strap.
 - a. Approved Manufacturers: Hubbell, Leviton, Pass & Seymour, Cooper.
- DDD. Hazardous (Classified) location receptacles shall comply with NEMA FB 11.

2.04 PIN AND SLEEVE DEVICES

- A. Industrial heavy-duty pin and sleeve devices shall comply with IEC 309-1.
1. IEC rated pin and sleeve watertight IP67 receptacle, raintight screw cap with safety chain and matching plug.
- B. 120/208 277/480-volt, 30 amp, 3-pole, 4-wire Pin and Sleeve Receptacle:
1. Approved Manufacturers: Hubbell, Pass and Seymour, Cooper, Leviton
- C. 120/208 277/480-volt, 60 amp, 3-pole, 4-wire Pin and Sleeve Receptacle:
1. Approved Manufacturers: Hubbell, Pass and Seymour, Cooper, Leviton
- D. 120/208 277/480-volt, 100 amp, 3-pole, 4-wire Pin and Sleeve Receptacle:
1. Approved Manufacturers: Hubbell, Pass and Seymour, Cooper, Leviton
- E. 480-volt, 60 amp, 4-pole, 4-wire Pin and Sleeve Simplex Receptacle:

1. Surface-mount enclosure with 15° mounting box, 1-1/2" conduit hub, raintight screw cap with safety chain.
 2. Approved Manufacturers: Appleton, Crouse-Hinds.
- F. 480-volt, 100 amp, 4-pole, 4-wire Pin and Sleeve Simplex Receptacle:
1. Surface-mount enclosure with 15° mounting box, 2" conduit hub.
 2. Approved Manufacturers: Appleton, Crouse-Hinds, Killark.
- G. 600-volt, 30 amp, 3-phase, 3-wire Pin and Sleeve Simplex Receptacle:
1. Provide with raintight, weatherproof enclosure.
 2. Approved Manufacturers: Appleton, Crouse-Hinds, Killark.

2.05 FLOOR BOXES

- A. Color: Verify with Architect.
- B. Coordinate with Technology drawings for voice/data outlet requirements.
- C. Floor Boxes for Installation in Cast-In-Place Concrete Floors: Fully adjustable, cast iron.
- D. Flush-mounted, round, cast iron floor box with one (1) fully adjustable, round brass cover with duplex flap cover and brass carpet flange.
1. Approved Manufacturers:
 - a. Hubbell
 - b. Wiremold
 - c. Steel City
- E. Fully adjustable cast iron floor box, dual compartment, flush mount, brass carpet flange. One compartment with brass 2-1/8" x 3/4" combination cover for power connections to partitions by others, connection wire by EC. One compartment with brass 1-1/2" x 1-1/2" duplex thread cover with one (1) 3/4" and one (1) 1" conduit stubbed to above the lay-in ceiling routed to the corridor cable tray.
1. Approved Manufacturers:
 - a. Hubbell
 - b. Wiremold
 - c. Steel City
- F. Cast iron floor box, dual compartment, flush mount, brass carpet flange. One compartment with one (1) brass duplex flap cover. One compartment with brass 2-1/8" x 3/4" combination cover and one (1) 3/4" and one (1) 1" conduit stubbed to above the lay-in ceiling routed to the corridor cable tray.
1. Approved Manufacturers:
 - a. Hubbell

- b. Wiremold
 - c. Steel City
 - G. Recessed multi-service floor box - tele/power/data. Equivalent mounting space of four (4) single gang boxes consisting of one (1) **[REC-DUP]**, one (1) voice outlet, one (1) data outlet, and one (1) spare. Cast iron adjustable rectangular floor box with cover. Provide one (1) 1" conduit for information outlet cabling, one (1) 1" conduit for audio/visual cabling, and one (1) 1" conduit as spare. Route low voltage cabling conduits to above the lay-in ceiling the corridor cable tray.
 - 1. Approved Manufacturers:
 - a. Wiremold RFB4-CI
 - b. Steel City 665-CI
 - c. Hubbell LCFBCA
 - H. Three service floor box - tele/power/data. Equivalent mounting space of four (4) single gang boxes consisting of one (1) voice outlet, one (1) data outlet, and one (1) spare. Steel adjustable rectangular floor box with flush cover. Provide one (1) 1" conduit for information outlet cabling, one (1) 1" conduit for audio/visual cabling, and one (1) 1" conduit as spare. Route low voltage cabling conduits to above the lay-in ceiling the corridor cable tray.
 - 1. Approved Manufacturers:
 - a. Wiremold
 - b. Steel City
 - c. Hubbell
- 2.06 SERVICE FITTING BOX
- A. Service fitting style box with 1" chase nipple. Two (2) **[REC-DUP]**. Install back to back in box.
 - 1. Approved Manufacturers:
 - a. Hubbell
 - b. Steel City
 - B. Cast aluminum service fitting style box mounted to underfloor duct. one (1) **[REC-DUP]**.
 - 1. Approved Manufacturers:
 - a. Walker Duct
 - b. Square D
 - c. Thomas & Betts
- 2.07 PEDESTAL STYLE BOX
- A. Cast aluminum pedestal style box with 1" hub. One (1) **[REC-DUP]**. Install back to back in box. Provide stainless steel cover plates.
 - 1. Approved Manufacturers:
 - a. Hubbell
 - b. Thomas & Betts

- B. Cast aluminum pedestal style box with 1" hub. Two (2) **[REC-DUP]**. Install back to back in box. Provide stainless steel cover plates.
 - 1. Approved Manufacturers:
 - a. Hubbell
 - b. Thomas & Betts

2.08 POKE-THROUGH FITTINGS

- A. UL listed as fire-rated poke-through device for 1, 1-1/2 and 2 hour rated floors: include fire stops and smoke barriers in through-floor component. UL514A listed for scrub locations.
- B. Terminate in 4-inch square by 2-1/2-inch deep junction box.
- C. Suitable for installation with a floor thickness of 2-1/4 to 7 inches.
- D. Semi-flush die-cast aluminum carpet flange.
- E. Spring loaded receptacle covers.
- F. Verify color with Architect.
- G. Fire Rated Poke-Through:
 - 1. Flush mounted. For use with 3-inch core holes. 125-volt, 20 amp, NEMA 5-20R duplex receptacle with 3/4" conduit and junction box. Provide with two (2) data jacks. With painted aluminum solid brass flange.
 - 2. Approved Manufacturers: Hubbell, Wiremold, Thomas & Betts.
- H. Fire Rated Poke-Through:
 - 1. Flush mounted. For use with 4-inch core holes. Provide with _____ 125-volt, 20 amp, NEMA 5-20R duplex receptacles with 3/4" conduit and junction box. Provide with capacity for six data jacks and oversized conduit, with solid brass flange.
 - 2. Cast aluminum cover with separate hinged doors to open 180°. Finish as selected by Architect.
 - 3. Approved Manufacturers: Hubbell, Wiremold, Thomas & Betts.
- I. Fire-Rated Multi-Service Recessed Poke-Through:
 - 1. Recessed mounted. For use with 6-inch core holes. Provide with two 125-volt, 20 amp, NEMA 5-20R duplex receptacles with 3/4" conduit and junction box. Provide with capacity for eight data jacks and 2" conduit.
 - 2. Cast aluminum cover with separate hinged doors to open 180°. Finish as selected by Architect.
 - 3. Approved Manufacturers: Hubbell, Wiremold.
- J. Fire-Rated Multi-Service Recessed 8" Poke-Through:

1. Recessed mounted. For use with 8-inch core holes. Provide with two (2) 125-volt, 20 amp, NEMA 5-20R duplex receptacles with 3/4" conduit and junction box. Provide with capacity for 12 data jacks and 2" conduit.
2. Cast aluminum cover with separate hinged doors to open 180°. Finish as selected by Architect.
3. Approved Manufacturers: Hubbell, Wiremold.

2.09 PENDANT CORD/CONNECTOR DEVICES

- A. Description: Matching, locking type plug and receptacle body connector, NEMA WD 6, Configurations L5-20P and L5-20R, heavy-duty grade or refer to Details as shown on drawings.
1. Body: Nylon with screw-open cable gripping jaws and provisions for attaching external cable grip.
- B. External Cable Grip: Woven wire mesh type made of high strength galvanized steel wire stand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.10 CORD AND PLUG SETS

- A. Description: Match voltage and current ratings and number of conductors to requirements of equipment being connected.
1. Cord: Rubber-insulated, stranded copper conductors, with Type SOW-A jacket; with green insulated grounding conductor and equipment rating ampacity plus a minimum of 30 percent.
 2. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection, FS/UL listed.

2.11 CORD REELS

- A. 50' 3#12 AWG type 'SOW-A' cord with adjustable ball stop. 120 volt, NEMA 5-20R, simplex receptacle connector, rated 16 amps continuous.
1. Approved Manufacturers:
 - a. Daniel Woodhead w/ Hubbell 5369
 - b. Appleton
 - c. Hubbell
- B. 50' 3#16 AWG type 'SJOW-A' cord with adjustable ball stop. Hand lamp with simplex 120-volt NEMA 5-15R receptacles, rated 6.5 amps.
1. Approved Manufacturers:
 - a. Daniel Woodhead
 - b. Appleton
 - c. Hubbell
- C. 25' 3#16 AWG type 'SJOW-A' cord with adjustable ball stop. Two 120-volt NEMA 5-15R receptacles mounted in cast outlet box, rated 10 amps.

1. Approved Manufacturers:
 - a. Daniel Woodhead
 - b. Appleton
 - c. Hubbell

SECTION 26 27 29

ELECTRIC VEHICLE CHARGING STATION

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Electric vehicle charging stations:
- B. Electric vehicle radio frequency identification (RFID) card system

1.02 REFERENCES

- A. CBC – California Building Code
- B. ADA – Americans with Disabilities Act
- C. The equipment and components in this specification shall be designed and manufactured according to the latest revision of the following standards (unless otherwise noted):
 - 1. SAE J1772 Standard for Electric Vehicle Conductive Charge Coupler
 - 2. NFPA 70 Article 625 Electric Vehicle Charging Systems
 - 3. UL 2202, Electric Vehicle (EV) Charging System Equipment
 - 4. UL 2231, Personnel Protection Systems for Electric Vehicle (EV) Supply Circuits
 - 5. UL 2251, Plugs, Receptacles and Couplers for Electric Vehicles
 - 6. UL 2594, Electric Vehicle Supply Equipment
 - 7. UL and cUL listed
 - 8. ISO 15693

1.03 DESIGN CRITERIA

- A. The project must provide electric vehicle supply equipment (EVSE) for at least 25% of all parking spaces including accessible EVCS for each type of charging capacity. EVSE shall be provided as required per regulations. Clearly identify and reserve these parking spaces for the sole use by plug-in vehicles. Accessible parking spaces shall not be used as charging spaces.
 - 1. Provide a Level 2 charging capacity (208 – 240 volts) or greater for each required space.
 - 2. Comply with the relevant regional or local standard for electrical connectors, such as SAE Surface Vehicle Recommended Practice J1772, SAE Electric Vehicle Conductive Charge Coupler or IEC 62196 of the International Electrotechnical Commission for projects outside the U.S.
 - 3. Meet the connected functionality criteria for ENERGY STAR certified for EVSE and be capable of responding to time-of-use market signals (e.g., price). Projects pursuing WA credit Grid Harmonization should incorporate EVSE into any demand response program or load flexibility and management strategies.

1.04 SUBMITTALS

- A. Submit product data.

- B. Provide product data showing configurations, finishes, dimensions, cable, and coupling information.
- C. Provide manufacturer installation, operation, and maintenance instructions.
- D. Cellular Network and Gateway Plan: Submit manufacturer cellular network and gateway site plan for RFID and revenue generation communication. The manufacturer site plan shall clearly identify the following:
 - 1. Location of gateway enabled stations
 - 2. Location of non-gateway enabled stations
 - 3. Manufacturer approval of gateway and non-gateway enabled stations to ensure unobstructed communication between stations types
- E. Submit RFID software, hardware, and RFID card information.

1.05 SPARE PARTS

- A. Provide RFID cards: 50

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Contractor shall store, protect, and handle products in accordance with recommended practices listed in manufacturer's installation and maintenance manuals.
- B. Contractor shall inspect and report for damage.
- C. Contractor shall store in a clean, dry space. Cover with heavy canvas or plastic to keep out dirt, water, construction debris, and traffic. Heat enclosures to prevent condensation.
- D. Contractor shall handle in accordance with manufacturer's recommendations to avoid damaging equipment, installed devices, and finish.

PART 2 PRODUCTS

2.01 ELECTRIC VEHICLE CHARGING STATION

- A. Plan Identification:
 - 1. Electric vehicle charging station, single port type.
 - 2. Electric vehicle charging station, single port type, with network gateway to communicate with non-gateway enabled devices.
 - 3. Electric vehicle charging station, dual port type.
 - 4. Electric vehicle charging station, dual port type, with network gateway to communicate with non-gateway enabled devices.
- B. Approved Manufacturers:
 - 1. Single/Dual Port Charging Station Pedestal Style:
 - a. Square D EVlink
 - b. Leviton EVR Green 4000
 - c. Siemens EV Charging

- d. General Electric DuraStation
 - e. Bosch EL series
 2. Single Port Charging Station Wall-Mounted Style
 - a. Square D EVlink
 - b. Leviton ECR Green 4000
 - c. Siemens EV Charging
 - d. General Electric DuraStation
 - e. Bosch EL Series
- C. Electric vehicle (EV) charging station, Level 2 charging, with LCD display, LED display for charging status, fault indication, power available, internal ground fault protection 20mA, integrated single phase revenue grade meter, anti-nuisance tripping, and re-closure feature.
 1. Enclosure Construction: NEMA 3R or 4X
 2. System Supply: 40 amp, 208-volt, single phase, 60Hz dedicated circuit.
 3. Cable / Connector: Flexible, 25ft, with SAE J1772 compliant connector. Provide complete with cable/connector support while not in use bracket.
 4. Environment: Wet location, -22°F to 122°F
- D. Electronics - Communication:
 1. Wi-Fi / wireless cellular network connection
 2. Ethernet Network Gateway: Provide identified station with network gateway when applicable.
- E. Credit Card Revenue Generation:
 1. Provide integral ChargePoint card / contactless credit card interface.
 2. The Owner will enter into a contract with a revenue service plan. The contractor shall provide provisions to coordinate and set up the revenue service plan on behalf of the Owner.
- F. RFID System Revenue Generation:
 1. Provide EVCS with integral radio frequency identification (RFID) reader.
 2. Provide manufacturer RFID software and RFID reader for customer programming of RFID cards.
 3. Provide RFID cards: Refer to spare parts.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Provide concrete pad and mow apron for pedestal installation.
- B. Placement:
 1. Verify field measurements with civil and architectural plans.

2. Install pedestal 12 inches behind concrete curb / paving limits or as directed by the manufacturer.
 3. Center pedestal in site islands 24 inches or less in width.
 4. Center dual port pedestals between parking stalls. Align with vehicle parking lines.
- C. Grounding Rod: Provide 5/8 x 10'-0" copper clad steel ground rod for each pedestal, installed 12 inches below finished grade. Provide bare #6 ground wire with exothermic weld for bonding to EVCS pedestal.
- D. Labeling: Provide panel and circuit label for all circuits serving the electric vehicle charging station. Locate circuit labels on the inside utility access cover for the charging station.
- E. Ethernet Connections: Provide final Ethernet cable and terminations per manufacturer instructions.
- F. Cellular Network: Provide setup, testing, and configuration of cellular network per manufacturer instructions.
- 3.02 OWNER TRAINING AND SYSTEM COMMISSIONING:
- A. Provide factory representative for Owner training and demonstration of the system. Owner training shall include service, maintenance, troubleshooting, and general operation of system. The factory representative shall also provide customer in-person training/support for the following:
1. RFID software setup on customer computer
 2. Training for RFID card program
 3. Cellular network registration, initialization, and testing

END OF SECTION

SECTION 26 29 23

VARIABLE FREQUENCY MOTOR CONTROLLERS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Variable frequency drives

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. ABB (General Electric)
- B. Danfoss
- C. Square D
- D. Campus Standards
 - 1. East LA College and Southgate Environmental Center – ABB, Toshiba, Square D
 - 2. LA Mission College – ABB
 - 3. LA Pierce College – ABB
 - 4. LA Southwest College – ABB
 - 5. LA Valley College – ABB, Danfoss, Toshiba, Square D
 - 6. West LA College – ABB, Danfoss

2.02 DESCRIPTION

- A. Converts 60 Hertz input power at voltage specified to a variable AC frequency and voltage for controlling the speed of AC squirrel cage motors. The controller shall be suitable for use with standard NEMA B squirrel cage 1.15 service factor induction motors without requiring any modifications to the motor or the drive.
- B. Controller shall have sufficient capacity to provide speed control of the motors shown or noted throughout the specified environmental operating conditions.
- C. Controller shall have the functional components listed below:
 - 1. Door interlocked input circuit breaker/fused switch.
 - 2. Input rectifier section to supply fixed DC bus voltage.
 - 3. Smoothing reactor for DC bus.
 - 4. DC bus capacitors.

5. Control transformer.
6. Separate terminal blocks for power and control wiring.
7. Terminal block for operator controls.
8. Sine weighted PWM generating inverter section.

2.03 RATINGS

- A. Displacement Power Factor: Between 1.0 and 0.95, lagging, over entire range of operating speed and load.
- B. Operating Ambient: 0°C to 40°C.
- C. Minimum Relative Humidity Range: 5% to 90% (non-condensing).
- D. Minimum Elevation without Derating: 3300 feet.
- E. Minimum Efficiency at Full Load: 96 percent.
- F. Overload Capability: 1.1 times the base load current for 60 seconds; 2.0 times the base load current for 3 seconds.
- G. Starting Torque: 100 percent of rated torque or as indicated.
- H. Speed Regulation: Plus or minus 1 percent with no motor derating.

2.04 DESIGN

- A. Pulse Width Modulated (PWM) Variable Frequency Drives:
 1. Converter shall be of a diode bridge design with a sine-weighted PWM inverter section.
 2. Main semi-conductors in the inverter section of controller shall be IGBT transistors capable of a carrier switching frequency of up to 8 kHz. If derating of the inverter is necessary to run at 8kHz, then the unit's derated currents must equal or exceed the motor full load currents listed in NEC Table 430-150.
 3. All controllers supplied with semi-conductors capable of switching at less than 8,000 Hertz shall be supplied with a motor acoustic noise reduction filter.
 4. Pulse width modulated (PWM) drives shall be supplied with drive input line reactors with a minimum impedance of 3%. Reactors shall be installed to filter entire drive input circuit.
 5. Pulse width modulated (PWM) drives shall be supplied with drive input harmonic filter to reduce the total harmonic distortion to less than the IEEE519-1992 limits at the utility service entrance.
 6. Drives that are located beyond the manufacturer's recommended maximum distance from the motor shall be provided with dV/dt (long lead) filters.
- B. All drives shall have built-in diagnostic capability with status and fault indicators mounted on enclosure door. Complete operating instructions for diagnostics shall be mounted inside of the enclosure door.

- C. Drive shall restart after power loss and under-voltage fault. The minimum number of restart attempts required shall be three, field adjustable.
- D. The drive shall allow unlimited switching of the output without damage to the drive or motor.

2.05 PRODUCT FEATURES

- A. Display: Provide integral digital display to indicate all protection faults and drive status (including overcurrent, overvoltage, undervoltage, ground fault, overtemperature, phase loss, input power ON, output voltage, output frequency, and output current).
- B. Protection:
 - 1. Input transient protection by means of surge suppressors.
 - 2. Snubber networks to protect against malfunctions due to system transients,
 - 3. Under- and overvoltage trips; inverter overtemperature, overload, and overcurrent trips.
 - 4. Motor thermal overload relay(s) adjustable and capable of NEMA Class 10 20 30 motor protection and sized per motor nameplate data. When multiple motors are connected to the VFD output, each motor shall have a manual starter with properly sized overload protection.
 - 5. Notch filter to prevent operation of the controller-motor-load combination at a natural frequency of the combination.
 - 6. Instantaneous line-to-line and line-to-ground overcurrent trips on input and output.
 - 7. Loss-of-phase protection.
 - 8. Reverse-phase protection.
 - 9. Short-circuit protection (fuses or circuit breaker).
 - 10. Motor overtemperature fault.
- C. Acceleration Rate Adjustment: 0.5 - 30 seconds.
- D. Deceleration Rate Adjustment: 1 - 30 seconds.
- E. Minimum Adjustment Range for the Lower Output Frequency shall be: 0 to 40 Hertz.
- F. Minimum Adjustment Range for the Upper Output Frequency Range shall be: 40 to 90 Hertz.
- G. Minimum Volts/Hertz Range: 3.7 to 8.6 volts/Hertz.
- H. Provide MANUAL-OFF-AUTOMATIC selector switch and manual analog speed control mounted on the front of the enclosure.
- I. Safety Interlocks: Provide terminals for remote contact to inhibit starting under both manual and automatic mode.
- J. Control Interlocks: Provide terminals for remote contact to allow starting in automatic mode.

- K. Provide adjustable skip frequencies on the drive output (minimum of three ranges).
- L. Automatic Reset/Restart: Attempts three restarts after controller fault or on return of power after an interruption, and before shutting down for manual reset or fault correction. Bidirectional autospeed search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to controller, motor, or load.
- M. Power-Interruption Protection: After a power interruption, it prevents the motor from re-energizing until the motor has stopped.
- N. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- O. Motor Temperature Compensation at Slow Speeds: Adjustable current fallback based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- P. Status Lights: Door-mounted LED indicators shall indicate the following conditions:
1. Power on.
 2. Run.
 3. Overvoltage.
 4. Line fault.
 5. Overcurrent.
 6. External fault.
- Q. Panel-Mounted Operator Station: Start-stop and auto-manual selector switches with manual speed control potentiometer and elapsed time meter.
- R. Indicating Devices: Meters or digital readout devices and selector switch, mounted flush in controller door and connected to indicate the following controller parameters:
1. Output frequency (Hz).
 2. Motor speed (rpm).
 3. Motor status (running, stop, fault).
 4. Motor current (amperes).
 5. Motor torque (percent).
 6. Fault or alarming status (code).
 7. PID feedback signal (percent).
 8. DC-link voltage (VDC).
 9. Set-point frequency (Hz).
 10. Motor output voltage (V).

- S. Control Signal Interface:
1. Electric Input Signal Interface: A minimum of 2 analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.
 2. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BMS or other control systems:
 - a. 0 to 10-V dc.
 - b. 0-20 or 4-20 mA.
 - c. Potentiometer using up/down digital inputs.
 - d. Fixed frequencies using digital inputs.
 - e. RS485.
 - f. Keypad display for local hand operation.
 3. Output Signal Interface:
 - a. A minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:
 - 1) Output frequency (Hz).
 - 2) Output current (load).
 - 3) DC-link voltage (VDC).
 - 4) Motor torque (percent).
 - 5) Motor speed (rpm).
 - 6) Set-point frequency (Hz).
 4. Remote Indication Interface: A minimum of 2 dry circuit relay outputs (120-V ac, 1A) for remote indication of the following:
 - a. Motor running.
 - b. Set-point speed reached.
 - c. Fault and warning indication (overtemperature or overcurrent).
 - d. PID high- or low-speed limits reached.
- T. Communications: Provide a communications card to interface VFD with Facility Management Control System (FMCS). Coordinate interface requirements with the FMCS provided under Section 23 09 00. Interface shall allow all parameter settings of VFD to be programmed via FMCS control and displayed on FMCS operator workstation. Provide capability for VFD to retain these settings within the nonvolatile memory.
- U. Three- Contactor Automatic Bypass:

1. Provide contactors, motor running overload protection, under-voltage and loss of phase protection, and short circuit protection for full voltage, non-reversing operation of the motor. Include isolation switch to allow maintenance of inverter during bypass operation.
2. All bypass circuitry shall be located within the same enclosure as the variable frequency drive.
3. All fire alarm and/or smoke control interconnections (e.g., air handling unit shutdown) shall apply regardless of whether control is through VFD or bypass.
4. Provide a Drive-Bypass Selector Switch.
5. Provide nameplate with instructions for switching from drive to bypass and from bypass to drive. Provide instructions for isolating VFD for maintenance.

V. Control:

1. With the "Manual-Off-Auto" switch in the "Manual" position and, if applicable, the "Drive-Bypass" in the "Drive" position, the drive shall be controlled by the manual speed potentiometer on the drive door.
2. With the "Manual-Off-Auto" switch in the "Auto" position and, if applicable, the "Drive-Bypass" in the "Drive" position, the drive shall be controlled by the input signal from an external source.
3. If applicable, with the "Drive-Bypass" in the "Bypass" position, regardless the position of the "Manual-Off-Auto" switch, the motor shall be connected across the lines and shall be run at full speed.
4. With the "Manual-Off-Auto" switch in the "Off" position, if applicable, the drive run circuit shall be open and the VFD shall not operate.
5. If applicable, signal from the fire alarm control panel shall shut down VFD and bypass.
6. All disconnect switches between VFD and motor(s) shall include an auxiliary contact interlock wired to the VFD fault trip input to shut down the drive upon opening of the disconnect main contacts.

2.06 ACCESSORIES

- A. Devices shall be factory installed in controller enclosure, unless otherwise indicated.
- B. All VFD supplied for fans shall have dynamic or DC injection braking capability to provide a means of rapid deceleration of the AC motor in not more than one (1) minute. Adjust controls to stop the motor within 30 seconds.
- C. All high inertia loads that cannot be stopped in 30 seconds with the VFD dynamic braking or DC injection braking shall be provided with a chopper module and dynamic braking resistor to stop the motor within 30 seconds.
- D. Push-Button Stations, Pilot Lights, and Selector Switches: NEMA ICS 2, heavy-duty type.
- E. Stop and Lockout Push-Button Station: Momentary-break, push-button station with a factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.

- F. Control Relays: Auxiliary and adjustable time-delay relays.
- G. Standard Displays:
 - 1. Output frequency (Hz).
 - 2. Set-point frequency (Hz).
 - 3. Motor current (amperes).
 - 4. DC-link voltage (VDC).
 - 5. Motor torque (percent).
 - 6. Motor speed (rpm).
 - 7. Motor output voltage (V).
- H. Historical Logging Information and Displays:
 - 1. Real-time clock with current time and date.
 - 2. Running log of total power versus time.
 - 3. Total run time.
 - 4. Fault log, maintaining last four faults with time and date stamp for each.
- I. Fabrication:
 - 1. Enclosure: NEMA 250, Type 1.
 - 2. Finish: Manufacturer's standard enamel.

SECTION 26 31 00

PHOTOVOLTAIC COLLECTORS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Photovoltaic Collectors.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

- A. Interactive PV System: Collectors connected in parallel to the electrical utility; and capable of providing power for Project and a distributed network.
 - 1. System Components:
 - a. PV modules.
 - b. Array frame.
 - c. Utility-interactive inverter.
 - d. Overcurrent protection, disconnect, and rapid shutdown devices.
 - e. Mounting structure.
 - f. Utility meter.
- B. Hybrid PV System: Collectors connected to provide power to dc and ac loads, connected to utility through interactive inverters or meters, and connected to energy storage.
 - 1. System Components:
 - a. PV modules.
 - b. Array frame.
 - c. Charge controller.
 - d. Energy storage.
 - e. System control.
 - f. Inverter.
 - g. Overcurrent protection, disconnect, and rapid shutdown devices.
 - h. Mounting structure.
 - i. Meter.
- C. Stand-Alone PV System: Collectors connected to provide power to Project dc and ac loads through an energy storage system.
 - 1. System Components:
 - a. PV modules.
 - b. Array frame.

- c. Charge controller.
- d. Energy storage.
- e. Inverter.
- f. Overcurrent protection, disconnect, and rapid shutdown devices.
- g. Mounting structure.

2.02 MANUFACTURED UNITS

- A. Cell Materials: Copper indium gallium (di)selenide (CIGS).
- B. Cell Materials: Cadmium telluride (CdTe).
- C. Front Panel: Tempered glass.
- D. Backing Material: Tempered glass.
- E. Junction Box:
 - 1. IP Code: IP65.
- F. Charge controller.
- G. Inverter Control Type: Pulse-width-modulation control.
- H. Disconnects: Rated for system voltage and conductor.
- I. System Overcurrent Protection: Fuses.

2.03 FRAMING

- A. Entire assembly listed for Class A fire rating according to UL 1703.
- B. Finish: Anodized aluminum.

2.04 INVERTER

- A. Central or micro inverters as required for the project requirements .
- B. Galvanized steel, NEMA 250, Type 3R enclosure.

2.05 MOUNTING

- A. Roof Mount: Extruded aluminum.
- B. Pole mount.
- C. Tracking Mounts: Two axis.

SECTION 26 32 13

EMERGENCY MOTOR GENERATOR

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Packaged engine generator system
- B. Exhaust silencer and fittings
- C. Fuel fittings and day tank
- D. Remote annunciator panel
- E. Battery and charger
- F. Weatherproof enclosure

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Kohler.
- B. Generac
- C. Onan
- D. Campus Standards
 - 1. East LA College and Southgate Environmental Center – Onan, Caterpillar, Kohler
 - 2. LA Harbor College – Onan, Caterpillar, Kohler, Cummins
 - 3. LA Mission College – Caterpillar
 - 4. LA Pierce College – Onan, Caterpillar
 - 5. LA Southwest College – Kohler
 - 6. LA Trade Tech College – Caterpillar
 - 7. LA Valley College – Onan, Caterpillar
 - 8. West LA College – Onan, Kohler, Caterpillar

2.02 PACKAGED ENGINE-GENERATOR SET

- A. Packaged engine-generator set shall be a coordinated assembly of compatible components.
- B. Safety Standard: Comply with ASME B15.1 and UL 2200.

- C. Nameplates: Each major system component shall be equipped with a nameplate to identify manufacturer's name and address, model and serial number, and component rating in integrated set and as required by the contract documents.
- D. Fabricate engine-generator set mounting frame and attachment of components to resist generator-set movement during a seismic event when generator-set mounting frame is anchored to building structure.
- E. Mounting Frame: Adequate strength and rigidity to maintain alignment of mounted components without depending on concrete foundation. Mounting frame shall be free from sharp edges and corners and shall have lifting attachments arranged for lifting with slings without damaging components. Provide a rigging diagram permanently attached to the mounting frame to indicate the capacity of each lifting attachment and the generator-set center of gravity.

2.03 ENGINE

- A. Type: Water-cooled in-line or V-type, four-stroke cycle spark-ignition compression ignition diesel electric ignition internal combustion engine.
- B. Rating: Sufficient to operate at 100 percent load for two hours at specified elevation and ambient limits.
- C. Fuel: Appropriate for use of No. 2 fuel oil.
- D. Engine Speed: 1800 RPM.
- E. Governor: Isochronous type with speed sensing.
- F. Safety Devices: Engine shutdown on high water temperature, low oil pressure, overspeed, and engine over crank. Limits as selected by manufacturer.
- G. Frequency Response:
 - 1. Steady State Operational Bandwidth: 0.5 percent of rated frequency from no load to full load.
 - 2. Transient Response: Less than 5 percent for a 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady state operating band within 5 seconds.
- H. Fuel System: Engine mounted diesel fuel pump and relief-bypass valve. Fuel Supply System: Comply with UL 142 fuel oil tank.
 - 1. Day Tank: UL listed fuel tank with 4 hour rated capacity. Integral rupture basin with 150% of nominal capacity and leak detection. Dual integral self-priming pumps and level control with indication. Low-level sensor at 25% with alarm and contacts. High-level sensor with alarm, contacts, and redundant fuel shutoff. Include flexible fuel line connections for all supply and return lines as indicated on the Mechanical Plumbing drawings. Provide with emergency vent cap.
 - a. Approved Manufacturers: Simplex, Tramont, Pyrco.

2. Base-Mounted Fuel Tank: UL 2080 listed fuel tank with 8 hour rated (NFPA 110 minimum run time by class) capacity. Integral rupture basin with leak detection. Provide fueling port with an overflow prevention type receptacle and lockable cap for exterior units. The tank shall include structural steel supports for top mounted engine generator set. Furnish complete with flexible fuel line connectors lockable cover, and analog level gauge. Furnish complete with float switches to indicate low fuel level. The footprint of the base-mounted fuel tank shall not exceed the footprint of the generator frame for interior applications or the footprint of the enclosure for exterior installations.
- I. Lubrication System: Engine or skid mounted filter and strainer, thermostatic control valve capable of full flow and designed to be fail safe, and crankcase drain arranged for gravity drainage with siphon or pump.
- J. Engine Jacket Heater: Thermal circulation type water heater with integral thermostatic control, sized to maintain engine jacket water at 90°F, and suitable for operation on 120 volts AC. The minimum wattage of the heater shall be watts or as recommended by the manufacturer.
- K. Cooling System: Closed loop, liquid cooled, with radiator factory mounted on engine-generator set mounting frame and integral engine-driven coolant pump.
 1. Remote Radiator: Vertical air discharge. Multiple belt drive from totally enclosed sealed bearing motor. Sized by generator manufacturer.
 2. Fan and Core: Nonferrous-metal construction sized to contain expansion of total system. Blower type fan, sized to maintain safe engine temperature in ambient temperature of 110°F. Radiator Airflow Restriction: 0.5 inches of water, maximum.
 3. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anti-corrosive additives.
 4. Provide expansion tank with gage glass and petcock, and self-contained, thermostatic-control temperature control valve.
- L. Engine Starting: DC starting system with positive engagement, number and voltage of starter motors in accordance with manufacturer's instructions. Include remote starting control circuit, with MANUAL-OFF-REMOTE selector switch on engine-generator control panel. Provide the following accessories:
 1. Battery: Voltage to match starter with capacity for three cranking cycles without recharge. Provide with battery cables and acid resistant battery tray.
 2. Battery-Charging Alternator: Factory mounted on engine with solid state voltage regulation.
 3. Battery Charger: Current limiting type designed to float at 2.17 volts per cell and equalize at 2.33 volts per cell. Include overload protection, full wave rectifier, DC voltmeter and ammeter, and 120 volts AC fused input. Provide wall-mounted enclosure to meet ANSI/NEMA 250, Type 1 requirements.
- M. Exhaust System: Critical type silencer (85 dBA max at 10 feet), side inlet with muffler companion flanges and flexible stainless steel exhaust fitting, suitable for horizontal orientation, sized in accordance with engine manufacturer's instructions. Silencer shall include a threaded opening for connection of 3/4" drain line. Opening shall be flush on inside of silencer.
- N. The packaged engine generator shall comply with the current Environmental Protection Agency EPA Emissions standards.

- O. Engine Accessories: Fuel filter, lube oil filter, intake air filter, lube oil cooler, fuel transfer pump, fuel priming pump, gear-driven water pump. Include fuel pressure gauge, water temperature gauge, and lube oil pressure gauge on engine-generator control panel.
- P. Mounting: Provide unit with suitable spring-type vibration isolators.

2.04 GENERATOR

- A. Generator: ANSI/NEMA MG 1; three phase, re-connectible brushless synchronous generator with brushless exciter and PMG alternator excitation.
- B. Rating: As indicated on the drawings, at 0.8 power factor, 60 Hertz at RPM to match engine rating.
- C. Insulation: ANSI/NEMA MG 1, Class H.
- D. Temperature Rise: 105°C continuous.
- E. Enclosure: ANSI/NEMA MG 1; open drip-proof.
- F. Voltage Regulation:
 - 1. The maximum instantaneous voltage dip (IVD) shall be 30 percent for building loads and 15 percent for the fire pump.
 - 2. Include solid-state type voltage regulator, separate from exciter to match engine and generator characteristics, with voltage regulation ± 1 percent from no load to full load. Include manual controls to adjust voltage drop ± 5 percent voltage level, and voltage gain.
- G. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.
- H. Strip Heater: Thermostatically controlled unit arranged to maintain stator windings above dew point.

2.05 CONTROLS AND INDICATION

- A. Operating and safety indications, protective devices, basic system controls, and engine gauges shall be grouped in a common control and monitoring panel mounted on the generator set. Mounting method shall isolate the control panel from generator-set vibration.
- B. Ground Fault: Provide ground fault sensing at the generator. The sensor shall be located ahead of the generator service disconnect. Provide a ground fault indication on the engine-generator control panel. Provide an instruction nameplate at the control panel.
 - 1. Instruction nameplate: Provide operational instructions for a ground fault indication as approved by the local Authority Having Jurisdiction.
- C. Engine-Generator Control Panel: ANSI/NEMA 250, Type 1 generator mounted control panel enclosure with engine and generator controls and indicators. Include provision for padlock and the following equipment and features:
 - 1. Alarm indication as required by NFPA 110 for a Level 1 system.
 - 2. AC frequency meter.
 - 3. AC output voltmeter with phase selector switch.
 - 4. AC output ammeter with phase selector switch.

5. Output voltage adjustment.
 6. DC voltmeter (alternator battery charging).
 7. Engine start/stop selector switch.
 8. Engine running time meter.
 9. Oil pressure gauge.
 10. Engine coolant temperature gauge.
 11. Shut down devices for overspeed, coolant high-temperature, coolant low-level, and oil low-pressure.
 12. Fuel derangement alarm.
 13. Generator overload.
 14. Auxiliary Relay: 3PDT, operates when engine runs, with contact terminals prewired to terminal strip.
 15. Remote Alarm Contacts: Pre-wire SPST contacts to terminal strip for remote alarm functions required by ANSI/NFPA 99.
 16. Ground fault indication.
- D. Remote Engine Annunciator Panel: ANSI/NFPA 99 and NFPA 110 for a Level 1 2 system. Include the listed pre-alarm and alarm points, audible alarm, alarm silencing means, repetitive alarm circuitry, and lamp test switch in a surface mounted panel with brushed OR color painted finish. Provide all interconnecting wiring in conduit per manufacturer's requirements by the Electrical Contractor. The remotely reported alarms shall include the following.
1. Overcrank
 2. Low water (engine) temperature
 3. High engine temperature pre-alarm
 4. High engine temperature
 5. Low lube oil pressure pre-alarm
 6. Low lube oil pressure
 7. Overspeed
 8. Low fuel main tank
 9. Low coolant level
 10. Not in auto
 11. Emergency Power Supply (EPS) supplying load
 12. High battery voltage
 13. Low battery voltage
 14. Battery charger failure (includes AC failure)
 15. Generator running
 16. Normal utility power
 17. Emergency stop
 18. Emergency Power Off Switch activated (EPO)
 19. Alarm for power supply or UPS serving motorized breakers

E. Building Automation System Integration:

1. Provide a terminal block to allow the Facility Monitoring and Control System (FMCS) to report generator alarms. Provide individual terminal points for each of the annunciator alarms and pre-alarms. Provide an additional terminal point to combine all generator alarms under a single terminal point. Provide a permanent label for each terminal point. Each terminal will provide a binary output for the FMCS to read. Refer to Specification Section 23 09 00 for alarms reported by the FMCS.

F. Diesel Particulate Filter

1. Provide diesel particulate filter for generators that are located within 100 meters from K-12 schools.

2.06 ACCESSORIES

A. Generator Circuit Breaker: Molded or insulated case, service-rated thermal-magnetic electronic trip type; 100% rated breaker complying with NEMA AB1 and UL 489.

1. Tripping Characteristic: Designed specifically for generator protection.
2. Trip Rating: Matched to generator rating.
3. Shunt Trip: Connected to trip breaker when generator is shut down by other protective devices.
4. Mounting: Provide freestanding enclosure or mount integrally with control and monitoring panel.
5. Arc Energy Reduction: Provide an arc energy reduction system to reduce the clearing time of an arc flash event. The arc energy system shall be provided for overcurrent protection devices rated 1200 amps or larger.

B. Remote Manual Stop Station (Emergency Power Off EPO): Provide a remote manual stop station with weather proof stainless steel or die cast housing, red mushroom button - push to stop operation, breakable cover/lens to access mushroom button, 120-volt rated. The manufacturer shall provide automatic monitoring of the EPO switch. Placing the EPO switch in the "Generator Powered OFF" status shall initiate a visual and audible alarm at each generator annunciator panel.

C. Remote Fuel Fill Station: Provide a remote fuel fill station including a fill port within a surface-mounted, lockable, NEMA 3R stainless steel construction with gasketed hinged door and lockable handle. The fill port shall have a minimum overflow holding capacity of five (5) gallons. The fill port inside the cabinet shall be field coordinated. Provide dust cover for fill connection. Include local light and horn alarm with test switch and silence feature when tank level is above 95 percent full. Provide additional float switch in tank for level indication. Include the following accessories:

1. Solenoid valve to prevent additional fuel delivery to the tank when full; 120-volt power provided by Contractor.
2. Lockable drain valve for overflow.
3. Local analog gauge of main tank fuel level.
4. Local digital gauge of main tank fuel level.

2.07 OUTDOOR GENERATOR-SET ENCLOSURE SKIN-TIGHT

A. Prefabricated or pre-engineered skintight enclosure with the following features:

1. Construction: Reinforced galvanized steel, metal clad, integral structural steel framed housing anchored to a concrete foundation. Construction shall allow access to control panels and service points. The panels shall enclose all components, including intake/exhaust louvers and sound attenuators. Extend the enclosure base frame as required for panels.
2. The generator control panel shall be located no greater than 5'-0" above finished grade for ease of access.
3. Structural Design and Anchorage: Wind resistant up to 100 mph.
4. Louvers: Equipped with bird screen and filter arranged to permit air circulation when engine is not running while excluding exterior dust, birds, and rodents. Motor operators shall be spring open, power close operating at 24 volts DC. The louvers shall be connected to the generator starting batteries through appropriate control relays.
5. Hinged Doors: Provide a minimum of four doors with padlocking provisions. Single doors shall be 36" wide and 84" high. Double doors shall be 60" wide and 84" high. As standard, doors shall include rain-rail moldings above all door openings, recessed, keyed mortise locks, panic bar door hardware and full weather-stripping. Doors shall be removable.
6. Thermal Insulation: Manufacturer's standard materials and thickness selected in coordination with space heater to maintain winter interior temperature within operating limits as required by engine-generator-set components.
7. Fuel Tank Vent: Provide vent piping from the fuel tank to the exterior of the enclosure.
8. Fuel Fill: Provide fill access on the exterior of the enclosure at an elevation not to exceed 5'-0" above finished grade.
9. The exhaust system silencer shall be installed within the enclosure housing.

2.08 SITE COORDINATION

- A. Generator to property line distance: 10 feet minimum.

SECTION 26 33 23

CENTRAL BATTERY EQUIPMENT FOR EMERGENCY LIGHTING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Central battery equipment for emergency lighting.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Myers Power
- B. DSPM Lighting Inverters
- C. Crucial Power Products (CPP)
- D. Campus Standards
 - 1. LA Mission College – Myers Power
 - 2. LA Pierce College – Myers Power
 - 3. LA Valley College – Myers Power
 - 4. West LA College – Myers Power

2.02 INTERRUPTIBLE (FAST-TRANSFER) CENTRAL BATTERY EQUIPMENT

- A. Performance Requirements: Passive standby (off-line) system.
- B. Unit Operating Requirements:
 - 1. Input AC Voltage Tolerance: Plus 10 and minus 15 percent.
 - 2. Input Frequency Tolerance: Plus or minus 3 percent.
 - 3. Synchronizing Slew Rate: 1 Hz per second, maximum.
 - 4. Minimum Off-Line Efficiency: 95 percent at 60 Hz, full load.
 - 5. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or operating condition.
 - 6. Ambient Temperature Rating (Other Than Batteries): Not less than 68 deg F (20 deg C) and not exceeding 86 deg F (30 deg C).
 - 7. Ambient Storage Temperature Rating (Other Than Batteries): Not less than minus 4 deg F (minus 20 deg C) and not exceeding 158 deg F (70 deg C).
 - 8. Ambient Temperature Rating (Batteries): Not less than 32 deg F (0 deg C) and not exceeding 104 deg F (40 deg C).

9. Ambient Storage Temperature Rating (Batteries): Not less than 0 deg F (minus 18 deg C) and not exceeding 104 deg F (40 deg C).
 10. Humidity Rating: Less than 95 percent (noncondensing).
 11. Altitude Rating: Not exceeding 3300 feet (1005 m).
 12. Off-Line Overload Capability: 1.1 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
- C. Inverter and Controls Logic: Microprocessor based, isolated from all power circuits; provides complete self-diagnostics, periodic automatic testing and reporting; with alarms.
- D. Integral Input Disconnecting Means and OCPD: Thermal-magnetic circuit breaker.
1. Integrated Equipment Minimum Short-Circuit Current (Withstand) Rating: 22 kA This shall be higher as required by the project's Electrical Distribution Study.
- E. Inverter: Solid-state, high-frequency, PWM type.
- F. Rectifier/Battery Charger: Solid state, variable rate, temperature compensated.
1. Maximum Battery Recharge Time from Fully Discharged State: 24 hours.
- G. Batteries: Premium VRLA batteries.
1. Capable of sustaining full-capacity output of inverter unit for minimum of 90 minutes.
- H. Maintenance Bypass Systems: Internal; manual operation only.
1. Transfer and Retransfer: Break-before-make, with disrupting power to the load.
- I. Integral Output Disconnecting Means and OCPD:
1. Single-Output OCPD: As scheduled Thermal-magnetic circuit breaker, complying with UL 489.

2.03 COMPONENTS AND ACCESSORIES

- A. Enclosures: Type 1 steel cabinets with access to components through hinged doors with flush tumbler lock and latch.
- B. Output breaker to match unit's output with option for branch distribution breakers. Coordination to be provided for upstream breakers as required on emergency systems.
- C. SPD Device
- D. Multiple-output voltages.
- E. Split-output configuration.
- F. Internal fax modem.
- G. Audible alarm with silencer switch.
- H. Remote summary alarm panel.
- I. Remote meter panel.

SECTION 26 33 53

STATIC UNINTERRUPTIBLE POWER SUPPLY

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Static uninterruptible power supply.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS - STATIC UNINTERRUPTIBLE POWER SUPPLY

- A. Liebert, Emerson Network Power
- B. Eaton Corporation
- C. Schneider Electric
- D. General Electrical (GE Critical Power)
- E. Mitsubishi Electric Power Products, Inc.
- F. Active Power
- G. MGE UPS Systems
- H. APC UPS Systems
- I. Myers Power Systems

2.02 CAMPUS STANDARDS

- A. East LA College and Southgate Environmental Center – APC, MGE, Schneider Electric
- B. LA Harbor College – Shneider Electric, Eaton, Myers Power Systems
- C. LA Mission College – APC
- D. LA Pierce College – Liebert, APC, Schneider Electric
- E. LA Southwest College – APC, Eaton
- F. LA Trade Tech College – Liebert, APC
- G. LA Valley College – APC, Eaton
- H. West LA College – Liebert, APC, Eaton

2.03 SYSTEM RATINGS AND OPERATING CHARACTERISTICS

- A. System Continuous Rating: As shown on the drawings, over entire battery voltage range at specified power factor. Maintain output voltage within specified limits at any load from full load to no-load.
- B. Battery Capacity: Capable of operating at full load for 30 minutes or higher as required per project program, school standards, etc.
- C. Voltage Rating: 480Y/277 volts, 3 phase input; 480Y/277 volts, 3 phase output.
- D. Input Voltage Limits: +10 percent/-15 percent without battery discharge.
- E. Input Frequency: 60 \pm 6 Hertz.
- F. Input Current Limit: Adjustable to maximum of 120 percent of that required to operate at full load with battery bank on float charge.
- G. Current Walk-In: 25 to 100 percent in 30 seconds (programmable).
- H. UPS Power Factor Over Full Range of Loads and Input Voltages: 0.99 lagging.
- I. Harmonic Distortion of Input Current Wave Form: 5 percent maximum at full load.
- J. Output Voltage Regulation:
 - 1. \pm 0.5 percent for balanced load, full range of DC input and no load to full load variations.
 - 2. \pm 2 percent for 50 percent unbalanced load, full range of DC input and no load to full load variations.
 - 3. \pm 5 percent during maximum overload of the system.
- K. Output Voltage Adjustment: \pm 5 percent.
- L. Output Free Running Frequency: 60 Hertz \pm 0.1 percent.
- M. Frequency Adjustment: \pm 2 Hertz.
- N. Output Harmonic Distortion: Maximum 5 percent rms total harmonic distortion (THD) and maximum 3 percent any single harmonic, at rated frequency and voltage, from 10 percent load to full load and over battery voltage range, measured into a linear load.
- O. Voltage Transient Response for Application of 0 to 50 Percent, 50 to 100 Percent, 100 to 50 Percent, and 50 to 0 Percent Step Loads, and Transfer to and From Bypass Line:
 - 1. +8, -10 percent for a maximum of 8.3 milliseconds.
 - 2. \pm 5 percent for a maximum of 25 milliseconds.
 - 3. \pm 3 percent for a maximum of 50 milliseconds.
 - 4. Recovery to steady state within 100 milliseconds after any out-of-tolerance variation.
- P. Phase Displacement:
 - 1. 120 \pm 1 degree for balanced loads.
 - 2. 120 \pm 4 degrees for 50 percent unbalanced loads.
- Q. Three-phase Overload Ratings:

1. 1000 percent for 10 ms; via static switch.
 2. 110 percent continuous.
- R. Output Current Limit: 110 percent of rated output current.
- S. Voltage Unbalance: 3 percent maximum line-line with 100 percent load unbalance.
- T. Efficiency: 96 percent at full load. 96.5 percent @ 50% load.
- U. Surge Protection: IEEE 587, Class A & B.

2.04 PHYSICAL CHARACTERISTICS

- A. All materials of the UPS shall be new, of current manufacture, high grade and free from all defects and shall not have been in prior service, except as required during factory testing. All active electronic devices shall be solid-state. All power semi-conductors shall be hermetically sealed. All relays and semi-conductors shall be dust-tight.
- B. Wiring: Wiring practices, materials and coding shall be in accordance with the requirements of the National Electrical Code, OSHA, and applicable local codes and standards. All bolted connections of bus bars, lugs, and cables shall be in accordance with requirements of the National Electrical Code and other applicable standards. All electrical power connections are to be torqued to the required value and marked.
- C. All power, control, and printed circuit components shall be mounted in bolt-on and/or swing-out type assemblies for ease of maintenance and replacement. Replacement of components shall not require the use of a soldering iron.
- D. Construction and Mounting: The UPS shall be NEMA Type 1 enclosures, designed for floor mounting. The UPS shall be structurally adequate and have provisions for hoisting, jacking, and forklift handling. Wire runs shall be protected in a manner which separate power and control wiring. Provisions shall be protected in a manner which separate power and control wiring. Provisions shall be made in the cabinets to permit installation of input, output, and external control cabling, using raceway or conduit.
- E. Ventilation: Adequate ventilation shall be provided to ensure that all components are operated within environmental ratings. Cooling fans shall be redundant. All fans are to be equipped with fan failure sensors connected to an alarm on the UPS control panel.
- F. Temperature sensors shall be provided to monitor UPS internal temperature. Upon detection of temperatures in excess of manufacturer's recommendations, the sensors shall cause audible and visual alarms to be sounded on the UPS control panel. A separate room ambient temperature sensor shall be provided to give an alarm if the temperature of the inlet air to the UPS is above specified limits.

2.05 RECTIFIER/CHARGER

- A. The term rectifier/charger shall denote the solid-state equipment and controls necessary to convert AC to regulated DC for input to the inverter and for charging the battery.
- B. Input Circuit Breaker: Internally mounted circuit breaker shall be of the frame size and trip rating to supply full rated load and recharge the battery at the same time. The circuit breaker shall have a shunt trip device operated by internal UPS control equipment.

- C. Transformer: A dry power transformer of the isolated winding type with vacuum impregnated windings shall be used. It shall be all copper wiring and have one 5% tap below and one 5% tap above rated voltage. The transformer's hottest spot winding temperature shall not exceed the temperature limit of the transformer insulation class of material when operating full load at maximum ambient temperature.
- D. Battery Charge Current Limiting: The rectifier/charger shall be equipped with a battery charge current limit circuit that shall limit battery charging to an adjustable level of 2% to 25% of full rectifier input current. The circuit shall have a second adjustment to provide greater limiting when signaled by the emergency generator. This circuit shall allow input power limiting but shall not cause battery discharge when a low AC input voltage condition occurs. Battery charge current limit is to be set at 15% for normal operation and 2% for "generator" operation. Electrical Contractor shall make required connections to generator.
- E. Input Current Walk-In: The rectifier/charger shall provide feature which upon AC power return to the AC input bus, after the UPS has been operating on battery power or has been de-energized, limits the total initial power requirement at the input terminals to 20% of rated load, and gradually increases power to 100% of full rating over the 15-second time interval.
- F. Fuse Failure Protection: Semi-conductors in the rectifier/charger shall be fused with fast-acting fuses so that loss of any semi-conductor shall not cause cascading failures. All fuses shall have a blown fuse indicator with an alarm light on the control panel.
- G. Output Filter: The rectifier/charger shall have an output filter to minimize ripple current into the battery. Under no conditions shall ripple current into the battery exceed 2% RMS. The filter shall be adequate to ensure that the DC output of the rectifier/charger will meet the input requirements of the inverter. The inverter shall be able to operate from the rectifier with the battery disconnected.
- H. Battery Recharge: In addition to supplying power for the load, the rectifier/charger shall be capable of recharging the battery as specified herein. The charging rate shall be sufficient to restore the battery from discharge to 95% charge within ten (10) times the discharge time. After the battery is recharged, the rectifier/charger shall maintain the battery at full charge until the next emergency operation.
- I. Battery Equalize Charge: An automatic equalize charge timer feature shall be provided to automatically apply an equalize voltage to the battery after a 5 second or longer utility outage. The duration of equalize charge time shall be adjustable from 0-72 hours. Manual override shall be provided for the automatic equalize circuit.
- J. Over-voltage Protection: There shall be DC over-voltage protection so that if the DC voltage raises to the pre-set limit, the UPS is to shut down automatically and the load transferred to the bypass line uninterrupted.

2.06 INVERTER

- A. The term inverter shall denote the equipment and controls to convert DC from the rectifier/charger or battery to precise AC to power the load. The inverter shall be solid-state, capable of accepting the rectifier/charger or battery output and providing rated output. The inverter is to be power SCR type, six (6) twelve (12) pole design. power transistor type, phase controlled pulse width modulated (PWM) design.

- B. **Overload Capability:** The inverter shall be able to sustain an overload across its output terminals up to 150% for 30 seconds without reducing output voltage. The inverter shall be capable of at least 300% current for short circuit conditions. If the short circuit is sustained, the inverter shall shut down and disconnect automatically from the critical load bus.
- C. **Output Frequency:** Output frequency of the inverter shall track the static bypass source provided source frequency maintains 60 Hz \pm 0.5 Hz to maintain synchronous operation for automatic transfers. If the bypass source fails to maintain proper frequency then control shall revert to an internal oscillator. The oscillator shall be temperature compensated and hold the inverter output frequency to \pm 0.1% for steady-state and transient conditions. Drift shall not exceed 0.1% during a 24-hour period. Total frequency deviation, including short time fluctuations and drift, shall not exceed 0.1% from the rated frequency.
- D. **Phase Balance:** Electronic controls must be used to provide individual phase voltage compensation to obtain phase balance under all conditions including up to 50% load unbalance.
- E. **Internal Protection:** Fault sensing and static isolation shall be part of the inverter as well as an output circuit breaker for removal of a faulted module from the load, without affecting the critical load but beyond the stated limits.
- F. **Fuse Failure Protection:** Semi-conductors in the inverter shall be fused with fast acting fuses to prevent cascading failures. Each fuse shall be provided with blown fuse indicator with an alarm light on the control panel.
- G. **Output Circuit Breaker:** Internally mounted circuit breaker shall be of the frame size and trip rating to supply full rated load. The circuit breaker shall have a shunt trip device operated by internal UPS control equipment.
- H. **Load Sharing:** The inverter shall be capable of load sharing operation with like UPS modules without the use of master controls, oscillators, or sharing reactors. The inverters shall load share to within \pm 5% of the average individual inverter load current.
- I. **Output Power Transformer:** A dry power transformer of the isolated winding type with vacuum impregnated windings shall be used. It shall have copper wiring exclusively. The transformers hottest spot winding temperature shall not exceed the temperature limit of the transformer insulation class of material when operating at full load at maximum ambient temperature.
- J. **Output Filter:** The inverter shall have an output filter to maintain the total harmonic distortion (THD) of the output voltage to the specified limits.

2.07 SYSTEM PROTECTION

- A. **Built-in Protection:** Against surges, sags, and over-current from the AC source, over-voltage and voltage surges from output terminals of paralleled sources, and load switching and circuit breaker operation in the distribution system.
- B. The UPS shall be protected against sudden changes in output load and short circuits at the output terminals. The UPS shall have built-in protection against permanent damage to itself and the connected load for all predictable types of malfunctions.

- C. Fast-acting current limiting devices shall be used to protect against cascading failure of solid-state devices. Internal UPS malfunctions shall cause the module to trip off-line with minimum damage to the module and provide maximum information to maintenance personnel regarding the reason for tripping. The load shall be automatically transferred to the bypass line uninterrupted for an internal UPS malfunction. Open protective devices shall be indicated by Light Emitting Diodes (LEDS) on the control panel.

2.08 DISPLAY AND CONTROLS

- A. The term UPS Module Control Panel, as used herein, denotes that portion of the UPS module containing the display screen and control functions. The display panel shall be liquid crystal type to provide complete monitoring and control using menu-prompted commands. Switches shall be used to select and execute operations from a Master Menu. The display and control panel shall be mounted on the control section door.
- B. UPS module system logic and control programming shall be resident in Application Specific Integrated Circuits. Logic components shall be physically isolated from heat sources and voltage hazards. There shall be two power supplies for the logic and control circuits, one connected to the input AC source and the other connected to UPS module output.
- C. Monitoring: UPS module monitoring shall be provided by a microprocessor-based graphic display capable of simultaneously reporting input and output and battery voltage and current; output frequency and total load KVA and KW for all three phases, within 1% accuracy.
 - 1. History File: The control system shall maintain this information in discrete windows updating memory on a First-In First-Out basis. This shall provide status recall of a period of at least 256 milliseconds (64 windows); 160 milliseconds before the malfunction (40 windows), and 96 milliseconds after the malfunction (24 windows).
 - 2. Power Flow Indication: Power flow indicators shall graphically depict whether the load is being supplied from UPS, bypass or battery and provide, on the same screen, input, output and battery voltage, amperages, frequency, KVA and KW. The following components must be indicated:
 - a. AC Input Circuit Breaker
 - b. Battery Circuit Breaker
 - c. Inverter Output Circuit Breaker
 - d. Bypass Switch
 - e. Static Transfer Switch (Off-Line/Available)
 - 3. Battery Status Indicator: The battery status indicator shall display DC alarm and shutdown voltages and maintain the battery voltage drop during discharge. Battery time remaining after a power outage shall be graphically displayed to permit prediction of battery shutdown.
- D. Alarms: The control panel shall report the system level alarms listed below. An audible alarm is to be activated when any of the above alarms occur. All alarms shall be displayed in text form.
 - 1. Input Power Fail
 - 2. Output Overload
 - 3. Overload Shutdown
 - 4. Overload Transfer
 - 5. Emergency Power Off

6. DC Over Voltage
 7. DC Cap Fuse
 8. Ambient Over-temp
 9. UPS Over-temp
 10. Over-temp Shutdown
 11. Low Battery Reserve
 12. Battery Disconnected
 13. Battery Discharging
 14. Rectifier Fuse Failure
 15. Inverter Fuse Failure
 16. Fan Failure
 17. Static Switch Disabled
 18. Bypass Not Available
 19. Auto Transfer to Bypass
 20. Reverse Power
 21. Control Power Failure
 22. Load on Bypass
 23. Output Over/Under Voltage
- E. Controls: System level control functions shall be:
1. UPS/Bypass Transfer Pushbuttons.
 2. AC Output Voltage Adjust 5%.
 3. Battery Circuit Breaker Trip Pushbutton.
 4. Emergency Power Off Pushbutton with Protective Cover.
 5. Alarm Silence Pushbutton.
 6. Control Enable Pushbutton.
 7. Display Control Switches.
 8. Alarm Reset Switch.
- F. Manual Procedures: Start-up, load transfers, and shutdown procedures shall be detailed on the display panel in text and graphic form.
1. Start-Up:
 - a. Step-by-step procedure screen.
 - b. Walk-in display screen to simultaneously indicated DC volts, output volts, and input phase amps.
 - c. Mimic screen to indicate power flow.
 2. Load Transfers:
 - a. Step-by-step procedure screen.
 - b. Mimic screen to indicate power flow.

3. Shutdown:
 - a. Step-by-step procedure screen.
 - b. Mimic screen to indicate power flow.

- G. Emergency Power Off: The UPS control panel shall have a local emergency shutdown. Pressing the emergency shutdown shall cause:
 1. Uninterrupted transfer of the load to bypass.
 2. The input, output, and battery breakers.
 3. Power off circuit, which completely removes power from the critical bus when activated.

- H. Self-Diagnostics: The UPS module shall be provided with the following built-in diagnostics for troubleshooting and circuit alignment aids:
 1. Rectifier in control mode.
 2. UPS synchronizing with critical load bus.
 3. Positive DC bus ground fault.
 4. Negative DC bus ground fault.
 5. Bypass frequency higher than system output frequency.
 6. Bypass frequency lower than system output frequency.
 7. Automatic static transfer lockout.
 8. Command given to close inverter output circuit breaker.
 9. Command given to close bypass switch.
 10. Command given to open inverter output circuit breaker/bypass switch.
 11. Degree of overload.
 12. Under-voltage trip for battery disconnect switch.
 13. Under-voltage trip for input circuit breaker.

- I. Remote Monitoring Capability: UPS control circuits shall be interfaced with the site central monitoring system (CMS). Interface shall be built into the UPS. The site monitoring signal processing module shall be factory installed. The following shall be available for display:
 1. Metering:
 - a. Bypass volts (line-line, all phases)
 - b. Critical bus volts (line-line & line-neutral, all phases)
 - c. Critical bus current (all phases)
 - d. Critical bus frequency
 - e. Critical bus KVA
 - f. Critical bus KW
 - g. DC volts
 - h. Battery amps (\pm)
 - i. % Capacity
 2. Digital Alarms:

- a. Fuse Cleared
 - b. Output Overload
 - c. Emergency Power Off
 - d. Ambient Over-temp
 - e. Battery Flywheel Discharging
 - f. Low Battery Reserve
 - g. Load On Bypass
 - h. Static Switch Disabled
 - i. Battery Flywheel Disconnected
 - j. Module Cooling Failure (Fan Failure or Over-temp)
 - k. Control Power Failure
3. Alarm Outputs: The following will have a N.O. isolated contact for remote indication on the RTU provided by others. Electrical Contractor shall route conduit and wire, make all connections.
- a. UPS System Mode
 - b. Battery Flywheel Discharging
 - c. Low Battery Reserve
 - d. UPS Alarm Condition
- J. Communication Port: The UPS shall be provided with an RS-232 port capable of interfacing with a remote location. All monitoring information shall be capable of being downloaded to remote device.

2.09 STATIC TRANSFER SWITCH

- A. The term static transfer switch shall denote the solid-state device that automatically transfers the critical load to bypass without interruption if the UPS cannot supply continuous power. The term bypass switch shall denote the electromechanical device that will connect the load to bypass. Automatic load transfers are to be initiated when a malfunction occurs within the UPS or a sustained system overload occurs.
- B. Momentary Overloads: In the event of a branch load circuit fault or load current inrush, the static transfer switch is to pulse-on for at least 40 milliseconds allowing at least 1000% load current to flow from bypass line to clear the overload. If the overload is cleared, a load transfer shall not be made. If the overload is not cleared, then the transfer is to be accomplished maintaining load voltage within specified limits.
- C. Automatic Closing: The static transfer switch is to be of the energy saving type. Once the load is transferred to the bypass line by the static transfer switch, the bypass switch is to automatically close removing the static transfer switch from the power flow.
- D. Manual Transfers: A manual load transfer between the UPS and bypass line is to be initiated from the control panel. All transfers from bypass to the inverter shall be manually initiated.
- E. Switch Isolation: The static switch SCR device shall include series connected switch/circuit breaker and backfeed circuit monitoring per UL Standard 1778 for automatic (and manually) initiated circuit isolation of static switch SCR device.

2.10 BATTERY DISCONNECT BREAKER

- A. The UPS shall have a properly rated circuit breaker (500 VDC) to isolate it from the battery.
- B. The switch shall be in the battery compartment of the UPS module housing. When open, there shall be no battery voltage in the rectifier/inverter compartment.
- C. The UPS shall automatically be disconnected from the battery by opening the switch when the battery reaches the minimum discharge voltage level or when signaled by other control functions.
- D. The UPS shall be provided with a pushbutton to trip the breaker from the control panel.

2.11 BATTERY

- A. Storage Battery: Valve regulated (sealed, reduced maintenance) type. Maximum specific gravity of 1.3, and minimum cell end voltage of 1.65 volts. Heavy duty industrial design. Provide with impact resistant plastic case which meets or exceeds 94V2 to meet UL Standard 1778 requirements.
- B. Batteries shall be furnished with flame arrestors, lead covered solid copper terminal posts, and transparent container to allow visual inspection of the plates and sediment spaces.
- C. Battery system shall be furnished as a part of the UPS system and sized to maintain the rated UPS system load output for the specified duration. Submit battery Amp-hour rating, cell end voltage, specific gravity, and battery system calculations with shop drawing submittals.
- D. Battery system design life shall be 10 years under full float operation and shall be provided with a pro rata cycle duty warranty based on the following discharges at the 15-minute rate:

CYCLE DURATION

NUMBER OF CYCLES	0 to 30s	30s to 1M	1M to 5M	5M to 15M
	3,700	1,125	410	225
	2,700	600	200	120
	10,500	2,100	660	300
	4,571	2,560	853	481

- E. The battery system shall provide 100% of specified capacity at initial start-up.
- F. Batteries shall be mounted on slide out racks in battery compartment of UPS module enclosure.
- G. Rack system shall be painted with corrosion resistant paint and supplied with all required lead plated copper bolted connectors, terminal lugs, cable supports, rack mounting bolts, and accessories. Provide acid resistant aisle matting adjacent to racks.
- H. Racks shall be sized to fit into battery room as shown on the drawings and configured to hold batteries totaling 250 VDC maximum. Contractor shall size conductors and conduit between UPS and battery disconnect breaker, and between battery disconnect breaker and battery racks as required by UPS supplier. All cables leaving a continuous rack area shall be in conduit.
- I. Provide the following battery system accessories:
 1. Set of battery identification numbers.
 2. Battery arrangement and wiring diagram indicating battery numbers.

3. Lifting strap and spreader block.
4. Anti-corrosion compound.

2.12 EMERGENCY POWER OFF

- A. The UPS shall include an Emergency Power Off (EPO) circuit. Activating this circuit shall cause immediate shutdown of all UPS operations. This operation will shut down the critical load.
- B. The UPS module shall include provisions to activate the EPO circuit remotely by a contact closure.

SECTION 26 36 00
TRANSFER SWITCH

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Automatic transfer switch
- B. Manual transfer switch
- C. Remote annunciator for ATS

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. ASCO.

2.02 AUTOMATIC TRANSFER SWITCH

- A. Description: NEMA ICS 2; automatic transfer switch.
- B. Configuration: Electrically-operated, mechanically-held transfer switch.
- C. Control panel shall be micro-processor based.

2.03 AUTOMATIC TRANSFER

- A. Description: NEMA ICS 2; automatic transfer switch
- B. Configuration: Draw-out type electrically-operated, mechanically-held transfer switch with manually-operated CONNECTED, TEST, and DISCONNECTED draw-out positions, and with mechanically-operated, mechanically-held transfer switch connected to bypass automatic switch.

2.04 MANUAL TRANSFER SWITCH

- A. Description: NEMA ICS2; manual transfer switch.
- B. Configuration: Manually operated, three-position center-off transfer switch.
- C. Engine start switch.

2.05 SERVICE CONDITIONS

- A. Service Conditions: NEMA ICS 1.

2.06 RATINGS

- A. The transfer switch shall be series rated with the equipment feeding the transfer switch. The series rating shall be the larger of the two AIC values when the AIC rating of the equipment feeding the normal and emergency sides of the transfer switch is not equal.
- B. Series rating with upstream devices shall be allowed per UL-1008.

2.07 AUTOMATIC SEQUENCE OF OPERATION

- A. Initiate Time Delay to Start Alternate Source Engine Generator: Upon initiation by normal source monitor.
- B. Time Delay to Start Alternate Source Engine Generator: 0 to 10 seconds, adjustable.
- C. Initiate Transfer Load to Alternate Source: Upon initiation by normal source monitor and permission by alternate source monitor.
- D. Time Delay Before Transfer to Alternate Power Source: 0 to 30 seconds, adjustable.
- E. Initiate Retransfer Load to Normal Source: Upon permission by normal source monitor.
- F. Time Delay Before Transfer to Normal Power: 0 to 30 minutes, adjustable; bypass time delay in event of alternate source failure.
- G. Time Delay Before Engine Shut Down: 0 to 30 minutes, adjustable, of unloaded operation.

2.08 ENCLOSURE

- A. Enclosure: NEMA ICS 6; Type 1.

2.09 ACCESSORIES

- A. Load Shed:
 - 1. The controller shall be capable of being programmed to automatically shed the connected load from the generator in the event of a user configurable under- frequency, under-voltage or overload condition. Under-frequency shedding shall occur if generator is less than 58Hz for greater than 3 seconds or less than 50 Hz for greater than 0.5 seconds.
 - 2. Switch shall be configurable to pick up an output status relay upon activation of the auto load shed feature. Output shall be usable to trip/isolate downstream loads in the event of an overload.
 - 3. Reset of the auto load shed function shall be via operator reset on display, remote reset contact input, or via network signal.
- B. Indicating Lights: Mount in cover of enclosure to indicate NORMAL SOURCE AVAILABLE, ALTERNATE SOURCE AVAILABLE, SWITCH POSITION.
- C. Test Switch: Key operated or password protected switch. Mount in cover of enclosure to simulate failure of normal source.
- D. Engine Start Signal: Rated 10 amps at 30VDC shall be provided to start the engine generator in the event of a normal source outage.
- E. Return to Normal Switch: Mount in cover of enclosure to initiate manual transfer from alternate to normal source.

- F. Transfer Switch Auxiliary Contacts: 2 normally open; 2 normally closed indicating switch to normal source or emergency source.
- G. Normal Source Monitor: Monitor each line of normal source voltage and frequency; initiate transfer when voltage drops below 85 percent or frequency varies more than 3 Hertz from rated nominal value, values shall be field adjustable.
- H. Alternate Source Monitor: Monitor each line of alternate source voltage and frequency; inhibit transfer when voltage is below 85 percent or frequency varies more than 3 percent Hertz from rated nominal voltage, values shall be field adjustable.
- I. Engine Exerciser: Start engine every 28 days. Run for 30 minutes before shutting down. Each event shall be configurable for Test with Load or Test Without Load. Bypass exerciser control if normal source fails during exercising period.
- J. In-Phase Monitor: Inhibit transfer until source and load are within 30 electrical degrees.
- K. Provide 2 N.O. and 2 N.C. isolated contacts to indicate:
 - 1. Normal source available.
 - 2. Emergency source available.
 - 3. Exercise mode in operation.
- L. Serial Communication Port: Two twisted pairs of shielded communication cable in conduit shall daisy chain all transfer switches with a remote annunciator.
- M. Remote Annunciator: A remote annunciator shall be provided that shall monitor and control the following functions for each transfer switch:
 - 1. Load Connect to Emergency/Normal Indication
 - 2. Source Available: Emergency/Normal Indication
 - 3. Time Delay Indication and Key Locked Bypass Switch
 - 4. Transfer Test Indication and Key Locked Switch
 - 5. Remote transfer loads between normal and emergency sources with Key Locked Switch
 - 6. Remote generator start with Key Locked Switch
 - 7. Remote generator stop with Key Locked Switch
- N. Annunciators shall be located as directed by the Owner. Extend conduit and wire as required by the manufacturer.
- O. An adjustable emergency to normal pre-signal signal to elevator controller.
- P. Metering Capabilities: The following metered readings shall be available at the local display. [The metering information shall also be shared by serial connection to the master control cubicle of the emergency power paralleling equipment.]
 - 1. Current, per phase RMS and neutral
 - 2. Current unbalance %
 - 3. Voltage, phase-to-phase and phase-to-neutral
 - 4. Voltage unbalance %
 - 5. Real power (KW), per phase and 3-phase total

6. Apparent power (KVA), per phase and 3-phase total
7. Reactive power (KVAR), per phase and 3-phase total
8. Power factor, 3-phase total & per phase
9. Frequency
10. Accumulated energy, (KWH, KVAH, and KVARH)
11. Demand, (KWH, KVA)

END OF SECTION

SECTION 26 51 00
INTERIOR LIGHTING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Interior luminaires, drivers, and accessories
- B. Performance Requirements
- C. Luminaire Requirements

1.02 DEFINITIONS

- A. CCT: Correlated color temperature, measured in degrees Kelvin (K)
- B. CRI: Color rendering index
- C. IES: Illuminating Engineering Society

PART 2 PRODUCTS

2.01 INTERIOR LIGHT FIXTURES (LED)

- A. Acceptable manufacturers as listed below meet the qualifications as outlined in this specification. Contractor is responsible for verifying that selected manufacturer can furnish the complete system as specified herein.
 - 1. Prudential, Lithonia, Lightolier, and HE-Williams
 - 2. Campus Standards
 - a. East LA College & South Gate Educational Center – Prudential, Lithonia, HE Williams, Lightolier Smart System preferably in the IoT Platform
 - b. LA Harbor College – Prudential, Lithonia, HE Williams, Lightolier, Meets Energy Star Requirements
 - c. LA Mission College – LED
 - d. LA Pierce College – Lithonia, Cree
 - e. LA Southwest College – Prudential, Lithonia, HE Williams, Lightolier, must meet DLC, Energy Star requirements.
 - f. LA Trade Tech College – LED by GE, Lithonia, Hubbell
 - g. LA Valley College – Prudential, Lithonia, HE Williams, Lightolier
 - h. West LA College – Prudential, Lithonia, HE Williams

2.02 INTERIOR LUMINAIRES AND ACCESSORIES - GENERAL

- A. Recessed Luminaires: Confirm ceiling and wall type and furnish trim and accessories necessary to permit proper installation in each system. Where fire-rated ceiling or wall assemblies are specified, furnish, and install listed enclosures around luminaires that maintain the system rating.
- B. Luminaires: Louvers shall be anodized low iridescent specular aluminum with mitered corners and interlocking construction. Provide ballast covers to separate inboard/outboard lamps when multi-level switching is indicated, so light does not spill into unlit cells.
- C. Suspended Luminaires: Coordinate power feed and suspension canopies with ceiling type and architectural RCP for proper fit and location. Ensure finished installations are plumb and level at elevations specified.
1. Acceptable Manufacturers
 - a. Prudential
 - b. Lithonia
 - c. Campus Standards
 - 1) East LA College and Southgate Environmental Center – Prudential, Lithonia, Philips
 - 2) LA Harbor College – Prudential, Philips, LED with 10 years warranty on LED and driver
 - 3) LA Mission College – Lithonia, LED
 - 4) LA Valley College – Designer to submit for LAVC approval
 - 5) West LA College – LED type, 10 years warranty on LED and driver.
- D. Exit Signs: Stencil single or double face, 6-inch high letters with green color, with or without directional arrows, universal mounting type as indicated on the drawings.
1. Acceptable Manufacturers - Campus Standards
 - a. East LA College & South Gate Educational Center – LED, Active Safety, Pentico, Lithonia, Extronix
 - b. LA Harbor College, LA Mission College, LA Pierce College, West LA College – LED
 - c. LA Southwest College – LED, Active Safety, Pentico, or equal
 - d. LA Trade Tech College – LED, Active Safety, Spectron or equal
 - e. LA Valley College – LED by Active Safety, Spectron
- E. Self-Powered Emergency Lighting Units: One-piece, self-contained unit with sealed, maintenance-free nickel cadmium battery, automatic charger and electronic circuitry. Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
- F. Painted reflector surfaces shall have a minimum reflectance of 90%.
- G. Restroom Light Fixtures – Campus Standards

1. LA Harbor College – vandal-resistant construction preferred.
2. LA Trade Tech College – vandal-resistant construction preferred.

H. Vandal Proof Lighting Fixtures

1. LED by Ruud Lighting/Cree, Metalux, Kim Lighting
2. Campus Standards
 - a. East LA College and Southgate Environmental Center – Rude, Stanco, Sequoia, BE, Lucalux, Metalux. Smart system, preferably in the IoT platform. The controls shall have to communicate and work with HVC controls through BACnet.
 - b. LA Harbor College – LED with 10 years warranty on LED and driver, Ruud/Cree, Stanco
 - c. LA Mission College – LED type, 10 years warranty on LED and driver.
 - d. Southwest LA College – Ruud Lighting, Stanco, Sequoia, BE, Lucalux, Metalux
 - e. LA Trade Tech College – LED by Eaton, Lamar, Luminaire
 - f. LA Valley College – LED by Ruud, Stanco, GE
 - g. West LA College – LED type, 10 years, warranty on LED and driver

2.03 LIGHT EMITTING DIODE (LED) LUMINAIRE SYSTEMS

- A. Light emitting diodes used in interior applications shall have a minimum color rendering index (CRI) of 80. Color temperature of the luminaires shall be 3500 Kelvin (in accordance with the specific requirements for a given space).
- B. LED luminaires shall have a minimum efficacy of 100 lumens per watt.
- C. LED chip arrays specified as color changing shall have chip colors.
- D. LED chips shall be wired so that failure of one chip does not prohibit operation of the remainder of the chip array.
- E. Luminaire minimum lumens is defined as the absolute lumens per the manufacturers LM-79-08 test report.
- F. LED luminaires shall have a total harmonic distortion (THD) of 20% or lower.
- G. LED luminaires shall have a power factor of 0.9 or above.
- H. LED Driver:
 1. Solid state driver with integral heat sink. Driver shall have over heat, short-circuit, and overload protection, power factor 0.90 or above and maximum total harmonic distortion of 20%. Surge suppression device for all exterior luminaires.
 2. Drivers shall have dimming capabilities.
 3. Driver shall have a minimum of 50,000 hours rated life.
- I. Luminaires shall conform to Title 24 lighting and lighting control standards.
- J. LED luminaire shall have a minimum warranty of 5 years if available.

2.04 SUBSTITUTIONS

- A. Prior approval is a procedure for substitution of products before issuance of bid documents. These substitutions may be requested by the bidder, contractor, subcontractor, manufacturer, or other qualified party who wishes to propose use of an alternate product in lieu of that specified.
1. The prior approval request shall include sufficient data so that direct comparison of a proposed product to a specified product can be made.
 2. If a prior approval request is received (before issuance of bid documents), the request will be reviewed at the specifier's discretion. Inadequate warranty, vagueness of submittal, failure to meet project requirements, or insufficient data may be cause for disapproval or rejection of request.
 3. Upon review, the Luminaire Schedule will be updated to reflect the accepted alternates.
- B. Any alternate product not listed on the Luminaire Schedule as shown in the Drawings at the issuance of bid documents shall be formally submitted to the design team as a substitution request. Refer to other Sections of these Specifications for substitution requirements.

2.05 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Luminaires.
 2. Suspended ceiling components.
 3. Partitions and millwork that penetrate the ceiling or extend to within 12 inches (300 mm) of the plane of the luminaires.
 4. Structural members to which **equipment and** luminaires will be attached.
 5. Access panels.
 6. Items penetrating finished ceiling, including the following:
 - a. Other luminaires.
 - b. Air outlets and inlets.
 - c. Speakers.
 - d. Sprinklers.
 - e. Access panels.
 - f. Ceiling-mounted projectors.
- B. Qualification Data: For testing laboratory providing photometric data for luminaires.
- C. Seismic Qualification Data: For luminaires, accessories, and components, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

- D. Product Certificates: For each type of luminaire.
- E. Product Test Reports: For each type of luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency.
- F. Sample warranty.

2.06 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For luminaires and lighting systems to include in operation and maintenance manuals.
 - 1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.
 - 2. Provide driver and light engine replacement installation instructions as applicable.

2.07 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Screw-in Lamps for Decorative Luminaires: **Ten for every 100** of each type and rating installed. Furnish at least two of each type.
 - 2. Luminaires with LED light engines: **Ten for every 100** of each type and rating installed. Furnish at least two of each type.
 - a. Does not apply to decorative luminaires.

2.08 QUALITY ASSURANCE

- A. Luminaire Photometric Data Testing Laboratory Qualifications:
 - 1. Luminaire manufacturer's laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.
 - 2. Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7, accredited under the NVLAP for Energy Efficient Lighting Products, and complying with the applicable IES testing standards.
- B. Provide luminaires from a single manufacturer for each luminaire type.
- C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.
- D. Mockups: For interior luminaires in room or module mockups, complete with power and control connections.
 - 1. Obtain Architect's approval of luminaires in mockups before starting installations.
 - 2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
 - 3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
 - 4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

PART 3 EXECUTION

3.01 INSTALLATION

- A. All light fixtures shall be in area of easy access for maintenance. No overhead light fixtures over the raised floor if possible.
- B. All selected light fixtures shall have minimum effort in luminaire repair/replacement.

3.02 DELIVERY, STORAGE, AND HANDLING

- A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

3.03 WARRANTY

- A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures, including luminaire support components.
 - b. Faulty operation of luminaires and accessories.
 - c. of metals, metal finishes, and other materials beyond normal weathering.
 - 2. Warranty Period: **Five** year(s) from date of Substantial Completion.

END OF SECTION

SECTION 26 56 00
EXTERIOR LIGHTING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Parking lighting and security walkway lighting
- B. LED's
- C. Drivers
- D. Poles

PART 2 PRODUCTS

2.01 LANDSCAPING FIXTURES

- A. West LA College Campus Standards:
 - 1. Cree
 - 2. Deco
 - 3. Cooper

2.02 EXTERIOR LIGHTS - PARKING LOT FIXTURES

- A. Kim Lighting LED, Hubbell MH
- B. Campus Standards
 - 1. East LA College and South Gate Educational Center – LED (Lamp wattage to match existing)
 - 2. LA Mission College – LED Type, 10years warranty on LED and Driver
 - 3. LA Pierce College – LED Type, 10 years warranty on LED and Driver, Deco
 - 4. LA Southwest College – LED (Lamp wattage to match existing)
 - 5. LA Valley College – LED
 - 6. West LA College – LED Type, 10 years warranty on LED and Driver

2.03 PARKING LOT FIXTURES

- A. Kim Lighting, Prudential, Gullwing LED
- B. Campus Standards
 - 1. East LA College – Philips, Gardco, Gullwing LED GL13 & GL18
 - 2. LA Harbor College – LED
 - 3. LA Mission College – LED, 10 years, warranty on Led and Driver
 - 4. LA Southwest College – Philips, Gardco, Gullwing LED GL13 & GL18
 - 5. LA Trade Tech College – LED by GE, Lithonia, ASL
 - 6. LA Valley College – Philips, Gardco, Gullwing LED GL13 & GL18

7. West LA College – LED Type, 10 years warranty on Led and Driver

2.04 EXTERIOR LUMINAIRES AND ACCESSORIES – GENERAL

A. Campus Standards

1. LA Harbor College – LED
2. LA Trade Tech College – Bega Lighting

- B. Listed for wet or damp location as scheduled. Fountain and pool luminaires shall be listed for submersible location to meet depth specified.
- C. Provide low temperature LED drivers, with reliable starting to -20°F.
- D. In-grade luminaires shall have lamp/optic separation to prevent surface temperature from exceeding 115°F. Compartment separation of wire entry and control gear/lamp chamber.

2.05 LIGHT EMITTING DIODE (LED) LUMINAIRE SYSTEMS

- A. Light emitting diodes used in exterior applications shall have a minimum color rendering index (CRI) of 90 and color temperature of 3500 K.
- B. LED chip arrays specified as color changing shall have chip colors as noted on the luminaire schedule.
- C. LED chips shall be wired so that failure of one chip does not prohibit operation of the remainder of the chip array.
- D. Luminaire minimum lumens is defined as the absolute lumens per the manufacturers LM-79-08 test report.
- E. Photometry for LED luminaire to follow IES recommendations for testing.
- F. LED products shall have minimum 5 years warranty.
- G. LED Driver:
 1. Solid state driver with integral heat sink. Driver shall have over heat, short-circuit and overload protection, power factor 0.90 or above and maximum total harmonic distortion of 10%. Surge suppression device for all exterior luminaires.
 2. Drivers shall have dimming capabilities as outlined in the luminaire schedule for each luminaire type.
 3. Driver shall have a minimum of 50,000 hours rated life.

2.06 ACCEPTABLE MANUFACTURERS - POLES

- A. Manufacturer of Luminaire.
- B. Valmont Poles.
- C. U. S. Pole Company.
- D. KW Industries

2.07 LIGHTING POLES

- A. Metal Poles: Round straight steel lighting pole with embedded anchor base.
- B. Prestressed Concrete Poles: Round straight lighting pole with embedded anchor base.
- C. Wind Load: 100 MPH velocity, with 1.3 gust factor with luminaires and brackets mounted.

- D. Hand Hole: 2 x 4 inches with removable weatherproof cover installed at manufacturer's standard location. Provide matching gasketed cover plate.
- E. Pole Top: Provide mast arm(s) in array as indicated.
- F. Anchor Bolts: As recommended by pole manufacturer. Provide template, flat washers, lock washers, and hex nuts for each pole. Grout between anchor plate and concrete base with non-shrink grout after pole is plumbed.
- G. Vibration Damper: Canister or snake type second mode vibration damper internal to the pole as recommended by pole manufacturer. Provide additional pole top damper for first mode vibration on single-head poles where recommended by manufacturer.

2.08 SUBSTITUTIONS

- A. Prior approval is a procedure for substitution of products before issuance of bid documents. These substitutions may be requested by the bidder, contractor, subcontractor, manufacturer, or other qualified party who wishes to propose use of an alternate product in lieu of that specified.
 - 1. The prior approval request shall include sufficient data so that direct comparison of a proposed product to a specified product can be made.
 - 2. If a prior approval request is received (before issuance of bid documents), the request will be reviewed at the specifier's discretion. Inadequate warranty, vagueness of submittal, failure to meet project requirements, or insufficient data may be cause for disapproval or rejection of request.
 - 3. Upon review, the Luminaire Schedule will be updated to reflect the accepted alternates.
- B. Any alternate product not listed on the Luminaire Schedule as shown in the Drawings at the issuance of bid documents shall be formally submitted to the design team as a substitution request. Refer to other Sections of these Specifications for substitution requirements.

2.09 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Luminaires.
 - 2. Structural members to which **equipment and** luminaires will be attached.
 - 3. Underground utilities and structures.
 - 4. Existing underground utilities and structures.
 - 5. Above-grade utilities and structures.
 - 6. Existing above-grade utilities and structures.
 - 7. Building features.
 - 8. Vertical and horizontal information.
- B. Qualification Data: For testing laboratory providing photometric data for luminaires.

- C. Seismic Qualification Data: For luminaires, accessories, and components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- D. Product Certificates: For each type of the following:
 - 1. Luminaire.
 - 2. Photoelectric relay.
- E. Product Test Reports: For each luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency.
- F. Source quality-control reports.
- G. Sample warranty.

2.10 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For luminaires **and photoelectric relays** to include in operation and maintenance manuals.
 - 1. Provide a list of all lamp types used on Project. Use ANSI and manufacturers' codes.
 - 2. Provide driver and light engine replacement installation instructions as applicable.
 - 3. Provide a list of all photoelectric relay types used on Project; use manufacturers' codes.

2.11 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Glass, Acrylic, and Plastic Lenses, Covers, and Other Optical Parts: **One for every 100** of each type and rating installed. Furnish at least one of each type.
 - 2. Diffusers and Lenses: **One for every 100** of each type and rating installed. Furnish at least one of each type.
 - 3. Globes and Guards: **One for every 20** of each type and rating installed. Furnish at least one of each type.

2.12 QUALITY ASSURANCE

- A. Luminaire Photometric Data Testing Laboratory Qualifications:
 - 1. Luminaire manufacturers' laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.
 - 2. Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7, accredited under the NVLAP for Energy Efficient Lighting Products and complying with applicable IES testing standards.
- B. Provide luminaires from a single manufacturer for each luminaire type.
- C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.
- D. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.
- E. Mockups: For exterior luminaires, complete with power and control connections.
 - 1. Obtain Architect's approval of luminaires in mockups before starting installations.
 - 2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed work.
 - 3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
 - 4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

2.13 DELIVERY, STORAGE, AND HANDLING

- A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering prior to shipping.

2.14 FIELD CONDITIONS

- A. Verify existing and proposed utility structures prior to the start of work associated with luminaire installation.
- B. Mark locations of exterior luminaires for approval by Architect prior to the start of luminaire installation.

2.15 WARRANTY

- A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures, including luminaire support components.
 - b. Faulty operation of luminaires and accessories.

- c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
2. Warranty Period: **5** year(s) from date of Substantial Completion.

END OF SECTION

SECTION 26 56 68
EXTERIOR ATHLETIC LIGHTING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Athletic Field luminaires and accessories
- B. Interior Athletic luminaires and accessories
- C. Blackout shutters indoor applications
- D. Mounting hardware indoor applications
- E. Poles outdoor applications
- F. Wireless lighting control

1.02 RELATED REQUIREMENTS:

- A. Section 260500 "Common Work Results for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.

1.03 DEFINITIONS

- A. CCT: Correlated color temperature
- B. CRI: Color rendering index
- C. LLF: Light loss factor

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Athletic Field
 - 1. Musco, Morris, Lithonia
 - 2. Campus Standards
 - a. East LA College and Southgate Environmental Center – Musco, Morris, Lithonia
 - b. LA Harbor College – Musco
 - c. LA Mission College – Lithonia
 - d. LA Pierce College – Musco, Lithonia
 - e. Southwest LA College – Musco

- f. LA Trade Tech College – Musco
- g. LA Valley College – Musco, Morris, Lithonia
- h. West LA College – Not Allowed.

B. Outdoor

- 1. Musco
- 2. GE Sports Lighting Powerspot III New glare 'SLOG' with Spill/Glare control.
- 3. Qualite PRO-Series with Spill/Glare control.
- 4. Hubbell Sportsliter System SLS series with Spill/Glare control.

C. Indoor:

- 1. WideLite Arena Eclipse II with Shutter System.
- 2. Sterner Para II with motorized shade.

2.02 GENERAL

- A. Manufacturer shall have a minimum of 5-years' experience in the design, manufacturing, and installation support of their sports lighting system.
- B. Sports lighting system shall be ETL or UL listed as a complete system.
- C. Outdoor Fixtures and structural system shall withstand 100 mph constant wind forces with a 1.3 gust factor without misalignment to crossarms or individual fixture aiming.
- D. Manufacturer shall provide a minimum of 5-year warranty, from date of Owner accepted installation, against defects in material. All parts and labor to replace will be at no cost to the Owner. The alignment/aiming of individual fixtures shall be warranted against any movement over this same 5-year period.
Lamps shall be warranted for two years from date of Owner accepted installation. Lamps failed within this time shall be replaced and installed at no cost to the Owner by the sports lighting manufacturer.

2.03 PERFORMANCE DESIGN CRITERIA

A. Outdoor

- 1. Calculations for Outdoor Baseball Fields, Football Fields, Soccer Fields, and Tennis Courts:
 - a. Photometric analysis shall state the maintained horizontal footcandle level at 3' above playing field level using a 20' x 20' grid. Test points shall include the sidelines and endline.
 - b. The average maintained horizontal light level shall have a maximum to minimum ratio of 2:1 or less.
 - c. Calculations shall include a light loss factor. The light loss factor, LLF, shall be the combination of the lamp lumen depreciation, LLD, and the luminaire dirt depreciation, LDD. For calculations, use a LDD=0.90. The LLD shall be determined by the lamp manufacturer's stated mean lumens at 40% rated life divided by the 100 hour burn in initial lumens.

For example: The new GE Lighting High Output 1500W multi-vapor universal burn 'Sportstar' has the following initial and mean lumen ratings:

	Vertical	Horizontal	45°
Initial Lumens	178,000	170,000	160,000
Mean Lumens	160,000	140,000	145,000
LLD (mean/initial)	0.899	0.824	0.906
(x)LDD	0.90	0.90	0.90
LLF	0.81	0.74	0.82

- d. Calculations shall state the final design lumens used per fixture. The final design lumens are calculated by multiplying the 100 HR initial lamp lumens by the light loss factor (LLF).
- e. Include "spill light" calculation showing maintained horizontal and vertical footcandles at 3' above grade along the property line.
- f. Calculations shall include Maximum-to-Minimum Ratio, Coefficient of Variation, and Uniformity Gradients as defined by the Illuminating Engineering Society of North America.

2. Outdoor Lighting System Levels

- a. Class I: competition play before a large group (5,000 or more spectators)
- b. Class II: Competition play with facilities for up to 5,000 spectators
- c. Class III: Competitions play with facilities for up to 2,000 spectators
- d. Class IV: Competition or recreational play only (limited or no provision for spectators)

FACILITY	CLASS			
	I	II	III	IV
College	X	X		
Sports Clubs	X	X	X	
Training Facilities			X	X
Recreational Event				X

- e. Outdoor Baseball and Softball Fields:
 - 1) IESNA RP-6, Class: I.
 - 2) Horizontal Illuminance:
 - a) Infield: 150 FC
 - b) Outfield: 100 FC
- f. Outdoor Football Fields:
 - 1) IESNA RP-6, Class: I.

- 2) Horizontal Illuminance: 100 FC
- g. Outdoor Soccer Fields:
 - 1) IESNA RP-6, Class: II.
 - 2) Horizontal Illuminance: 50 FC
- h. Outdoor Tennis Courts:
 - 1) IESNA RP-6, Class: I.
 - 2) Horizontal Illuminance: 125 FC

B. Indoor

1. Calculations for Indoor Basketball, Soccer – Arena Football, and Volleyball:
 - a. Photometric analysis shall state the maintained horizontal footcandle level at 3' above playing field level using a 10' x 10' grid.
 - b. The average maintained horizontal light level shall have a maximum: minimum ratio of 2:1 or less.
 - c. Calculations shall include a light loss factor. The light loss factor, LLF, shall be the combination of the lamp lumen depreciation, LLD, and the luminaire dirt depreciation, LDD. For calculations, use a LDD=0.90. The LLD shall be determined by the lamp manufacturer's stated mean lumens at 40% rated life divided by the 100 hour burn in initial lumens.

For example: The new GE Lighting High Output 1500W multi-vapor universal burn 'Sportstar' has the following initial and mean lumen ratings:

	Vertical	Horizontal	45°
Initial Lumens	178,000	170,000	160,000
Mean Lumens	160,000	140,000	145,000
LLD (mean/initial)	0.899	0.824	0.906
(x)LDD	0.90	0.90	0.90
LLF	0.81	0.74	0.82

- d. Calculations shall state the final design lumens used per fixture. The final design lumens are calculated by multiplying the 100 HR initial lamp lumens by the light loss factor (LLF).
 - e. Calculations shall include Maximum-to-Minimum Ratio, Coefficient of Variation, and Uniformity Gradients as defined by the Illuminating Engineering Society of North America.
2. Lighting System Levels:
 - a. Indoor Basketball:
 - 1) IESNA RP-6, Class: I.
 - 2) Horizontal Illuminance: 125 FC
 - b. Indoor Volleyball:

- 1) IESNA RP-6, Class: II.
- 2) Horizontal Illuminance: 75 FC
3. Indoor: Calculations for Work Lighting:
 - a. Photometric analysis for Work Lighting shall be sub-divided into three areas: the Arena floor, the north and south side of seating areas, and the west end seating area.
 - b. The maintained horizontal footcandle level for the seating areas shall be measured at seat level on the sloped incline using a 10'x10' calculation grid. The average maintained horizontal light level shall not be less than 15 foot-candles with a maximum: minimum ration of 4:1or less.
4. Indoor: Calculations for House Lighting:
 - a. Photometric analysis for House Lighting shall be sub-divided into three areas: the Arena floor, the north and south side of seating areas, and the west end seating area.
 - b. The maintained horizontal footcandle level for the seating areas shall be measured at seat level on the sloped incline using a 10'x10' calculation grid. The average maintained horizontal light level shall not be less than 10 footcandles with a maximum: minimum ratio of 3:1 or less.
5. Indoor: Calculations for Emergency Lighting (Portion of the House Lighting on Emergency)
 - a. Photometric analysis for Emergency Lighting shall be sub-divided into three areas: The Arena floor, the north and south side of seating areas, and the west end seating area.
 - b. The maintained horizontal footcandle level for seating areas shall be measured at seat level on the sloped incline using a 10'x10' calculation grid. The average maintained horizontal light level shall not be less than 3.0 foot-candles with a maximum: minimum ration of 3:1 or less. The minimum at any meter point shall not be less than 1.5 footcandles.
 - c. Emergency Lighting shall be provided within 30 seconds of power failure. Duration of emergency illumination shall be not less than 15 minutes.
6. Both outdoor and indoor Luminaire Mounting Height: Comply with recommendations in IESNA RP-6, Section 3.

2.04 FIXTURES

- A. Outdoor: The sports floodlights optical assembly shall be a one piece spun aluminum parabolic type reflector finished inside and out with a corrosion resistant anodized finish for maximum optical performance and lumen maintenance.
- B. Indoor: The arena sports floodlights, Type A1, optical assembly shall be a multi-segmented aluminum reflector with 95% reflective specular finish. Manufacturer to determine proper optical assembly beam pattern to achieve performance criteria.
- C. Outdoor: The optical assembly shall include a thermal and impact resistant glass lens in a stainless steel hinged doorframe. The doorframe shall be permanently attached to the reflector by the stainless steel hinge and held in place with stainless steel spring latches. The doorframe shall include a concentric butt-welded high temperature solid silicone gasket. The reflector shall also include a granular charcoal filter to protect the internal reflective surface from photometric degradation caused by the entry of dust and other fine particulate.

- D. Indoor: The optical assembly shall include a thermal and impact resistant glass lens in an aluminum doorframe. The doorframe shall be permanently attached to the reflector by screws. The doorframe shall include a concentric butt-welded high temperature solid silicone gasket. The reflector shall also include a granular charcoal filter to protect the internal reflective surface from photometric degradation caused by the entry of dust and other fine particulate.
- E. The optical assembly shall include a thermal resistant, vibration dampening lamp support positioned opposite of the lamp base so as to not interfere with light distribution. This support will dampen vibrations, which otherwise would decrease overall lamp life and maintain proper position of lamp within reflector.
- F. Outdoor: All fixtures mounted on the sideline poles shall be provided with means to minimize glare and spill lighting. Use of internal louvers and/or external visors shall be securely assembled to the optical housing.
- G. Indoor: All arena sports floodlights shall include a total blackout motorized shutter or shade system. This shutter/shade system shall provide no light leak when closed and maintain 100% lights output. Shutter system can remain closed indefinitely without excessive heat build-up. Shutter shall close/open in less than three (3) seconds and include a fail-safe lamp extinguishing relay to turn off lamp if the shutter would not close to ensure a dark arena when required. Shutter shall not interfere with photometric distribution of the fixture. Power for the motorized shutter/shade via 120-volt ballast tap from the remote ballast.
- H. All sports floodlights and work floodlights shall utilize the same 1500-watt metal halide lamp source for consistency in relamping and maintenance. Each fixture shall have a lockable aiming mechanism that will allow fixture to be rotated for relamping and repositioned without reaiming.
- I. Outdoor: The sports floodlights shall mount to the crossarms with a fully adjustable mounting bracket to allow aiming of fixture. The ballast assembly shall be remote from the fixture in a separate enclosure mounted near the base of the pole (10 feet above grade). Wiring between the remote ballast enclosure(s) and fixtures shall be via a wiring harness located within the pole.
- J. Indoor: The sports floodlights and work floodlights shall mount to the catwalk railings with a fully adjustable mounting bracket to allow aiming of fixture. The ballast assembly shall be remote from the fixture in a separate enclosure mounted to the same fixture mounting bracket supported to catwalk. Wiring between the remote ballast enclosure and fixture shall be via a cord and modular plug for both lamp and motorized shutter. Ballast also shall include 6' cord and locking plug for 277-volt operation.
- K. Indoor: The Work floodlights, Type A2, are separate from the Arena sports floodlights and are controlled all on/off only for clean up or set up work mode. The work floodlights will not have a shutter/shade system and cannot be used to supplement the sports floodlights.
- L. Indoor: The House floodlights, Type A3, are separate from both the Arena sports floodlights and Work floodlights and are controlled through the House dimming system. A portion of the House floodlights shall be an emergency power to yield emergency lighting of the Arena per the performance criteria.
- M. Indoor: In addition to each fixture being supported from the mounting hardware, the manufacturer shall supply stainless steel safety aircraft cable to support the fixture independently to the catwalk railing.

- N. All wiring on the Luminaire assembly shall meet National Electric Code and shall pass from each Luminaire on the assembly through protective enclosures to join in a common enclosure. Each luminaire shall have individual supplemental fuse protection located in remote ballast boxes. Fusing must be UL listed. In-line is not acceptable.

2.05 OUTDOOR: WIRING HARNESS

- A. The wiring harness between the fixtures and remote ballast enclosure(s) shall be multi-conductor type cable with an overall outer PVC jacket for physical protection. Minimum conductor size shall be #14AWG with individual color-coated insulation jacket to facilitate any troubleshooting. All conductors shall be stranded copper with 600-volt insulation with 90°C temperature rating.
- B. In addition to the outer PVC jacket around the multiple conductors, provide rubber bumpers spaced no greater than 10' on-center to minimize possible abrasion of outer PVC jacket on interior finish of pole.
- C. Include stainless steel wire mesh strain relief at top of wiring harness and secure to inside top of pole.
- D. Each end of wiring harness shall have a quick connector plug for ease of installation.
- E. Each wiring harness shall be tested at the factory to verify proper operation between ballast and fixture and to minimize field installation time.

2.06 OUTDOOR POLES

- A. Comply with AASHTO LTS-3 for poles or other support structures, brackets, arms, appurtenances, base, anchorage, and foundation.
- B. Wind-Load Strength of Total Support Assembly: Adequate to carry support assembly plus luminaires without failure, permanent deflection, or whipping in steady winds of 100 mph with a gust factor of 1.3.
- C. Mountings, Fasteners, and Appurtenances: Corrosion resistant, compatible with support components, and shall not cause galvanic action at contact points.
 - 1. Steel Components: Hot-dip galvanized after fabrication, complying with ASTM A 123 / A 123M.
 - 2. Mounting Hardware Fasteners: Hot-dip galvanized, complying with ASTM A 153 / A 153M.
- D. Poles shall be sectional type hot dipped galvanized steel poles to achieve minimum fixture mounting height specified. All poles shall include grounding lug, wire access handhole, remote ballast enclosure(s) mounting brackets and wiring access, lightning terminal atop pole, and jacking brackets. Contractor/Manufacturer may use prestressed centrifugally spun concrete poles meeting all structural requirements at their discretion.
- E. Pole base may either be a prestressed centrifugally spun concrete base pier or direct embedded hot dipped galvanized steel pole with black tar coating entire embedded length or a poured in place foundation concrete base.

- F. The foundation for either prestressed concrete base or base plate steel pole shall be designed around standard auger sizes with concrete fill to achieve a minimum 28-day compression strength of 3000 psi or greater as required by manufacturer's structural design analysis. Crushed rock or earth backfill is not acceptable!
- G. The sports lighting system manufacturer shall provide complete calculations within submittals verifying that the lighting pole meets the wind load requirements specified herein.
- H. The sports lighting structure system shall be designed to withstand an Isotach wind velocity of 90 mph plus a 1.3 gust factor, including the total effective projected area and weight of the fixtures and complete assembly. The loads computed by this method shall not be less than those based on 1 90 mph wind with an exposure "B" per International Building Code 2000 and ASCE 7-98.
- I. Sports lighting system manufacturer shall provide complete calculations within submittals verifying that the lighting pole meets the wind load requirements specified herein.
- J. Each section of the pole shaft shall be of a single ply of steel with no welded splices and having only one longitudinal seam weld. Each slip joint shall be assembled in the field by slipping the upper section over the lower section by a minimum lap of 1.5 times the largest inside diameter of the upper section. The pole cross section shall be rounded or 16-sided with a four-inch corner radius. The pole shaft sections shall be high strength steel meeting the requirements of ASTM A595 Grade A or B or ASTM A572 Grade 65.
- K. Poles shall be hot-dipped galvanized in accordance with the requirements of ASTM A123. Each component must be completely coated in a single dip. No double dipping will be allowed. All miscellaneous hardware shall be galvanized per ASTM A153.
- L. Each pole shall include a ½" diameter by 48" tall solid copper lightning protection air terminal with nickel plated tip.
- M. Crossarms shall be fabricated from hot dipped galvanized tubular steel. All mounting brackets and hardware shall be galvanized to ASTM A123 requirements.
- N. Manufacturer of sports lighting structure shall receive soil tests from Owner to properly design pole foundations.
- O. Manufacturer shall include cost to hire the services of a licensed Structural Engineer to review soil tests and design appropriate pole foundations. Include signed foundation drawings, calculations and all installation requirements in sports lighting system submittal.
- P. The poles shall have a 1" diameter grommet drilled in the pole shaft, prior to galvanizing, and furnished with a rubber plug for future speaker wiring access. This grommet shall be located approximately 12" below the externally mounted cross-arm or bracket and shall be suitable for supporting up to 4 speakers.

2.07 INDOOR: MOUNTING HARDWARE

- A. Manufacturer to provide complete mounting system for all arena sports lighting, work lighting and house lighting fixtures. The mounting system bracket shall be supported from a minimum of two (2) railings on the catwalk and be capable of stacking two fixtures, one above the other.
- B. Mounting bracket shall utilize cantilevered arms to hold fixtures out from the catwalk railing and allow for complete tilt and rotation of fixtures even when double stacked. Spacing and length of arms shall not restrict the aiming or relamping of fixtures.

- C. Mounting system shall include provisions for mounting remote ballast enclosures on a Z-spline bracket located on the catwalk side of the mounting system.
- D. The mounting system hardware shall be capable of supporting up to a minimum of 500 lbs.

2.08 WIRELESS LIGHTING CONTROL

- A. Manufacturer to provide wireless lighting control to manage, monitor and control all sports lighting.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for luminaire electrical and communications conduit to verify actual locations of connections before pole or luminaire installation.
- C. Examine foundations for suitable conditions where luminaires will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Shop Drawings: Prepare and submit the following:
 - 1. Nonstandard or Custom Luminaire Drawings, Diagrams, and Supporting Documents:
 - a. Include plans, elevations, sections, and mounting and attachment details.
 - b. Details of luminaire assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - c. Diagrams for power, signal, and control wiring.

3.03 INSTALLATION OF ATHLETIC FIELD LIGHTING

- A. Comply with manufacturer's published instructions.
- B. Reference Standards for Installation: Unless more stringent installation requirements are specified in Contract Documents or manufacturers' published instructions, comply with the following:
 - 1. Luminaires and Lamps: Article 410 of NFPA 70.
 - 2. Consult **Architect** for resolution of conflicting requirements.
- C. Special Installation Techniques:
 - 1. Athletic Field Luminaires:
 - a. Install luminaires at height and aiming angle as indicated on Drawings.

- b. Install controls in cabinets mounted on support structure at least **10 ft** above finished grade.
 2. Structural Supports:
 - a. Provide **steel or aluminum** poles and other support structures, brackets, arms, appurtenances, bases, anchorages, and foundations for athletic field lighting.
 - b. Use web fabric slings (not chain or cable) to raise and set structural members. Protect equipment during installation to prevent corrosion.
 - c. Install poles and other structural units level, plumb, and square.
 - d. Except for embedded structural members, grout void between pole base and foundation. Use nonshrinking or expanding concrete grout firmly packed in entire void space. Use a short piece of **1/2 inch** diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole. Nonshrink grout is specified in Section 055000 "Metal Fabrications."
 - e. Extend cast-in-place bolted base foundations **36 inch** above grade, minimum.
 3. Wiring Methods:
 - a. Install cables in raceways, except when cables are installed within boxes and poles. Conceal raceways and cables.
 - b. Feeders, Subfeeders, Branch Circuits, and Control Wiring: Underground nonmetallic raceway; 10 AWG minimum conductor size for power wiring.
 - c. Electrical Enclosures Exposed to Weather: UL 50E, Type 3R enclosure constructed from **stainless steel**, with hinged doors fitted with padlock hasps or lockable latches.
 - d. Install lighting control equipment and cabling connections to luminaires.
 4. Identification: Provide labels for athletic field lighting and associated electrical equipment.
 - a. Identify system components and terminals.
 - b. Identify field-installed conductors, interconnecting wiring, and components.
 - c. Provide warning signs.
 - d. Label each enclosure with engraved metal or laminated-plastic nameplate.
- D. Interfaces with Other Work:
1. Coordinate installation of new products with existing conditions.
 2. Coordinate with Section 260573.13 "Short-Circuit Studies" for determining available fault current on input feeder.
 3. Coordinate with Section 260573.19 "Arc-Flash Hazard Analysis" for determining arc-flash hazard inside equipment.
- E. Systems Integration: Integrate athletic field lighting controls with facility lighting controls.
- 3.04 FIELD QUALITY CONTROL OF ATHLETIC FIELD LIGHTING
- A. Field tests and inspections must be witnessed by authorities having jurisdiction.
- B. Tests and Inspections:

1. After installing sports lighting system and after electrical circuits have been energized, perform proof-of-performance field measurements and analysis for compliance with requirements.
 2. Playing and Other Designated Areas: Make field measurements at intersections of grids, dimensioned and located as specified in "Performance Requirements" Article
 3. Verify that grid sizes and number of measurements stated in first six subparagraphs below are adequate for Project and relate to Project boundaries.
 4. Make field measurements at established test points in areas of concern for spill light and glare.
 5. Perform analysis to demonstrate correlation of field measurements with specified illumination quality and quantity values and corresponding computer-generated values that were submitted with engineered design documents. Submit a report of the analysis. For computer-generated values, use manufacturer's lamp lumens that are adjusted to lamp age at time of field testing.
 6. Report results in writing.
- C. Nonconforming Work:
1. Sports lighting will be considered defective if it does not pass tests and inspections.
 2. Remove and replace defective units and retest.
 3. Correction of Illumination Deficiencies for Playing Areas: Make corrections to illumination quality or quantity, measured in field quality-control tests, that varies from specified illumination criteria by plus or minus 10 percent.
 - a. Add or replace luminaires; change mounting height and aiming; or install louvers, shields, or baffles.
 - b. If luminaires are added or mounting height is changed, revise aiming and recalculate and modify or replace support structures if indicated.
 - c. Do not replace luminaires with units of higher or lower wattage without Architect's approval.
 - d. Retest as specified above after repairs, adjustments, or replacements are made.
 - e. Report results in writing.
- D. Correction of Excessive Illumination in Spill-Light-Critical Areas: If measurements indicate that specified limits for spill light are exceeded, make corrections to illumination quantity, measured in field quality-control tests, that reduce levels to within specified maximum values.
1. Replace luminaires; change mounting heights and revise aiming; or install louvers, shields, or baffles.
 2. Obtain Architect's approval to replace luminaires with units of higher or lower wattage.
 3. If mounting height is changed, revise aiming and recalculate and modify or replace support structures if indicated.
 4. Retest as specified above after repairs, adjustments, or replacements are made.
- E. Assemble and submit test and inspection reports.
- 3.05 SYSTEM STARTUP
- A. Perform startup service.

1. Complete installation and startup checks in accordance with manufacturer's published instructions
- B. Manufacturer Services: Engage factory-authorized service representative to **supervise** system startup.
1. Manufacturer's Field Reports for System Startup Support: Prepare and submit report after each visit by factory-authorized service representative, documenting activities performed at Project site.
- 3.06 ADJUSTING
- A. Adjust luminaires and supports to maintain orientation and aiming as recommended by manufacturer.
- 3.07 PROTECTION
- A. After installation, protect athletic field lighting and associated electrical equipment from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.
- 3.08 MAINTENANCE
- A. Maintenance Service Agreement: Beginning at Substantial Completion, verify that maintenance service agreement includes **12 months'** full maintenance by **skilled employees of athletic field lighting Installer**. Include **annual** preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper athletic field lighting operation. Verify that parts and supplies are manufacturer's authorized replacement parts and supplies.

END OF SECTION

DIVISION 27

COMMUNICATIONS

This page intentionally left blank

SECTION 27 00 00
COMMUNICATIONS BASIC REQUIREMENTS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Basic Communications Systems Requirements.

1.2 GENERAL PROJECT INFORMATION

- A. The design-build team should provide a compliance letter with a statement of being fully compliant with Campus standards and requirements for the campus as part of the final submission documentation to the district. The design-build team should follow the latest District Design Guidelines and standards.
- B. This district-wide design standard and the accompanying specifications govern the work involved in furnishing, installing, testing, and placing into satisfactory operation the Communications Systems as specified herein.
- C. The contractor is to provide all new materials as indicated on the drawings, and/or in these specifications, and all items required to make their portion of the Communications Systems a finished and working system.
- D. For a complete list of material for each campus where work is performed.
- E. Project Description
 - 1. These Specifications and associated drawings are the governing document for the installation of the telecommunications infrastructure and include project descriptions, specified and recommended products, installation and project management methods, the scope of work, and elevation drawing specifications.
- F. Scope Summary description of Communications Systems include but are not limited to the following:
 - 1. Complete Structured Cabling System including, but not limited to:
 - a. Voice and data backbone cabling and terminations.
 - b. Voice and data horizontal cabling and terminations.
 - c. Information outlets (IO's) including faceplates, jacks, and labeling.
 - d. Equipment racks, cabinets, cable management, and equipment.
 - e. Telecommunication Room equipment including patch panels, optical distribution cabinets, and termination blocks.
 - f. Cabling pathways.
 - g. Grounding and Bonding
 - h. Testing

2. Complete Data Communications Equipment Systems.
3. Complete Voice Communications Equipment Systems.
4. Complete Audio/Visual Systems.
5. Low Voltage Communications Wiring (less than +120VAC) as specified and required for proper system control and communications.
6. All associated electrical backboxes, conduit, miscellaneous cabling, and power supplies are required for proper system installation and operation as defined in the "Suggested Matrix of Scope Responsibility".
7. All work and equipment shall conform to the most current ratified version of the following published standards unless otherwise indicated that draft standards are to be followed:
 - a. ANSI/NECA/BICSI 568 - Standard for Installing Commercial Building Telecommunications Cabling
 - b. ANSI/TIA-568-C.0 - Generic Telecommunications Cabling for Customer Premises
 - 1) C.1 - Commercial Building Telecommunications Standard
 - 2) C.2 - Balanced Twisted-Pair Telecommunications Cabling and Components Standard
 - 3) C.3 - Optical Fiber Cabling Components Standard
 - c. ANSI/TIA-569-C - Telecommunications Pathways and Spaces
 - d. ANSI/TIA-606-B - Administration Standard for Commercial Telecommunications Infrastructure
 - e. ANSI/TIA-607-B - Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - f. ANSI/TIA-758-B - Customer-Owned Outside Plant Telecommunications Standard
 - g. ANSI/TIA-862-A - Building Automation Systems Cabling Standard
 - h. ANSI/TIA-942-A - Telecommunications Infrastructure Standard for Data Centers
 - i. ANSI/TIA-1152 - Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling
 - j. ANSI/TIA/EIA-598-C - Optical Fiber Cable Color Coding
 - k. NFPA 70 (NEC) - National Electrical Code (Current Edition)
 - l. UL 444 - Standard for Safety for Communications Cable

- m. LACCD facilities Design standards cabling Telecommunications Ver2-February 2017
8. Bid Proposals
- a. Add/Delete prices must reflect the cost for adding outlet location Pre-Installation and Post-Installation.
 - b. The proposal shall include a complete Schedule of Values including the following items:
 - 1) All materials being proposed.
 - 2) Unit quantities for all materials
 - 3) Unit pricing for all materials
- G. Scope of Work:
- 1. General
 - a. The following Scope of Work is meant as a guideline for this project. Acceptable and recommended products, installation methods, project timelines, and Contractor responsibilities are detailed in other sections of this document.
 - b. It is the responsibility of the Contractor awarded this project to ensure that all quantities, materials, labor, permits, sales taxes, and any other costs to provide a turnkey project are included in their bid. Omissions on the part of the Contractor, either due to misinterpretation of this contract specification, the bid documents, or any other conditions of the project will be the responsibility of the Contractor and not result in any contract modification or additional costs to the Owner.
 - c. Floor plans, BDF Room and IDF Room drawings, elevation drawings, and other drawings received by the Contractor as part of the bid process are hereby incorporated into this document by reference. It is the responsibility of the Contractor to ensure that amounts and lengths of cabling and pathways are correct and that all materials and labor are included to install the system per the drawings and these specifications.
 - d. It is the responsibility of the Contractor to ensure that all materials and methods comply with all conditions of these specifications.
 - e. All materials required to provide a turn-key cabling infrastructure are to be provided and installed by the Contractor as part of this Scope of Work. Any item of equipment or material not specifically addressed on the drawings, specifications, or elsewhere in this document, but required to provide complete and functional systems as contemplated and/or specified herein, shall be provided at no additional charge to the owner in a quantity and quality consistent with other specified items.
 - f. The Contractor is responsible for ensuring the timely completion of the project based on the provided project timeline and is responsible for an investigation of any issues, including delivery, local licensing, and union, that might affect in any manner the scheduled installation of this project.
 - g. The Contractor is responsible to ensure all debris caused by drilling, saw cutting, filing, etc. are vacuumed daily to prevent potential injury to others and possible damage to electronic equipment.
 - h. The Contractor is responsible to maintain a clean work environment, all trash and debris caused by such contractor shall be picked up daily per general contractor requirements, terms, and conditions.

- i. Non-compliance with these conditions will result in the removal of any portion, not in compliance, and replacement at the expense of the Contractor per these Contract Conditions.
- j. A minimum of (1) complete copy of this Scope-of-Work/Specifications must be kept in the field at all times for the duration of the project build-out for reference by the Contractor's installation crew, managers, and the Owner.
- k. The division of work is the responsibility of the Prime Contractor. Any scope of work described in the contract document shall be sufficient for including the said requirement in the project. The Prime Contractor shall be solely responsible for determining the appropriate subcontractor for the described scope. In no case shall the project be assessed as an additional cost for the scope that is described in the contract documents. The following division of responsibility is a guideline based on typical industry practice.

H. Definitions:

- 1. "Electrical Contractor" as referred to herein refers to the Contractors listed in Division 26 of the Specification.
- 2. "Electrical Contractor" shall also refer to the Contractor listed in Division 27 of the specification when the "Suggested Matrix of Scope Responsibility" indicates the work shall be provided by the EC. Refer to the Contract Documents for the "Suggested Matrix of Scope Responsibility".
- 3. "Communications Contractor" as referred to herein refers to the Contractors listed in Division 27 of the Specification.
- 4. Low Voltage Communications Wiring: The wiring (less than 120VAC) associated with the Communications Systems, used for analog and/or digital signals between equipment.
- 5. Telecommunications Rough-in: Relates specifically to the backboxes, necessary plaster rings, and other miscellaneous hardware required for the installation and mounting of the telecommunications information outlet. Rough-in shall include conduit from the information outlet backbox to above the lay-in ceiling the nearest cable tray. Where surface mounted backboxes are required, the conduit shall be routed to above the lay-in ceiling the bottom of the exposed structural joists the nearest cable tray.

I. Miscellaneous:

- 1. The purpose of these standards is to outline typical Electrical and Communications contractors' work responsibilities as related to Communications Systems including Telecommunications rough-in, conduit, cable tray, power wiring, and Low Voltage Communications Wiring. The prime contractor is responsible for all divisions of work.

2. The exact wiring requirements for much of the equipment cannot be determined until the systems have been purchased and submittals are approved. Therefore, only known wiring, conduits, raceways, and electrical power as related to such items, is shown on the Communications Drawings. Other wiring, conduits, raceways, junction boxes, and electrical power not shown on the Communications Drawings but required for the successful operation of the systems shall be the responsibility of the Communications Contractor and included in the Contractor's bid.
 3. Where the Electrical Contractor is required to install conduit, conduit sleeves, and/or power connections in support of Communications systems, the final installation shall not begin until a coordination meeting between the Electrical Contractor and the Communications Contractor has convened to determine the exact location and requirements of the installation.
 4. Where the Electrical Contractor is required to install a cable tray that will contain Low Voltage Communications Wiring, the installation shall not begin until the Communications Contractor has completed a coordination review of the cable tray shop drawing.
 5. This Contractor shall establish Electrical and Communications utility elevations prior to fabrication and installation. The Communications Contractor shall cooperate with the Electrical Contractor and the determined elevations per the guidelines below. This Contractor shall coordinate utility elevations with other trades. When a conflict arises, priority shall be as follows:
 - a. Lighting Fixtures
 - b. Gravity Flow Piping, including Steam and Condensate
 - c. Sheet Metal
 - d. Electrical Busduct
 - e. Cable Trays, including 12" access space
 - f. Sprinkler Piping and other Piping
 - g. Conduit and Wireway
 - h. Open Cabling
- J. Electrical Contractor's Responsibility:
1. Assumes all responsibility for all required conduit and power connections when shown on the "Suggested Matrix of Scope Responsibility" to be provided by the Electrical Contractor.
 2. Assumes all responsibility for providing and installing a cable tray.
 3. Responsible for Communications Systems grounding and bonding.
 4. This Contractor is responsible for the coordination of utilities with all other Contractors. If any field coordination conflicts are found, the Contractor shall coordinate with other Contractors to determine a viable layout.
- K. Communications Contractor's Responsibility:

1. Assumes all responsibility for the Low Voltage Communications Wiring of all systems, including cable support where the open cable is specified.
2. Assumes all responsibility for all required backboxes, conduit, and power connections not specifically shown as being provided by the Electrical Contractor on the "Suggested Matrix of Scope Responsibility."
3. Assumes all responsibility for providing and installing all ladder rack and other cable management hardware (as defined herein).
4. Responsible for providing the Electrical Contractor with the required grounding lugs or other hardware for each piece of Communications equipment which is required to be bonded to the Communications ground system.
5. This Contractor is responsible for the coordination of utilities with all other Contractors. If any field coordination conflicts are found, the Contractor shall coordinate with other Contractors to determine a viable layout.

L. Coordination Drawings General Requirements:

1. Coordination drawing files shall be made available to the A/E and Owner's Representative for approval prior to the start of work. The A/E will only review identified conflicts and give an opinion, but will not perform as a coordinator.
2. A plotted set of coordination drawings shall be available at the project site.
3. Coordination drawings are not shop-drawings and shall not be submitted as such. The contractor shall be responsible to produce and submit shop drawings for approval from the campus and/or A/E.
4. The contractors will not be allowed additional costs or time extensions due to participation in the coordination process.
5. The contractors will not be allowed additional costs or time extensions for additional fittings, reroutings, or changes of duct size, which are essentially equivalent sizes to those shown on the drawings and determined necessary through the coordination process.
6. The A/E reserves the right to determine the space priority of equipment in the event of spatial conflicts or interference between equipment, piping, conduit, ducts, and equipment provided by the trades.
7. Changes to the contract documents that are necessary for systems installation and coordination shall be brought to the attention of the A/E.
8. Access panels shall preferably occur only in gypsum board walls or plaster ceilings where indicated on the drawings.
 - a. Access to mechanical, electrical, technology, and other items located above the ceiling shall be through accessible lay-in ceiling tile areas.
 - b. Potential layout changes shall be made to avoid additional access panels.
 - c. Additional access panels shall not be allowed without written approval from the A/E at the coordination drawing stage.

- d. Providing additional access panels shall be considered after other alternatives are reviewed and discarded by the A/E and the Owner's Representative.
 - e. When additional access panels are required, they shall be provided without additional cost to the Owner.
- 9. Complete the coordination drawing process and obtain sign off of the drawings by all contractors prior to installing any of the components.
 - 10. Conflicts that result after the coordination drawings are signed off shall be the responsibility of the contractor or subcontractor who did not properly identify their work requirements, or installed their work without proper coordination.
 - 11. Updated coordination drawings that reflect as-built conditions may be used as record documents.

M. Qualifications:

- 1. Only products of reputable manufacturers as determined by the Architect/Engineer will be acceptable.
- 2. The installing contractor shall have at a minimum a C-10 License and be certified by the manufacturer of the structured cabling system. Certification of Contractor shall have been in place for a minimum of one (1) year prior to bidding on this project. Documentation of certification is required at the time of the bid. Shop drawings will not be approved until proof of certification is submitted. Refer to the end of this specification section for certification documentation requirements.
- 3. Each Contractor and their subcontractors shall employ only workers who are skilled in their respective trades and fully trained. All workers involved in the termination of cabling shall be individually certified by the manufacturer.
- 4. The Contractor shall be experienced in all aspects of this work and shall be required to demonstrate direct experience on recent systems of similar type and size.
- 5. The Contractor shall own and maintain tools and equipment necessary for successful installation and testing of optical and copper structured cabling systems and have personnel adequately trained in the use of such tools and equipment.
- 6. The Contractor must have an active RCDD (Registered Communications Distribution Designer) on-staff serving as a project manager. Project shop drawings and test reports shall be stamped by the RCDD.
- 7. The Contractor shall have certified BICSI installation technicians on staff to perform the following tasks on the project:
 - a. Act as the field superintendent or job foreman with the responsibility of monitoring the daily work of each technician.
 - b. Oversee all testing and termination of cabling.
- 8. A resume of qualification shall be submitted with the Contractor's bid indicating the following:

- a. Documentation of certification of This Contractor by the proposed structured cabling system manufacturer as required at the end of this specification section.
 - b. A list of recently completed projects of similar type and size with contact names and telephone numbers for each.
 - c. A list of test equipment proposed for use in verifying the installed integrity of copper and fiber optic systems on the project.
 - d. A technical resume of experience for the Contractor's project manager and on-site installation supervisor assigned to this project.
 - e. Resume and certification of the RCDD for the project as required by the form at the end of this specification section.
 - f. Resume and certification of the BICSI installation technician for the project.
- N. Compliance with Codes, Laws, Ordinances:
1. The Contractor shall conform to all requirements of the City of Los Angeles Codes, Laws, Ordinances, and other regulations having jurisdiction over this installation.
 2. The Contractor shall also conform to all published standards of the Los Angeles Community College, as related to this installation.
 3. If there is a discrepancy between the codes and regulations having jurisdiction over this installation, and these specifications, the codes, and regulations shall determine the method or equipment used, otherwise the contractor shall be responsible to provide products specified where required.
 4. Verify the installation environment prior to purchasing or installing any cable. Cable installed in a plenum environment shall be appropriately rated. Bring all discrepancies between the contract documents and installation conditions to the attention of the Architect/Engineer prior to purchase or installation.
 5. All changes to the system made after the letting of the contract, in order to comply with the applicable codes or the requirements of the Inspector, shall be made by the Contractor without cost to the Owner.
- O. Warranty requirements at a minimum shall provide a five (5) year service warranty for all equipment, materials, and workmanship. Individual specifications sections may require additional warranty requirements for specific equipment or systems.
- P. Warranty requirements for CAT-6A and Fiber cabling shall be at a minimum of twenty-five (25) years. Cabling manufacturers shall not be mixed in order to maintain the warranty.
- Q. The contractor shall be responsible to provide a maximum 4-hour response time for servicing or replacing any equipment or devices installed for the project.

- R. The warranty period for the entire installation described in this Division of the specifications shall commence on the date of substantial completion unless a whole or partial system or any separate piece of equipment or component is put into use for the benefit of any party other than the installing contractor with prior written authorization. In this instance, the warranty period shall commence on the date when such a whole system, partial system, or a separate piece of equipment or component is placed in operation and accepted in writing by the Owner or their representative.
- S. Warranty requirements shall extend to correction, without cost to the final user, of all work and/or equipment found to be defective or non-conforming to the contract documents. The Contractor shall bear the cost of correcting all damage resulting from such defects or nonconformance with contract documents exclusive of repairs required as a result of improper maintenance or operation, or of normal wear as determined by the Architect/Engineer.
- T. Where several manufacturers' names are given, the first-named manufacturer constitutes the basis for job design and establishes the equipment quality required to be used per the contract.
- U. Equivalent equipment manufactured by the other named manufacturers may be used. The contractor shall be responsible to provide a side by side comparison chart for approval, this will not constitute the replacement of specified items. The contractor shall ensure that all items submitted by these other manufacturers meet all requirements of the drawings and specifications and fits in the allocated space. The Architect/Engineer shall make the final determination of whether a product is an equivalent.
- V. Any material, article, or equipment of other unnamed manufacturers which will adequately perform the services and duties imposed by the design and is of a quality equal to or better than the material, article, or equipment identified by the drawings and specifications may be used if approval is secured in writing from the Architect/Engineer not later than ten (10) days prior to the bid opening date. The Contractor bears full responsibility for the unnamed manufacturer's equipment adequately meeting the intent of the design. The Architect/Engineer may reject the manufacturer at the time of the shop drawing submittal. The Contractor assumes all costs incurred by other trades on the project as a result of changes necessary to accommodate the offered material, equipment, or installation method.
- W. Should this Contractor be unable to secure approval from the Architect/Engineer for other unnamed manufacturers as outlined above, this Contractor may list voluntary add or deduct prices for alternate materials on the bid form. These items will not be used in determining the low bidder. Should a voluntary alternate material be accepted, This Contractor shall assume all costs that may be incurred as a result of using the offered material, article, or equipment necessitating extra expense on This Contractor or on the part of other Contractors whose work is affected.
- X. Installation requirements shall be adhered to as follows. Installation of all conduits and cabling shall comply with Div. 26 specifications as required. Additional conduit requirements described within this Division shall be supplemental to the requirement described in Electrical Section 26 05 33. Conflicts exist between the two Divisions the more stringent (more expensive material and labor) condition shall prevail until bidding addendum or construction clarification or RFI can be submitted and responded to. In no case shall the Contractor carry the least stringent condition in the pricing.
- Y. It is the Contractor's responsibility to survey the site and include all necessary costs to perform the installation as specified.

- Z. The Contractor shall be responsible for identifying and reporting to the Architect/Engineer any existing conditions including but not limited to damage to walls, flooring, ceiling, and furnishings prior to the start of work. All damage to interior spaces caused by this Contractor shall be repaired at this Contractor's expense to pre-existing conditions, including final colors and finishes.
- AA. The Contractor shall conduct all tests required and applicable to the work both during and after the construction of the work.
1. The necessary instruments and materials required to conduct or make the tests shall be supplied by the Contractor who shall also supply competent personnel for making the tests who have been schooled in the proper testing techniques.
 2. In the event the results obtained in the tests are not satisfactory, This Contractor shall make such adjustments, replacements and changes as are necessary and shall then repeat the test or tests which disclose faulty or defective work or equipment, and shall make such additional tests as the Architect/Engineer or code enforcing agency deems necessary.
 3. All telecommunications tests that fail, including those due to excessive cabling lengths, shall be remedied by the Contractor without cost to the project.
 4. Application of foreign materials of any kind on any cable, cable jacket, or cable termination component will not be accepted. It shall be the Contractor's responsibility to replace any component containing overspray, in its entirety, at no additional cost to the project. Cleaning of the cables with harsh chemicals is not allowed. This requirement is regardless of the PASS/FAIL test results of the cable containing overspray. Should the manufacturer and warrantor of the structured cabling system desire to physically inspect the installed condition and certify the validity of the structured cabling system (via a signed and dated statement by an authorized representative of the structured cabling manufacturer), the Owner may, at their sole discretion, agree to accept said warranty in lieu of having the affected cables replaced. In the case of plenum cabling, in addition to the statement from the manufacturer, the Contractor shall also present to the Owner a letter from the Local Authority Having Jurisdiction stating that they consider the plenum rating of the cable to be intact and acceptable.
- AA. Before final payment will be authorized, this Contractor must have completed the following:
1. Submitted operation and maintenance manuals to the Architect/Engineer for review and final approval. The contractor will be responsible to provide any additional forms or documentation required by the District as applicable to the project
 2. Submitted bound copies of approved shop drawings for district record keeping. Such drawings shall be provided in the original condition as to when they were approved.
 3. A clean set of record documents including edited drawings and specifications accurately reflecting field conditions, inclusive of all project revisions, change orders, and modifications.
 4. Submitted a report stating the instructions given to the Owner's representative complete with the number of hours spent in the instruction. The report shall bear the signature of an authorized agent of This Contractor and shall be signed by the Owner's representative as having received the instructions.

5. Submitted testing reports for all systems requiring final testing as described herein in native and electronic PDF format and provide manufacturer software.
 6. Submitted start-up reports on all equipment requiring a factory installation inspection and/or start.
 7. Provide spare parts, maintenance, and extra materials in quantities specified in individual specification sections. Deliver to project site insert address here; submit the receipt to Architect/Engineer prior to final payment being approved.
- BB. Provide adequate instructions to the Owner's designated representative or representatives in the maintenance, care, and operation of the complete systems installed under this contract.
- CC. Provide verbal and written instructions to the Owner's representative or representatives by FACTORY PERSONNEL in the care, maintenance, and operation of the equipment and systems.
- DD. (3) hard copies of all deliverables shall be provided in a 3-ring binder. Soft copies of all deliverables shall be provided on an MP4 USB thumb drive. Must provide (2) thumb drives. The contractor where required shall make a DVD video recording of instructions to the Owner while explaining the system so additional personnel may view the instructions at a later date. The video recording shall be the property of the Owner.
- EE. The Architect/Engineer shall be notified of the time and place for the verbal instructions to be given to the Owner's representative so that their representative can be present if desired.
- FF. At a minimum, the contractor shall provide (4) hours of instruction time for each system or as specified and requested by the owner. Verbal requests shall not constitute the minimum time required for instruction. A written statement shall be provided to document the time of instruction.
1. The Contractor is responsible for all instructions to the Owner and/or Owner's operating staff on the Communications Systems.
 2. If the Contractor does not have Engineers and/or Technicians on staff who can adequately provide the required instructions on system operation, performance, troubleshooting, care, and maintenance, they shall include in the bid an adequate amount to reimburse the Owner for the Architect/Engineer to perform these services.
- GG. The Communications Systems included in the construction documents are to be complete and operating systems. The Architect/Engineer will make periodic job site observations during the construction period. The system start-up, testing, configuration, and satisfactory system performance is the responsibility of the Contractor. This shall include all calibration and adjustments of electrical equipment controls, equipment settings, software configuration, troubleshooting and verification of software, and final adjustments that may be required.

- HH. The Contractor, subcontractors, and equipment suppliers are expected to have skilled technicians to ensure that the system performs as designed. If the Architect/Engineer is requested to visit the job site for troubleshooting, assisting in the satisfactory start-up, obtaining satisfactory equipment operation, resolving installation and/or workmanship problems, equipment substitution issues, or unsatisfactory system performance, including callbacks during the warranty period through no fault of the design; the Contractor shall reimburse the Owner on a time and material basis for services rendered at the Architect/Engineer's standard hourly rates in effect at the time the services are requested. The Contractor shall be responsible for making payment to the Owner for services required that are product, installation, or workmanship related. Payment is due within 30 days after services are rendered.
- II. This Contractor shall maintain at the job site, a separate and complete set of Communications Drawings which shall be clearly and permanently marked and noted in complete detail any changes made to the location and arrangement of equipment or made to the Communications Systems and wiring as a result of building construction conditions or as a result of instructions from the Architect or Engineer. All Change Orders, RFI responses, Clarifications, and other supplemental instructions shall be marked on the documents. Record documents that merely reference the existence of the above items are not acceptable. Should This Contractor fail to complete Record Documents as required by this contract, This Contractor shall reimburse Architect/Engineer for all costs to develop record documents that comply with this requirement. Reimbursement shall be made at the Architect/Engineer's hourly rates in effect at the time of work.
- JJ. The above record of changes shall be made available for the Architect and Engineer's examination during any regular work time.
- KK. Upon completion of the job, and before final acceptance, This Contractor shall give the complete close-out documents to the Architect/Engineer.
1. Fiber and Copper Test results. Testers shall be calibrated 30 days prior to testing.
 2. Updated rack elevations after all equipment have been installed.
 3. Unique cable identifier for all installed communications cabling.
 4. Main pathways must be identified.
 5. All wireless access points must have the customer's AP # and MAC# included along with the unique cable number. Additional information shall be coordinated with the District Representative.
 6. Fiber Backbone, Copper Backbone and Horizontal Cables Schedule - Patching Matrix Spreadsheet.
 7. As-built drawings shall be provided by the contractor at two stages of the project.
 - a. Handwritten work in progress mark-ups of floor plan drawings showing all cable locations with the unique cable identification shall be delivered 4-weeks prior to the move-in date.
 - b. Electronic As-built drawings in Revit/CAD and PDF files shall be provided and delivered to the Owner and Owners Representative no more than five days after move-in.
 - c. One hard copy of the completed as-built drawings (floor plans only) shall be mounted within the BDF and IDF Rooms.
 - d. Additional hard copies may be requested by the Owner during the course of the project. All such requests shall be granted at no cost to the Owner.
 8. Warranty and Operations & Maintenance Documentation.
 - a. Workmanship Installation warranty.
 - b. Manufacturer performance warranty.
 - c. Manufacturer cut-sheets.
 9. Transmittal for non-installed equipment and accessories:
 - a. Patch cables
 - b. Passive hardware

SECTION 27 05 00

COMMON WORK RESULTS FOR COMMUNICATIONS

PART 1 GENERAL

1.01 SUMMARY

- A. The work shall consist of the design, provision, termination, testing, and documentation of a complete and fully functional structured high-performance copper and optical fiber communications cabling system. The instructions in this section are specific to communications installations and should be read in conjunction with other contract documents as applicable.
- B. Where there are discrepancies between the drawings and the specification, herein, and related specifications sections, the Contractor shall be responsible for providing the more onerous solution.

1.02 RELATED SECTIONS

- A. 27 05 28 – Pathways for Communications Systems
- B. 27 08 00 – Commissioning of Communications
- C. 27 11 00 – Communications Equipment Room Fittings
- D. 27 15 00 – Communications Horizontal Cabling
- E. 27 16 00 – Communications Connector Cords, Devices and Adapters

1.03 QUALIFICATIONS

- A. The communications cabling system installation work detailed in this section shall be carried out by a specialist installer company. The installer shall be certified by the system manufacturer (or manufacturers in the installation and testing of the cabling system).
- B. The installer shall have a proven track record in the field of telephone and data (high performance copper and optical fiber) cabling system installation. The installer shall have completed at least three previous installations of comparable size, complexity and manpower within the last three years. Each installation shall utilize components, installation practices and testing procedure equivalent to those specified in this document.

C. The Installer shall hold a valid State Contractors License (if required by the State) for the duration of the project. The Installer shall be responsible for obtaining permits and other requirements for performing work on this project. All costs associated with obtaining permits and other documentation shall be included in the bid sum for the project.

D. The installer shall be a locally registered and approved Certified Installer (CI) and shall be qualified to provide a twenty-five (25) year premium warranty covering products, performance, and applications assurance.

1.04 DEFINITIONS

A. Throughout this specification, the following definitions will apply:

1. Provide: Supply, furnish, deliver, install, pull, fix, dress, terminate, label, test, ground and document the components as per these specifications.
2. Entrance Facility (EF): An entrance to a building for both public and private network service cables, including wireless, mechanical, and electrical services, and the entrance point at the building wall, and continuing to the entrance room or space. Also known as building entrance, demarcation point (demarc) and entrance room or space.
3. Equipment Rooms (ERs), also known as MDF (Main Distribution Frame) Rooms or BDF (Building Distribution Frame) Rooms, are special-purpose rooms that provide space and maintain a suitable operating environment for the termination of backbone and campus cabling and house centralized communications and/ or computer equipment (such as Core Switches and Servers).
4. Telecommunications Rooms (TRs), also known as IDF Closets, Telecommunications Closets or Tele/Data Rooms are floor-serving spaces that provide a connection point between backbone and horizontal distribution pathways.
5. Backbone Cables: Cables interconnecting the Equipment Room (ER) and Telecommunications Rooms (TRs).
6. Link Cables: Cables interconnecting Telecommunications Rooms (TRs).
7. Horizontal Cables: Cables interconnecting the Telecommunications Rooms (TRs) to each workstation outlet.
8. External Cables: Cables that interconnect the building to external connection point(s) and/or other building(s). These cables are considered to be Outside Plant (OSP).
9. Station Cables: Cables linking workstation outlet to active equipment.
10. Client: The Owner, LACCD
11. Construction Manager: TBD
12. Architect: TBD
13. Consultant: TBD
14. Bidder: A company invited to bid for the works

15. Installer/Contractor: The Company installing the equipment as defined in this specification.
16. Owner's Representative: Vantage Technology Consulting Group

1.05 MANUFACTURER'S COMPLETE SYSTEM

- A. The cabling system specified in this document shall be an end-to-end solution that is sourced from a single manufacturer or partnered manufacturers. Unless explicitly noted within these specifications, this shall include patch panels, connectors, cables, patch cords, face plates and other associated components.
- B. Where it is specified that a system be provided by "manufacturer xxx or equal", a substitution of another manufacturer's products will only be considered for a complete end-to-end solution of equal quality, as determined by the Owner's Representative. All substitutions shall conform to the substitution requirements detailed in the specifications. In instances where these specifications do not include the statement "or equal" for a particular component or system, substitutions will not be entertained.

1.06 JOB CONDITIONS

- A. Prior to bidding, visit the site and determine all existing conditions affecting work. The Bidder shall examine all drawings and specifications to familiarize themselves with the type of construction to be used, and the nature and extent of work provided by other trades.
- B. Verify dimensions and the correct location of hardware before proceeding with the installation of hardware, cabling and/or connections.
- C. Contractor to field verify the location of all communications infrastructure and confirm it is in conformance to industry standards. This would include bend radius, pathways accessibility, pathways lengths to MDF/IDF or other conditions that would impair the ability of the contractor to adhere to these specifications.
- D. The contractor shall notify the Owners' Representative in writing via RFI immediately of the discovery of construction discrepancies or other conditions detrimental to proper performance of the Work. In the event the contractor installs systems components that do not meet this specification, it will be the responsibility of the contractor to revise the installation at no cost to the owner.

1.07 PERSONNEL

- A. The personnel who will be employed on the contract shall be suitably trained in the management of a project of this nature and/or in the installation and maintenance of products of the type being provided to be able to carry out all work in a competent manner.

- B. The Installer shall provide a site manager responsible for all site-related issues. This individual shall be the single point of contact for the project team and shall carry a mobile phone so they can be contacted during the working hours of the project.
- C. The Installer shall be certified by the component manufacturer(s) in the installation and testing of the cabling system and shall be able to provide a manufacturers' extended performance warranty for the end-to-end cabling system.

1.08 LABELING AND NUMBERING SCHEME

- A. Labeling of the cabling system shall be in accordance with ANSI/TIA-606-C Administration Standard for Telecommunications Infrastructure, unless otherwise directed by the Owner.
- B. The contractor shall submit for approval the proposed numbering scheme prior to removal of any temporary labeling.

1.09 WARRANTY

A. Installation Warranty.

- 1. Installer to provide a warranty for one year from Notice of Completion on all materials and workmanship installed or supplied as part of the cabling system. The warranty shall cover all labor and materials necessary to correct a failed portion of the system and to demonstrate performance within the original installation specifications after repairs are accomplished. This warranty shall be provided at no additional cost to the Owner.

B. Cabling System Warranty:

- 1. The contractor shall facilitate a 25-year system performance warranty between the manufacturer and the Owner. A component warranty shall be provided which warrants functionality of all components used in the system for 25 years from the date of acceptance. The performance warranty shall warrant the installed horizontal copper, and both the horizontal and the backbone optical fiber portions of the cabling.

C. Post Installation Series:

- 2. The contractor shall furnish an hourly rate with the proposal submittal which shall be valid for a period of one year from the date of acceptance. This rate will be used when cabling support is required to affect moves, adds, and changes to the system (MACs). MACs shall not void the Contractor's nor manufacturer's warranty.

1.10 QUALITY

- A. The Contractor shall be responsible for the complete provision and installation of all components as specified herein. The Contractor shall provide all tools, equipment, fixtures, appliances, ancillary piece parts and hardware as necessary to complete the assembly and installation as required. The Owner's Representative may conduct scheduled or unscheduled inspections of the Contractor's work at any time during construction. All work included in the scope assigned to the contractor that is associated with this project shall be accomplished in a workmanlike manner, installed, and assembled plumb, level and square. The product shall be delivered to the Owner finished, complete, and ready to operate according to the manufacturer's specifications.
- B. All installation work shall be completed to the standard of the samples approved by the Owner's Representative during the submittal process. Any products not installed to the quality detailed in these specifications and approved in the submittal process shall be reworked by the Installer to the satisfaction of the Owner's Representative at no additional cost to the Owner.
- C. All equipment and components shall be installed per the manufacturer's directions and installation instructions. Any products not installed per manufacturer guidelines shall be reworked by the Installer to the satisfaction of the Owner's Representative at no additional cost to the Owner.

1.11 STANDARDS

- A. All materials provided by the Installer shall meet the requirements of the following where applicable:
 - 1. National Electrical Manufacturer's Association (NEMA)
 - 2. American National Standards Institute (ANSI)
 - 3. Underwriters Laboratories, Inc. (UL)
 - 4. Intertek Electrical Testing Labs (ETL)
- B. All products, services and documentation provided by the Installer shall meet the requirements of the following where applicable. Use latest edition or edition adopted by the Authority Having Jurisdiction.
 - 1. National Electric Code (NEC) – NFPA 70
 - 2. National Fire Alarm and Signaling Code - NFPA 72
 - 3. Relevant State Electric and Fire Codes
 - 4. ANSI/TIA-568.0-E Generic Telecommunications Cabling for Customer Premises
 - 5. ANSI/TIA-568.1-E Commercial Building Telecommunications Cabling
 - 6. ANSI/TIA-568.2-D Balanced Twisted-Pair Telecommunications Cabling and Components
 - 7. ANSI/TIA-568.3-D Optical Fiber Cabling Components
 - 8. ANSI/TIA-568.4-D Broadband Coaxial Cabling and Components
 - 9. ANSI/TIA-569-E Telecommunications Pathways and Spaces

10. ANSI/TIA-606-C Administration Standard for Telecommunications Infrastructure
 11. ANSI/TIA-607-C Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises
 12. Manufacturer's design and installation agreements.
 13. LACCD Standards for IT Infrastructure and Technology Systems
 14. Los Angeles City College Campus Standards Matrix dated 08/12/2021 (or latest revision).
 15. BICSI publications:
 - a. Telecommunications Distribution Methods Manual
 - b. Network Design Reference Manual
 - c. Information Transport Systems Installation Manual
 - d. Customer Owned Outside Plant Design Manual
- C. All publications referred to in this document shall be the latest edition.

1.12 SUBMITTALS

A. Project References

1. Submit for approval, references for a minimum of three similar projects successfully undertaken and completed within the last three years. These projects should be a similar scale, complexity and have similar time scales as this project.
2. Provide project name and address, client contact name and telephone number and construction manager name and telephone number. Provide a brief description of each project indicating types of system installed, quantities and configurations of outlets and project time scales.
3. At least two of the references shall be located within 100 miles of the project and shall be available for the Owner's Representative and other members of the Design Team to visit and inspect the installation, should, in the opinion of the Owner's Representative, this be necessary.
4. These references are intended to show that the Installer has successfully completed similar projects. Failure to produce satisfactory references may result in the bid being deemed non-compliant.

B. Product Literature/Data Sheets

1. Submit for approval manufacturer's product data sheets for each component of the telephone and data cabling systems contained within this specification and associated documentation. Certify that the data sheets depict the components to be provided by the Installer to make up the complete system as described in this specification.
2. Submit the required information for all products within a specification Section at one time unless the Owner's Representative has given prior approval to submit information otherwise.

3. Equipment installed and not approved for installation via the submittal process will be replaced at no expense to the Owner.
4. Prior to installation, submit for approval records regarding the management, installation, and testing personnel to be used on the project. These records shall include resumes, training certificates, previous work experience details (especially on reference projects) and other relevant information.
5. Submit records to confirm that the personnel who will be employed in an installation capacity are suitably trained in the installation and maintenance of equipment and systems of the type being provided.
6. Submit records to confirm that the personnel that will be responsible for testing the system are suitably trained in the operation of the test equipment being used in this project.

C. Shop Drawing/Cabling Diagram

1. Submit shop drawings for approval and a complete single-line cabling diagram. The diagram shall be based on the single line drawing included in the Construction Documents and show all ER/MDF, TR/IDF and cable termination points or pass-through locations in the building riser.
2. Single line to be coordinated with building riser diagrams and reflect for record the building conduits used cable quantities in each bundle and conduits with spare capacity.
3. Single line to show quantities and part numbers for all typical components including faceplates, patch panels, cable, equipment racks, splice cases and all other system components.

D. Test Equipment

1. Submit, for approval, details of each item of test equipment to be used to test the optical fiber and copper components. Include patch cords and other specialized components.
2. Submit for approval a written description of the cable (copper/fiber) testing procedure indicating each test to be performed, and the process of correcting any failures prior to commencement testing for approval. Any testing to copper/fiber components performed without an approved test procedure shall be retested at the contractor's expense.
3. Contractor to provide certification of calibration dated within one (1) year of installation date. Any testing to copper/fiber components performed without calibration certification is to be retested upon certification at the contractor's expense.

E. Component Samples and Mock-ups

1. Provide one full size installation sample mock-up of each of the following components for approval. All samples are to be fully labeled as per these specifications. Samples are to be delivered to the Construction Manager's office on site prior to installation.
2. All sample mock-ups are intended to represent the components that are to be installed as part of this project; therefore, they are to be provided with all associated components and labeling necessary to make up a complete mock-up. This will include but not be limited to: Backbox, and 12" span of conduit as specified in the construction documents, cable, jacks, wire ties and any other components that make up an outlet location.
3. Installation shall not proceed until the Owner's Representative has approved the samples. Once samples and other documents have been submitted, inspected by the Owner's Representative, and approved, they shall be retained. The samples will be used as the standards by which the quality of work on the project by the Installer shall be judged. Any installation that does not meet this standard shall be replaced or re-worked as approved by the Owner's Representative, at no cost to the project.
4. Outlet Samples.
 - a. Provide a mock-up of each communications outlet, as listed below. The sample is intended to represent a typical communications outlet and shall include all associated parts to make a complete sample. Provide bushings and strain relief for the horizontal cable jacket, demonstrating how the cable shall be secured. Label the outlet and each connector as detailed in this specification.
 - b. Provide samples of the following outlet configurations:
 - 1) Wall-mounted
 - 2) Ceiling outlet
 - 3) Floor outlet

F. As-Built Documentation

1. Following completion of the installation, submit the following record drawings, documentation, and testing records for approval.
2. As-Built Drawings

- a. All drawings shall be provided in hard copy (half size) and electronic format in AutoCAD DWG and/or Revit RVT, as directed by the Owner, and PDF files supplied on USB flash drive or other approved media. It is the contractor's responsibility to acquire current architectural backgrounds for production of as-built documentation.
 - b. Legend Sheet: Provide a drawing identifying all symbols used within the as-built record set and any relevant notations.
 - c. Floor Plans: To be of identical scale to architectural document set and consist of all outlet locations, fact plate labels, major cable pathways, riser locations, splice points, consolidation box locations Technology Rooms (TR), Equipment Rooms (ER), and Entrance Facilities (EF).
 - d. Enlarged Plans: Shall be enlarged plans of each TR, ER, EF or Machine room/datacenter. They shall reflect Equipment Racks, Backboards, Telecommunication Grounding Busbars (TGB) locations, equipment rack elevations, wall elevations where equipment is present and cabling pathways.
 - e. Single line diagram as previously submitted and updated to reflect any changes since original submission.
3. Final Test Results
- a. Contractor to provide testing results of all tests performed on each cable indicating tests performed, results obtained, and values measured.
 - b. Test results shall be all inclusive to the scope of work and include punch list items and all required retests for failed components. Incomplete submittals will be rejected without re- view, for re-submittal.
 - c. Electronic native format test results shall include the test equipment manufactures software for reading and interpreting test results. OTDR test results shall be in electronic format as well.
 - d. Test results include the test equipment by name, manufacturer, model number, serial number and copy last calibration certificate.
4. Warranties
- a. 25-year Manufacturer Warranty
 - b. Workmanship Warranty
 - c. Transmittal of non-installed equipment and hardware

SECTION 27 05 03

COMMUNICATIONS THROUGH PENETRATION FIRESTOPPING

PART 1 - GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.01 SECTION INCLUDES

- A. This section includes fire stopping for through-penetrations and joints in or between the following fire-resistance-rated assemblies, including both blank openings, linear openings, and openings containing penetrating items:

1. Floor-ceiling assemblies.
2. Roof-ceiling assemblies.
3. Walls and partitions.
4. Smoke barriers.
5. Construction enclosing compartmentalized areas.

1.02 QUALITY ASSURANCE

- A. Manufacturer: Company specializing in manufacturing products specified in this Section.
- B. Installer: Individuals performing work shall be certified by the manufacturer of the system selected for installation.

1.03 REFERENCES

- A. Underwriters Laboratories (UL) of Northbrook, IL "Fire Resistance Directory".
1. Through Penetration Firestop Systems (XHEZ)
 2. Joint Systems (XHBN)
 3. Perimeter Fire Containment Systems (XHDG)
 4. Continuity Head-of-Wall Joint Systems (XHBO)
 5. Fill, Void, or Cavity Materials (XHHW)
 6. Firestop Devices (XHJI)
 7. Forming Materials (XHKU)

8. Wall Opening Protective Materials (CLIV)
- B. All major building codes:
1. International Building Code published by ICC.
 2. (Note to specifier: Retain or delete the building codes listed above as applicable).
- C. National Fire Protection Association (NFPA) of Quincy, MA “NFPA 101: Life Safety Code”.
- D. National Fire Protection Association (NFPA) of Quincy, MA “NFPA 70: National Electrical Code”.
- E. Factory Mutual Approvals (FM) of Norwood, MA “FM 4991: Standard for Approval of Firestop Contractors”.
- F. Underwriters Laboratories (UL) of Northbrook, IL “UL Qualified Firestop Contractor Program”

1.04 PERFORMANCE REQUIREMENTS

- A. Provide products that upon curing do not re-emulsify, dissolve, leach, breakdown, or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water, or other forms of moisture characteristic during and after construction.
- B. When intumescent products are used, provide products that do not contain sodium silicate or any other water-soluble intumescent ingredient in the formulation.
- C. Provide firestop products that do not contain ethylene glycol.
- D. Provide firestop sealants sufficiently flexible to accommodate motion such as pipe vibration, water hammer, thermal expansion, and other normal building movements without damage to the seal.
- E. Pipe insulation shall not be removed, cutaway, or otherwise interrupted through wall or floor openings. Provide products appropriately tested for the thickness and type of insulation utilized.
- F. Fire-rated pathway devices shall be the preferred product and shall be installed in all locations where frequent cable moves, add-ons, and changes will occur. Such devices shall be:
1. Capable of retrofit around existing cables
 2. Designed such that two or more devices can be ganged together
 3. Maintenance-free such that no action is required to activate the smoke and fire sealing mechanism
- G. When mechanical cable pathways are not practical, openings within walls and floors designed to accommodate voice, data, and video cabling shall be provided with re-entenable products specifically designed for retrofit.

- H. Provide fire-resistive joint sealants sufficiently flexible to accommodate movement such as thermal expansion and other normal building movements without damage to the seal.
- I. Provide fire-resistive joint sealants designed to accommodate a specific range of movement and tested for this purpose in accordance with a cyclic movement test criteria as outlined in Standards, ASTM E1966, or ANSI/ UL 2079.
- J. Provide penetration firestop systems, fire-resistive joint systems, or perimeter fire barrier systems subjected to an air leakage test conducted in accordance with Standard, ANSI/ UL1479 for penetrations and ANSI/UL2079 for joint systems with published L-Ratings for ambient and elevated temperatures as evidence of the ability of firestop system to restrict the movement of smoke.
- K. Provide T-Rating Collar Devices tested in accordance with ASTM E814 or ANSI/UL1479 for metallic pipe penetrations requiring T-Ratings per the applicable building code.
- L. Provide a fire-rated grommet for all individual or small grouped cable applications up to 0.53 in. (14 mm).
- M. Provide moisture-curing products where inclement weather or greater than transient water exposure is expected.

1.05 MEETINGS

- A. Pre-installation meeting: A pre-installation meeting shall be scheduled and shall include the Construction Manager, General Contractor, all Subcontractors associated with the installation of systems penetrating fire barriers, Firestopping Manufacturer's Representative, and the Owner.
 - 1. Review foreseeable methods related to fire stopping work.
 - 2. Tour representative areas where fire stopping is to be installed; inspect and discuss each type of condition and each type of substrate that will be encountered, and preparation to be performed by other trades.

1.06 WARRANTY

- A. Provide a one-year warranty on parts and labor at a minimum. The contractor should provide an added warranty to the district based on inspection frequency.
- B. Warranty shall cover repair or replacement of firestop systems which fail in joint adhesion, cohesion, abrasion resistance, weather resistance, extrusion resistance, migration resistance, stain resistance, general durability, or appear to deteriorate in any manner not clearly specified by the manufacturer as an inherent quality of the material.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

- A Subject to compliance with through-penetration firestop systems (XHEZ) and/or wall opening protective materials (CLIV) and/or joint systems (XHBN) and/or perimeter fire containment systems (XH DG) and/or continuity head-of-wall joint systems (XHBO) listed in Volume 2 of the UL Fire Resistance Directory, provide products of the following manufacturers as identified below:
1. Acceptable Manufacturer: Specified Technologies Inc., 210 Evans Way, Somerville, NJ 08876. Tel: (800) 992-1180, Fax: (908) 526-9623, Email: specseal@stifirestop.com, Website: www.stifirestop.com.
 2. Hilti, Inc., Tulsa, Oklahoma 800-879-8000 www.us.hilti.com
 3. Single Source: Obtain firestop systems for each type of penetration and construction condition indicated only from a single manufacturer.

2.02 THROUGH PENETRATION FIRESTOP SYSTEMS

- A General: LACCD standards should be to provide Kit Style assembly system and putty style fire blocking materials where possible. Use only fire stopping products that have been tested for specific fire-resistance-rated construction conditions conforming to construction assembly type, penetrating item type or joint opening width and movement capabilities, annular space requirements, and fire-rating involved for each separate instance.
- B Intumescent Sealants: Single component intumescent latex formulations containing no water-soluble intumescent ingredients capable of expanding a minimum of 8 times, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSS Intumescent Sealant
 2. Specified Technologies, Inc. (STI) SpecSeal Series LCI Intumescent Sealant
 3. HILTI
- C Endothermic Sealants: Single component latex formulations that upon cure do not re-emulsify during exposure to moisture, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series LC Endothermic Sealant
 2. HILTI
- D Elastomeric Sealants: Single component latex formulations that upon cure do not re-emulsify during exposure to moisture and accommodate minimum ± 25 percent movement, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series AS Elastomeric Spray
 2. Specified Technologies, Inc. (STI) SpecSeal Series ES Elastomeric Sealant
 3. HILTI
- E Firestop Devices: Factory-assembled steel collars lined with intumescent material capable of expanding a minimum 30 times sized to fit the specific outside diameter of penetrating item, the following products are acceptable:

1. Specified Technologies, Inc. (STI) SpecSeal Series SSC Firestop Collars
 2. Specified Technologies, Inc. (STI) SpecSeal Series LCC Firestop Collars
 3. HILTI
- F. Fire Rated Cable Pathways: Gangable device modules capable of being retrofitted around existing cables and comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill and requiring no additional action in the form of plugs, twisting closure, putty, pillow, or sealant to achieve fire and leakage ratings, the following products are acceptable:
1. Specified Technologies Inc. (STI) EZ-Path Fire Rated Pathway
 2. HILTI
- G. Wall Opening Protective Materials: Intumescent, non-curing pads or inserts for protection of electrical switch and receptacle boxes to reduce horizontal separation to less than 24" (610 mm), the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSP Firestop Putty Pads
 2. Specified Technologies, Inc. (STI) SpecSeal Series EP PowerShield Insert Pads
 3. HILTI
- H. Firestop Putty: Intumescent, 100% solids, non-hardening, water-resistant, butyl rubber based putties containing no solvents or silicone compounds, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSP Firestop Putty
 2. HILTI
- I. Wrap Strips: Single component intumescent elastomeric strips faced on both sides with a plastic film and capable of expanding a minimum of 30 times, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series RED2 Wrap Strip
 2. Specified Technologies, Inc. (STI) SpecSeal Series BLU2 Wrap Strip
 3. HILTI
- J. Firestop Pillows: Re-enterable, non-curing, mineral fiber core encapsulated with an intumescent coating on all six sides contained in a flame retardant polybag, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSB Firestop Pillows
 2. HILTI
- K. Mortar: Portland cement-based dry-mix product formulated for mixing with water at Project site to form a non-shrinking, water-resistant, homogenous mortar, the following products are acceptable:

1. Specified Technologies, Inc. (STI) SpecSeal Series SSM Firestop Mortar
 2. HILTI
- L. Silicone Sealants: Moisture curing, single component, silicone elastomeric sealant for horizontal surfaces (pourable or non-sag) or vertical surface (non-sag), the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal SIL300 Silicone Firestop Sealant
 2. Specified Technologies, Inc. (STI) SpecSeal SIL300 SL Self-Leveling Silicone Firestop Sealant'
 3. HILTI
- M. All-Weather Coatings: Moisture curing, single-component silicone copolymer elastomeric spray coatings for horizontal surfaces where greater water resistance is required or inclement weather is anticipated, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal FT305 Firestop Spray
 2. HILTI
- N. Silicone Foam: Multicomponent, silicone-based liquid elastomers, that when mixed, expand and cure in place to produce a flexible, non-shrinking foam, the following products are acceptable:
1. Specified Technologies, Inc. (STI) Pensil 200 Silicone Foam
 2. HILTI
- O. Composite Sheet: Intumescent material sandwiched between a galvanized steel sheet and steel wire mesh protected with aluminum foil capable of sustaining a minimum of 2,500 lbs (1,134 kg) when subjected to load testing, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal CS Composite Sheet
 2. HILTI
- P. Cast-In-Place Firestop Device: Single component molded firestop device installed on forms prior to concrete placement with totally encapsulated, tamper-proof integral firestop system and smoke sealing gasket, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal CD Cast-In Firestop Device
 2. HILTI
- Q. Fire-Rated HVAC Retaining Angles: Steel angle system with integral intumescent firestop gasket for use on steel HVAC ducts, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal FyreFlange Firestop Angles
 2. HILTI
- R. Firestop Plugs: Re-enterable, foam rubber plug impregnated with intumescent material capable of expanding minimum of 10 times with expansion beginning at 350°F (177°C) for use in blank openings and cable sleeves, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series FP Firestop Plug
 2. HILTI

- S. Fire-Rated T Rating Collar Device: Louvered steel collar system with synthetic aluminized polymer coolant wrap installed on metallic pipes where T Ratings are required by applicable building code requirements, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal T-Collar Device
 2. HILTI
- T. Fire-Rated Cable Grommet: Molded two-piece grommet made from plenum grade polymer with a foam inner core for sealing cable penetrations up to 0.53 in. (14 mm) diameter, the following products are acceptable:
1. Specified Technologies, Inc. (STI) EZ-Firestop Grommet (RFG1 or RFG2)
 2. HILTI
- U. Fire-Rated Closet Flange Gasket: Molded, single-component, intumescent gasket for use beneath a closet flange in floor applications, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series CF34 Closet Flange Firestop Gasket
 2. HILTI

PART 3 – EXECUTION

3.01 EXAMINATION

- A. Examination of Conditions: Examine areas and conditions under which work is to be performed and identify conditions detrimental to proper or timely completion.
- B. Surfaces to which firestop materials will be applied shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellents, and any other substances that may inhibit optimum adhesion.
- C. Provide masking and temporary covering to prevent soiling of adjacent surfaces by fire stopping materials.
- D. Do not proceed until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General Requirements: Install through-penetration firestop systems and fire-resistive joint systems in accordance with the "Performance Criteria" Article and in accordance with the conditions of testing and classification as specified in the published design.
- B. Manufacturer's Instructions: Comply with manufacturer's instructions for installation of fire stopping products.
1. Seal all openings or voids made by penetrations to ensure an air and water-resistant seal.

2. Consult with the mechanical engineer, project manager, and damper manufacturer prior to installation of through-penetration firestop systems that might hamper the performance of fire dampers as it pertains to ductwork.
3. Protect materials from damage on surfaces subjected to traffic.
4. Apply a suitable bond-breaker to prevent three-sided adhesion in applications where this condition might occur such as the intersection of a gypsum wallboard/steel stud wall to floor or roof assembly where the joint is backed by a steel ceiling runner or track.
5. Where the joint application is exposed to the elements, the fire-resistive joint sealant must be approved by the manufacturer for use in exterior applications and shall comply with ASTM C-920, "Specification for Elastomeric Joint Sealants".

3.03 CLEANING AND PROTECTING

- A. Clean excess fill materials adjacent to openings as Work progresses by methods and with cleaning materials that are approved in writing by through-penetration firestop system manufacturers and that do not cause damage. The contractor shall be responsible to provide visual inspection at end of the project and shall be responsible to correct any deficiencies prior to the owner's visual verification. Where the owner finds enough repairs are needed, the contractor shall make the repair at no additional cost.
- B. Provide final protection and maintain conditions during and after installation that ensures that through-penetration firestop systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, remove damaged or deteriorated through-penetration firestop systems immediately and install new materials to produce systems complying with specified requirements.

3.04 IDENTIFICATION

- A. Provide and install labels adjacent to each fire stopping location. The label shall be provided by the firestop system supplier and contain the following information in a contrasting color:
 1. The words "Warning - Through Penetration Firestop System - Do Not Disturb. Notify Building Management of Any Damage."
 2. Firestop System Supplier; UL or listed by Intertek / Warnock Hersey system number; date installed; contractor name and phone number; manufacturer's representative name, address, and phone number.

3.05 INSPECTION

- A. All penetrations shall be inspected by the manufacturer's representative to ensure proper installation.
- B. Access to firestop systems shall be maintained for examination by the Authority Having Jurisdiction at their request.

- C. Proceed with enclosing through-penetration firestop system with other construction only after inspection reports are issued and firestop installations comply with requirements.
- D. The contractor shall allow for a visual destructive review of 5% of installed firestop systems (minimum of one) to prove compliance with specifications and manufacturer's instructions and details. Destructive system removal shall be performed by the contractor and witnessed by the Architect/Engineer and manufacturer's factory representative. The Architect/Engineer shall have the sole discretion of which firestop system installations will be reviewed. The contractor is responsible for all costs associated with this requirement including labor and material for removing and replacing the installed firestop system. If any firestop system is found to not be installed per manufacturer's specific instructions and details, all firestop systems are subject to destructive review and replacement at the Architect/Engineer's discretion and the contractor's expense.

SECTION 27 05 26

COMMUNICATIONS BONDING

PART 1 - GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.1 SECTION INCLUDES

- A. Bonding Conductors
- B. Bonding Connectors
- C. Grounding Busbar (TMGB and TGB)
- D. Rack-mount Telecommunications Grounding Busbar

1.2 RELATED WORK

- A. Refer to Division 26 for Raceways and Boxes for Electrical Systems, Grounding, and Bonding for Electrical Systems.
- B. Refer to Division 27 for Basic Communications Systems Requirements, Through Penetration Firestopping, Communication Equipment Rooms, Interior Communications Pathways, and Identification and Administration.

1.3 QUALITY ASSURANCE

- A. Communications bonding system component, device, equipment, and material manufacturer(s) shall have a minimum of five (5) years of documented experience in the manufacture of communications bonding products.
- B. The entire installation shall comply with all applicable electrical codes, safety codes, and standards. All applicable components, devices, equipment, and material shall be Underwriters' Laboratories, Inc. Listed.

1.4 REFERENCES

- A. ANSI/IEEE 1100 – Recommended Practice for Power and Grounding Sensitive Electronic Equipment in Industrial and Commercial Power Systems
- B. ANSI/TIA/EIA 568-C – Commercial Building Telecommunications Cabling Standard
- C. ANSI/TIA/EIA 569-A – Commercial Building Standard for Telecommunications Pathways and Spaces
- D. ANSI/TIA/EIA 606 – Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
- E. ANSI/TIA/EIA 758 – Customer-Owned Outside Plant

- F. ANSI-J-STD-607-A – Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
- G. IEEE 81 – IEEE Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System Part 1: Normal Measurements
- H. IEEE 837 – IEEE Standard for Qualifying Permanent Connections Used in Substation Grounding
- I. NFPA 70 – National Electrical Code
- J. NFPA 780 – Standard for the Installation of Lightning Protection Systems
- K. UL 96 – Lightning Protection Components
- L. UL 96A – Installation Requirements for Lightning Protection Systems
- M. UL 467 – Grounding and Bonding Equipment

1.5 SYSTEM DESCRIPTION

- A. The system described her-in shall meet or exceed LACCD district standards and shall meet at a minimum the work listed below.
- B. Contractor to be responsible for the furnishing, installation, adjusting, and testing of a complete turnkey communication bonding system, including connection to the electrical ground grid.
- C. Performance Statement: The contractor will be responsible to provide proper shop drawings describing the material quality, required features, operational requirements, and performance of the system. The Contractor will be solely responsible for determining all components, devices, equipment, wiring, connections, and terminations required for a complete and operational system that provides the required performance.
- D. The major components of the system shall be as per below per LACCD districtwide standards. All additional hardware, subassemblies, supporting equipment, and other miscellaneous equipment required for complete, proper system installation and operation shall be provided by the Contractor with minimal or no impact to owner cost.
- E. Basic System Requirements:
 - 1. A complete communications bonding infrastructure is required. Refer to the requirements of ANSI-J-STD-607-A and NFPA 70 for complete information.
 - 2. The bonding system shall include, but not be limited to, the following major components:
 - a. Bonding Conductor for Telecommunications (BCT)
 - b. Telecommunications Main Grounding Busbar (TMGB)
 - c. Telecommunications Bonding Backbone (TBB)
 - d. Telecommunications Grounding Busbar(s) (TGB)
 - e. Rackmount Telecommunications Grounding Busbar(s)

- f. Bonding Conductor(s) (BC)
 - g. Bonding Connectors
 - h. Bonding system labeling, and administration where required.
3. LACCD Bonding and Grounding Standards:
- a. BDF/IDF rooms shall be provided with a copper Telecommunications ground busbar in each room. The grounding conductor shall be a 1/0 copper wire, cad-welded directly to the Ufer ground, or main entrance ground, or building steel.
 - b. Racks and ladder racks shall be bonded to the Telecommunications ground busbar with a minimum of a # 6 AWG stranded wire.
 - c. The cable tray shall be bonded to the Telecommunications ground busbar in the BDF/IDF rooms on the same floor as the tray. All non-contiguous segments of the cable tray shall bond together using a minimum of a # 6 AWG copper wire, with crimp-on lugs bolted to each segment of the cable tray to ensure electrical continuity throughout the length of the cable tray system.
 - d. Each BDF shall be provided with a copper signal grounding busbar. The grounding conductor shall be 1/0 copper cable, cad-welded directly to the Ground busbar or Main Building Entrance Ground or building Steel.

PART 2 – PRODUCTS

2.1 BONDING CONDUCTORS

- A. Bare Copper:
 - 1. Annealed uncoated stranded conductor.
 - 2. Minimum size 1-0 AWG.
- B. Insulated Copper:
 - 1. Annealed uncoated stranded conductor.
 - 2. Insulation:
 - a. PVC insulation with nylon outer jacket.
 - b. Rated \geq 600 volts.
 - c. Green.
 - 3. Minimum size 6 AWG.
- C. All bonding conductors shall be listed and recognized by a nationally recognized testing laboratory as being suitable for the intended purpose and for installation in the space in which they are installed.
- D. Bonding Conductor Sizing

1. All Communications bonding system conductors shall be sized by length as follows:

Length Linear ft. (m)	Size (AWG)
Less than 13 (4)	6
14 - 20 (4 - 6)	4
21 - 26 (6 - 8)	3
27 - 33 (8 - 10)	2
34 - 41 (10 - 13)	1
42 - 52 (13 - 16)	1/0
53 - 66 (16 - 20)	2/0
Greater than 66 (20)	3/0

2. The BCT shall be the same size as the TBB or larger.

2.2 BONDING CONNECTORS

- A. Acceptable Types: Mechanical connector bonding lugs shall be prohibited.
 1. Two-hole compression lug
 2. Exothermic weld
 3. Irreversible compression
- B. Connectors shall comply with IEEE 837 and UL 467 and be listed for use for specific types, sizes, and combinations of conductors and connected items.

2.3 GROUNDING BUSBAR (TMGB AND TGB)

- A. Features:
 1. Busbar to be Wall-mount configuration.
 2. Listed and recognized by a nationally recognized testing laboratory as being suitable for the intended purpose.
 3. Hole patterns compliant with BICSI recommendations and ANSI-J-STD-607-A standards.
 4. Busbar shall be provided with stainless steel offset mounting brackets.
- B. Specifications:
 1. Material: Electrolytic tough pitch copper bar with tin plating. Minimum Dimensions: 1/4" thick x 4" high x 12" long.
 - a. Increase dimensions and/or quantity furnished and installed as required to accommodate all terminations required by the project, plus 20% spare capacity.
 2. Hole pattern shall include:

- a. A minimum of 15 sets of 5/16" holes, 5/8" on center, to accommodate "A" spaced 2-hole compression lugs.
- b. A minimum of three (3) sets of 7/16" holes, 1" on center, to accommodate "C" spaced 2-hole compression lugs.

2.4 RACK-MOUNT TELECOMMUNICATIONS GROUNDING BUSBAR

- A. General: each telecommunication rack shall a separate TBB to the TGB as required per district.
 1. Listed and recognized by a nationally recognized testing laboratory as being suitable for the intended purpose.
 2. Mounts in a standard 19" equipment rack.
- B. Specifications:
 1. Material: Electrolytic tough pitch copper bar with tin plating. Minimum Dimensions: 3/16" thick x 3/4" high x 19" long.
 - a. Increase dimensions and/or quantity furnished and installed as required to accommodate all terminations required by the project, plus 20% spare capacity.
 2. Hole pattern shall include:
 - a. A minimum of eight (8) 6-32 tapped lug mounting holes on 1" centers.
 - b. A minimum of two (2) pairs of 5/16" diameter holes spaced 3/4" apart.

PART 3 – EXECUTION

3.1 ADJUSTING

- A. All work must be adjusted and completely secured prior to completion.
- B. The contractor will be required to make all adjustments to the communications bonding system necessary to ensure that the installed system meets all requirements listed herein. Modifications necessary to comply with listed requirements or to provide specified performance shall be completed by the Contractor at no additional cost to the Owner.
 - A. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General Requirements: Install bonding systems in accordance with "Performance Criteria" and manufacturers installation recommendations with the conditions of testing and classification as specified in the published design.

3.3 TESTING

- A. Test installed system.

- B. Measure and document resistance to ground at TMGB, each TGB, each RTGB, and each electrical distribution panel bonded to the TMGB or a TGB.
 - 1. Measurements shall be made not less than two full days after the last trace of precipitation, and without the soil being moistened by any means other than natural drainage or seepage, and without chemical treatment or other artificial means of reducing natural ground resistance. Perform tests by the fall-of-potential method according to IEEE 81.
 - 2. Measured resistance to ground at TMGB, each TGB, and each RTGB must not exceed 5 ohms.
 - 3. Under no circumstances shall any point in the communications bonding system has a lower resistance to the ground than that of nearby electrical distribution system components that it is bonded to.
- C. Measure and document voltage between the screen of installed and terminated ScTP, FTP, and/or SSTP horizontal cables and electrical ground of electrical outlet(s) serving the information outlet location area.
 - 1. The voltage between the screen and the ground wire shall not exceed 1.0 V RMS, and 1.0 V dc for any installed and terminated ScTP, FTP, and/or STP horizontal cables.
- D. Include measurement documentation in test data submitted at the completion of the project as required per LACCD district standards.

3.4 SYSTEM TRAINING

- A. All labor and materials required for on-site system training shall be provided. Training shall be conducted at the project site using the project equipment.
 - 1. Provide two week's advanced notice of training to the Owner and Architect/Engineer.
 - 2. The Architect/Engineer shall be presented with the option to attend the training.
 - 3. Provide a training outline agenda describing the subject matter and the recommended audience for each topic.
- B. At a minimum, the following training shall be conducted:
 - 1. A course detailing the system functions and operations that a technical user will encounter. Provide training on all aspects of using the system, including making new bonding connections to the TMGB, TGB, or RTGB. Provide training on all recommended inspection, maintenance, and repair procedures for the system.
- C. Minimum on-site training times shall be:
 - 1. Technical user: Four hours.

3.5 INSPECTION

- A. All bonding systems shall be inspected by the LACCD's representative to ensure proper installation.

SECTION 27 05 28

COMMUNICATIONS RACEWAY

PART 1 - GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.1 SECTION INCLUDES

- A. The work covered under this section per LACCD districtwide standards shall consist of the furnishing of all necessary labor, supervision, materials, equipment, tests, and services to install complete wire mesh support systems, conduits, sleeves, inner-duct, etc. for an interior cabling plant. The contractor will be responsible to provide complete shop drawings for approval by the District, EOR, or architect prior to installation and shall comply with the set standards as required. Where contractor installation is provided without approval, said the contractor will be responsible to remove and reinstall any and all equipment or devices to meet district standards at no cost to the owner/district.
- B. The contractor will be responsible to refer to the Latest District Facilities Standards for additional information required to provide proper raceway installation per LACCD's referenced drawings.
- C. Wire mesh support systems are defined to include but are not limited to straight sections of continuous wire mesh, field formed horizontal and vertical bends, tees, dropouts, supports, and accessories.

1.2 RELATED WORK

- A. Refer to Division 26 for Conduit, Raceways, and Boxes for Electrical Systems, Grounding, and Bonding for Electrical Systems.
- B. Basic Communications Systems Requirements

1.3 QUALITY ASSURANCE

- A. The entire installation shall comply with all applicable electrical codes, safety codes, and standards. All applicable components, devices, equipment, and material shall be Underwriters' Laboratories, Inc. Listed.

1.4 REFERENCES

- A. ANSI/IEEE 1100 – Recommended Practice for Power and Grounding Sensitive Electronic Equipment in Industrial and Commercial Power Systems
- B. ANSI/TIA/EIA 568-C – Commercial Building Telecommunications Cabling Standard

- L. UL 96A – Installation Requirements for Lightning Protection Systems
- M. UL 467 – Grounding and Bonding Equipment
- N. NEMA VE 2-2000 – Cable Tray Installation Guidelines

1.5 SYSTEM DESCRIPTION

- A. The system described here-in shall meet or exceed LACCD district standards and shall meet at a minimum the work listed below.
- B. Contractor to be responsible for the furnishing, installation, adjusting, and testing of a complete turnkey communication support systems, including bonding connections.
- C. Performance Statement: The contractor will be responsible to provide proper shop drawings describing the material quality, required features, operational requirements, and performance of the system. The Contractor will be solely responsible for determining all components, devices, equipment, connections, and terminations required for a complete and operational system that provides the required performance.
- D. The major components of the system shall be as per LACCD districtwide standards. All additional hardware, subassemblies, supporting equipment, and other miscellaneous equipment required for complete, proper system installation and operation shall be provided by the Contractor with minimal or no impact to owner cost.

PART 2 – PRODUCTS

2.1 CONDUIT

- A. Refer to Division 26 - Electrical for conduit requirements.

- B. Provide communication cable conduit in locations where access to cable tray is unavailable or where portions of the pathway span are inaccessible (i.e. embedded in walls or inaccessible ceilings). Provide a conduit for small quantities of the cable where cable tray is impractical. Conduit materials may be used to house non-rated cables between endpoints to ensure NEC Code compliance. Conduits serving individual workstation outlets shall be a minimum of 1 inch. The 1-inch conduits shall be connected to 5S deep device boxes (2-7/8-inch deep), equipped with a single gang mud ring at the outlet location. Individual workstation conduits are to be dedicated to only one outlet box each and shall not be “daisy-chained” together.
- C. Acceptable Conduit Manufacturers:
1. Appleton
 2. Crouse-Hinds
 3. Or approved equal
- D. Acceptable Conduit Support Manufacturers
1. Kindorf
 2. Unistrut
 3. Thomas & Betts

2.2 CABLE TRAY

- A. Acceptable Manufacturers:
1. Cable wire mesh systems with solid bottom cable tray systems
 2. Eaton cable tray systems
 3. Nvent Caddy WBT cable tray systems
 4. Approved equal must be accompanied by a comparison chart and will only be taken into consideration. The owner shall provide final approval before installation.
- B. General: Provide wire mesh per LACCD with connector assemblies, clamp assemblies, connector plates, splice plates, and splice bars. Provide drop-out fittings where the cable tray is installed over equipment racks. Two drop-out fittings shall be installed over each rack so that a controlled radius is maintained on each side of every equipment rack that the cable tray passes over. Construct units with rounded edges and smooth surfaces; in compliance with applicable standards; and with the following additional construction features.
- C. Wire mesh shall be made of high strength steel wires and formed into a standard 18 inch by 4-inch wire mesh pattern with intersecting wires welded together. All wire ends along wire mesh sides (flanges) shall be rounded during manufacturing for the safety of cables and installers.
- D. Materials and Finishes: Material and finish specifications for each wire mesh type are as follows:

1. Electro-Galvanized Zinc: Straight sections shall be made from steel meeting the minimum mechanical properties of ASTM A510 and shall be electro-plated zinc per ASTM B633 SC2.
2. Accessories:
 - a. Overhead cable tray shall be provided with bend radius control fittings at all inside corners.

E. Type of Overhead Wire Mesh Support System:

1. All straight section longitudinal wires shall be straight (with no bends).
2. Wire mesh supports shall be trapeze hangers or wall brackets.
3. Trapeze hangers are to be supported by 1/4 inch or 3/8 inch diameter rods.
4. Provide manufacturer-approved grounding clips as necessary for continuous grounding of the tray.

2.3 CABLE HANGERS AND SUPPORTS

A. Provide a non-continuous cable support system suitable for use on a limited basis within concealed accessible ceiling areas (e.g. above removable ceiling tiles) into the outlet locations only.

B. Cable Hooks:

1. Construction: Flat bottom design with a minimum cable bearing surface of 1-5/8". Hooks shall have 90-degree radius edges.
2. All cable hook mounting hardware shall be recessed to prevent damage to the cable during installation. Installed cabling shall be secured using a cable latch retainer that shall be removable and reusable.
3. Finish: Pre-galvanized steel, ASTM A653 suitable for general duty use zinc-plated steel, ASTM B633 SC3 suitable for heavy-duty use. Provide stainless steel AISI Type 304 hooks for corrosive locations.

C. Cable Hangers:

1. Adjustable, non-continuous cable support slings for use with low voltage cabling.
2. Steel and woven laminate construction rated for indoor non-corrosive use. Laminate material shall be suitable for use in plenum environments.
3. Sling length shall be adjustable to a capacity of between 200 and 300 or of UTP, and FTP Cat 6A cables.
4. The cabling hanger load limit shall be 100 lbs per foot.
5. Manufacturer: Erico Caddy, Chatsworth Products, Cooper B-Line, Mono or approved equal.

2.4 PULL BOXES

- A. Acceptable Manufacturers:
 - 1. Hoffman Enclosures.
 - 2. Wire Guard.
 - 3. Approved equal

2.5 METAL OUTLET BOXES – SINGLE GANG FOUR PLEX OR DOUBLE GANG, EXTRA DEEP

- A. Acceptable Manufacturers:
 - 1. RANDL
 - 2. Appleton.
 - 3. Raco.
 - 4. Steel City.

PART 3 – EXECUTION

3.1 CABLE HOOK SUPPORT SYSTEM

- A. In areas where cabling is not supported by cable tray, ladder tray, or installed in conduit, such cabling shall be supported by an approved cable hook support system only.
- B. Refer to manufacturer's requirements for allowable fill capacity for selected cable hook. In no case shall a 40% fill capacity be exceeded.
- C. Cable hooks shall be securely mounted per manufacturer's instructions with a minimum 3/8" rod. In no case shall the side-to-side travel of any cable hook exceed 6".
- D. Cable hooks shall be selected based on the contractor's cable routing. Hooks shall be capable of supporting a minimum of 30 pounds with a safety factor of 3.
- E. Support spans shall be based on the manufacturer's load ratings. In no case shall a 4-foot span be exceeded.
- F. The resting and supporting of cabling on structural members shall not meet the requirements for cabling support specified herein.
- G. The use of tie-wraps or hook and loop type fasteners is specifically prohibited as a substitute for cable hooks specified herein.

3.2 CONDUIT AND CABLE ROUTING

- A. All conduits shall be reamed and shall be installed with a nylon bushing.
- B. Maintain appropriate conduit bend radius at all times. For conduits with an internal diameter of 2" or less, maintain a bend radius of at least 6 times the internal diameter. For conduits with an internal diameter greater than 2", maintain a bend radius of at least 10 times the internal diameter.
- C. No conduit or sleeve containing more than two (2) cables shall exceed a 40% fill ratio, regardless of length.

- D. Any conduit exceeding 90' in length or containing more than two (2) 90-degree bends shall contain a pull box sized per ANSI/TIA/EIA 569 requirements.
 - 1. A separate pull box is required for each 90' (or greater) length section.
 - 2. A separate pull box is required after any two (2) consecutive 90-degree bends.
 - 3. The pull box shall be located in an area that maintains accessibility of the box, including the ability to remove the box lid without removal or relocation of any other materials.
- E. Any conduit with bends totaling 90 degrees or more shall have the fill capacity derated by 15% for every 90 degrees of cumulative bend.
- F. Provide conduit in locations where access to cable tray is unavailable or where portions of the pathway spans are inaccessible (i.e. embedded in-wall or inaccessible ceilings).
- G. Provide a conduit for small quantities of cables where a cable tray is not practical.
- H. Minimum conduit size for communications cabling serving individual workstations shall be 1" and be connected to 5s backbox with a minimum depth of 2-7/8" and provide a single gang plaster ring. Individual workstations conduits are to be dedicated to one information outlet location, no daisy-chaining of conduit between backboxes will be accepted.
- I. Cables installed in any conduits that do not meet the above requirements shall be replaced at the Contractor's expense after the conduit condition has been remedied.

3.3 WIRE MESH TRAY STANDARD INSTALLATION REQUIREMENTS

- A. The wire mesh cable tray system shall be only for telecommunications.
- B. Install wire mesh as indicated; in accordance with recognized industry practices (NEMA VE-2 2000), to ensure that the cable tray equipment complies with requirements of NEC, and applicable portions of NFPA 70B and NECA's "Standards of Installation" pertaining to general electrical installation practices.
- C. Cable tray sections shall be grounded in accordance with the manufacturer's recommendations using manufacturer-approved hardware. Painted sections shall have paint removed at each grounding attachment point.
- D. Test wire meshes support systems to ensure the electrical continuity of bonding and grounding connections, and to demonstrate compliance with specified maximum grounding resistance. Refer to NFPA 70B, Chapter 18, for testing and test methods.
- E. Provide sufficient space encompassing wire mesh to permit access for installing and maintaining cables.
- F. The tray shall be continuous from source to termination and shall not change elevation, direction, or otherwise expose cables to travel without 2" x 4" mesh support.
- G. Overhead and Underfloor Tray shall be field cut using only manufacturer-approved cutting devices and methods. The cutting device shall be an offset blade bolt cutter; standard bolt cutters are specifically not permitted. Drop-in tray sections shall not be field cut or field modified in any way.
- H. Bends in overhead and underfloor trays shall be accomplished by utilizing the manufacturer's cutting guides.

- I. All splices of tray shall be provided with splice washers, bars, or springs as recommended by the manufacturer.

3.4 ATTACHMENT TO METAL DECKING

- A. Where supports for cable trays and cable hook systems attach to metal roof decking, excluding concrete on metal decking, do not exceed 25 lbs. per hanger and a minimum spacing of 2'-0" on center. This 25 lb. load and 2'-0" spacing include adjacent electrical and mechanical items hanging from deck. If the hanger restrictions cannot be achieved, supplemental framing off steel framing will need to be added.

- B. Cabling conditions:

1. Horizontal cable length maximum of 90 meters or 295'
2. Tie wraps that distort the cable jacket will affect cable performance
3. Velcro strap shall be utilized to organize cabling
4. 4 pair horizontal cable: 25 lbs. of force maximum pull tension
5. UTP Bend Radius = 4 X Cable OD
6. FTP Bend Radius = 8 X Cable OD

- C. Horizontal Pathways in Conduit

1. Two 90 degree bends maximum between pull points
2. 30 meters (100ft) max
3. Flexible Conduits are not acceptable

- D. Conduit Fill Requirements

1. Maximum 40% fill in conduit
2. Trade Size 1 = 4 CAT 6A UTP Cables
3. Trade Size 1.25 = 7 CAT 6A UTP Cables
4. Trade Size 1.5 = 10 CAT 6A UTP Cables
5. Trade Size 2 = 18 CAT 6A UTP Cables

3.5 INSPECTION

- A. All communications raceway systems shall be inspected by the LACCD's representative to ensure proper installation.

END OF
SECTION

SECTION 27 05 43
COMMUNICATIONS EXTERIOR PATHWAYS

PART 1 - GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.1 SECTION INCLUDES

- A. Exterior communication pathway standards below are listed per LACCD and shall be adhered to with minimal disruption to existing facility pathways and underground topology. Contractors shall be responsible to provide and install any underground and exterior conduit and pull boxes without disruption to existing systems throughout the campus where work will be performed.
- B. This section describes the products and execution requirements relating to furnishing and installing telecommunications handholes, exterior pull boxes, cable support ladders, conduits, sleeves, inner-duct, etc. for an exterior cabling plant or parking structures that will require work to be performed.

1.2 RELATED WORK

- A. Basic Communications Systems Requirements

1.3 QUALITY ASSURANCE

- A. Precast Manufacturer (if applicable): Company specializing in precast concrete structures with three (3) years of documented experience.
- B. The contractor will be responsible for coordinating with other trades, the proper installation of Exterior Trenching, Conduit, Boxes and Manholes, Aerial Entrance Masts, Service Cabinets, Bonding and Grounding, Etc. per LACCD and industry standards and requirements.

1.4 REFERENCES

- A. ANSI/TIA 758-B – Customer-Owned Outside Plant Telecommunications Infrastructure Standard.
- B. ANSI/TIA 607-B - Generic Telecommunications Bonding and Grounding (Earthing) For Customer Premises
- C. ANSI/ASTM A153 - Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
- D. ANSI/ASTM A569 - Steel, Sheet and Strip, Carbon (0.15 Maximum Percent), Hot-Rolled, Commercial Quality.
- E. ASTM A48 - Gray Iron Castings.

- F. ASTM A123 - Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strips.

1.5 SYSTEM DESCRIPTION

- A. The system described here-in shall meet or exceed LACCD district standards and shall meet at a minimum the work listed below.
- B. Contractor to be responsible for the furnishing, installation, adjusting, and testing of a complete turnkey communication exterior pathway infrastructure systems.
- C. Performance Statement: The contractor will be responsible to provide shop drawings for the main pathways must be identified. The Contractor will be solely responsible for determining all components, connections, and terminations required for a complete and operational system.
- D. The major components of the system shall be as per LACCD districtwide standards. All additional hardware, subassemblies, supporting equipment, and other miscellaneous equipment required for complete, proper system installation and operation shall be provided by the Contractor with minimal or no impact to owner cost.

PART 2 – PRODUCTS

2.1 OUTSIDE PLANT CONDUIT

- A. Rigid Metallic Conduit (RMC) and Fittings:
 - 1. Rigid steel conduit hot-dipped galvanized inside and out with threaded ends meeting ANSI C80.1.
 - 2. Fittings and Conduit Bodies:
 - a. End Bell Fittings: Malleable iron, hot-dip galvanized, threaded flare type with provisions for mounting to form.
 - b. Expansion Joints: Malleable iron and hot-dip galvanized providing a minimum of 4 inches of movement. The fitting shall be watertight with an insulating bushing and a bonding jumper.
 - c. Expansion Joint for Concrete Encased Conduit: Neoprene sleeve with bronze end coupling, stainless steel bands, and a tinned copper braid bonding jumper. Fittings shall be watertight and concrete-tight.
 - d. Conduit End Bushings: Malleable iron-type with molded-on high impact phenolic thermosetting insulation. Where required elsewhere in the contract documents, bushing shall be complete with ground conductor saddle and clamp. High impact phenolic threaded type bushings are not acceptable.
 - e. All other fittings and conduit bodies shall be of malleable iron construction and hot-dip galvanized.
 - 3. Acceptable Manufacturers:
 - a. Allied, LTV, Steel duct, Wheatland Tube Co, O-Z Gedney, or pre-approved equal.

B. Rigid Non-Metallic Conduit (RNC) and Fittings:

1. UL listed, NEMA TC2 and TC6 Schedule 40 or 80 rigid polyvinyl chloride (PVC) approved for direct burial without concrete encasement.
2. Fittings: NEMA TC3 and TC9, sleeve type suitable for and manufactured especially for use with the conduit by the conduit manufacturer.
3. Plastic cement for joining conduit and fittings shall be provided as recommended by the manufacturer.
4. Acceptable Manufacturers:
 - a. Carlon (Lamson & Sessions) Type 40, Cantex, J.M. Mfg., or pre-approved equal.

C. High-Density Polyethylene (HDPE) Conduit:

1. Minimum Size: 2 inches, unless noted otherwise.
2. Acceptable Manufacturers: Carlon, Chevron Phillips Chemical Company, or pre-approved equal.
3. Materials used for the manufacture of polyethylene pipe and fittings shall be extra high molecular weight, high-density polyethylene resin. The material shall be listed by PPI (Plastic Pipe Institute) and shall meet the following resin properties:

ASTM Test	Description	Values HDPE
D-1505	Density g/CM 3	< .941
D-1238	Melt Index, g/10 min Condition E	> .55 grams/10 min.
D-638	Tensile Strength at Yield (psi)	3000 min.
D-1693	Environmental Stress Crack Resistance Condition B, F 20	96 hrs.
D-790	Flexural Modulus, MPa (psi)	< 80,000
D-746	Brittleness Temperature	-75°C Max

4. The pipe shall contain no recycled compound except that generated in the manufacturer's plant from the resin of the same raw material, including both the base resin and coextruded resin. The pipe shall be homogeneous throughout and free of visible cracks, holes, voids, foreign inclusions, or other defects that may affect the wall integrity.
5. Fitting and Conduit Bodies:
 - a. Directional Bore and Plow Type Installation: Electrofusion or universal aluminum threaded couplings. The tensile strength of the coupled pipe must be greater than 2,000 lbs.
 - b. For All Other Types of Installation: Coupler must provide a watertight connection. The tensile strength of the coupled pipe must be greater than 1,000 lbs.

- c. E-loc type couplings are not acceptable in any situation.
 - d. Acceptable Manufacturers: ARCON, Carlon, or approved equal.
 - D. Fittings:
 - 1. Sweeps: Factory manufactured RMC wrapped with 4 mil vinyl tape with a bend radius as follows:
 - a. Conduit internal diameter of 2" or less is 6 times the internal conduit diameter.
 - b. Conduit internal diameter of more than 2" is 10 times the internal conduit diameter.
 - 2. End Caps (Plugs): Pre-manufactured and watertight. The tape is not an acceptable end cap or cover.
- 2.2 HAND HOLES
- A. Type:
 - 1. Polymer concrete
 - B. Dimensions:
 - 1. As indicated in the drawings.
 - C. Requirements:
 - 1. Includes polymer concrete cover cast iron cover steel checker plate covers.
 - D. Acceptable Manufacturers
 - 1. Jensen
 - 2. Old Castle Precast Christy®
 - 3. Brooks.
- 2.3 TEXTILE INNERDUCT
- A. The contractor shall provide and install the Flexible fabric innerduct system in each conduit identified to have copper and fiber optic cable installed.
 - B. Innerduct shall have an 18 gauge solid copper core tracer wire installed into each cell to allow for detection by industry-standard toning equipment.
 - C. Each innerduct cell shall have a pull tape installed.
 - D. Acceptable Manufacturers:
 - 1. MaxCell
- 2.4 UNDERGROUND WARNING TAPE

- A. Detectable three-layer laminate, consisting of a printed pigmented polyolefin film, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core, bright-colored, compounded for direct-burial service.
- B. Overall Thickness: 5 mils (0.125 mm).
- C. Foil Core Thickness: 0.35 mil (0.00889 mm).
- D. Orange colored tape 3-wide with 1-inch high black letters permanently imprinted with "CAUTION – BURIED COMMUNICATIONS LINE BELOW". Printing on tape shall be permanent and shall not be damaged by burial operations.
- E. Tape material and ink shall be chemically inert, and not subject to degrading when exposed to acids, alkalis, and other destructive substances commonly found in soils.
- F. Comply with ANSI Z535.1 through ANSI Z535.5.
- G. Acceptable Manufacturer: CARLON

2.5 UNDERGROUND PULL BOX AND RACEWAY COMPONENTS

- A. Pull Rope 1700lb tensile strength by Carlon.
- B. Bonding ribbon (in Vaults) by INWESCO Cat 12A55.
- C. Bonding ribbon clamps (in Vaults) by INWESCO Cat 12A56.
- D. Fargo Clamp by INWESCO Cat 12A57.
- E. Ground Rod by INWESCO Cat 12A60.
- F. Ground Inserts (Cast Bronze) by INWESCO Cat 12H69.
- G. Manhole and Pull Boxes hardware by INWESCO products.
- H. Manholes by Utility Vault (Oldcastle); Jensen, Brooks.
- I. Manhole lids by Alhambra Foundry, OPW Manhole.
- J. Manhole Ladders by Alhambra Foundry – Model A – 3382 w/A3383 Support Bar.

PART 3 – EXECUTION

3.1 DUCTBANK MINIMUM REQUIREMENTS

- A. Make duct bank installations and penetrations through foundation walls watertight.
- B. Top of duct banks shall be a minimum of 24 inches below grade unless otherwise indicated on drawings.
- C. Assemble duct banks using non-magnetic saddles, spacers, and separators. Position separators to provide 3-inch minimum separation between the outer surfaces of the ducts.
- D. The transition from non-metallic to galvanized rigid steel conduit where duct banks enter buildings, manholes, and handholes.
- E. Where ducts enter structures such as manholes, handholes, pull boxes, and buildings, terminate the ducts in suitable end bells.

- F. Slope duct runs for drainage toward manholes and away from buildings with a slope of approximately 3-inches per 100 feet.
- G. After completion of the duct bank and prior to pulling cable, pull a mandrel, not less than 12 inches long and with a cross-section approximately 1/4 inch less than the inside cross-section of the duct, through each duct. Then pull a rag swab or sponge through to make certain that no particles of earth, sand, or gravel have been left in the duct.
- H. Plug and seal empty spare ducts entering buildings and structures. Seal watertight all ducts in use entering buildings and structures.

3.2 TEXTILE INNERDUCT

- A. Provide two (2) 3-cell innerducts per 4" conduit or as recommended by the manufacturer.
- B. Install innerduct per manufacturer's guidelines.
- C. Cut and tie off innerduct and pull tape inside each communications vault or Entrance Room.

3.3 EXCAVATION, FILL, BACKFILL, COMPACTION

- A. General:
 - 1. The Contractor shall do all necessary excavating, securing, filling, backfilling, compacting, and restoration in connection with their work.
- B. Excavation:
 - 1. Excavations for trenches shall be excavated to proper dimensions to permit installation and inspection of work.
 - 2. Where excavations are carried in error below indicated levels, thoroughly compacted sand-gravel fill shall be placed in such excess excavations.
 - 3. Excavations shall be protected against frost action and freezing.
 - 4. Care shall be exercised in excavating so as to not damage surrounding structures, equipment, and buried utilities. In no case shall any major structural footing or foundation be undermined.
 - 5. Excavation shall be performed in all ground characteristics, including rock if encountered. Each bidder shall visit the premises and determine, by actual observations, borings, or other means, the nature of the soil conditions. The cost of all such inspections, borings, etc., shall be borne by the bidder.
 - 6. In the case where the trench is excavated in the rock, a compacted bed with a depth of 3" (minimum) of sand and gravel shall be used to support the conduit unless masonry cradles or encasements are used.
 - 7. Where satisfactory bearing soil is not found at the indicated levels, the Architect/Engineer or their representative shall be notified immediately and no further work shall be done until further instructions are given.

8. Mechanical excavation of the trench to line and grade of the conduit, unless otherwise indicated on the drawings.
- C. Underground Obstructions:
1. The contractor is responsible for obtaining all utility locates for all trades on the project to determine obstructions indicated. The Contractor shall use great care in installing in the vicinity of underground obstruction.
- D. Fill and Backfilling:
1. No rubbish or waste material shall be permitted in excavations for trench fill and backfill.
 2. The Contractor shall provide the necessary sand for backfilling.
 3. Dispose of the excess excavated earth as directed.
 4. Soils for backfill shall be suitable for required stability and compaction, clean and free from perishable materials, frozen earth, debris, or earth with an exceptionally high void content, and free from stones greater than 4 inches in diameter. Under no circumstances shall water be permitted to rise in unbackfilled trenches after the installation has been placed.
 5. All trenches shall be backfilled immediately after installation of conduit unless other protection is directed.
 6. All conduits shall be laid on a compacted bed of sand at least 3" deep. Backfill around the conduit with sand, spread in 6" layers, then compact each layer.
 7. Use sand for backfill up to grade for all conduits located under building slabs or paved areas. All other conduits shall have sand backfill to 6" above the top of the conduit.
 8. The backfilling above the sand shall be placed in uniform layers not exceeding 6" in depth. Each layer shall be placed, then carefully and uniformly tamped, so as to eliminate the possibility of lateral or vertical displacement.
 9. Install a warning tape approximately 12 inches below finished grade overall underground duct banks. The identifying warning tape shall be as specified above.
 10. Where the fill and backfilling will ultimately be under a building, floor, or paving, each layer of fill shall be compacted to 95% of the maximum density as determined by AASHTO Designation T-99 or ASTM Designation D-698. The moisture content of the soil at the time of compaction shall not exceed plus or minus 2% of optimum moisture content as determined by AASHTO T-99 or ASTM D-698 test.

3.4 RESTORATION REQUIREMENTS

- A. Where soil and sod have been removed, it shall be replaced as soon as possible after backfilling is completed. All areas disturbed by work shall be restored to their original condition. The restoration shall include any necessary topsoiling, fertilizing, liming, seeding, or mulching.

END OF
SECTION

SECTION 27 05 53

COMMUNICATIONS IDENTIFICATION AND ADMINISTRATION

PART 1 GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.1 SECTION INCLUDES

- A. This section describes the execution and administration requirements set forth by LACCD standards relating to the structured cabling system and its termination components and related subsystems.
- B. Contractor shall Obtain facilities IT Approval for labeling prior to installation. Where Labeling is found to be deficient or not installed per said documents, the contractor will be responsible to reinstall proper labels at no cost to the owner and shall be responsible for time delay where occurs.

1.2 RELATED WORK

- A. Basic Communications Systems Requirements

1.3 QUALITY ASSURANCE

- A. Refer to other sections for relevant latest standards. See BuildLACCD web site for any additional labeling requirements not listed here-in.
- B. Refer to DW cabling Standards.

PART 2 PRODUCTS

2.1 LABELING

- A. Adhesive labels shall meet the requirements of UL 969 (Ref D-16) for legibility, defacement, and adhesion. Exposure requirements of UL 969 for indoor and outdoor (as applicable) use shall be met.
- B. Insert labels shall meet the requirements of UL 969 for legibility, defacement, and general exposure.
- C. Labeling shall be consistent for all common elements in the project. This consistency shall include label size, color, typeface, and attachment method.
- D. Labels incorporating bar codes shall be either Code 39 conforming to USS-39 or Code 128 conforming to USS-128.
 - 1. All Code 39 bar codes shall have a ratio between 2.5:1 and 3.0:1. Provide a minimum "quiet zone" of 0.25" on each side of the bar code.

2. A descriptive label for reading by personnel shall be provided with any bar code. Bar codes by themselves are not acceptable.
- E. Color Code: Observe the following requirements for color-coding:
1. Labels on each end of a cable shall be the same color for each termination.
 2. Labels for cross-connects shall be two different colors at each termination field, representative of the color of that field.
 3. Orange (Pantone 15C) shall be used for the demarcation point.
 4. Green (Pantone 353C) shall be used for the termination point of the network connection on the facility side of the demarc.
 5. Purple (Pantone 264C) shall be used to identify the termination of cables from common equipment (PBX, computers, LANs, etc.)
 6. White shall be used to identify the first-level backbone termination in the main cross-connect.
 7. Gray (Pantone 422C) shall be used to identify the second-level backbone termination in the main cross-connect.
 8. Blue (Pantone 291C) shall be used to identify the termination of station cabling at the telecommunications closet and/or equipment room end of the cable.
 9. Brown (Pantone 465C) shall be used to identify the termination of the interbuilding backbone cable terminations.
 10. Yellow (Pantone 101C) shall be used to identify the termination of auxiliary circuits, alarms, maintenance, security, etc.
 11. Red (Pantone 184C) shall be used to identify the termination of key telephone systems.
- F. Tag all CAT6A and optical fiber cables at both the Communications Equipment Room and the information outlets using the following alphanumeric labeling system. All copper horizontal cables are to be labeled using a machine-printed label at each end of the cable at approximately 4 to 12 inches of the termination point. Handwritten labels shall not be used.
1. (Telecom Room Number) – (Room Number) - (Patch Panel Letter) – (Patch Panel Port Number).
 2. “Telecom Room Number”
 3. “Room Number”
 4. “Patch Panel Letter” shall start with ‘A’ for the top modular patch panel, increasing sequentially from top to bottom across the equipment rack.
 5. “Patch Panel Port Number” shall start with ‘1’ for the upper left port in each modular patch panel, increasing sequentially from left to right and top to bottom across the modular patch panel face.

6. Example: BDF1001 1023 A 1-2 indicates the first and second modular patch panel port in modular patch panel 'A' in Building Distribution Frame (BDF) 1001 room 1023.
 7. The contractor shall utilize the blank designation inserts which accompany the manufacturer's Patch Panel hardware to label the hardware. The contractor shall remove the Inserts and input LACCD's labeling scheme. All information shall be laser printed, no handwritten labeling shall be permitted or approved.
- G. Tag each individual 900 microns buffered fiber 3" from the connector with a polyester film marker tape as a "flag", designated in a numerical sequence.
- H. Label fiber optic innerduct every 4' with a 1" by 3 1/2" "Fiber Optic Caution" label.
- I. The contractor shall furnish and install self-laminating type labels to the utilized spur cable's overall jacket, six (6) inches from the fiber storage panel strain relief, with the EF/IDF number and fiber number in numerical sequence.
- J. Label the front of each fiber termination shelf with the labels furnished with such shelf, using LACCD's approved scheme.
- K. No handwritten labels will be accepted.

2.2 IDENTIFICATION AND LABELING

- A. Cable Labeling: Backbone and horizontal cables shall be labeled at each end.
1. Provide additional cable labeling at each manhole and pull box.
 2. Fiber innerduct labeling shall be provided at both ends using machined-produced labels with Black typeface on Yellow Background, a minimum of 2 inches wide.
 3. Cables that are routed through multiple pathway segments shall contain a reference to all pathway segments in the pathway linkage field.
 4. Cables that differ only by performance class shall have a suitable marking or label to indicate the higher performance class. For example, station cabling utilizing the blue color may include blue with a white stripe to indicate the higher performance class station cabling.
- B. Information Outlet Labeling: Tag all voice and data jacks as defined herein.
- C. Termination Hardware Labeling:
1. An identifier shall be provided at each termination hardware location or its label.
 2. The contractor shall label the cross-connect blocks using the appropriate manufacturer's labels. The labels shall be designed every four (4) and/or five (5) pairs as determined by IT. The label designations shall be printed with machine-produced type. Handwritten designations shall not be acceptable. Where handwritten labels are used, the contractor shall be responsible to remove and install proper labeling as required and shall be responsible for time and material.
- D. Grounding/Bonding Labeling:

1. The TMGB shall be labeled "TMGB." There shall be only one TMGB in the facility.
2. Label all TBB conductors connecting to the TMGB with a unique label, located at both ends of the TBB.
3. Each TGB shall be labeled with a unique label.
4. All TBB conductors connecting to the TGB shall be labeled uniquely at each end of the cable.

E. Cable Plant labeling:

1. Contractor shall; label splice cases to match the existing labels, using letters with machine-produced black typeface on an Orange Background. The contractor shall identify all binder groups utilizing color Zipp Ties. The contractor shall furnish and install stamped metal band labels on all feed cables indicating cable size, gauge, and plant pair count.

2.3 CABLE TAGS

A. Acceptable Manufacturers:

1. 3M
2. Panduit

PART 3 EXECUTION

3.1 CABLE LABEL SCHEME PER LACCD

- A. Contractor to present a mockup of a faceplate to facilities IT for verification and approval of the labeling scheme to match campus standards. The following is an example to be followed and approved.
- B. All patch panel ports and telecommunication outlet ports shall be labeled with the cable identifier. Owner may provide specific labeling requirements coordinate with the owner.
- C. All fiber cabling shall be labeled in the front of each fiber termination shelf with the labels furnished with such shelf, using LACCD's approved scheme.
- D. See Attachment A below, Faceplate – Patch Panel – Cable Labeling.
- E. See Attachment B below, Fiber Labeling Layout.

END OF SECTION

SECTION 27 11 00

COMMUNICATIONS EQUIPMENT ROOMS

PART 1 GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.01 SECTION INCLUDES

- A. This section describes the products and execution requirements related to furnishing and installing equipment for Communication Equipment Rooms. Communication Equipment Rooms include rooms for the Building Distribution Frame (BDF) and Intermediate Distribution Frame (IDF).
- B. Definitions:
1. Building Distribution Frame (BDF): Allows single-point administration of technology components for cross-connect of first-level backbone cables, entrance cables, and equipment cables.
 2. Intermediate Distribution Frame (IDF): Cross-connect location between the horizontal cabling and the backbone cabling.
- C. Refer to Specification Section 27 05 28 for cable pathway and support requirements.

1.02 RELATED WORK

- A. Basic Communications Systems Requirements
- B. Communications Bonding
- C. Interior Communication Pathways
- D. Horizontal Cabling Requirements

PART 2 PRODUCTS

2.01 EQUIPMENT GROUNDING

- A. Refer to section 27 05 26 for grounding and bonding requirements.
- B. All equipment required to be grounded shall be provided with a grounding lug suitable for termination of the specified size electrode conductor.

2.2 EQUIPMENT RACKS

- A. Where identified on the drawings in Communication Equipment Rooms, equipment racks shall be furnished and installed by the Contractor to house cable termination

components (e.g., copper and optical fiber) and network electronics.

B. The equipment rack shall conform to the following requirements:

1. Standard TIA/EIA 19" Floor Rack:

- a. Equipment rack shall be 84" in height, self-supporting, and provide a useable mounting height of 44 rack units (RU) (1 RU = 1 $\frac{3}{4}$ ").
- b. Channel uprights shall be spaced to accommodate industry standard 19" mounting.
- c. Equipment rack shall be double-side drilled and tapped to accept 12-24 screws. Uprights shall also be drilled on the back to accept cable brackets, clamps, power strip(s), etc. The hole pattern on the rack front shall be per TIA/EIA specifications (5/8"-5/8"-1/2"). Hole pattern on the rear shall be at 3" intervals to accept cable brackets.
- d. Equipment racks shall be provided with a supply of spare screws.
- e. Equipment racks shall be provided with a ground bar and #6 AWG ground lug.
- f. Provide all mounting hardware and accessories as required for a complete installation.
- g. Manufacturer: Chatsworth Products
 - 4-Post Adjustable Racks
 - Concrete Floor Installation kit

2.3 LADDER RACK

- A. Cabling Contractor to coordinate the installation with Electrical Contractor.
- B. Cabling Contractor to provide and install an 18-inch ladder rack shown on drawings for horizontal cable support.
- C. Include connecting and support hardware to suit installation. Including but not limited to:
 1. Rack-to-runway mount plate
 2. Wall angle support bracket
 3. Butt splice kit
 4. Junction-splice kit
 5. Grounding straps. (Metallic ladder racks must be grounded)
 6. Ladder racking
 7. J-bolt kit
 8. Cable Runway Elevation Kits
 9. Cable Runway Radius Drops
- D. Rack shall be a hollow or solid sidebar nominally 3/8" thick by 1 1/2" high with rungs 12" on center.
- E. Shall be painted black.
- F. Design Make: Chatsworth Products
 1. 18-inch ladder rack

2. Wall angle support kit
3. Wall angle support bracket
4. In-line coupler
5. Junction splice kit
6. Grounding straps
7. J-bolt kit
8. Top plate
9. Cable runway elevation kits
10. Tool-less Pathway dividers
11. Cable runway radius drop, cross members
12. Rack Ground jumper kit
13. Fixed Shelf
14. Foot Kit

2.4 VERTICAL CABLE MANAGEMENT SYSTEM

- A. Vertical wire management is required to manage patch cables within the BDF and IDF Rooms.
- B. Cable Contractor will be responsible for installing wire management and patch cables as part of this specification.
- C. Provide double-sided wire managers and accessories at 4-post racks serving horizontal cabling as indicated on the drawings.
- D. Design Make: Chatsworth Products
 1. 10-inch double-sided vertical wire manager
 2. 6-inch double-sided vertical wire manager

2.5 HORIZONTAL CABLE MANAGEMENT

- A. Horizontal wire management is required to manage patch cables within the Communication Room.
- B. Cable Contractor will be responsible for installing wire management and patch cables as part of this specification.
- C. Provide a 2U wire manager s at 2-post racks serving horizontal cabling as indicated on the drawings.
- D. Design Make: Chatsworth Products
 1. Horizontal Wire Manager

2.6 POWER STRIPS

- A. Provide power strips on all equipment racks, unless noted otherwise. These power strips shall have the following characteristics:
 1. Standard Rack Mount:
 - a. TIA/EIA 19" equipment rack-mountable.
 - b. Compliant with UL-1449 Third Edition and UL-497A.
 - c. Provide transient suppression to 12,000-A. Protection shall be in all three modes (line-neutral, line-ground, and neutral-ground).

- d. Shall meet or exceed ANSI C62 Category A3 requirements.
 - e. Provide high-frequency noise suppression as follows:
 - 1) >20-dB @ 50 kHz
 - 2) >40-dB @ 150 kHz
 - 3) >80-dB @ 1 MHz
 - 4) >30-dB @ 6 to 1000 MHz
 - f. Protection Modes and UL 1449 Clamping Voltage: 475-volt L-N, L-G, and N-G.
 - g. Components: Nonmodular units composed of 20mm metal oxide varistors (MOV). Series inductors, SAD, or selenium cells may be used in addition to MOVs.
 - h. Be equipped with a 10-foot power cord.
 - i. Design Make: APC or CPI
- 2.7 UPS SHELF
- A. Provide and install a shelf to support rack mount UPS.

PART 3 EXECUTION

3.01 FLOOR MOUNTED RACKS

- A. All Racks shall be anchored to the concrete slab at four points.
- B. Provide vertical and horizontal cable management as described in section 2 and as shown in the drawing.
- C. Mount with a minimum of 36" of clear access if applicable behind and in front of each rack where possible, refer to Telecom enlarged plan drawings.
- D. All racks shall be labeled on top brace utilizing machine-printed labels.
- E. Ground each cabinet to the equipment ground busbar with a #6 gauge. copper wire, "daisy chain" grounding will not be permitted on racks and cabinets. This will prevent ground section break in the case of rack or cabinet removal.

3.02 LADDER RACK

- A. Cabling Contractor to coordinate ladder rack installation with Electrical Contractor.
- B. Ladder Rack is required within the BDF and IDF Rooms.
- C. Ladder Rack to be secured to walls and top of each equipment rack.
- D. Ladder Rack sections must be bonded to each other and the Ladder Rack system shall be bonded to the equipment ground bar with a #6 copper wire.

3.03 CABLE MANAGEMENT

- A. Provide a rack-mounted 2U horizontal cable management system as indicated on the drawings.
- B. Provide two vertical cable managers for each cabinet installed.
- C. The installation of hook and loop "Velcro" fasteners will be the only acceptable form of bundling and securing cables within the BDF and IDF Rooms. Match Velcro color with cable color when possible.

3.04 POWER STRIPS

- A. Cable Contractor shall install one per Rack.
- B. Confirm requirements with Owner prior to purchasing. Should the Owner decide to change the model or type, any return or restocking fees will be the responsibility of the Cable Contractor.
- C. Install per manufacturer's recommendations.

3.05 UPS SHELF

- A. Cable Contractor shall install one per Rack.
- B. Install per manufacturer's recommendations.

3.06 MISCELLANEOUS REQUIREMENTS

- A. All cables shall be neatly "dressed out" in equipment rooms and behind termination hardware.
- B. Fire stops all conduit openings after the cable installation is complete. This includes all conduits with low voltage wire installed.

END OF SECTION

SECTION 27 13 00
COMMUNICATIONS BACKBONE CABLING

PART 1 GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.01 SECTION INCLUDES

- A. This section describes the products and execution requirements per LACCD relating to furnishing and installing backbone communications cabling and termination components and related subsystems as part of a cabling plant. The cabling plant consists of both optical fiber and/or copper cabling.

1.02 QUALITY ASSURANCE

- A. All cables shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner. Equipment and materials shall be of the quality and manufacturer indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "or equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval by the Owner.
- B. Existing pathways (conduit and raceway) shall be reutilized where possible; in all other instances, a new conduit pathway will be provided to support the installation of new Fiber Optic Backbone.
- C. These Specifications and associated drawings are the governing document for the installation of the telecommunications infrastructure and include project descriptions, specified and recommended products, installation and project management methods, the scope of work and elevation drawing specifications.
- D. Any and all materials required to provide a turn-key cabling infrastructure are to be provided and installed by the Cabling Contractor as part of this Scope of Work.
- E. Materials and work specified herein shall comply with the applicable requirements of:
1. ANSI/TIA - 568-C Commercial Building Telecommunications Cabling Standard
 2. ANSI/TIA - 569-A Commercial Building Standard for Telecommunications Pathway and Spaces
 3. TIA-606-A Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
 4. TIA-607 Commercial Building Grounding and Bonding Requirements for Telecommunications
 5. Local Building Code
 6. NFPA 70 – 2002 (current edition), including:
 - a. NEC - Article 770
 - b. NEC - Article 800
 7. Underwriters Laboratory

8. NEMA - 250
 9. Federal Communications Commission 47 CFR 68.
 10. BICSI Telecommunications Distribution Methods Manual (current edition)
 11. BICSI Customer-Owned Outside Plant Design Manual (current edition)
 12. BICSI Information Transport Systems Installation Manual (current edition)
 13. ANSI/NECA/BICSI 568 2001 Standard for Installing Commercial Building Telecommunications Cabling (current edition)
 14. ISO/IEC 11801
- F. The fiber optic cable specified in this project may be used to support a 10 Gigabit Ethernet network. At the time of installation, all fiber optic products shall support the latest draft or formal specification released by the IEEE 802.Z (for 10 Gigabit Ethernet).

1.03 RELATED WORK

- A. Basic Technology Systems Requirements.
- B. Horizontal Cabling Requirements.

1.04 SUBMITTALS

- A. Manufacturers catalog sheets, specifications and installation instructions for all products to be installed within the scope of work and included under this contract (submit with response).
- B. Test Results and Documentation as per Sections requirements.

PART 2 PRODUCTS

- 2.01 Prior to ordering cable, contractor shall physically inspect (field verify) existing and new infrastructure and be responsible for confirming available pathways and needed cable lengths.

2.02 OPTICAL FIBER BACKBONE

- A. Multimode (MM) and Single Mode (SM):
 1. This optical fiber backbone cable shall be suitable for installation in building riser systems, in conduit, in cable tray and/or in innerduct.
 2. Optical fiber cable shall be Air-Blown Fiber.
 3. Temperature Range:
 - a. Storage: -40°C to +70°C (no irreversible change in attenuation).
 - b. Operating: -40°C to +70°C.
 4. Humidity Range: 0% to 100%.
 5. Maximum Tensile Strength (≥ 12 fibers):
 - a. During Installation: 1332 Newton (300 lb. force) (no irreversible change in attenuation).

- b. Long-Term: 600 N (135 lb. force).
 6. Maximum Tensile Strength (\leq 6 fibers):
 - a. During Installation: 1000 Newton (225 lb. force) (no irreversible change in attenuation).
 - b. Long-Term: 100 N (67 lb. force).
 7. Bending Radius:
 - a. During Installation: 20 times cable diameter.
 - b. No Load: 10 times cable diameter.
 - B. Optical fiber cables suitable for installation in multiple environments (e.g., underground duct and building risers) may be used at the Contractor's option. Such optical fiber cables shall meet all specifications noted above for cables designated for each environment through which the optical fiber cable shall pass.
 - C. OM4 Multimode:
 1. Sumitomo Electric FutureFlex; FB12G55S
 - D. OS2 Single Mode:
 1. Sumitomo Electric FutureFlex; FB24SX
 2. Sumitomo Electric FutureFlex; FB12SXS
- 2.2 INTER-BUILDING FIBER TUBE CABLE (INDOOR/OUTDOOR)
 - A. Sumitomo Electric Future Flex 4-CELL TUBES; TC04MTX
- 2.3 INTRA-BUILDING FIBER TUBE CABLE (INDOOR PLENUM)
 - A. Sumitomo Electric Future Flex 4-CELL TUBES; TC04TP2
- 2.4 FIBER TUBE DISTRIBUTION UNIT
 - A. Provides tube management and organization
 - B. Sumitomo Electric Future Flex; DE20IDUP
- 2.5 FIBER ENCLOSURE
 - A. Must comply with TIA -568-C standard specifications.
 - B. Rack-mount fiber patch panels shall be mountable in a standard 19-inch rack.
 - C. Fiber optic shall be connected to modular cassettes.
 - D. 2U housings shall be rack mounted.
 - E. Manufacturer: Sumitomo
 1. Fiber panel shelf 2U, part# FT02L06ST
- 2.6 MM FIBER CASSETTE MODULE
 - A. Optical fiber multimode module with LC connectors.
 - B. Manufacturer:
 1. Sumitomo MM cartridge – part# FTLC-FSP12TBFOM4

2.7 SM FIBER CASSETTE MODULE

- A. Optical fiber single-mode module with LC connectors.
- B. Manufacturer:
 - 1. Sumitomo SM cartridge – part# FTLC-FSP24TBFOS2
 - 2. Sumitomo SM cartridge – part# FTLC-FSP12TBFOS2

2.8 COPPER MULTI-PAIR BACKBONE CABLE

- A. Copper cabling shall only be installed for existing campuses where VOIP Systems are not installed. CAT 3 Backbone Cable:
 - 1. The CAT 3 backbone cable shall link Communication Equipment Rooms serving the building. These CAT 3 backbone cables shall be terminated on rack-mounted RJ-45 Category 6A modular patch panels.
 - 2. CAT 3 backbone cable shall incorporate 24 AWG solid annealed copper conductors insulated with a polyvinyl chloride (PVC) CMR thermoplastic CMP plenum-rated skin. Conductors shall be twisted to form pairs and be full color-coded.
 - 3. Conductors shall be identified by the insulation color of each conductor. The color code shall follow the industry standard composed of 10 distinctive colors to identify 25-pairs in accordance with ICEA publication S-80-576-1988. Marking of each mate of the primary conductor in a pair with the color of that primary conductor is optional.
 - 4. CAT 3 backbone cable shall meet the TIA/EIA 3 performance requirements.
 - 5. When CAT 3 backbone cables of larger than 25-pairs are required, the core shall be assembled into 25-pair sub-units, each color-coded in accordance with ICEA publication S-80-576-1988. CAT 3 backbone cables with over 600-pair shall have 25-pair binder groups combined into super units. These super units shall be wrapped with a solid color thread that follows the primary color scheme of white, red, black, yellow and violet. Binder color code integrity shall be maintained wherever cables are spliced.
 - 6. CAT 3 backbone cables shall contain an overall corrugated, coated aluminum shield that is electrically continuous over its entire length.
 - 7. CAT 3 backbone cables shall be Air Core with an 8-mil ALVYN Sheath.
 - 8. Acceptable Manufacturers:
 - a. General Cable
 - b. Superior Essex
 - 1) OSP 25-pair Part Number 09-097-02
 - 2) ISP 12-pair Part Number 18-872-33

2.9 100-STYLE TERMINATION HARDWARE

- 1. UTP copper backbone cable shall be installed in the ITB building. All copper UTP cable shall be terminated onto plywood backboard wall-mounted 110-style termination hardware. All 110-style blocks are to be permanently labeled as directed by the District Representative.
- 2. All 110 termination hardware shall have C5 Connecting Blocks and wire management installed.

3. Manufacturer:
 - a. Belden, 100-pair with legs, Part Number AX100694
 - b. Belden, 110 Jumper Troughs with legs, Part Number AX100706
 - c. Belden, C5 110 Connecting Blocks, Part Number AX100708
 - d. Belden, 110 Designation Strip, Part Number AX100721
 - e. Or approved equal

2.10 PROTECTION PANELS AND MODULES

1. Inter-building UTP backbone cable protection in building entry rooms at ITB Building and Building 1000.
2. Protection panels shall provide protection for communications equipment and circuits exposed to voltage surges and sneak currents.
3. Protection panels shall be the wall-mount type with 110 input and output connectors.
4. Protector modules shall be UL 497 listed for primary circuit protection and shall provide protection for communications equipment and circuits exposed to voltage surges and sneak currents.
5. The protector modules shall be solid-state, self-resetting, digital and analog, and feature PTC (positive temperature coefficient) technology with 240VDC voltage break over.
6. Manufacturer:
 - a. CIRCA, 25-pair Building Entrance Terminal, Part Number 1880B1-25K
 - b. CIRCA, Surge Protection Modules, Part Number C4B1FS (PTC)

2.11 VOICE FEED CABLE

1. Material – 24 AWG Category 3 25 pair PVC jacketed single-ended cable.
2. Material – 24 AWG Category 3 12 pair PVC jacketed single-ended cable.
3. Length – as needed to reach from the Rack voice patch panel to the Protector Panels installed on the backboard.
4. Length – as needed to reach from the Rack voice patch panel to the 110-block installed on the backboard. Patch panel is 1-pair per port.
5. Acceptable Manufacturers:
 - a. General Cable
 - b. Superior Essex

2.12 COPPER PATCH CABLES

- A. Patch cords:
 1. Provide Category CAT6A specification for UTP copper patch cords for 50% of all assigned ports on the modular patch panel. Of these cords, 60% shall be 2' in length and 40% shall be 3' in length. These patch cords shall be the cross-connect between the network electronics and the horizontal RJ-45 modular patch panel. Copper patch cords shall be equipped with a 4-pair RJ-45 connector on each end.
 2. Patch cords shall not be made-up in the field.

3. Manufacturer:
 - a. Panduit P/N: TX6A-28 small diameter patch cables

PART 3 EXECUTION

3.01 FIBER CABLE INSTALLATION REQUIREMENTS

- A. Cable slack shall be provided in each backbone fiber optic cable. This slack is exclusive of the length of fiber that is required to accommodate termination requirements and is intended to provide for cable repair and/or equipment relocation. The cable slack shall be stored in a fashion as to protect it from damage and be secured in the termination enclosure or a separate enclosure designed for this purpose. Multiple cables may share a common enclosure.
- B. A minimum of 5 meters (approximately 15 feet) of slack cable (each cable if applicable) shall be coiled and secured at both ends located in the entrance room, Telecommunications Room or main equipment room, for backbone and intra-building cable.
- C. Where exposed, all backbone fiber optic cable shall be installed in protective inner duct. This includes areas where the cable is routed in cable tray and where making a transition between paths (e.g., between conduit and cable tray or into equipment racks). The inner duct should extend into the termination and/or storage enclosure(s) at system endpoints.

3.02 CROSS-CONNECTS

- A. The Contractor will be responsible for all cross-connects between the data backbone cabling and network electronics and between the data network electronics and horizontal cabling.
- B. The Contractor shall be responsible for the cross-connect wiring between the horizontal and backbone voice cabling.
- C. The Contractor shall not be responsible for cross-connects between the cabling terminations at the Entrance Room and the telephone utility network point-of-presence. It shall be the responsibility of the Contractor, to work with the Owner and provide the necessary assistance to allow Owner and/or telephone company personnel to make the necessary connections to establish service on the new cable system. These activities include, but are not limited to cross-connect documentation, general wiring overview, and cable pair identification.

3.03 OPTICAL FIBER TERMINATION HARDWARE

- A. Adhere to all manufacturer installation guidelines.

3.04 OPTICAL FIBER PATCH PANEL

- A. Install as shown on drawings.
- B. Furnish and Install labels for each strand per the Owner's instruction in the field or as shown on drawings.
- C. Install blank adapter panels in all positions not used at time of installation for fiber terminations.

3.05 FIBER GENERAL REQUIREMENTS

- A. All placements shall conform to industry standards with regards to anchoring, cable support, and separation from other facilities.
- B. Cables shall not sag or droop but should be installed to maintain a flat plane with smooth transitions from one level or direction to another.
- C. Fusion splice required, in fiber splice housing enclosures. Only those fiber splices referred to within this document shall be allowed. Splice loss shall be no greater than 0.15 dB. Spliced fibers shall be placed within splice trays. Install trays into the splice housings.
- D. A mechanical splice is not acceptable.
- E. All cables entering and leaving a splice, as well as the splice itself, shall be appropriately racked, routed, and secured to eliminate stress on the cables and/or connections.

3.6 COPPER CABLE INSTALLATION STANDARDS

A. General

- 1. The contractor, prior to placing cable orders, shall inspect existing underground infrastructure and verify that herein specified cables are an appropriate match to existing cables. If cables are not a match, the Contractor shall submit written notice to the Owner and or its agent of the cable disparity and make appropriate recommendations for the correct cable.
- 2. The contractor shall inspect, verify and determine raceway (including required cable) lengths and their adequacy to support specified cable systems, as well as the needed methodology required for installation of cable before proceeding with work.
- 3. The contractor shall ensure that the manufacturer-recommended maximum pulling tensions and minimum bending radius of cables being installed are not exceeded at any time during installation. Failure to follow such guidelines may result in the Contractor providing additional material and labor necessary to rectify any problems resulting from such situations, at no additional cost to the Customer. This shall also apply to any and all damages to cables caused by the Contractor during implementation.
- 4. The contractor shall provide sufficient length for one complete 25' service loop within each communications vault and 25' service loops at each cable end.
- 5. All cables shall be installed with adequate slack to allow for repair and/or splicing as may be required due to damage or breaking.
- 6. All cable, including splice cases, routed vertically or horizontally in maintenance holes shall be secured to existing or, if necessary, contractor-provided manhole racking hardware. Place splice cases at the highest point of the manhole to prevent them from being submerged.
- 7. It is the responsibility of the contractor to keep the work area free of related debris, trash, reels, scrap wire, etc., and to dispose of these materials on a daily basis.

B. Multi-pair Copper Backbone Cable

- 1. All cables shall be installed in a neat and orderly manner that provides the maximum amount of room for future cable additions. Cable shields shall be grounded and bonded end-to-end.
- 2. Cable routes must be field engineered to avoid obstruction of spare ducts and other facilities. Cable routes that block spare ducts shall be re-pulled as directed by the Customer's agent at no additional cost.
- 3. Cables shall be placed with no kinks, twists, or impact damage to the sheath.
- 4. All multi-pair copper cables shall have continuous sheath continuity.
- 5. Each cable shall be identified with a pre-established uniform numbering system. Identification will be securely attached to the cable at each end, whenever it enters or leaves a conduit sleeve, conduit in telecommunication rooms.

6. All cable runs installed in conduit shall include a nylon pull cord (1/4-inch), tied off at each end of run, unless the conduit is full.
7. Placement of cable in individual conduits shall be determined by the Contractor and the Customer's Agent to ensure the most efficient utilization.
8. All cables shall be clearly labeled with cable number, size, at each end of the cable, when it enters or leaves a conduit.
9. All cables shall be routed with wide sweeps without bends or kinks in the cable or sheath. The minimum bending radius for all cable, unless specified otherwise, is sixteen (16) times the cable diameter or manufacturer's specifications, whichever is greater.
10. Cuts and abrasions that penetrate the outer sheath of the cable shall be inspected by the Contractor, Customer, and/or the Customer's Agent to determine if the cable must be replaced or maybe patched. Decisions regarding the suitability of cables damaged during placement will be the responsibility of the Contractor, the Customer, and/or Customer's Agent.
11. All cable shields shall be bonded end-to-end and grounded per TIA-607 – Commercial Building Grounding and Bonding Requirements for Telecommunications.

C. VOICE FEED CABLE INSTALLATION

1. Neatly route the cable from the rack location to the Protector Panels. Allow approximately five feet of slack cable at the Rack patch panel.
2. Attach the cable to the cable runway and backboard as necessary. Do not allow the cable to sag.
3. Terminate cable onto the Protector Panels.
4. Provide and install cross-connects between 110 blocks and Rack patch panel for analog voice devices as required.

3.7 TESTING

A. Copper General

1. Testing shall be completed as stated below and prior to final acceptance.
 - a. All test results must be permanently recorded and presented in a format acceptable to the Customer before system acceptance. Any copper pairs failing to meet the above-indicated standards must be removed and replaced (at no cost to the Customer) with cables, which prove to meet the required standards.
 - b. Each test set and associated equipment shall be calibrated per the manufacturers' printed instructions at the beginning of each day's testing and after each battery charge. The test sets shall be fully charged prior to each day's testing.
 - c. The installation will not be accepted until testing has indicated a 100% availability of all UTP cable pairs or the Customer has approved any deviation from this requirement.
 - d. In addition to testing, validation of service at the user end (e.g., computer terminal, telephone, fax, etc.) shall be completed before testing shall be considered complete.

B. Fiber General

1. Testing shall not commence until installation and labeling are approved by the District Representative.
2. The District Representative shall be invited to witness the testing prior to commencing.
3. Every optical fiber in the completed end-to-end shall be 100% tested for defects in installation and to verify performance in accordance with the test specifications defined in ANSI/TIA -568 and TIA TSB-140 Tier 1 and Tier 2.
4. All fibers shall be tested in accordance with this document, the latest ANSI/TIA standards and best industry practice. All fibers must meet the minimum requirement of these standards. If any of these are in conflict, the Contractor shall bring any discrepancies to the attention of the District Representative for clarification and resolution.

3.8 TEST RESULTS

- A. Fiber cable test results information for each link shall be recorded in the memory of the field testers upon completion of the tests.
- B. The test results records saved by the OLTS Cable Analyzer shall be transferred onto the Test Documentation memory card upon completion of all performance tests. Results data shall be in an unaltered non-printable format and must be compatible with LinkWare Cable Management Software. General information to be provided shall include:
 1. The Contractor name
 2. The Cable ID
 3. The overall Pass/Fail summary of the link under test
 4. The Date and Time the test was performed
 5. Headroom
 6. The Test Limit
 7. The Cable Type
 8. The name of the Technician that performed the testing
 9. The Software Version of the tester software
 10. The model number of the tester
 11. The serial number of the main and remote unit
 12. The identification of the test adapters
 13. The Bi-directional Loss results
 14. Identification of the Site
 15. The Project ID
- C. The test results records saved by the OTDR shall be transferred onto the Test Documentation memory card upon completion. Results, when viewed with the OTDR software tools, shall display:

1. The brand, model, and serial number of the OTDR
 2. The software version of the OTDR
 3. The fiber ID as specified under Installation and Labeling
 4. The signature trace, identifying all splices and connectors
 5. Analysis of the signature trace.
- D. Perform Power Meter Test for each fiber strands. Fluke versive preferred tester.
- E. The test equipment shall be calibrated within 1 year of performing any cabling certification testing.
- F. The test database for the completed job shall be provided to the District Representative on a memory card, including the latest version of any necessary software tools required to view, inspect, and print any selection of the test results. Delivery shall be within three weeks after the completion of the project. The disk shall be clearly identified with the words "Test Documentation, ITB", and the date of completion (month and year) on a machine-printed label.
- G. The test equipment name, manufacturer, model number, serial number, software version, and last calibration date shall be provided as part of the documentation. Unless the manufacturer specifies a more frequent calibration cycle, an annual calibration cycle is anticipated on all test equipment used for this installation.
- H. When repairs and re-test are performed, the problem found and corrective action taken shall be noted, and both the failed and passed test data shall be documented.

3.9 FINAL ACCEPTANCE

- A. Successful completion of the installation, in-progress and final inspections, receipt of the test and as-built documentation, and successful performance of the cabling system for a two-week period will constitute acceptance of the system. The owner will appoint an authorized agent that will sign a formal acceptance document upon completion of all of the above.

3.10 DELIVERABLES

- A. As-built drawing identifying each data port number location on floor plan labeled per district standards for copper and fiber.
- B. Redlines drawing identifying all cable pathways for fiber and copper.
- C. Backbone as-built identifying all splice points, manholes, pull-boxes/transitions, and labeling information on a site plan for copper and fiber.
- D. All copper test results (in Native and PDF format).
- E. All fiber power meter test results (in Native and PDF format).
- F. All fiber OTDR test results (in Native and PDF format).
- G. Tester certification documentation.
- H. Cable records showing copper and fiber cable counts.
- I. Manufacturer 25-year warranty registration for all copper and fiber.

END OF SECTION

SECTION 27 15 00

COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

- A. These standards are provided to serve as a guideline for the construction project to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.1 SECTION INCLUDES

- A. This section describes the products and execution requirements per LACCD relating to furnishing and installing horizontal communications cabling and termination components and related subsystems as part of a cabling plant. The cabling plant consists of copper and optical fiber cabling.
1. Copper Horizontal Cable.
 2. Station Outlets.
 3. Faceplates
 4. Wireless Access Points

1.2 APPLICABLE PUBLICATIONS

- A. Telecommunications Structured Cabling System Standards:
1. The cabling system shall include high-performance copper Category 6A (STP, FTP) cabling where appropriate and as defined by LACCD. Cables may be routed through conduit, cable trays, spaces below raised floors, open ceiling areas, non-ventilated spaces above the ceiling tile, and through plenum air-handling spaces above the ceiling tile. Cables shall not be attached to ceiling grid or lighting fixture wires. Where support for horizontal cable is required, the contractor shall install appropriate carriers to support the cabling.
 2. All work and equipment shall conform to the most current ratified version of the following published standards unless otherwise indicated that draft standards are to be followed:
 - a. ANSI/TIA-568-C.0, Generic Telecommunications Cabling for Customer Premises
 - b. ANSI/TIA-568-C.1, Commercial Building Telecommunications Cabling Standard
 - c. ANSI/TIA-568-C.2, Balanced Twisted-Pair Telecommunication Cabling and Components Standard
 - d. ANSI/TIA-568-C.3, Optical Fiber Cabling Components Standard
 - e. ANSI/TIA-569-C, Telecommunications Pathways and Spaces

- f. ANSI/TIA-598-C, Optical Fiber Cable Color Coding
- g. ANSI/TIA-606-B, Administration Standard for Telecommunications Infrastructure
- h. ANSI/TIA-607-B, Generic Telecommunications Bonding and Grounding (Earthing) For Customer Premises
- i. ANSI/TIA-758-B, Customer-Owned Outside Plant Telecommunications Infrastructure Standard
- j. ANSI/TIA-526-7, Measurement of Optical Power Loss of Installed Single-Mode fiber Cable Plant
- k. ANSI/TIA -526-14, Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant
- l. ANSI/TIA-942, Telecommunications Infrastructure Standard for Data Centers
- m. ASHRAE 9.9, Thermal Guidelines for Data Processing Environments

PART 2 PRODUCTS

2.1 COPPER HORIZONTAL CABLE (CATEGORY 6A, F/UTP PLENUM)

A. Material

1. Use for voice and data applications to interconnect services from workstation to the wiring closet in a plenum or non-plenum rated space.
2. CMP rated only, except where cabling is routed under-slab on grade, then use OSP rated cable.
3. Four pairs, 23 AWG, Category 6A, F/UTP, as defined by the EIA/TIA standards intended for use with transmission rates up to and including 10 Gbps. Cabling shall be tested up to 750 MHz. Cable shall exceed transmission requirements listed in ANSI/TIA/EIA-568-C.2. Performance tests shall be conducted using swept-frequency testing through 500 MHz for the channel. All numbers given are for a 4-connection channel. Discrete frequency testing results at 500 MHz is not acceptable.
4. The horizontal cable requirements must be met, as well as the following channel requirements.
5. CAT 6A cable shall terminate on rack-mounted modular patch panels in their respective communication equipment room as indicated on the drawings.
6. Performance tests shall be conducted using swept-frequency testing through 500 MHz for the channel. All numbers given are for a 4-connection channel. Discrete frequency testing results at 500 MHz is not acceptable.
7. Performance data shall be provided by third-party independent testing laboratories only. Testing data shall be submitted on the third-party testing laboratory letterhead. Test data will only be accepted if it displays testing as a channel. Electrical characteristics of the performance of the cable itself will not

satisfy this requirement.

8. The structured cabling and connectivity may be provided by the same company. For this document that shall mean that the cabling and connectivity must be marketed, branded, supported, warranted, and distributed by the same company. Specifically, ally or partnerships between cabling manufacturers and connectivity manufacturers do not meet this requirement unless otherwise listed as an acceptable manufacturer. Specifically, products made by others through an OEM relationship are acceptable if the products are marketed, branded, supported, warranted, and distributed by the same company.
9. The 4-connector channel performance margins in the table below shall be guaranteed margins above ANSI/TIA/EIA-568-C.2:

Electrical Value (1 - 500 MHz)	Minimum Margin
Insertion Loss:	3%
NEXT:	2 dB
PS NEXT:	3 dB
PSA NEXT:	3dB
PSA NEXT (Average):	
ACR-F:	2 dB
PS ACR-F:	3 dB
PSA ACR-F:	3 dB
PSA ACR-F (Average):	3 dB
Return Loss:	2 dB

B. Manufacturer:

1. Panduit Cable
 - a. Indoor Plenum Rated (Blue)
 - b. Indoor/Outdoor Rated (Black)
 - c. Outdoor OSP rated (Black)

2.2 OUTLET LABELS

A. Materials:

1. All labels shall be made using a label maker that produces clear adhesive labels with black typeset characters. The labels must have a strong adhesive that will not come off unless it is forced off. The label size will be 3/16 inch wide with a typeset font no smaller than 10 points. The Contractor shall utilize the label maker and labels that are recommended for the selected Structured Cabling System.
2. There shall be no difference, in numbering, between a voice jack and a data jack. Voice and data will be punched down side-by-side on the same patch panel, the campus standard is for all Cat 6A jacks to be identified as D01, D02,

D03, etc. The number indicates the position on the patch panel. So D186 is the 186th position on the patch panel in the telecom room.

3. The Contractor must submit a sample label to the District for approval before labeling the new outlets.
4. Manufacturer: Panduit label or approved equal

2.3 STATION OUTLETS

A. Data Outlets

1. The standard data outlet shall consist of four (4) Category 6A four-pair cables, each terminated on a separate Category 6A rated RJ45 8- position jack following EIA/TIA T568B wiring standards. Jacks colors shall be blue.
2. The modular jacks shall be rated for Category 6A performance in the configuration installed. Manufacturer: Panduit Mini-Com.
3. The faceplate will be clearly labeled with outlet number, and each jack will be labeled with jack number. All labels will be typed or preprinted and shall be securely affixed to the faceplate.
4. Dust covers shall be placed in the vacant slots.
5. Manufacturer: Panduit Faceplates

B. Voice Outlets

1. Voice only outlets shall consist of a single four-pair Category 6A cable connected to a wire modular jack assembly with a metal cover plate suitable for securing a wall-mounted telephone. The color of the jack will be white designated for voice.
2. The modular jacks shall be rated for Category 6A performance in the configuration installed. Manufacturer: Panduit Mini-Com.
3. All wall phone outlets shall be placed at 44 inches above the finished floor unless otherwise noted to make the maximum height to the top of the telephone 48 inches above the finished floor.
4. Wall phone outlets shall be equipped with a duplex mud-ring around the standard dual gang outlet box recessed in the wall where possible.
5. Wall phone outlets shall consist of a stainless steel duplex faceplate equipped with a single RJ45 jack.
6. Manufacturer: Panduit Faceplates.

2.4 FACEPLATES

- A. Faceplates will be supplied for every information outlet (voice, data, and network). Unless otherwise noted. They shall meet the required NEMA standard.
- B. All faceplates shall be available in a single, duplex, triplex, quadplex, or six-plex arrangement in a single gang configuration.
- C. Faceplates shall be available in eight plex arrangement in a dual gang box configuration.

- D. Surface mount boxes shall be available in single, dual, quad, and six-plex configuration.
- E. Manufacturer: Panduit Faceplates

2.5 COPPER PATCH PANELS

- A. Modular patch panels shall be furnished and installed by the Contractor for termination of copper cable.
- B. Copper cabling shall be terminated in modular patch panels consisting of a modular connector system incorporating modular CAT6A jacks.
- C. The largest single modular patch panel configuration shall not exceed 48-Ports. Modular patch panels shall be fully populated (all ports occupied by jacks) and be provided in increments of no less than 12 jacks. High-density modular patch panels will not be accepted.
- D. Panel Label: the 48 port patch panels will be terminated from A1, A2, A3, and so on until A40. Ports 41 through 48 will be to be used as spares.
- E. Modular patch panel blocks shall be designed to maintain the cables' pair twists as closely as possible to the point of mechanical termination.
- F. Modular patch panels shall incorporate cable support and/or strain relief mechanisms to secure the horizontal cables at the termination block and to ensure that all manufacturer's minimum bend radius specifications are adhered to.
- G. Manufacturers: Panduit
 - 1. 48-port modular flat patch panel
 - 2. 24-port modular flat patch panel

2.6 COPPER PATCH CABLES

- A. Patch cords:
 - 1. Provide Category CAT6A specification for UTP copper patch cords for 50% of all assigned ports on the modular patch panel. Of these cords, 60% shall be 2' in length and 40% shall be 3' in length. These patch cords shall be the cross-connect between the network electronics and the horizontal RJ-45 modular patch panel. Copper patch cords shall be equipped with a 4-pair RJ-45 connector on each end.
 - 2. Patch cords shall be small diameter constructed of 28 AWG with high performance RJ45 modular plugs
 - 3. Patch cords shall not be made-up in the field.
 - 4. Manufacturer:
 - a. Panduit P/N: TX6A-28
 - b. Or approved equivalent

PART 3 EXECUTION

3.1 EXAMINATION

- A Check actual site conditions prior to the start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work that must be checked include, but are not limited to:
1. Electrical requirements (conduit installation and capacity)
 2. The telecommunications rooms are the size shown on the project drawings.
 3. Adequate clearances of doors, riser spaces, and ceilings for all components of the telecommunications system.
 4. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 INSTALLATION

- A Process:
1. Install all horizontal station cabling per the manufacturer's recommended installation instructions, under the guidelines of TIA/EIA 568C and BICSI, and in quantities indicated in the Telecom Drawings.
 2. Locations requiring horizontal cable shall be, but not limited to Wireless Access points, work area outlet, and camera (indicated in Security Drawings).
 3. Install all cables with proper attention to bend radii, pulling method, attachment method, and pulling forces. All cables shall be pulled using an appropriate measuring device to ensure that the specified force is not exceeded as noted in BICSI installation guidelines. Also, refer to the cable manufacturer's specifications for exact cable requirements per the particular cable type.
 4. All cables shall be visually inspected for insufficient bend radius during and after pulling. Damaged cables, or those installed under questionable methods and/or circumstances shall be replaced at no additional cost to the owner.
 5. The contractor shall ensure that all TIA/EIA and industry standards are met with special regard to the maximum stripping length of cable jackets. No four (4) pair UTP cables shall have more than three-eighth inch (3/8") of cable jacket removed beyond the termination points.
 6. Install the horizontal cabling with attention paid to aesthetic means and methods when routing cabling within IT spaces. All horizontal cabling shall terminate in their respective floor serving technology space; specifically, cables from floor outlets need to terminate in their corresponding floor telecom room.
 7. All cabling distributed horizontally through metal stud framing shall have plastic protective bushings inserted to protect cables prior to installation.
 8. All cables shall be clearly labeled on both ends and in an accessible location, no more than six inches (0'-6") from the cable ends.
 9. The owner reserves the right to specify a new location for any outlet or equipment without increasing contractor unit cost – providing that the new location is specified prior to roughing-in of technology cable and is no farther than ten (10) feet away from the original location specified.
 10. Communication EMT conduit sleeves shall receive conduit waterfall to control bend radius of the communication cable to a minimum of a 4" radius.
 11. Install all connectors and couplers under the guidelines of the

manufacturers' recommended instructions and per all TIA/EIA 568C standards, BICSI guidelines, and manufacturer-approved industry practices.

12. The installation and performance parameters of all installed couplers and connectors shall be verified by the trade contractor through TIA/EIA 568C testing procedures.
13. Color of all outlet housing components shall be coordinated with the Owner before purchase and installation.
14. All technology outlets located on walls shall be flush mounted, level and plumb.
15. All technology outlets shall be mounted at right angles and parallel to the floor unless installation requirements or design dictate otherwise.
16. Install blank inserts in outlet housing spaces that are not being filled with cable termination modules. Blank inserts shall match the workstation housing color unless otherwise indicated in the drawings.
17. All outlets located in systems furniture may be served from a wall adjacent to the furniture cluster or a floor box. If the cable is exposed prior to entering the furniture raceway, install spiral wrap tubing to protect the cable per the manufacturer's recommendations.
18. All outlet housings as well as each individual utilized port must be labeled in accordance with the Owner-approved labeling scheme.

3.3 RE-INSTALLATION

- A. No additional burden to the owner regarding costs, network downtime, and end-user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning any re-installation work.

3.4 CLOSE-OUT ACTIVITIES

- A. The contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.
- B. Fiber and Copper Cable Systems
 1. The Contractor shall use forms provided by the District or Structured Cabling System manufacturer if approved by the Engineer of Record, to document the successful testing of all inter-building, intra-building, entrance, and tie cables.
 2. Test equipment used shall be Fluke Versive for OTDR and Power meter Testing for fiber and copper cables. Category 6A station cable test results noting unique station numbers and group test results by floor shall be provided. The Contractor shall neatly note floor plans with "as-built" station numbers and any changes, additions, or deletions to outlet placement. Inter-building, entrance, and riser plans shall be updated to include actual routes, cable numbers and counts, and lengths of cables.
- C. Deliverables
 1. As-built drawing identifying each data port number location on floor plan labeled per district standards for copper and fiber.
 2. Redlines drawing identifying all cable pathways for fiber and copper.

3. Backbone as-build identifying all splice points, manholes, pull-boxes/transitions, and labeling information on a site plan for copper and fiber.
4. All copper test results (in Native and PDF format).
5. All fiber power meter test results (in Native and PDF format).
6. All fiber OTDR test results (in Native and PDF format).
7. Tester certification documentation.
8. Cable records showing copper and fiber cable counts.
9. Manufacturer 25-year warranty registration for all copper and fiber.
10. Provide as-built floor plan laminated and placed in each BDF and IDF to show all data drop locations with cable identifiers. Also, to include cable routing for the Backbone Distro site plan with manhole butterfly details "to/from" and all pull points and splice points for copper if applicable.

END OF SECTION

SECTION 27 20 00

DATA COMMUNICATIONS

PART 1 GENERAL

1.1 SUMMARY

- A. Section Includes:
1. Management of Owner who is installing IT Equipment in Telecommunication Spaces before Substantial Completion
 2. Management of third-party providers who are installing equipment to connect to the Owner's network
- B. Related Requirements:
1. Section 01 74 23.05 Final Cleaning of Telecommunication Spaces
 2. Section 14 20 00 Elevators
 3. Section 22 00 00 Plumbing
 4. Section 23 00 00 Heating, Ventilating, and Air Conditioning (HVAC)
 5. Section 26 00 00 Electrical
 6. Section 27 05 00 Communications Work Results for Communications
 7. Section 27 00 00 Communications Basic Requirements
 8. Section 27 08 00 Data Communications Commissioning
 9. Section 27 15 00 Structured Cabling
 10. Section 27 13 00 Communications Backbone Cabling
 11. Section 27 41 00 Audio-Video System
 12. Section 28 00 00 Security Systems Basic Requirements

1.2 REFERENCES

- A. Definitions
1. *Owner* Used here to refer to the Owner or the Owner's directly procured contractor
 2. *Third-party provider* is any subcontractor or sub-subcontractor engaged under the Contract to the Contractor providing edge-devices as part of the Work.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Coordination
1. Coordinate with third-party providers to understand the LAN requirements of their devices, convey these requirements to the Owner, the network switches cannot be
 2. Liaise with the Owner
 3. Advise third-party providers on how to harden devices
 4. Manage the connection of devices to the network
 5. Manage the owner and the installation of network switches
- B. Preinstallation Meetings
1. Organize and lead a meeting with all third-party providers
 2. Organize a meeting with the Owner to understand their requirements
- C. Sequencing

1. Adhere to Section 27 06 20.10 - Telecommunication Space Room Ready Schedule
2. Determine sequencing of telecommunication spaces in order that the IT Equipment is installed and the third-party providers are able to connect to and make use of the network

D. Notification

1. Notify the Contract Administrator:
 - a. Where the document references sections that are unavailable
 - b. Where conflicts arise from requests in the documentation, implement the most onerous provision

1.4 ACTION SUBMITTALS

- A. Installation schedule for IT Equipment
- B. Sequencing schedule for ensuring third-party providers devices are ready to connect to the network and do connect to the network in time to complete any requisite commissioning

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data:
 1. Penetration test results including all corrective actions

1.6 QUALITY ASSURANCE

- A. Qualifications
 1. Integrator
 - a. ISO 9001 – Quality Management Certification
 - b. ISO 14001 – Environmental Management Certification
 - c. ISO 27001 – Information Security Management Certification
 - d. Project Manager:
 - 1) Registered Communications Distribution Designer (RCDD)
 - 2) Project management certification:
 - a) Project Management Professional (PMP), or
 - b) Registered Telecommunications Project Manager (RTPM)

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Storage and Handling Requirements
 1. Provide physical storage
 - a. Secured with access control and a monitored video security system
 - b. On site
 - c. Sized for Owner's equipment

PART 2 PRODUCTS

2.1 NOT USED

PART 3 EXECUTION

3.1 PREPARATION

- A. Ensure all preceding Work is complete.
 - 1. Section 01 00 00
 - 2. Section 27 05 00
 - 3. Section 27 11 00
 - 4. Section 27 13 00
 - 5. Section 27 15 00
 - 6. Section 27 05 53

3.2 MANAGEMENT OF NETWORK INSTALLATION

- A. Manage the Owner and the installation of the network switches and any other IT Equipment in the telecommunication spaces.
- B. Manage the creation of an IT Service Catalog and Configuration Database for every edge-device.
- C. Manage the third-party providers and the connection of their devices to the Owner's network.

3.3 SITE QUALITY CONTROL

- A. Nonconforming Work
 - 1. Review the output of Section 27 08 00 – Data Communications Commissioning. Ensure all third-party providers correct their vulnerabilities.
 - 2. Review the output of the closeout activities: endurance testing and ensure all third-party providers correct all failures.

3.4 CLOSEOUT ACTIVITIES

- A. Demonstration:
 - 1. Lead the General Tests
 - 2. Lead the Penetration Test
 - 3. Lead the Cabling Test

END OF SECTION

This page intentionally left blank

SECTION 27 32 43

DAS - PUBLIC SAFETY & EMERGENCY RESPONDER

PART 1 GENERAL

1.01 SUMMARY

- A. Distributed Antenna System (DAS) Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.
- B. The project delivery of the system will be by the Design-Build method. The Design-Build contractor and/or system vendor shall include all physical infrastructure and pathways to facilitate installation, configuration, and operation of the system. This includes all structural, electrical, mechanical and other infrastructure elements that impact the operation and performance of the DAS and are part of the permanent building structure and finishes. (For example: conduits, pathways, equipment support structures, electrical power services, etc.)
- C. The scope of the DAS will cover the underground parking areas, back of house facilities, and all other accessible areas of levels P1 through P3 in compliance with the California Building Code Section 510 and any other applicable codes and requirements.
- D. The general contractor must coordinate with the City of Beverly Hills Fire department during construction of the building to perform pre-test for expected areas which shall have Public Safety & Emergency Responder coverage within levels P1 through P3. Once the tests have been completed the required areas shall be reviewed by the Design-Build team to confirm coverage by antenna locations remain adequate.

1.02 RELATED DOCUMENTS

- A. General and Supplementary Conditions

1.03 RELATED SECTIONS

- A. Division 01 – General Conditions
- B. Division 07 – Penetration Firestopping
- C. Division 26 - Grounding and Bonding
- D. Division 26 - Raceway and Boxes
- E. Division 26 - Wiring Devices
- F. Division 27 - Communications

1.04 ABBREVIATIONS

- A. ACG: Automatic Gain Control
- B. AHJ: Authority Having Jurisdiction
- C. ATP: Acceptance Test Plan
- D. AWS: Advanced Wireless Service
- E. BDA: Bi-Direction Amplifier

- F. BOM: Bill-of-Material

- DD. RSL: Received Signal Level
- EE. SISO: Single-Input, Single-Output
- FF. SMR: Specialized Mobile Radio
- GG. SMS: Short Message Service
- HH. SNIR: Signal-to-Noise Interference Ratio
- II. SNMP: Simple Network Management Protocol
- JJ. SOW: Statement of Work
- KK. VSWR: Voltage Standing Wave Ratio
- LL. WSP: Wireless Service Provider

1.5 DEFINITIONS

- A. Acceptance: Expressed approval by the customer
- B. Active: DAS components that require AC/DC power for operation.
- C. Carrier Approval: Expressed approval to interconnect to the WSP macro network.

- D. Channel: A path for an RF transmission between two points.
- E. Component: A main system element of the DAS.
- F. Contractor: The prime contractor bidding the project.
- G. Passive: DAS components that do not require AC/DC power for operation.

- T. NEC Article 250 for System Grounding
- U. NEC Articles 770 and 800 for Cable Listing Requirements
- V. Work performed should additionally comply with and follow guidelines established in the latest edition/revision, as of the date of the Contract Documents, of the following publications:

1. BICSI Telecommunications Distribution Methods Manual (TDMM)
 2. National Electrical Contractors Association (NECA)/BICSI ANSI/NECA/BICSI-568-2006 Standard for Installing Commercial Building Telecommunications Cabling
- W. All materials shall be new and listed by UL and shall bear the UL label. If UL has no published standards for a particular item, then other national independent testing standards shall apply and such items shall bear those labels. Where UL has an applicable system listing and label, the entire system shall be so labeled.
- X. Notify Consultant of all material believed to be inadequate, unsuitable, in violation of law, ordinances, rules or regulations of authorities having jurisdiction.

1.07 CONFLICTING REQUIREMENTS

- A. Referenced Standards: If compliance with two or more standards is specified and the standards establish different or conflicting requirements for minimum quantities or quality levels, comply with the most stringent requirement. Refer uncertainties and requirements that are different, but apparently equal, to Consultant for a decision before proceeding.
- B. Minimum Quantity or Quality Levels: The quantity or quality level shown or specified shall be the minimum provided or performed. The actual installation may comply exactly with the minimum quantity or quality specified, or it may exceed the minimum within reasonable limits. To comply with these requirements, indicated numeric values are minimum or maximum, as appropriate, for the context of requirements. Refer uncertainties to Consultant for a decision before proceeding.

1.08 SUBMITTALS REQUIREMENTS

- A. Submittals shall include complete documentation of the system, products and accessories in a single submittal. Incomplete submittals will be returned unreviewed.
- B. Prior to the start of work the Contractor shall submit shop drawings in an electronic form. Plans shall be fresh designs by the contractor; they cannot be overlays of the Consultant's package which are indicative as the contract documents. Shop drawings shall contain:
1. Full size floor plans showing distribution of antenna conduit and cable routing running within the parking level slab ceilings.
 2. Drawings shall include of donor antenna, routing, equipment, conduits, pullboxes and grounding.
 3. Full size frequency modeling plans and RF Propagation Modeling by iBWAVE Software, or equal subject to review. These shall indicate full coverage expectations of system antennas as per floor plans.
 4. Signal to Noise Interference Ratio (SNIR) Map.
 5. RF Link Budget.
 6. Full size floor plans and elevations of all equipment within telecom room racks and on wall.
 7. Single-line and/or block diagrams indicating signal and component relationships for the system end-to-end.
 8. Equipment wiring diagrams.
 9. Primary and secondary primary sources and connectivity diagram(s).
 10. Physical dimensions of equipment clearly identified.
 11. Bill of Materials.
 12. All seismic bracing and support details shall be provided in coordination with the general contractor as needed.

- C. Permit drawings as required by the AHJ.
- D. Submittals shall include antenna mockups sent to the Consultant for final review. Mockups shall have the manufacturer's cable markings clearly visible.
- E. Where applicable, dimensions should be marked in units to match those specified.
- F. Work shall not proceed without the Consultant's "no exception taken" of the submitted items.
- G. Floor plans will be provided to the Contractor in electronic (AutoCAD, ".dwg") formats to be utilized by the contractor in creating complete submittals and as-built documentation. These modified documents shall be provided to the Owner as part of the Record Documents.
- H. All submittal documentation shall bear the stamp of a currently verifiable BICSI RCDD.
- I. Plans shall be fresh designs by the Contractor; they cannot be overlays of the Consultant's package which is indicative as contract documents.
- J. Contractor must submit documentation to ensure qualifications have been met by the manufacturers. This includes but it's not limited to the following:
 - 1. End to end solution and partner documentation indicating contractor's staff has gone through proper channels and training support the applicable warranty and service program by the manufacturers.
 - 2. BICSI affiliations by contractor.
 - 3. Current copy of the State contractor's license.
 - 4. Documentation of (3) similar projects within the past 5 years in the same State.
- K. Certificates:
 - 1. A FCC-issued general radio operators license (GROL) for the installation personnel.
 - 2. A certificate from the manufacturer of the equipment to be installed stating that the DAS installer is trained and qualified on the equipment.
 - 3. Associated Public Safety Commissions Officials (APCO).
 - 4. National Association of Business Education Radio (NABER).
 - 5. Personal Communications Industry Association (PCIA).
 - 6. Certifications for iBWAVE Software, or equal subject to review.
- L. Test Equipment
 - 1. Submit certificates indicating that staff is certified on required test equipment including by not necessarily limited to:
 - a. Signal Generators.
 - b. Spectrum Analyzers.
 - c. PIM Testers.
 - 2. Submit current calibration data for test equipment to be used.
 - 3. Submit certificates indicating that staff is certified on required test equipment.
 - 4. Submit current calibration data for test equipment to be used.
- M. Equipment cutsheets on any equipment proposed for substitution in compliance with Section 1.7 of the specifications.
- N. Bid Assumptions
 - a. Contractors shall state the assumed channel count for the PSN Frequency Bands identified above with submittal of bid response. Prior to installation, contractors

shall confirm the channel count and frequencies with the AHJ, and shall guarantee coverage for these channels per the criteria stated above.

- O. Statement of Work (SOW): The contractor shall submit a SOW that has been accepted by the customer or customer's designated representative.
 - P. Acceptance Test Plan (ATP): The contractor shall submit an ATP that has been accepted by the customer or customer's designated representative.
 - Q. To scale floor plans showing the location of system Components.
 - R. Final RF link budget.
 - S. Detail Drawings for Donor Antenna and grounding.
 - T. RF propagation modeling (Heat maps).
 - U. Product Data Sheets for each type of equipment to be installed.
 - V. Maintenance Service Contract.
- 1.09 SUBMITTAL REQUIREMENTS AT CLOSE OUT
- A. Drawings: Submit as-built drawings indicating:
 - a. Donor antenna, grounding and lightning protection details.
 - b. Cable routing, splitters, couplers and coverage antenna locations.
 - c. Active component locations, layout and configuration.
 - d. All items as listed in Section 1.8 representing final project completed conditions.
 - B. Test Reports:
 - a. PSN: Submit Accepted ATP reports confirming the requirements of Section 1.4 have been met.
 - b. WSP DAS: Submit accepted ATP reports confirming the requirements of Section 1.4 have been met.
 - C. Cable Test Reports: Submit cable test results for all cable segments. Testing shall include Return Loss (RL), Distance to Fault (DTF) and Passive Intermodulation (PIM).
 - D. Field Reports: Submit OTDR test results for all fiber runs.
 - E. Operation and Maintenance Data: Submit hardware and software manuals for all Active Components.
 - F. Acceptance Certificate or Document from the AHJ
 - G. Warranty Documents:
 - a. Submit for all manufactured components specified in this Section.
 - b. Submit Contractor's System Warranty.
 - c. Submit Manufacturer's Extended Warranty
- 1.10 MANUFACTURER CERTIFIED WARRANTY REQUIREMENTS
- A. The system shall be comprised of components from a single manufacturer or a combination of manufacturers entering into a partnering agreement that allows for a warranty of the system.
 - B. System warranty program documents must be from that of the cabling, component and equipment manufacturer and associated partners. Cabling, component and equipment manufacturer warranty programs offered by the contractor alone are not acceptable.

1.11 QUALITY ASSURANCE

- A. Installer Qualifications: A firm or individual experienced in installing, erecting, or assembling work similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.
- B. Specialists: Certain sections of the Specifications require that specific construction activities shall be performed by entities who are recognized experts in those operations. Specialists shall satisfy qualification requirements indicated and shall be engaged for the activities indicated.
- C. Requirement for specialists shall not supersede building codes and regulations governing the Work.
- D. Factory-Authorized Service Representative Qualifications: An authorized representative of manufacturer who is trained and approved by manufacturer to inspect installation of manufacturer's products that are similar in material and design.

1.12 QUALITY CONTROL

- A. Contractor Responsibilities: Tests and inspections not explicitly assigned to Owner are Contractor's responsibility. Perform quality-control services required of Contractor by authorities having jurisdiction, whether specified or not.
- B. Manufacturer's Field Services: Where indicated, engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including service connections. Report results in writing.
- C. Manufacturer's Technical Services: Where indicated, engage a manufacturer's technical representative to observe and inspect the Work.
- D. Coordination: Coordinate sequence of activities to accommodate required quality-assurance and quality-control services with a minimum of delay and to avoid necessity of removing and replacing construction to accommodate testing and inspecting.

1.13 SUBSTITUTIONS

- A. Contractor Responsibilities: Tests and inspections not explicitly assigned to Owner are Contractor's responsibility. Perform quality-control services required of Contractor by authorities having jurisdiction, whether specified or not.
- B. Contract Documents are based on equipment manufacturers as called out in the Specifications and indicated on the Drawings. Acceptance of substitute equipment manufacturers does not relieve Contractor of the responsibility to provide equipment and materials, which meet the performance as, stated or implied in the Contract Documents.
- C. Submit proposals to provide substitute materials or equipment, in writing, in compliance with Bidding and Division 1 requirements. Reimburse Owner for costs associated with the review of the proposed substitution whether substitution is accepted or rejected.
- D. Indicate revisions required to adapt substitutions including revisions by other trades. Substitutions that increase the cost of the work of related trades are not permitted.
- E. Proposals for substitutions shall include the following information:
 - 1. Passive Components:

- a. Product samples.
 - b. Detailed product specifications.
 - c. Independent test results verifying the product specifications.
 - d. Written documentation from the manufacturer guaranteeing that the alternative component(s) shall remain available for new purchase for a period of 7 years from the date of system acceptance.
2. Active Components:
- a. Hardware and software manuals.
 - b. Detailed product specifications.
 - c. Mean Time Between Failure (MTBF) data for each Active Component.
 - d. Independent test results verifying the product specifications.
 - e. Written documentation from the manufacturer guaranteeing that the alternative component(s) shall be supported for a period of 7 years from the date of system acceptance.
 - f. For Active Components serving the WSPs, written documentation from the WSPs that the alternative component(s) are approved for use within the WSP's network and that interconnection of the DAS to the WSP's network will not be withheld due to the alternative component being used in the DAS.
 - g. For Active Components serving the PSN, written documentation from the AHJ that the alternative component(s) are approved for use within the PSN and that system acceptance of the DAS to the PSN will not be withheld due to the alternative component being used in the DAS.

1.14 SYSTEM DESCRIPTION

- A. Services: Upon Acceptance Testing, the DAS shall provide coverage for the WSPs and PSNs listed below on all frequencies currently being used by the designated WSPs and PSNs in the given market.
- B. Separate Infrastructures. The PSN DAS shall be deployed on a cabling and antenna infrastructure that is segregated from the components supporting Cellular, paging and facility radio system.
- C. Services Supported. The DAS infrastructure shall be designed to support the services described in Table 1 below.

TABLE 1 SERVICES SUPPORTED ON THE DAS

Baseline Configuration (All information to be determined by BHFD, other local authorities and FCC) Frequencies:	Service Level:	Provider:
453.52500	BH PD 1 Police Dispatch	City/Beverly Hills
453.65000	Police Tactical (Encrypted)	City/Beverly Hills
485.35000	Police Detectives (Encrypted)	City/Beverly Hills
453.22500	Police Traffic Units	City/Beverly Hills
460.6250 N	BHFD Primary Dispatch	City/Beverly Hills

465.5750 N	BHFD Tac/Chain	City/Beverly Hills
453.6875 N	BHFD Tac-Direct	City/Beverly Hills
458.6875 N	BHFD Tac-Direct	City/Beverly Hills

D. PSN Coordination/Approval:

1. The Contractor shall propose and deploy a DAS system capable of receiving approval of the PSN Authority Having Jurisdiction (AHJ).
2. The Contactor shall coordinate and submit all documentation required for AHJ approval.

E. WSP Approval: The Contractor shall propose and deploy a DAS system capable of receiving WSP Approval for interconnection to the WSPs’ macro networks.

F. Broadband Active Distribution: Single-mode fiber-optic cable will be used for active distribution. In-line amplifiers are not allowed.

G. System Management:

1. SMS: The DAS shall have a Systems Management System (SMS) capable of alarm, monitor, configuration and control of all Active Components.
2. SNMP Integration: The DAS NMS shall be capable of integration with 3rd party SNMP based NMS products for alarm purposes and provide alarming information.

1.15 PERFORMANCE REQUIREMENTS

A. Public Safety Network (PSN) DAS:

1. The PSN DAS shall comply with CFC 2013 and NFPA-72 as enforced by the local AHJ.
2. Contractors shall state the assumed channel count for the PSN Frequency Bands identified above with submittal of bid response. Prior to installation, contractors shall confirm the channel count and frequencies with the AHJ, and shall guarantee coverage for these channels per the criteria stated above.
3. The DAS shall deliver coverage per the criteria in Table 2 throughout 95% of all occupied building spaces and 99% in critical areas as defined in NFPA 72.

TABLE 2 SYSTEM PARAMETERS PSN

Parameters	Units	Public Safety ~ 450 MHz
Minimum Downlink RSL	dBm	-95

4. The DAS shall be capable of upgrade, without additional hardware or software, to allow for changes to system frequencies within the deployed frequency band in order to maintain radio system coverage as originally designed.

B. Paging and Facility Radio Systems:

1. The DAS shall deliver coverage per the criteria in Table 3 throughout 95% of all occupied building spaces.

TABLE 3 SYSTEM PARAMETERS IN HOUSE SYSTEMS

Parameters	Units	Paging and Facility Radio
Minimum Downlink RSL	dBm	-95

2. The contractor shall explain the method used to avoid downlink and uplink interference.

1.16 OWNER STANDARDS

- A. Wanda Hotel Design Guidelines April 2, 2015.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Subject to compliance with requirements, provide products by one of the following:
 1. DAS Simplified.
 2. Zinwave.
 3. Commscope / Andrew.
 4. Or equal subject to review.

2.02 HEAD END COMPONENTS

- A. Public Safety Bi-Directional Amplifier (BDA)
 1. BDA: The BDA shall be of modular design and use digital filtering to mitigate interference and accommodate multiple services for PSN.
 2. Characteristics:
 - a. Operating Temperature Range: -33 °C to +50 °C.
 - b. Chassis: Shall be of modular design with ≥ 4 frequency bands per 19" chassis. Chassis shall not exceed four Rack Units (RUs) in height.
 - c. Filtering: Digital
 - d. Separate Control: Each RF amplifier shall be capable of adjusting and controlling power levels for each WSP when multiple WSPs share a single amplifier.
 - e. FCC Part 90.219 Type Classification: Class A narrowband for LMR/SMR/ ESMR frequency bands.
 - f. Alarming: Shall support both SNMP and SMS using wireless modem.
 - g. Mounting Options: Shall support rack, wall and pole mounting.
 3. NEMA 4 or IP65 Enclosure.
 4. Compliance:
 - a. CFC: The BDA shall comply CFC 2013 requirements for supervision and monitoring.
 - b. FCC: Shall be FCC type certified.
- B. System Primary and Backup Power Units:

1. The contractor shall confirm all power requirements (e.g. 120V/20A, 208V/30A) have been met per system requirements. If not, the contractor must coordinate electrical services and connections as needed with the electrical contractor.
 2. Contractor shall design and furnish ability to provide system operation for a period of at least 24 hours when primary power is lost.
- C. Controller and System Annunciation Panel:
1. Provide annunciation panel as necessary per the City of Beverly Hills AHJ. This panel should be located within the Fire Control Room unless otherwise noted.
 2. Provide controller for annunciation panel as/if needed. Controller must be located next to the final location of the annunciation panel.
- D. Fiber-optic Master Unit:
1. When building size dictates an Active fiber DAS, the Fiber-Optic Master Unit shall convert radio over coax to Radio-Over-Fiber (RoF) for distribution to Fiber-Optic Remote Units.
 2. Characteristics:
 - a. Transmission Media: Single-mode fiber at 1310 nm.
 - b. Operating Temperature Range: +5 °C to +40 °C.
 - c. Impedance: 50 Ohm.
 3. Chassis:
 - a. Shall be of modular design capable of supporting up to 32 Remote Units per 19", 4 RU chassis
 - b. Shall support redundant power supplies
 - c. Shall have the capability to remotely power the Remote Units via composite fiber-optic cable
 4. Automatic Gain Control (AGC): Shall provide AGC for optical loss compensation
 5. Optical Budget: Shall support ≤ 3 dB optical budget (~3 km or 2 miles)
 6. Auxiliary Channel: Shall provide an input to support 400 to 2700 MHz for future expandability
 7. Interconnect link: Shall support one fiber or two fibers bi-directional optical link for distances up to 20 km with a 10 dB optical budget
 8. Remote Supervision:
 - a. Shall support the TCP/IP protocol, SNMPv2, FTP, HTTP, Telnet, and be fully compatible with general purpose SNMP managers.
 - b. Remote access shall be available via Point-to-Point Protocol (PPP), over circuit-switched/packet data and wired/wireless modems.
 - c. Each Active device shall be manageable via a Web GUI.
 - d. Auto Mapping: Each board position shall be automatically mapped during system turn-up.

2.03 FIBER OPTIC REPEATERS

- A. Public Safety Bi-Directional Amplifier (BDA)
1. The Fiber-Optic Remote Unit converts the RoF signal back to radio over coax, as well as provides filtering so that multiple frequency bands can reside over the same passive cable and antenna infrastructure.

B. Remote Repeaters for Public Safety DAS

1. Electrical Characteristics:
 - a. Operating Temperature Range: +5 °C to +40 °C.
 - b. Impedence: 50 Ohm.
 - c. Power Consumption: ≤ 105 watts, maximum.
 - d. Output Power per Carrier at Antenna Port:

Technology/Band (MHz)	Carrier (dBm)
~ 450	18

- e. MTBF (excluding external power supply): ≥ 160,000 hours
- f. Frequency Bands supported: 380-520 MHz.
- g. Optical Port: 2xSC-APC connector (separated uplink/downlink)
- h. Antenna Port: Simplex or Duplex 50 Ohm N-type female connectors
- i. Auxiliary Ports: Two SMA female for add-on modules
- j. Uplink Noise Figure:
 - 1) LMR 450 ≤ 16.

2. Enclosure:
 - a. 24"Wx36"Hx6"D.
 - b. NEMA 4 rated, Red for PSN.

2.04 ANTENNAS

A. Public Safety Off Air Antenna

1. Yagi Antenna, or equal. Uplink frequency ranges to meet requirements of DAS system as necessary.
2. Electrical Specifications

Gain	11 dB
VSWR	<1.7 : 1
Horizontal Beamwidth	48 °
Vertical Beamwidth	42 °
Polarization	Vertical
Maximum Input Power	100 Watts
Electrical Downtilt	0 °
Front-back Ratio	>16 dB
Connectors	N-Female
Lightning Protection Direct	Ground

Rated Wind Speed	134 mph / (216 Kph)
Max. Dimensions of Antenna	2.2" x 8" x 33.1" / (55.8 x 203.20 x 840 mm)
Weight of Antenna	1.76 lb. / (0.8 Kg)
Mounting Hardware	U-Bolt

Included Mounting Hardware	fits 1 7/8" OD Pipe
----------------------------	---------------------

B. Horizontal Distribution Indoor Antenna

1. Omni-Directional Coverage – shall perform as follows:

Pattern Type:	omnidirectional
Frequency Range:	450-2700 MHz
Gain:	1.9dBd (4dBi) (similar at 2100MHz and 450 MHz)
VSWR:	1.2:1-1.8:1
Polarization:	Multi-Polarized
Impedance:	50 ohms nominal
Diameter:	7.5 in
Height:	7 in
Weight:	1 lb
Connector:	N-Female (others available)
Warranty:	1 Year Limited
Construction:	UV Stabilized ABS
Ground Plane:	Built In
Overall Dimensions	3 in x 3 in x 3 in
Color	White
Pigtail Included	Yes
Pigtail Length	18 in
Application	In Building
Mounting Style	3/4 in stud Mount
Mounting Hardware	Optional L-Bracket
H. Beamwidth (deg.)	360

2.05 COAXIAL CABLING

A. Riser Cabling

1. Construction Materials:
 - a. Jacket Material: Non-Halogenated, fire retardant polyolefin
 - b. Outer conductor material: Corrugate copper
 - c. Dielectric Material: Foam PE
 - d. Flexibility: Standard
 - e. Inner Conductor Material: Copper
 - f. Jacket Color: Black
2. Dimensions
 - a. Nominal Size: (1/2 inch)
3. Electrical Characteristics:

- a. Cable Impedance: 50 ohm \pm 1 ohm
 - b. Capacitance: 22.0pF/ft
 - c. Operating Band: 1 – 5000 MHz
4. Mechanical Specifications:
- a. Fire Retardancy Test Method: UL 1666/ CATVR/ CMR
 - b. Smoke Test Method: IEC 61034
 - c. Toxicity Index Test Method: IEC 60754-1/ -2
- B. Horizontal Distribution Cabling
1. Air Dielectric, Plenum Rated Cable: These cables shall be tested for Return loss, Distance to fault, PIM, continuity, shorts, reversals and grounds where applicable. The results of the tests shall be included in the ATP.
 - a. Material Characteristics:
 - 1) Jacket: Halogenated, Fire-Retardant
 - 2) Outer Conductor Material: Corrugated Aluminum or Corrugated Copper
 - 3) Inner Conductor Material: Copper-Clad Aluminum Wire
 - b. Electrical Characteristics:
 - 1) Impedance: 50 +/- 2 Ohm
 - 2) Frequency Band: 1 - 6000 MHz
 - 3) Peak Power Rating: 40.0 kW
 - c. Mechanical Characteristics:
 - 1) Diameter Over Jacket: \leq .627 in
 - 2) Minimum Bending Radius: \leq 5 in
 - 3) One Time Minimum Bending Radius: \leq 2.5 in
 - 4) Plenum rated
 - d. Standard Conditions: VSWR 1.0, ambient temperature 20 °C (68 °F)
 2. Jumper Cables.
 - a. Air Dielectric, Plenum Rated Coaxial Cable, Low PIM, Braided Coaxial cable, off white jacket
 - b. Material Characteristics:
 - 1) Jacket: PVC
 - 2) Braid Material: Tinned Copper
 - 3) Shield Tape Material: Aluminum
 - 4) Dielectric Material: Foam PE
 - 5) Inner conductor: Copper Clad Aluminum wire
 - 6) Jacket color: White
 - c. Dimensions:
 - 1) Nominal Size: 0.355 inch
 - 2) Cable Weight: 0.07 lb/ft
 - d. Electrical Characteristics:
 - 1) Impedance: 50 Ohm
 - 2) Frequency Band: 30 - 6000 MHz

- 3) Return Loss: > 24dB@3GHz
- e. Mechanical Characteristics:
- 1) Bending Moment: 0.5 ft-lb
 - 2) Fire Retardancy Test Method: NFPA 262/CATVP/ CMP
 - 3) Minimum Bending Radius, Single Bends: 1 inches
 - 4) Tensile Strength 120lb
- f. Electrical Performance
- | Frequency | Attenuation (dB/100 ft) |
|-----------|-------------------------|
| 50 MHz | 0.93 |
| 150 MHz | 1.65 |
| 200 MHz | 1.95 |
| 220 MHz | 2.03 |
| 300 MHz | 2.47 |
| 450 MHz | 3.10 |
| 900 MHz | 4.63 |
| 1500 MHz | 6.15 |
| 1800 MHz | 6.82 |
| 1900 MHz | 7.10 |
| 2000 MHz | 7.25 |
| 2500 MHz | 8.25 |
- g. PIM Performance:
- 1) Lower than -152dBc static and -149dBc dynamic PIM with N male connectors on both ends.
- h. Environmental:
- 1) Meet IEC60068 standard.
 - 2) IP65 water resistance level.
 - 3) Outdoor rated with the application of adhesive heat shrink tube to the jumper boot and wrapped with butyl tape.

C. Pre-manufacturing Requirements

1. All cables shall be tested prior to shipment for Return loss, Shorts and PIM

- a. Return Loss:
 - 1) Lower than -20dB during a sweep test.
- b. PIM Performance:
 - 1) Lower than -152dBc static and -149dBc dynamic PIM with N male connectors on both ends.

D. Connectors: N type, male

2.06 SPLITTERS AND DIRECTIONAL COUPLERS

- A. All splitters and couplers will be rated from 50-2700MHz and will be sized with attenuation values required to optimize at the highest required frequency for the system. Type N connectors.

2.07 MISCELLANEOUS

- A. Lightning Arrestor
 - 1. 50-2700MHz general coverage arrestor(s).
 - 2. Flange Mounting.
 - 3. N female to N female.
- B. Grounding Kit
 - 1. Compact Sure grounding kit for donor cable.
- C. Weather Seal Kit
 - 1. Connector weather proof kit.

PART 3 EXECUTION

3.01 INSTALLATION

- A. The contractor shall design, install, commission and test the DAS in accordance with the manufacturer's instructions and recommendations.
- B. Locate equipment, antennas and splitters at locations shown on the contract drawings.
- C. Extend cabling from the EOS enclosures to the splitters in a neat and orderly manner per the routing indicated on the contract drawings. Support cabling in compliance with NEC chapter 8 requirements and manufacturers recommendations.
- D. Maintain a 6" minimum distance from the DAS cabling and other cabling for parallel runs. Do not install coaxial cabling open in any areas were the cabling will subject to physical damage.
- E. Install antennas in or above ACT per the mounting details shown in the contract documents.

3.02 EQUIPMENT MOUNTING

- A. Install wall mounted EOS Enclosures in equipment spaces as indicated on plans in accordance with manufacturer's instructions and seismic requirements.
- B. Install EOS Headend equipment rack in equipment space indicated on the drawings. Fasten to the floor per manufacturer's instructions and provide seismic bracing if required in compliance with local codes.
- C. Install donor antennas per details shown on the contract documents.

3.03 COORDINATION WITH OTHER TRADES

- A. Field coordinate the installation of the headend equipment and remotes to ensure that each location is provided with the following:
 - 1. a 120V, 20A circuit served from the life safety generator system for each BDA and remote unit.
 - 2. (2) strands of single mode fiber from the head end location to each remote location terminated in AC APC connectors.
 - 3. Grounding per NEC and TIA standards.
 - 4. Coordinate Alarm and Monitoring points with the Fire Alarm contractor.

3.04 EXAMINATION

- A. The contractor must examine areas and conditions under which DAS components are to be installed and notify the owner's representative, in writing of those conditions which are, in the Contractor's opinion, potentially detrimental to proper completion of the work. The Contractor shall not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the owner.
- B. Examine pathway elements intended for cable, check raceways, cable trays and other elements for compliance with space allocations, installations tolerances, hazards to cable installation, and other conditions affecting installation. Proceed with installation only after unsatisfactory conditions have been corrected.
 - 1. Specific items of examination shall include, but shall not necessarily be limited to, the following:
 - a. Locations for all new DAS antennas, cable and splitter equipment.
 - b. The Contractor shall examine all rooms designated to house DAS equipment to ensure adequate space, power, and environment conditions to support installation.

3.05 TESTING

- A. Acceptance testing will be performed confirming the requirements have been met.
- B. The contractor shall complete the acceptance testing as prescribed in the approved Acceptance Test Plan (ATP) submittal. The DAS system shall be tested by a person or persons who are holders of a FCC General Radio Operator's License (GROL) or by the AHJ or his/ her designees.
- C. Testing Procedure (PSN):
 - 1. Test Location
 - a. Each floor of the building shall be divided into a grid of 20 approximately equal test areas.
 - b. Downlink received signal level measurements will be recorded in the coverage area using a CW test signal. Measurements will be collected using a spectrum analyzer and a dipole antenna.
 - c. Failure of a maximum of two nonadjacent test areas shall not result in failure of the test.
 - d. In the event that three of the test area fail the test, in order to be more statistically accurate, the floor shall be divided into 40 equal equal test areas. Failure of a maximum of 4our non adjacent test areas shall not result in failure of the test. If the system fails the 40-area test, the system shall be altered to meet the 90% coverage.
 - e. A test location approximately in the center of each test area shall be selected for the test. Once the location has been selected, the location shall represent the entire test area.
 - 2. Equipment Requirements
 - a. Test equipment shall be allowed to stabilize in test environment prior to calibration for a minimum of thirty minutes. Any change in temperature can void the calibration.
 - b. Signal generator must be connected to the Head end downlink (TX) interface via tested and approved coaxial cabling and connectors.

- c. Signal generator transmits frequency (MHz) and Power (dBm) must be preapproved by project engineer prior to testing. The control channel from the base station can be used as a signal source as well.
 - d. Verify that all remote units for the area under test are ON.
 - e. Test frequency and power must be recorded corresponding to the date and time of each site walk measurement.
 - f. Spectrum analyzer with unity gain (0dB, frequency specific) dipole receive antenna must be preapproved by the project engineer.
 - g. Site walk screen shots shall be saved with frequency span +/- 20 MHz relative to the center/measured frequency.
3. Documentation
 - a. Exact location of measurement must be marked on the grid print.
 - b. Screen shots must be taken in all designated grid spaces. If more than one reading is saved per grid zone, saved results shall be distinguished from one another using Grid##"A", Grid## "B" etc.
 - c. Results of testing are reported to project engineer for analysis and reporting.
- D. Proof of Performance and Testing Methodology
1. Test requirements specified in this document shall be successfully completed prior to issuance of a Certificate of Occupancy and yearly thereafter. Also testing with a successful result shall occur whenever a design change is made to the system, which changes the technical performance or coverage of the system. All tests shall be coordinated 10 days in advance with the AHJ. Results of the test shall be reported in writing to the AHJ.
 2. Equipment Requirements
 - a. Test equipment shall be allowed to stabilize in test environment prior to calibration for a minimum of thirty minutes. Any change in temperature can void the calibration.
 - b. Signal generator must be connected to the Head end downlink (TX) interface via tested and approved coaxial cabling and connectors.
 - c. Signal generator transmits frequency (MHz) and Power (dBm) must be preapproved by project engineer prior to testing
 - d. Verify that all remote units for the area under test are ON.
 - e. Test frequency and power must be recorded corresponding to the date and time of each site walk measurement.
 - f. Spectrum analyzer with unity gain (0dB, frequency specific) dipole receive antenna must be preapproved by the project engineer.
 - g. Site walk screen shots shall be saved with frequency span +/- 20 MHz relative to the center/measured frequency.
 3. Documentation
 - a. Exact location of measurement must be marked on the grid print.
 - b. Screen shots must be taken in all designated grid spaces. If more than one reading is saved per grid zone, saved results shall be distinguished from one another using Grid##"A", Grid## "B" etc.
 - c. Results of testing are reported to project engineer for analysis and reporting.

- d. Test Data shall be tabulated and reported to demonstrate that the system meets the specified coverage of -70dBm over 95% of the floor Area.

E. Technical Training.

1. The Contractor shall be responsible for organizing a structured demonstration of acceptance tests to ensure organized and efficient testing.
2. The Contractor shall provide written notice to the owner's representative at least thirty (30) calendar days in advance of the initiation of final system acceptance testing. Included in the advance notice shall be three (3) copies of the approved test plans and procedures to ensure acceptance test monitoring personnel are familiar with the tests, procedures and the expected results.
3. It is the responsibility of the Contractor to notify the owner's representative at appropriate times to permit visual inspections of all DAS components. No Installation work shall be covered until a visual inspection has been completed.
4. Provide the owner's representative with the opportunity to witness all testing. On reasonable request and with ten (10) working days' notice, the Contractor shall demonstrate that the test procedure competently identifies the parameter being demonstrated or the fault condition being tested.
5. The Contractor shall provide a Certificate of Compliance signed by a responsible company representative after completion of the site installation. This document shall certify that each element of the installed system and wiring complies with the requirements of the Contract Documents and the certification shall be included with the final acceptance report.
6. The Contractor shall provide training for elements of the DAS. Such training shall include management, operational and maintenance levels and shall be provided to individuals (maximum of 3) to be designated by the owner's representative.
7. Training shall be conducted by qualified personnel fully conversant on the equipment, materials, software, and over all operation of the installed elements. Training shall be based upon as much hands-on training as is possible. The Contractor shall provide all necessary training aids and materials, which shall include written handouts.
8. All training shall be completed prior to Final Acceptance.

3.06 TRAINING

- A. Retain the Systems Integrator to instruct the Owner/ Owners Maintenance Personnel on the proper operation of the system including alarms.
 1. Provide time for 1 training session for three hours.
- B. Refer to Division 1 Section "Demonstration and Training."

END OF SECTION

This page intentionally left blank

SECTION 27 41 00

AUDIO VISUAL SYSTEMS

PART 1 GENERAL

1.01 CORRELATED DOCUMENTS AND OTHER WORKS OF JURISDICTION

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. The Architectural Drawing Package, and any current revisions noted by project management.
- C. Audiovisual (AV) systems drawings and other attached appendices and tables.

1.02 DEFINITIONS OF TERMS

- A. Owner: shall refer to LACCD, and all subsidiaries and affiliates
- B. Architect: shall refer to the designated project architect
- C. Audiovisual Consultant (Audiovisual Consultant, Consultant): shall refer to Vantage Technology Consulting Group. Refer to "PART 1, SUBMITTALS" for any specific identification.
- D. Project/Construction Manager (CM): shall refer to BuildLACCD
- E. General Contractor (GC): shall refer to the GC awarded the construction contract.
- F. Bidder: shall refer to any party proposing to provide the services and material delineated in this Specification.
- G. Bid: shall refer to a Bidder's proposal to provide the services and material delineated in this Specification.
- H. Audiovisual Integrator (Audiovisual Contractor, Integrator, Contractor): shall refer to the awarded contractor for this scope of services.
- I. Audiovisual Specification (Specification): shall refer to the complete set of designs, performance, and delivery requirements delineated within this document and all referenced documents.
- J. Audiovisual System (AV System): shall refer to the complete complement of equipment, software, and other material that upon completion of assembly, installation and configuration provides the full functionality and technical performance delineated in this Specification.
- K. Audiovisual Equipment (AV Equipment): shall refer to any and all individual equipment items and equipment items supplied by others installed as a part of the Audiovisual System.
- L. Work: Design and provision the Audiovisual Systems and associated equipment, software, and services for the Project.
- M. Construction Documents: shall include all documentation associated with the design and general construction of the Project, including this Specification.
- N. Provide: Supply (furnish), deliver, install, test, configure, label, and commission.
- O. Manufacturer: shall refer to the original manufacturer of any equipment provided as part of the Work
- P. Commissioning Date: shall refer to the date at which a system is formally accepted by the Owner.
- Q. OFE: Owner Furnished Equipment.
- R. OFCI: Owner Furnished, Contractor Installed.
- S. CFCl: Contractor Furnished, Contractor Installed.

1.03 SCOPE/DESCRIPTION OF WORK

- A. The work covered in this specification consists of furnishing all labor, material, and services to install a complete audiovisual system as indicated on the project documentation, including this specification and related drawings.
- B. The work described in this Specification shall include, but not be limited to, the following Basic Services:
 1. Engineering and Design: The Audiovisual Systems Integrator shall provide all system engineering and design necessary to develop the complete systems described herein. Engineering and Design shall include preparation of all necessary electronic schematics, hardware drawings, systems diagrams, schedules, and lists.
 2. Procurement and Assembly: The Audiovisual Systems Integrator shall procure and assemble all hardware and equipment and any additional materials as required to deliver completely functioning Audiovisual Systems, unless otherwise noted.
 3. Software Programming: The Audiovisual Systems Integrator shall perform all required software setup, configuration, and programming required to develop a complete operating system in accordance with this Specification, including all control logic and push-button component faceplate or interface programming.
 4. Installation: The Audiovisual Systems Integrator shall install all equipment, cable, wiring, connectors, plates, and other material at the Project site per the Audiovisual Systems Integrator's approved designs. The Audiovisual Systems Integrator shall install any Owner Furnished Equipment identified in this document and calibrate it to work with the integrated systems.
 5. Testing and Adjustment: The Audiovisual Systems Integrator shall perform all tests and adjustments, furnish all test equipment necessary and perform all work required to properly configure the systems and to verify their performance in accordance with the information in this Specification and the Audiovisual Systems Integrator's approved engineered designs.
 6. Acceptance Testing: Prior to Owner acceptance and hand-over of the completed Audiovisual Systems, the Audiovisual Systems Integrator shall demonstrate the operation of the complete systems, including all individual devices and specified control functions. Both subjective and objective tests may be required by the Owner to determine compliance with the information in this Specification and the Audiovisual Systems Integrator's approved designs.
 7. Training: The Audiovisual Systems Integrator shall provide technical training of the Owner's staff, instructing them on Audiovisual Systems operation, maintenance, and troubleshooting.
 8. Warranty: The Audiovisual Systems Integrator shall warranty the Audiovisual Systems in accordance with the terms of this Specification.
 9. Specific Responsibilities:
 - a. Supply and install miscellaneous material, as necessary, to mount the audiovisual system equipment.
 - b. All primary conduit and wire-ways are included in the General Contractor's scope of work and are not to be provided in the Audiovisual Systems Contract. Supply and install all miscellaneous conduit and wireways to the extent not included in Division 26 in order to provide a complete and operable system.

10. The Preliminary Schedule below identifies critical Project milestones and delivery expectations currently anticipated. This information is provided for Bidder planning purposes only. The actual Schedule for delivery of the work shall be coordinated with the Owner's representative or Construction Manager.
11. Refer to "BID SUBMITTALS", Section 1.06 and "SUBMITTALS", Section 1.09 for additional information and requirements.
12. Green Building Requirements: Refer to the following Division 1 sections for general Green building requirements. Additional requirements are described in "SUBMITTALS", Section 1.09P and "SUSTAINABLE BUILDING CRITERIA", Section 1.10.
 - a. Construction Waste Management (017405)
 - b. Interior Air Quality Management (017410)
 - c. Sustainable Design and Construction (Includes Green Building Materials Certification Form) (018113)
 - d. Limits for Volatile Organic Compound Contents for Adhesives, Sealants, Paints and Coatings (018115)

1.04 REGULATORY REQUIREMENTS

- A. All onsite labor must comply with job-site union requirements.
- B. The Audiovisual Systems Integrator must obtain any permits and shall pay all fees required by public agencies having jurisdiction over the Work.
- C. All products and materials provided shall be listed by Underwriters Laboratory (UL) and shall bear the UL label intended for the purpose specified and indicated. If UL has no published standards for a particular item, then other national independent testing standards shall apply, and such items shall bear those labels.
- D. All equipment and installations under this Specification shall conform to the latest editions of the following:
 1. NFPA 70 - National Electrical Code.
 2. NFPA 72 - National Fire Alarm and Signaling Code
 3. IEEE C2 - National Electrical Safety Code
 4. ANSI/TIA-568, -569 and -607 Telecommunications Standards
 5. IEEE 142-2007 - Recommended Practice for Grounding of Industrial and Commercial Power Systems.
- E. The Audiovisual Systems Integrator and its employees shall perform all work in compliance with current Occupational Safety and Health Administration (OSHA) guidelines and regulations and other safety and health requirements as may be mandated by the Owner, the General Contractor, or other authorities.
- F. The Audiovisual Systems Integrator shall have a thorough knowledge of governing codes and standards in effect and having jurisdiction over the Project. Lack of awareness of any of the relevant codes and standards will not be accepted as a reason for non-compliance.
- G. The Audiovisual Systems Integrator shall be responsible for providing cable and materials that comply with applicable codes and requirements of regulating bodies. The cost for these materials shall be included in the Bid price, as the Owner shall not accept change orders for changes in materials.

1.05 COORDINATION OF RELATED WORK BY OTHERS

- A. Related Work Specified Elsewhere: The Audiovisual Systems Integrator shall coordinate with the General Contractor and other construction trades to ensure proper integration and operation of the Audiovisual Systems with the complete Project designs, building systems and all other elements of the Project. The Audiovisual Systems Integrator should request from the Owner, General Contractor, or Architect complete project Construction Documents to help facilitate effective coordination of the Audiovisual Systems Integrator's work with the work of others.
- B. Some components of the complete Audiovisual Systems will be provided by the GC, its sub-contractors, or the owner. It shall be the responsibility of the Audiovisual Integrator to coordinate with all parties whose work impacts the Audiovisual Integrator's work to ensure the complete coordination and successful implementation of the Audiovisual Systems. Related work by GC shall include, but may not be limited to, the following:
1. Electrical Work (Division 26):
 - a. Electrical (AC) Power Service and Connections:
 - 1) Technical Power Service: All electrical panels, power receptacles, lighting fixtures, dimmers, lighting controls, and interconnecting wiring shall be supplied by the Electrical Contractor.
 - 2) The Audiovisual Integrator shall extend AC power circuits and insulated ground wires into each equipment rack. This work must be done by a qualified electrician, licensed in the jurisdiction of this project, and under direction from the Audiovisual Integrator.
 - b. Low Voltage Cable Containment
 - 1) Low voltage cable containment, including raceways, conduits and junction boxes, required to support Audiovisual System devices and interconnecting cabling shall be as specified in the Construction Documents and shall be provided by the Division 26 Contractor.
 - 2) Upon commencement of work on the Project, the Audiovisual Systems Integrator shall review the Construction Documents to confirm that the infrastructure provided is sufficient to accommodate the Audiovisual Systems to be installed. Any conflicts or issues must immediately be brought to the attention of the Construction Manager or General Contractor, and the Audiovisual Systems Consultant.
 - 3) The Audiovisual Integrator shall provide blank cover plates or panels for all floor, wall, and ceiling boxes that are dedicated to the Audiovisual Systems but do not have devices and/or connectors at the time of Audiovisual System commissioning. Colors and types shall be coordinated with the Architect. Devices and plates for other trades (AC power, voice/data, and security) within the AV floor boxes are by those respective contractors.
 2. Metals (Division 5)
 3. Rough Carpentry (061000)
 4. Millwork (062200) and Interior Architectural Woodwork (064023): All millwork and cabinetry modifications required to accommodate the installation of Audiovisual Systems, equipment, and related cabling and connections, except as may be individually identified in this Specification, shall be provided by General Contractor.
 5. Joint Sealants (079200)
 6. Glazing (088115)
 7. Finishes (Division 9)
 8. Projection Screens (115213)

9. Information Technology Systems: Unless otherwise specified, all data networking cabling shall be provided by the Section 271300 and 271500 contractor(s) and the Owner. Unless otherwise specified, all active data networking electronics shall be provided by the Section 272000 contractor and the Owner. Patch cords to connect audiovisual equipment to a data network port shall be provided by the Audiovisual Systems Integrator. The Audiovisual Systems Integrator shall be responsible for coordinating with the Owner or the Owner's designated representative regarding connections between the Audiovisual Systems and the Owner's data network, including all client/server computing and peripherals, Internet, digital video storage and other data/media distribution systems.
10. Paging and life safety: Interfacing the Audiovisual System(s) to the paging or life safety systems may be required. The Audiovisual Integrator shall be responsible for coordinating with the Contractor or the Owner's designated representative regarding connections between the Audiovisual Systems and the Paging or Life Safety system. All Audiovisual Systems with a control processor shall be connected to the fire/life safety systems by cabling extended by the F/LS contractor into the AV equipment rack and shall be configured upon fire alarm or testing contact closure trigger to mute the audio until the trigger is cleared and the system audio (program and voice) can be un-muted again.
11. Audiovisual System Connections to Building Systems and Controls:
 - a. Building systems and controls provided by the General Contractor or Owner that may be interconnected to the Audiovisual System shall include environmental controls, fire and life safety, and security systems. Where required, interconnection between these systems and the Audiovisual System is designated in these Specifications and in the Construction Documents, including requirements for low voltage interface electronics. The Audiovisual Systems Integrator shall verify that all required system components and interfaces are specified and provided to enable the functional performance described in this Specification.
 - b. The Audiovisual Systems Integrator shall coordinate with the General Contractor to verify that all devices and controls to be interconnected to the Audiovisual System are functioning properly prior to commencing interconnection to the Audiovisual Equipment.
 - c. The Audiovisual Systems Integrator shall investigate all hardware and software control conflicts between the building systems and the Audiovisual Equipment before interconnecting the building systems. Report any conflicts, potential or existing, to the Audiovisual Systems Consultant, in writing, before interconnecting the systems. Damage caused to any base building systems due to the improper connection of Audiovisual Equipment shall be the sole responsibility of the Audiovisual Systems Integrator.
 - d. The Audiovisual Systems Integrator shall select and install the appropriate cable type to facilitate device communication from the Audiovisual Equipment to interconnected building systems.
 - e. The Audiovisual Systems Integrator shall coordinate with the General Contractor to verify proper operation of the connected Audiovisual Equipment and the building systems after interconnecting the systems.

12. Other Systems: The Audiovisual Systems Integrator shall be responsible for identifying and integrating with any other technology systems and services required to deliver the completely operating Audiovisual Systems.
 13. Equipment Mounting and Support:
 - a. Structural support for audiovisual system equipment shall be provided by others as noted and detailed in the Construction Documents. The Audiovisual Systems Integrator shall coordinate with the General Contractor and other trades as necessary to ensure compatibility of the structural supports provided by others with the Audiovisual Equipment provided by the Audiovisual Systems Integrator.
 - b. The Audiovisual Systems Integrator shall install all Audiovisual Equipment, including all loudspeaker and video monitor mounts, as indicated in this Specification and the Construction Documents. The Audiovisual Systems Integrator shall verify location and structural suitability before attaching equipment and mounts. Any variations from the drawings and specifications or any question of structural integrity shall be brought to the attention of the General Contractor, Architect, and Audiovisual Systems Consultant before installing the equipment.
- C. Work Furnished by Others ("F.B.O.") but installed by the AV Contractor:
1. Owner Furnished Equipment (OFE): Some equipment that will become a part of or connect to the Audiovisual Systems may be provided by the Owner and shall be designated as Owner Furnished Equipment (OFE). Owner Furnished Equipment shall be supplied by the Owner to the Audiovisual Systems Integrator for connection, installation and/or integration into the Audiovisual Systems as delineated in the construction documents and this Specification. This may include new or existing equipment. The Audiovisual Systems Integrator shall be responsible for coordinating with the Owner's representative or Construction Manager to ensure that all Owner Furnished Equipment is fully operational and compatible with other Audiovisual Equipment and that it is made available to the Audiovisual Systems Integrator in a timeframe that does not delay the Audiovisual Systems Integrator's work.

1.06 BID SUBMITTALS

- A. Examinations: Carefully examine the contract documents and the construction site to obtain first-hand knowledge of existing conditions. Contractors are not compensated for conditions that can be determined by examining documents or site and will not be relieved of any obligations with respect to bid.
- B. Questions: Submit all questions about the contract documents in writing. Replies requiring changes to the contract documents will be issued to all bidders as addenda and will become part of the Contract. The Architect and Owner may give, but will not be responsible for, oral clarifications. Questions received less than 10 days before bid date cannot be answered in writing.
- C. Equipment Availability: Verify with manufacturers' availability and cost of all equipment proposed, including equipment specified herein. No cost increases will be allowed for manufacturers' cost increases, or for substitutions required because of unavailability of proposed equipment.
- D. Performance Bond (Add Alternate): Furnish a Performance Payment Bond and Labor and Material Bond, underwritten by a surety company approved by the Owner or Owner's representative, for fulfillment of all provisions of the contract.
- E. Basis of Bids: To be eligible for Bid consideration, submit bids in accordance with the following:

1. Include a complete itemized list for each base-bid system indicating the manufacturer, model number, unit cost and total costs for all specified items. Itemization of miscellaneous equipment such as cable, switches, and receptacles is not required.
2. Clearly indicate the total cost, including all expenses, for each individual system to allow the Owner to select any or all to be included in the contract. Itemization of miscellaneous equipment such as cable, switches, and receptacles is not required.
 - a. Building or room type:
 - 1) General Classrooms; cost each and total
 - a) Classroom 308
 - b) Classroom 209
 - 2) Computer Lab; cost each and total
 - a) Computer Lab 206
 - b) Computer Lab 2
 - 3) Tutoring / Technology and Testing; cost total
 - 4) Tutoring Center 110; cost total
 - 5) Dietetics Lab and Suite; cost total
 - 6) Orientation Room 203; cost total
 - 7) Interview Room 406; cost total
 - 8) Employee Lounge & Break Room; cost total
 - 9) Multipurpose Room (Divisible); cost total
 - 10) Conference Rooms; cost each and total
 - a) Presidents meeting room
 - b) Large Meeting Room 309
 - c) Meeting Room 301
 - d) Meeting Room 1
 - e) Meeting Room 2
 - f) Meeting Room 18.7
 - 11) Small Meeting Rooms; cost each and total
 - a) President and Vice President's Offices
 - b) Staff Development Work Rooms
 - c) Small Meeting Room
 - d) X-Small Meeting Room
 - b. Building-wide system
 - 1) Digital Signage; cost each and total
3. Organize each list with the information presented, in the order that it appears in this specification, in 6 columns from left to right:
 - a. Paragraph number as it appears in this specification.
 - b. Paragraph title as it appears in this specification.
 - c. Manufacturer and model number.
 - d. Quantity.
 - e. Unit Cost.
 - f. Extension (unit cost times quantity).
4. At the end of each list, indicate the cost of all other items such as for miscellaneous equipment, engineering, installation labor, overhead, taxes, etc.
5. On a separate list, indicate costs of any specified add- or deduct-alternates with the information presented in the same manner as for the base-bid system.

6. Include a listing of any voluntary alternates proposed by the bidder as substitutions or additions to the specified systems.
 7. Include any notes or comments, if necessary, to qualify the bid.
 8. Identify any sub-contractors and indicate the work that is in their scope.
 9. Provide documentation of ability in installing similar systems. Furnish the names, addresses and telephone numbers of the System Designer, Architect, General Contractor and Owner on three projects similar in scope, which the Contractor has installed within the last 5 years.
 10. Identify the proposed project management, engineering, and installation staff. Include resumes for each individual indicating relevant experience and certifications.
 11. Include certification of ownership and full familiarity with the operation of the following minimum test equipment. Provide a list of the manufacturer, model, and serial number for each item of test equipment required, and the date of last calibration traceable to NIST, as applicable.
 - a. GENERAL CONTRACTING
 - 1) Multimeter.
 - 2) Cable Tester (Kopul CBT-MF or similar).
 - b. VIDEO/BROADCAST/TELECONFERENCE
 - 1) Multi-frequency computer test pattern generator with DVI output.
 - 2) Photometer with luminance and illuminance probes.
 - 3) DVD format test disc: 3:4 (SMPTE 259M-C) and 16:9 (SMPTE 294M/296M) NTSC/ATSC/US region 1 material.
 - 4) Fiber-optic testing and field servicing equipment.
 - c. AUDIO
 - 1) Measurement Microphone; 3 Hz-23 kHz, minimum frequency response.
 - 2) Signal Generator; pink noise, white noise, sweep, sine wave and impulse
 - 3) Spectrum Analyzer; NTi XL2 or equal
 12. Include certification of ownership and full familiarity with the operation of the following minimum software and analysis tools:
 - a. AutoCAD, version as required by the Owner (or .dwg compatible software, Stardraw not acceptable).
 - b. Revit, version as required by the Owner; or other BIM software, version as required by the Owner.
 13. BIDS NOT FULLY ITEMIZED OR NOT SUBMITTED IN THIS FORMAT WILL BE REJECTED.
- F. Delivery Schedule:
1. Unless otherwise directed in Division 0, within 14 days of receipt of bid package provide:
 - a. Basis of bid documents, including:
 - 1) Itemized equipment costs for specified equipment or APPROVED substitutions.
 - 2) Qualifications/References
 - 3) Certifications (including certificate of bonding, if required)
 - 4) Proposed payment terms.

1.07 QUALITY ASSURANCE

- A. Project Management: Maintain the same person in charge of work throughout installation. Engineering and construction supervisors shall be CTS-I certified.

- B. Contract Documents: Maintain a complete set of the latest version of system drawings and specifications, including any redlines, at the site at all times during installation.
- C. Fabrication and Installation: Fabricate all equipment racks and subassemblies. Make field connections of all audio, video and control wiring including microphone, line level, loudspeaker, video, and control system circuits to equipment, equipment racks and connection panels. Continuously supervise the installation and connections of cable and equipment.
- D. Audiovisual System Contractor Qualifications: To be considered qualified for this work, bidders must meet the following standards:
 - 1. The Contracting firm is experienced in the provision of audiovisual systems similar in complexity to those required for this project.
 - 2. The Contractor's primary business is the provision, fabrication and installation of professional video and related systems.
 - 3. The Contractor has been regularly engaged in the installation and service of professional audiovisual systems for a period of at least five years.
 - 4. The Contractor is an authorized dealer for the major products furnished.
 - 5. The Contractor retains current accreditation through the ISCA/CTS program.
 - 6. Additional certifications specific to project - (DMC-E-4K, XTP-E, etc.)
 - 7. At the request of the Owner, Owner's representative, or Architect, demonstrate the following capabilities:
 - a. Adequate plant and equipment to complete the work in accordance to the project schedule.
 - b. Sufficient staff with appropriate technical experience to oversee and execute the work.
- E. Subcontractors: The Contractor may arrange for sub-contract field and special shop work to be done by others.
- F. Prime Contractors: Any other installer who intends to bid on this work as the Prime Contractor and does not meet the "Contractor Qualifications" described above shall employ the services of a single "Audiovisual Systems Contractor" who does meet these requirements. The Audiovisual System Contractor shall Furnish and Install the equipment. The Prime Contractor shall clearly identify the Audiovisual Systems Contractor and submit complete qualification information for the Audiovisual Systems Contractor in the Bid. Failure to do so will be cause for rejection of the Bid.

1.08 SUBSTITUTIONS

- A. General:
 - 1. The Audiovisual Systems Contractor has the burden of proving, at the Contractor's own cost and expense and to the satisfaction of the Architect, that the proposed product is similar and equal to the named product.
- B. Documentation:
 - 1. File a formal request for each substitution, documenting the conditions outlined below, including:
 - a. Complete data on the proposed substitution, substantiating compliance with the Audiovisual Systems Contract Documents, including:
 - 1) Specification Section and description of the equipment or service originally specified by the Audiovisual Systems Consultant
 - 2) Product manufacturer, model, and description of the proposed substitution
 - 3) Performance specification and test data verifying the proposed substitution's compliance with Audiovisual System and installation requirements.

- 4) References and samples, where applicable
 - 5) An itemized comparison of the proposed substitution with the item originally selected in the Audiovisual Specification
 - 6) The impact of the proposed substitution on the Contract time schedule, system design, artistic effect (for changes in finish or dimension), and related contracts and trades
2. Submit item comparisons, coordination schedules, and design impact via addenda appended to manufacturer documentation.
- C. Basis:
1. Requests for acceptance of proposed equivalents made following the award of bid are considered only in the following cases:
 - a. The named products cannot be obtained by the Audiovisual Systems Contractor because of strikes, lockouts, bankruptcies or discontinuance of manufacturer and the Audiovisual Systems Contractor makes a written request for consideration of the proposed equivalent.
 - b. The proposed equivalent is approved as equal or superior to the named product and its use is to the advantage of the Owner.
- D. Consideration:
1. A request for substitution is a representation by the Audiovisual Systems Contractor that:
 - a. The Audiovisual Systems Contractor has personally investigated the proposed substitution and determined that it is equal or superior in all respects to that specified.
 - b. The same warranty is provided for the substitution as the original equipment specified.
 - c. The cost data presented is complete and includes all related costs under this Contract but excludes costs under separate contracts and excludes Architect's re-design costs, and that the Audiovisual Systems Contractor waives all claims for additional costs related to the substitution which subsequently becomes apparent.
 - d. Any cost impact on work by other trades is indicated.
 - e. Installation of the accepted substitute will be coordinated by the Audiovisual Systems Contractor, making such changes as may be required for the Work to be complete in all respects.
 2. An accepted substitution shall be documented by Change Order, effectively modifying the Audiovisual Systems Specification. The Contract Price will be changed only if the substitution results in cost savings to the Owner.
- 1.09 CONSTRUCTION SUBMITTALS
- A. Coordinate all submittals with requirements set forth in Section 013300.
 - B. General: Unless directed otherwise in Section 013300,
 1. Provide six (6) hard copies of all submittals (including USB flash drives) and final deliverables per site location unless otherwise directed by the project manager.
 2. Delivery Schedule:
 - a. Within 21 days of award provide:
 - 1) Bill of Materials
 - 2) Manufacturer Catalog Data Sheets: Product Submittals shall be issued no sooner than six (6) months prior to scheduled installation onsite.
 - 3) Shop Drawings
 - 4) Custom finish material samples, if applicable.

- b. One week before acceptance testing visits (system “check-out”) provide:
 - 1) System test and certification reports
 - 2) Manufacturer’s owner’s manuals
 - 3) One (1) draft copy of user operational manuals
 - 4) One (1) draft copy of “as-built” system diagrams
 - c. Within 30 days after final acceptance testing visit provide:
 - 1) As-built system diagrams
 - 2) User operational manuals
 3. Unless otherwise directed by contract, do not order equipment until the Bill of Materials, Catalog Data Sheets, and shop drawings have been reviewed and approved by the Owner, Owner’s representative, or Audiovisual Systems Consultant. Any acquisition, assembly or installation of any systems or components without Audiovisual Systems Consultant’s approval will be subject to removal at the Audiovisual Systems Integrator’s expense.
 4. Approval for isolated items will not be considered, except by prior authorization by the Audiovisual Systems Consultant.
 5. All rejected items and items requiring correction must be resubmitted together in entirety, unless otherwise approved.
 - C. Binders:
 1. Provide indexed tabs and flyleaf for each separate product, or each piece of operating equipment.
 2. Commercial quality three-ring binders with durable and cleanable plastic covers, 1" minimum, 2" maximum ring size
 3. When multiple binders are used, collate the data into related consistent groupings.
 4. Provide product data sheets in electronic .pdf format, or other approved file format. Data sheets shall be organized in a logical manner, such as per system, to allow efficient review against the design documents.
 - D. Bill of Materials & Manufacturer Product Data Sheets:
 1. Organize the Bill of Materials with the information presented in the order and format that it appears in this specification.
 2. After the Bill of Materials, include Catalog Data Sheets (“cut” sheets) for all specified products arranged in the order listed in the Bill of Materials.
 3. Clearly indicate all finishes, colors and, options for equipment.
 - E. Shop Drawings:
 1. Size: minimum 24” x 36” unless otherwise specified.
 2. Media: provide in electronic .pdf file format unless otherwise specified or directed by the Construction Manager.
 3. Prepare a drawing package on the approved Computer Aided Drafting (CAD) or Building Information Modeling (BIM) system, including:
 - a. Audiovisual Systems Integrator name, address, and phone number.
 - b. Block diagrams indicating proposed connections of all equipment and indicating equipment brand and model numbers.
 - c. DSP Settings: Schematic diagram of processing blocks and signal flow in CAD, printed block diagram with settings from manufacturer’s software, or saved software settings and manufacturer’s authorized DSP editing software on USB flash drive.
 - d. Equipment/ control room layout and equipment rack and cabinet details
 - e. Provide detailed drawings of custom-fabricated or stock mounts and hardware.

- f. Video display arrangements.
 - g. Flown loudspeaker arrangements.
 - h. Shop drawings of any unit to be fabricated or modified under the scope of the Audiovisual Systems Integrator such as control panels, switch panels, loudspeaker enclosures or grilles.
 - i. Detailed control panel layouts and control logic notes prepared by the control system programmer:
 - 1) Provide engraved button labeling details or page graphics (including text, button colors, images, and backgrounds) as well as page flips, sub-pages and overall command logic flow.
 - 2) Audiovisual Systems contractor may choose to submit control panel information under separate cover, bound into a commercial quality three-ring binder.
 - j. Other drawings and sketches as required by the Architect or Audiovisual Systems Consultant during the course of project installation.
4. Design drawing files provided by the Architect and/or Audiovisual Systems Consultant as a courtesy in aiding the Audiovisual Systems Integrator in preparing Shop Drawings must be modified to include the information specified above. Submitting design drawings without these modifications is not acceptable.
- F. Data Network Connectivity
- 1. Any system, or components of a system, provided in this specification section which are to be connected to the Owner's data network either via wired or wireless connections will conform to the requirements described in PART 3 - EXECUTION. Vendors shall review the requirements of this section and provide a statement of compliance for each item that either:
 - a. Confirms that the proposed System (or any applicable components of the System) is compliant with the requirements listed in the item, or
 - b. Explains why the proposed System (or any applicable components of the System) is not compliant, including any potential mitigation measures that may resolve the non-compliance issue.
- G. Control System Software Submittals
- 1. Control System Software consists of the following two primary components:
 - a. Control System Graphical User Interface (GUI)
 - b. Control System Processor Software
 - 2. In order to develop Control System Software that is functional and understandable by the intended users, it will be necessary for the Audiovisual Systems Integrator to provide "working" copies of software for review and comment by the Owner and the Project team as it is being developed.
 - 3. The software programming process must be an iterative process that includes a minimum of three (3) iterative submittals prior to first beneficial use. The following table is provided to help facilitate the software development process:

Deliverable	Notes	Due
Initial Submittal	Listing of individual device control functions GUI logic flow diagram Static touch panel layouts Initial labeling of button panels	Due no later than one week after return of approved shop drawings
First Beta Review	Dynamic touch panel Layouts including page flips, pop-ups, feedback, etc. to show operational relationships between pages	Due no later than two weeks after return of approved Initial Submittal
Second Beta Review	Interface updates and revisions Test of loaded working system (in shop or on site)	Due no later than three weeks after return of approved First Beta Review submittal
Implementation / On-site Testing	Loading of live code into working systems	Prior to Substantial Completion
Completion	Follow-up programming review and minor modifications based on user feedback	60 days after Final Acceptance

H. Project Plan

1. Provide a complete and detailed Schedule for the Audiovisual Systems Integrator's work describing the major tasks, sequence of work, submittals and other critical milestones. At a minimum, the tasks noted in the Schedule shall include all required submittals, rack assembly and shop testing, on-site cable installation, periodic shop and site visits, on-site equipment installation, testing and commissioning, Substantial Completion and Project Completion. Indicate the sequence of installation and completion by room and/or system. The Schedule shall also include anticipated dates of acquisition of major equipment and their installation milestones.
2. Provide a complete listing of the Audiovisual Systems Integrator's project team, including the names and all contact information (email address, cell phone, etc.) for all personnel assigned to the Project. At a minimum, this Project Team Directory shall include the Audiovisual Systems Integrator's executive in charge of the Project as well as the Project Manager, Lead Engineer and Lead Installer. Include names and contact information for all sub-contractors.

I. Weekly Status Reports

1. If directed by the Construction Manager, the Audiovisual Systems Integrator shall provide weekly progress updates to the Architect and Audiovisual Systems Consultant. Weekly Status Reports shall be submitted as directed by the Construction Manager via hard copy or electronic means (i.e. email). Issuance of Weekly Status Reports shall commence from the date of the first submittal delivery and shall continue until contract closeout.
2. The Weekly Status Report shall not be used as an official means of communicating Project issues. It does not replace any part of a required submittal, request for information, proposed change order, report of field conditions, schedule issues, etc. No official response will be given to the Weekly Status Report.

3. A representative of the Audiovisual Systems Integrator shall attend the weekly construction meeting, or as directed by the Construction Manager, at the job site. This representative shall be fully knowledgeable in all aspects of the Project and the Audiovisual Systems Integrator's work and shall have the authority to make binding commitments on behalf of the Audiovisual Systems Integrator.
- J. Substantial Completion Submittals
- Substantial Completion of the Audiovisual System installation shall be the point at which all Audiovisual Equipment has been installed, programmed, configured, and initially tested to confirm proper operation. The point of Substantial Completion shall be as mutually agreed between the Audiovisual Systems Integrator and the Audiovisual Systems Consultant following discussion and observation. At the point of agreed Substantial Completion, the Audiovisual Systems Integrator shall submit the following:
1. Test Reports:
 - a. Upon completion of SYSTEM PERFORMANCE TESTS AND ADJUSTMENTS specified in PART 3 - EXECUTION, submit for approval in writing test results including numerical values for all measurements.
 - b. Submit written certification that the installation conforms to specifications, is complete and operable, and is ready for FINAL ADJUSTMENTS AND ACCEPTANCE TESTS specified in PART 3 - EXECUTION.
 - c. The Owner or Owner's representative reserves the right to withhold the final site visit "check-out" and any final certification of project completion until receipt of test report documents, as outlined in this section (SECTION 1 – "Test Reports").
 2. Preliminary Project Record Documents Submittal
 - a. Upon Substantial Completion the Audiovisual Systems Integrator shall submit Preliminary Project Record Documents to the Audiovisual Systems Consultant. Preliminary Project Record documents shall be submitted prior to the Preliminary Checkout.
 - b. Preliminary Project Record Documents shall include:
 - 1) Corrected/updated shop drawings
 - 2) Updated Equipment List
 - 3) Half-size drawings modified to reflect the actual installation conditions
 - 4) USB flash drive or other approved media with manufacturers' operation manuals arranged alphabetically and current drawings in .DWG format
 - c. Audiovisual Systems Consultant's Preliminary Checkout will be scheduled after the Preliminary Project Record Documents and Test Reports have been approved.
- K. Manufacturer's Owner's Manuals:
1. Archive all Manufacturers' Owner's Manuals for specified equipment in the following manner:
 - a. One original (not photocopy) manufacturer's owner's manual per equipment item.
 - b. Submit in a 3-ring binder including a cover page and spine insert identifying the project, site location and submittal.
 - c. Arrange manuals in alphabetical order, by manufacturer.
 - d. Provide a table of contents and separate each section within the binder with tab dividers.

- e. Provide all Manufacturer's Owner's Manuals in electronic .pdf format on USB flash drive or other approved media. Owner's Manuals shall be organized in a logical manner such as per system and/or alphabetical order, by manufacturer.
- L. User Operational Manual:
1. Intent: Prepare in the form of a system operations manual for use by Owner's personnel. System documentation shall be adequate such that a person trained on the System, but with no familiarity with this specific implementation, shall be able to understand the configuration and implementation of all major and minor systems as well as how these systems are integrated to form the overall System.
 2. Cover: Identify each volume with typed or printed titles "SYSTEM OPERATING INSTRUCTIONS".
 3. Format: Submit the User Operational Manual in the following format:
 - a. Size: 8-1/2" x 11", 20 lb. minimum weight white paper for typed pages, either manufacturer's printed data, or neatly typewritten.
 - b. Drawings: Provide reinforced punched binder tab, bind in with text. Fold larger drawings to size of text pages.
 - c. Provide Operational Manual in electronic .pdf format on USB flash drive or other approved media.
 4. Content of Manuals: Prepare the User Operational Manual with the following content:
 - a. Neatly typewritten table of contents for each volume, arranged in systematic order. Identify each product by product name and other identifying symbols as set forth in Contract Documents.
 - b. Contractor name of responsible principal, address, and telephone number
 - c. Certificate of Warranty
 - d. Service Contract: Include a preliminary schedule for the specified semi-annual site visits.
 - e. Complete as-built diagrams for systems.
 - f. Receptacle Location Plan
 - g. Shop drawings of all custom-fabricated items
 - h. Control Setting Schedule.
 - i. Documentation of all touch-panel screens both in the form of data files on USB flash drive, or other approved media, and graphical printouts.
 - j. Audiovisual control system programming files on USB flash drives, or other approved media, for the control system, the touch screen display program, and all programming, graphics, communication, or other software required for re-programming the AV control system.
- M. System Diagrams:
1. Provide sufficiently clear and complete information that a technician of average skill may efficiently troubleshoot and service the system, even if unfamiliar with the installation, based on diagrammatic representations of the installed system.
 2. Provide drawings showing all terminal blocks, connectors, relays, switches, equipment, components, and wires.
 3. Provide layout drawings of panels and other custom assemblies containing switches, relays, terminal blocks, receptacles, etc., using reference numbers to identify physical locations of devices or label devices with reference numbers in a location visible while viewing cable terminations.
 4. On wiring diagrams, label all conductors within cables for insulation color or other identifier.

5. Label connectors, barrier strips, switches, relay sockets, etc., for terminal number.
 6. If device does not provide terminal designations, provide key diagram for reference.
 7. Label all devices with manufacturer, model number, and reference number (e.g. "SW 15", "TB 6"); reference numbers shall be consistent across all drawings with no repetitions.
 8. Provide labels for cables continued onto another drawing, indicating termination device, terminal numbers, and drawing sheet on which the termination is shown.
 9. Illustrate all receptacles, patch panel jacks, and switches.
 10. Mount one photographic, wash-off Mylar or rag paper photocopy prints of each system behind acrylic at locations to be determined.
 11. Receptacle Location Plan: Plan drawing of area showing locations and designations of all receptacles.
 12. Control Setting Schedule: Fully document the settings of all non-user-adjustable controls. This includes power amplifier gain controls, equalizer settings, etc.
- N. Samples:
1. Advance Finish Samples for Approval/Coordination: Provide advance samples of finish for custom control panels and other custom items specified and provided by the Audiovisual Systems Contractor, as mandated within this document.
 2. As-built Finish Samples for Archiving: For future repairs or modifications, include source information and samples for any custom finish or material including custom control panels and other custom items provided by the Audiovisual Systems Contractor.
- O. Forward all submittals to:
1. The Construction Manager, or as directed.
- P. Sustainable Building Submittals
1. Sustainable Building Submittals are required to verify compliance with the "Sustainable Building Performance Criteria" defined in this section.
 2. Refer to Division 1 Section "Sustainable Design and Construction," for detailed descriptions of the submittal documents listed below.
 3. Green Building Materials Certification Form (GMF): Submit a completed GMF for the materials included in this section (blank copy is appended to Division 1 Section "Sustainable Design and Construction"). The following information shall be provided:
 - a. Itemized material costs for the Green Building Focus Material (GBFMs) identified under the "Sustainable Building Performance Criteria" heading of this section.
 4. Supplementary Information: In addition to the GMF, the following Sustainable Building submittal information shall be provided per Section 01 81 13:
 - a. GMF Back-Up Documentation
 - b. Product Cut Sheets
 - c. Verification of lack of Prohibited Compounds in Adhesives, Sealants, and Sealant Primers.
 - d. Energy Star Label Certification (Note: only include where applicable).
- 1.10 SUSTAINABLE BUILDING CRITERIA
- A. Green Building Focus Materials (GBFMs) for this Section:
 1. Audiovisual Equipment
 2. Field-applied sealants, adhesives, paints, and coatings.
 - B. All applicable Audiovisual products purchased under this section shall be "EnergyStar" labeled under the U.S. EPA/DOE EnergyStar program.

- C. Provide all field-applied adhesives, sealants, paints and coatings that meet the volatile organic compound (VOC) and chemical component limitations as defined under Section under Section 01 81 15 - Limits for Volatile Organic Compound Contents for Adhesives, Sealants, Paints and Coatings.
- 1.11 JOB CONDITIONS
- A. Sequencing and Scheduling:
 - 1. Coordinate work with adjacent work of other trades to facilitate construction and prevent conflicts.
 - 2. Afford other trades reasonable opportunity for installation of work and for the storage of materials.
 - 3. Staff the job to keep pace with the other Trades; otherwise, the project manager will require an increase in force or overtime work without additional expenses to the Owner.
 - 4. Abide by the decision of the project manager in case of conflict or interference by other trades.
 - 5. Remove all refuse from the job site to the satisfaction of the Owner's representative.
 - B. Do not install equipment in dusty conditions or allow dust to accumulate in or on installed Audiovisual Equipment.
 - C. Protect all work and equipment from damage by others.
 - D. Protect all existing work-in-place by others from damage by the Audiovisual Systems Integrator, the Audiovisual Systems Integrator's agents and/or sub-contractors, or any employees or vendors. The Audiovisual Systems Integrator will be solely responsible for any/all damage to work-in-place by others.
 - E. Keep areas around and inside of each piece of equipment and each rack free from dust, dirt, and debris throughout the project. Equipment that is not properly maintained during installation shall be replaced at no cost to the Owner before final payment is made to the Audiovisual Systems Integrator.
 - F. Storage and Staging:
 - 1. The Audiovisual Systems Contractor is ultimately responsible for acquiring secure storage at the job site. Coordinate with project management and/or Owner to determine the location and size of the storage area.
 - 2. All Audiovisual Systems Integrator equipment and materials and all owner furnished equipment turned over to the Audiovisual Systems Integrator stored at the Audiovisual Systems Integrator's facility(s) or stored and/or installed at the Project site will remain the property of the Audiovisual Systems Integrator unless ownership is legally transferred and accepted in writing by the Owner. The Audiovisual Systems Integrator shall be solely responsible for the protection of all equipment from damage, theft or vandalism regardless of cause, until the work described herein is accepted by the Owner at the time of Final Checkout.
 - G. Refuse and Repair:
 - 1. Upon completion of work remove all associated debris, waste, refuse, and rubbish from premises. Leave all areas and equipment within the scope of this contract clean, free of blemishes, and operational.
 - 2. Repair any damage to the premises, at no cost to the Owner, caused by the Audiovisual Systems Contractor, its agents, and/or subcontractors.
 - H. Adhere to the safety standards established by the General Contractor while performing work on site.
 - I. All employees of the Audiovisual Systems Integrator shall wear identification clearly indicating the Audiovisual Integrator's company name while on site.
 - J. All employees of the Audiovisual Systems Integrator shall comply with rules and policies established by the Owner and/or the General Contractor.

- K. All vehicles of the Audiovisual Systems Integrator or employees shall be parked in areas designated by the Owner and/or the General Contractor.
 - L. Environmental Impact Considerations
 - 1. The Audiovisual Systems Integrator is expected to comply with project specific practices and environmental considerations to comply with any LEED objectives and local environmental regulations.
 - 2. The Audiovisual Systems Integrator is encouraged to utilize environmentally sustainable materials and work practices in the delivery of the Work. This may consist of (but not be limited to):
 - a. Energy Efficiency/Conservation
 - b. Waste Reduction/Recycling
 - c. Water Conservation
 - d. Pollution Prevention
 - e. Employee Education Programs
 - f. Transportation Planning
 - g. Utilization of Renewable Materials
 - h. Minimize Emission of Greenhouse Gases
 - 3. Upon request, the Audiovisual Systems Integrator shall supply documentation on in-house policies for recycling and environmental offset goals.
 - M. Promotion/Publication:
 - 1. The contractor does not have the rights to use any information or images, relative to this contractor installation, for publication or in promotional materials without the express written permission of the Owner, Architect, and Vantage Technology Consulting Group. Upon approval, the contractor must disclose full credit to the Architect and Consultant for facilities and system design.
 - N. Insurances on the work of this specialty trade shall be provided as specified in relevant project documentation.
 - O. Inspection
 - 1. Notify the Architect of any defects in work by other trades affecting installation.
 - P. Packaging: Material and equipment manufacturers shall demonstrate efforts to reduce packaging waste and/or to use environmentally friendly packaging materials. Examples include, but are not limited to, the following:
 - 1. Reusable and/or returnable pallets or crates
 - 2. FSC-certified wood or salvaged wood pallets or crates
 - 3. High recycled-content cardboard, paper, steel, or plastic packaging
 - 4. Bio-based foam packing materials
- 1.12 DESCRIPTION OF SYSTEMS:
- A. Project Description
 - 1. The project concerns the installation of new audiovisual systems in new spaces at the Ceaser Chavez Administration and Workforce Replacement Building in Monterey Park CS, as described below and shown on the drawings.
 - 2.
 - B. Functional Requirements of Systems:
 - 1. General Classroom
 - a. In order to facilitate instruction in the General Classroom a media presentation system will be provided. This system will comprise of a ceiling-mounted video projector and ceiling-recessed widescreen motorized projection screen to facilitate video display.
 - b. Ceiling-mounted loudspeakers are provided to reproduce media audio.

- c. A small form factor computer with wireless keyboard, mouse and input interface will be provided in the instructor lectern. Additional input interfaces facilitate connection of portable devices such as laptop computers and to provide convenient control of the audiovisual switcher/controller. A wireless presentation gateway shall be provided for wireless presentations.
 - d. Primary control of the audiovisual system for the room will be provided via a touch control panel located at the instructor station.
 - e. A portable desktop color document camera located in the instructor station shall be included and will connect to the system for image magnification.
 - f. A mono RCA output connection for portable RF based assistive listening system shall be provided to accommodate ADA requirements and support all voice and program audio for the space.
 - g. Audiovisual equipment shall be housed in an equipment rack within the instructor station and shall house presentation source devices and other audiovisual processing and control equipment.
 - h. System Summary:
 - i. Digital video projector(s)
 - 1) WUXGA native resolution (1920 x 1200 pixels)
 - 2) High light output (min. 5,500 ANSI lumens)
 - j. Ceiling recessed projection screen
 - k. Widescreen matte whiteboard surface
 - l. Ceiling recessed loudspeakers
 - m. Wireless instructor microphone
 - n. Small form factor computer
 - o. Wireless presentation gateway
 - p. AV system presentation switcher (controller, switcher, amplifier)
 - q. Mono RCA output for portable ALS transmitter
 - r. Auxiliary AV input panel
2. Computer Lab
- a. In order to facilitate instruction in the Multipurpose Computer Lab a media presentation system will be provided. This system will comprise of a ceiling-mounted video projector and ceiling-recessed widescreen motorized projection screen to facilitate video display.
 - b. Ceiling-mounted loudspeakers are provided to reproduce media audio.
 - c. A small form factor computer with wired keyboard, mouse and input interface will be provided in the instructor lectern. Additional input interfaces facilitate connection of portable devices such as laptop computers and to provide convenient control of the audiovisual switcher/controller. A wireless presentation gateway shall be provided for wireless presentations.
 - d. Primary control of the audiovisual system for the room will be provided via a touch control panel located at the instructor station.
 - e. A portable desktop color document camera located in the instructor station shall be included and will connect to the system for image magnification.
 - f. A mono RCA output connection for portable RF based assistive listening system shall be provided to accommodate ADA requirements and support all voice and program audio for the space.
 - g. Audiovisual equipment shall be housed in an equipment rack within the instructor station and shall house presentation source devices and other audiovisual processing and control equipment.
 - h. System Summary:

- 1) Digital video projector(s)
 - a) WUXGA native resolution (1920 x 1200 pixels)
 - b) High light output (min. 5,500 ANSI lumens)
 - 2) Ceiling recessed projection screen
 - 3) Widescreen matte whiteboard surface
 - 4) Ceiling recessed loudspeakers
 - 5) Wireless instructor microphone
 - 6) Small form factor computer
 - 7) Wireless presentation gateway
 - 8) AV system presentation switcher (controller, switcher, amplifier)
 - 9) Mono RCA output for portable ALS transmitter
 - 10) Auxiliary AV input panel
3. Tutoring/Technology and Testing and Tutoring Center
- a. In order to facilitate instruction in the Tutoring & Testing Room, a media presentation system will be provided. This system will comprise of a ceiling-mounted video projector and ceiling-recessed widescreen motorized projection screen to facilitate video display.
 - b. Ceiling-mounted loudspeakers are provided to reproduce media audio.
 - c. Network-based ceiling camera(s) shall be included for close-circuit monitoring during testing.
 - d. A small form factor computer with wired keyboard, mouse and input interface will be provided in the instructor lectern. Additional input interfaces facilitate connection of portable devices such as laptop computers and to provide convenient control of the audiovisual switcher/controller. A wireless presentation gateway shall be provided for wireless presentations.
 - e. Support for hybrid learning shall be included comprising of a USB media hub to interface with the room computer, a room camera and instructor microphone.
 - f. Primary control of the audiovisual system for the room will be provided via a touch control panel located at the instructor station.
 - g. A portable desktop color document camera located in the instructor station shall be included and will connect to the system for image magnification.
 - h. A mono RCA output connection for portable RF based assistive listening system shall be provided to accommodate ADA requirements and support all voice and program audio for the space.
 - i. Audiovisual equipment shall be housed in an equipment rack within the instructor station and shall house presentation source devices and other audiovisual processing and control equipment.
 - j. System Summary:
 - 1) Digital video projector(s)
 - a) WUXGA native resolution (1920 x 1200 pixels)
 - b) High light output (min. 5,500 ANSI lumens)
 - 2) Ceiling recessed projection screen
 - 3) Widescreen matte whiteboard surface
 - 4) Ceiling recessed loudspeakers
 - 5) Ceiling (or wall) mounted camera for web-conferencing
 - 6) Wireless instructor microphone
 - 7) Small form factor computer
 - 8) Wireless presentation gateway
 - 9) AV system presentation switcher (controller, switcher, amplifier)
 - 10) Mono RCA output for portable ALS transmitter
 - 11) Auxiliary AV input panel

4. Dietetics Lab And Suite
 - a. Dietetics Lab
 - b. In order to facilitate instruction in the Dietetic Lab, a media presentation system will be provided. This system will comprise of three station-mounted flat panel displays to facilitate video display.
 - c. Ceiling-mounted loudspeakers are provided to reproduce media audio.
 - d. A small form factor computer with wired keyboard, mouse and input interface will be provided in the instructor lectern. Additional input interfaces facilitate connection of portable devices such as laptop computers and to provide convenient control of the audiovisual switcher/controller. A wireless presentation gateway shall be provided for wireless presentations.
 - e. Support for hybrid learning shall be included comprising of a USB media hub to interface with the room computer, two room cameras and an instructor microphone. One wall-mounted camera shall face the instructor and one to face the audience.
 - f. Primary control of the audiovisual system for the room will be provided via a touch control panel located at the instructor station.
 - g. A portable desktop color document camera located in the instructor station shall be included and will connect to the system for image magnification.
 - h. A mono RCA output connection for portable RF based assistive listening system shall be provided to accommodate ADA requirements and support all voice and program audio for the space.
 - i. Audiovisual equipment shall be housed in an equipment rack within the instructor station and shall house presentation source devices and other audiovisual processing and control equipment.
 - j. System Summary:
 - 1) Three (3) Medium format 4K commercial-grade, 75" displays
 - 2) Ceiling recessed loudspeakers
 - 3) Two wall-mounted cameras for web-conferencing
 - 4) Wireless instructor microphone
 - 5) Small form factor computer
 - 6) Wireless presentation gateway
 - 7) AV system presentation switcher (controller, switcher, amplifier)
 - 8) Mono RCA output for portable ALS transmitter
 - 9) Auxiliary AV input panel
5. Orientation Room
 - a. The Orientation Room will comprise of a wall mounted flat panel HD TV as the main video display.
 - b. A floor box will be located under the table to accommodate table surface AV input, power and data connections in a flip-up well.
 - c. A wall mounted push-button control panel will select the source or default back to the digital signage source when not in use which will also be based on system timing.
 - d. The system will be equipped with a wireless presentation gateway mounted behind the display.
 - e. System Summary:
 - 1) Medium format 4K commercial-grade, 75" display
 - 2) Wall push-button control panel
 - 3) Wireless presentation gateway
6. Interview Room
 - a. The Interview Room will comprise of a wall mounted flat panel HD TV as the main video display.

- b. A wall box will be located under the table to accommodate table surface AV input, power and data connections in a flip-up well.
 - c. A wall mounted push-button control panel will select the source or default back to the digital signage source when not in use which will also be based on system timing.
 - d. A display camera and microphone soundbar will be mounted below the display for conferencing capability.
 - e. System Summary:
 - 1) Medium format 4K commercial-grade, 75" display
 - 2) Wall push-button control panel
 - 3) Conferencing soundbar (with camera)
7. Employee Lounge & Break Room
- a. These areas shall comprise of a wall mounted flat panel HD TV as the main video display.
 - b. The digital signage source will activate the display during normal building hours.
 - c. A digital signage appliance will be located behind the display for program or department content playback. All content shown on the display will be created and provided by the College and/or LACCD.
 - d. System Summary:
 - 1) Small format 4K commercial-grade, 55" display
 - 2) Networked digital Signage appliance
8. Multipurpose Room (Divisible)
- a. In order to facilitate instruction in the three-zone divisible Multi-Purpose Room, a media presentation system will be provided. This system will comprise of five (5) ceiling-mounted video projectors and five (5) ceiling-recessed motorized widescreen motorized projection screens to facilitate video display in various configurations. The space will also accommodate the recording of the presenters as well as the audience response.
 - b. Ceiling-mounted loudspeakers are provided to reproduce media audio and can be split into three distinct zones when rooms are divided.
 - c. Three small form factor computers with wired keyboard, mouse and input interface will be provided in the instructor lectern. Additional input interfaces facilitate connection of portable devices such as laptop computers and to provide convenient control of the audiovisual switcher/controller. A wireless presentation gateway shall be provided for wireless presentations.
 - d. Primary control of the audiovisual system for the room will be provided via 12" touch control panels located at three entry door locations.
 - e. Three portable desktop color document cameras shall be included that can be connected to the system for display and shall be located in the instructor station.
 - f. Three wireless microphone systems (each with a lapel and handheld microphone) shall be included for voice reinforcement within the space. An overhead ceiling array microphone will be used in each of the three partitioned sections to capture audience response. The floor boxes will each have (3) XLR connections for additional wired microphones to support panel discussions and multiple styles of presentations within the venue. Six wired handheld microphones and six 25 ft. extension cables will be included along with two 4 ft. adjustable microphone stands. Ceiling array microphones will be included in each section to provide suitable coverage for event audience response during recorded sessions.

- g. Each of the three divisible rooms shall receive both a front and rear HD camera for both audience and presenter capture.
 - h. The cameras, content and audio (program and microphones) shall be integrated into a media bridge to accommodate both zoned/separated and combined support for web-conferencing. Multicast streaming and recording appliances will be provided to accommodate video and audio capture and live network broadcast during special presentations or Board of Trustees meetings.
 - i. Three fixed RF based assistive listening systems (ALS) shall be provided to accommodate ADA requirements and support all voice and program audio for the space. A wireless network audio appliance for providing live audio feeds to personal devices via an smart app will be included for the combined room used (to supplement the ALS equipment).
 - j. General audiovisual equipment shall be housed in a full-height equipment rack that shall house the presentation source devices and base audiovisual processing and control equipment.
 - k. Three podiums shall be included for the presenters that shall interface with three from floor box positions with recessed connection plates for power, AV and data signals.
 - l. System Summary:
 - 1) 5 Digital video projector(s)
 - a) WUXGA native resolution (1920 x 1200 pixels)
 - b) High light output (min. 6,500 ANSI lumens)
 - 2) 5 Ceiling recessed projection screens
 - 3) Widescreen matte whiteboard surface
 - 4) Zoned ceiling recessed loudspeakers
 - 5) Small form factor computers
 - 6) HD cameras (pan-tilt-zoom-focus)
 - 7) Media Bridge (web-collaboration)
 - 8) Multicast network streaming appliance
 - 9) Recording appliance
 - 10) Wireless microphones (handheld and lapel)
 - 11) Wired handheld microphones and stands
 - 12) Wired overhead microphone arrays
 - 13) Media-to-USB bridge appliances
 - 14) Wireless presentation gateways
 - 15) AV system presentation matrix switcher (controller, switcher, amplifiers)
 - 16) Digital audio signal processor
 - 17) ALS transmitters & receivers
 - 18) Wi-Fi audio appliance
 - 19) Auxiliary AV input panels
9. Large Conference Room
- a. The Large Conference Room will comprise of a large wall mounted flat panel HD TV as the main video display.
 - b. A floor box will be located under the table to accommodate table surface AV input, power and data connections in a flip-up well.
 - c. A wall mounted touch-control panel will select the source and control system functions.
 - d. A front camera and room microphone system will facilitate web-conferencing through the dedicated room computer.
 - e. The system will be equipped with a wireless presentation gateway mounted behind the display.

- 1) System Summary:
 - a) Large format 4K commercial-grade, 90" display
 - b) Ceiling speakers
 - c) Wall touch control panel
 - d) Wireless presentation gateway
 - e) Ceiling microphone array
 - f) Front wall HD camera
 - g) Media-to-USB converter appliance
 - h) Table AV input connections
 - i) Mono RCA output for portable ALS transmitter
 - j) Equipment Rack
 - k) Dedicated computer
10. Small Meeting Rooms
 - a. The Conference Rooms will comprise of a wall mounted flat panel HD TV as the main video display.
 - b. A floor box will be located under the table to accommodate table surface AV input, power and data connections in a flip-up well.
 - c. A wall mounted touch-control panel will select the source and control system functions.
 - d. A front camera and room microphone system will facilitate web-conferencing through the dedicated room computer.
 - e. The system will be equipped with a wireless presentation gateway mounted behind the display.
 - f. System Summary:
 - 1) Medium format 4K commercial-grade, 65-75" display
 - 2) Ceiling speakers (or display speakers)
 - 3) Wall touch control panel
 - 4) Wireless presentation gateway
 - 5) Table (or display soundbar) microphone
 - 6) Front wall HD soundbar camera
 - 7) Table AV input connections
 - 8) Mono RCA output for portable ALS transmitter
 - 9) Dedicated computer (micro PC) behind display

PART 2 PRODUCTS

2.01 ENGINEERING AND DESIGN

- A. Engineering and other pre-site services included in this Specification are considered furnished goods delivered to the site in a similar manner to physical materials. PART 2 of the AV specifications is for review by the AV contractor's engineering department. The contractor is responsible for reviewing the specification and drawings and providing an ENGINEERED fixed-price quotation covering the cost of all equipment and labor to install, program, warranty and service the systems described.
- B. The contractor is responsible for attending all pre-bid meetings and reviewing and understanding the systems design, functionality and intent.
- C. The owner assumes that all contractors providing bid responses have included all the necessary equipment, parts, cabling, labor, engineering, programming, project management, testing and training costs, and will not approve any additional fees or costs, unless shown and approved to be beyond the scope of the specification and drawings.

- D. The equipment identified below provides examples of the level of quality and functionality required. These are predominantly major or unusual items and do not represent a complete list of equipment. The contractor is responsible for providing all equipment necessary for fully functioning turnkey systems.
- E. Where the equipment described includes “or approved equal”, the contractor shall provide all documentation as indicated in paragraph 1.08 Substitutions to allow the owner or owner’s representative to make a determination prior to bid submittal.
- F. Where the equipment described includes “or equal”, the contractor shall provide all documentation as indicated in paragraph 1.08 Substitutions as part of the product data submittal package delivered after award of contract.
- G. Where the equipment described does not include “or approved equal” or “or equal”, the contractor shall provide only the product specified. No substitutions will be accepted.

2.02 GENERAL CLASSROOM

- A. Sources
 - 1. USB Camera: Aver PTZ310W and wall mount bracket.
 - 2. Document Camera – Epson DC-21 or approved equal.
 - 3. Wireless Presentation Gateway – Extron ShareLink Pro 500.
 - 4. Microphone Array – Shure MXA920, or approved equal, coordinate color with architect.
- B. Mixing, Processing, Routing, Distribution
 - 1. Presentation Switcher – Extron DTP CrossPoint 84 4k, or approved equal.
 - 2. HDBT Receiver – Extron DTP-HDMI-4K-230-RX, or approved equal.
 - 3. Assistive Listening System – Listen Technologies LS-30-072, or approved equal.
 - 4. Wireless Microphone System – Shure SLXD24D/B58, or approved equal.
 - 5. Media Bridge - Extron Mediaport, or approved equal.
- C. Audio:
 - 1. Ceiling Speakers: Extron FF-220T
 - 2. Amplifier: Extron MPA 601 70v, 60 watt amplifier with Extron PC101 AV Power Controller for relay power control.
 - 3. Ceiling Microphone Array: Shure MXA920S or approved equal, coordinate color with architect.
 - 4. Connection to portable ALS equipment per specification 27 51 26.
- D. Display
 - 1. Video Projector – Epson L630u projector with BMS LCD LOC IV ceiling lock mount.
 - 2. Manual (preferred) or motorized non-tab tensioned projection screen per specification section 11 52 13.
 - 3. Monitor, Primary (24”-27” diagonal): Smart Technologies SMART Podium 624 27” touch-enabled monitor mounted to left side of VESA articulating desk arm.
 - 4. Monitor, Secondary (27” diagonal): OFCI 27” monitor mounted to right side of VESA articulating desk arm. Min. resolution 1920x1080. Match LACCD latest computing standards.
- E. Control
 - 1. Control Panel – Extron TLP Pro 725T, or approved equal.
 - 2. Web-based User Interface: LinkLicense for use with touch-enabled monitors for control.
- F. Equipment Racks & Miscellaneous Systems
 - 1. Instructor Station:
 - a. Computer Comforts Sit-To-Stand desk with front and rear louvered locking doors, 14RU equipment rack. Laminate/trim color to be coordinated with the architect during product submittal.

- b. Dual-arm articulating VESA monitor mount.
 - c. Extron Cable Cubby 500 series cable well.
 - 2. Equipment Rack (Desk) & Miscellaneous Equipment
 - a. Included with Computer Comforts Sit-To-Stand desk. Include rear cooling kit to accommodate proper active/forced cooling of internal equipment. Include leveling feet to accommodate underside ventilation and cabling run into rack from bottom side. Coordinate prior to ordering with LACCD for enclosure (if not room millwork).
 - b. Middle Atlantic 2RU locking drawer #UD2 with #KYLK lock option.
 - c. Middle Atlantic 2RU clamping shelf for wireless mirroring device.
 - d. Middle Atlantic 3RU clamping shelf for PC.
 - e. Middle Atlantic power distribution unit (PDU) #PD-915R or approved equivalent.
- 2.03 LARGE CONFERENCE ROOM
- A. Sources
 - 1. USB Camera: Aver PTZ310W and wall mount bracket centered on the wall above the displays and the on the side wall.
 - 2. Wireless Presentation Gateway – Extron ShareLink Pro 500.
 - B. Mixing, Processing, Routing, Distribution
 - 1. Presentation Switcher – Extron DTP CrossPoint 84 4k, or approved equal.
 - 2. HDBT Transmitter – Extron DTP-HDMI-4K-230-TX
 - 3. HDBT Transmitter Type 2– Extron DTP-HDMI-4K-231-D or approved equal.
 - 4. HDBT Receiver – Extron DTP-HDMI-4K-230-RX, or approved equal.
 - 5. Media Bridge - Extron Mediaport, or approved equal.
 - 6. Microphone Input Panel – RDL DD-RN40 wall mounted bi-directional Mic/Line Dante interface, or approved equal.
 - C. Audio:
 - 1. Ceiling Speakers: Extron FF-220T
 - 2. Amplifier: Extron MPA 601 70v, 60 watt amplifier with Extron PC101 AV Power Controller for relay power control.
 - 3. Ceiling Microphone Array: Shure MXA920S or approved equal, coordinate color with architect.
 - 4. Connection to portable ALS equipment per specification 27 51 26.
 - D. Display
 - 1. Monitor: NEC V864Q (or approved consecutive model) 86” Flat Panel Monitor with Premier Mounts AM300 articulating wall mount.
 - 2. USB Extender: Extron UCS FTR 900 Kit (in ceiling enclosure) to support USB 3.0 and higher data rates.
 - 3. Equipment Management: Chief Manufacturing CSMP9X12 Proximity Storage Panel (one per display).
 - E. Control
 - 1. Control Panel – Extron TLP Pro 725M, or approved equal.
 - F. Equipment Rack (Desk) & Miscellaneous Equipment
 - 1. Middle Atlantic SRSR-12-2 (located within room millwork). Include rear cooling kit to accommodate proper active/forced cooling of internal equipment. Include leveling feet to accommodate underside ventilation and cabling run into rack from bottom side. Coordinate prior to ordering with LACCD for enclosure (if not room millwork).
 - 2. Middle Atlantic 2RU locking drawer #UD2 with #KYLK lock option.
 - 3. Middle Atlantic 2RU clamping shelf for wireless mirroring device.
 - 4. Middle Atlantic 3RU clamping shelf for PC.
 - 5. Middle Atlantic power distribution unit (PDU) #PD-915R or approved equivalent.

6. Six-outlet 115VAC surge power strip mounted within rack for monitor & PC, etc.
- 2.04 SMALL MEETING ROOMS
- A. Sources
 1. Conferencing Soundbar – Poly X52, or approved equal.
 - B. Mixing, Processing, Routing, Distribution
 1. HDMI Switcher – Extron SW2-HD-4K-Plus, or approved equal.
 2. HDBT Transmitter – Extron DTP-HDMI-4K-230-TX
 3. HDBT Receiver – Extron DTP-HDMI-4K-230-RX, or approved equal.
 - C. Display
 1. Wall Mounted Monitor – NEC 4P-B65EJ2U, or approved equal, with Chief universal ceiling mount kit.
 - D. Control
 1. Control Panel – Extron TLP Pro 725M, or approved equal.
- 2.05 DIGITAL SIGNAGE
- A. Source Equipment:
 1. Networked digital signage appliance. Configure settings in conjunction with LACCD IT Dept. Content provided by LACC/LACCD.
 - B. Display:
 1. Monitor: NEC V551 (or approved consecutive model) 55” Flat Panel Monitor with Premier Mounts P4263F wall mount.
 2. Equipment Management: Chief Manufacturing CSMP9X12 Proximity Storage Panel.
- 2.06 GENERAL EQUIPMENT AND MISCELLANEOUS
- A. Cabling, and Misc.
 1. Use plenum-rated versions of the cables listed below in accordance with the NEC and all local codes.
 2. Cables (Non-Plenum Applications):
 - a. Analog Microphone and Line Level:
 - 1) Twisted pairs of color-coded AWG #22 stranded conductors with overall foil shield, stranded tinned copper drain wire, and jacket.
 - 2) Belden 9451, Liberty 22-1P-EZ, or equal.
 - b. Digital Audio:
 - 1) 110 ohms, Low Capacitance STP
 - 2) Belden 1800B, Liberty 24 1p DIG-AUDIO, or equal.
 - c. Loudspeaker, Constant Voltage:
 - 1) Stranded 18 AWG
 - 2) Belden 5300UP, Liberty 18-2C, or equal.
 - d. Loudspeaker, Low Impedance
 - 1) Twisted color-coded stranded and paired conductors with overall jacket. Gauge as required or shown on drawings.
 - 2) AWG #16: Belden 5200UP, Liberty 16-2C-TTP, or equal.
 - 3) AWG #14: Belden 5100UP, Liberty 14-2C-TTP, or equal.
 - 4) AWG #12: Belden 5000UP, Liberty 12-2C-TTP, or equal.
 - 5) AWG #10: Belden 5T00UP, or equal.
 - e. Installation Cable (use for non-plenum lectern multi-pin applications only)
 - 1) Multi conductor audio, video and control cable in single PVC jacket.
 - 2) Belden, Extron, Liberty, or equal.
 - f. Precision Video Lines (use for all discreet video connections and in-rack wiring):

- 1) Low-noise coaxial cable with AWG #20 solid center conductor, polyethylene dielectric, foil-plus-copper-braid shield, and overall PVC jacket.
- 2) Belden 1505A, CommScope 5565, or equal.
- g. Precision Video Lines (use for all RGBHV combination runs > 50 feet.)
 - 1) Low-noise coaxial cable with AWG #20 solid center conductors, polyethylene dielectric, foil-plus-copper-braid shield, and overall jacket containing all 5 individually contained coaxial cables.
 - 2) Extron M59-5 BNC series, West Penn WP 8195, or equal.
- h. Precision Video Lines (use for all RGBHV combination runs < 50 feet.)
 - 1) Low-noise coaxial cable with AWG #25 solid center conductors, polyethylene dielectric, foil-plus-copper-braid shield, and overall jacket containing all 5 individually contained coaxial cables.
 - 2) Extron MHR-5 BNC series, West Penn WP 8255, or equal.
- i. CATV Trunk
 - 1) Quad-shield Series 11.
 - 2) CommScope F11SSVR, Belden 7731A, or equal.
- j. CATV Drop
 - 1) Quad-shield Series 6.
 - 2) CommScope F6SSV, or equal.
- k. Control (Cresnet, AxLink)
 - 1) Liberty LLinx-U, Belden 1502P, or control system manufacturer-certified equal.
- l. Control (serial, dry contact, etc.)
 - 1) Color-coded stranded copper conductors with overall jacket. Number of conductors as specified.
 - 2) Belden, Liberty, West Penn, or equal.
- m. Fiber Optic
 - 1) 50 or 62.5 micron multimode, or singlemode per Owner's standard.
 - 2) Manufacturer: Per Owner's standard.
- n. UTP for non-IP media transport and control
 - 1) Four-pair unshielded twisted pair cable. Exceeds requirements for Category 5e/6/6A applications, as required.
 - 2) Cat 5e: Belden 1701A, or equal. Coordinate jacket color with Owner.
 - 3) Cat 6: Belden 1874A, or equal. Coordinate jacket color with Owner.
 - 4) Cat 6A: Belden 10GX33, or equal. Coordinate jacket color with Owner.
- o. UTP for IP-based media transport and control, and data network
 - 1) Four-pair unshielded twisted pair cable. Exceeds requirements for Category 5e/6/6A applications, as required.
 - 2) Manufacturer: Per Owner's standard.
- p. Hybrid Fiber Optic Cable
 - 1) SMPTE 311M compliant: Two strands 9.2um/125um single mode fiber; one twisted pair, 24 AWG (7x32); two twisted pairs, 20 AWG (19x32); one strength member, 16 AWG stranded steel; overall braided shield, 95%
 - 2) Gepco HDC920R, Belden 7804R, General Cable 742608, or equal.
- q. HDBase-T (copper)
 - 1) Four-pair shielded twisted pair cable. Exceeds requirements for shielded Category 6 applications.

- 2) Crestron DM, or per HDBase-T electronics manufacturer's recommendations.
 - r. HDBase-T (fiber)
 - 1) 50 or 62.5 micron multimode, or singlemode per HDBase-T electronics manufacturer's recommendations and Owner's standard.
 - 2) Manufacturer: Per Owner's standard.
 - s. HDMI Video Cable
 - 1) Factory-terminated High-Speed cable assembly, verified to resolution/frame rate/data rate/distance as required.
 - 2) Extron HDMI Pro Series, Liberty HD-700 Series, or equal.
 - t. HDMI Digital Ribbon Cable
 - 1) Factory-terminated High Speed cable assembly, verified to resolution/frame rate/data rate/distance as required.
 - 2) FSR DR-PCB-HxxM, or equal.
 - 3. Cable Markers:
 - a. High-grade PVC clip-on or permanent-type cable markers with permanent markings, or printed vinyl tape protected by clear shrink tubing or adhesive wrap.
 - b. Acceptable Products:
 - 1) Electrovert Type C or Z.
 - 2) Brady B-702 with Alpha FIT-221 series clear tubing.
 - 3) Thomas & Betts EZCODER.
 - 4. Microphone and Line-Level Line Terminal Blocks:
 - a. Insulation displacement "punch" block.
 - b. Contact Construction: Insulation displacement phosphor bronze contact, with plastic insulator, for AWG #22, #24, and #26 solid or stranded wire, allowing 100 insertions/ withdrawals, and accepting four wires total for each connection point.
 - c. Acceptable Products:
 - 1) ADC Products UP3 with UP-W or UP-R mounts as required with one Q-814-804 wire insertion tool.
 - 2) Siemens Multiflex block with one 714 insertion tool with cutting blade.
 - B. Connectors:
 - 1. Microphone and Line Connectors (Panel Mount):
 - a. Balanced Input Receptacles
 - 1) Female gender "XLR"-type receptacles.
 - 2) Acceptable Products:
 - a) Switchcraft C3F or D3F.
 - b) Equivalent.
 - b. Balanced Output Receptacles
 - 1) Male gender "XLR"-type receptacles.
 - 2) Acceptable Products:
 - a) Switchcraft C3M or D3M.
 - b) Equivalent.
 - c. Dual Format Line Input Receptacles
 - 1) Balanced input receptacle accepting both male gender "XLR"-type connectors and 1/4" TRS phone plugs.
 - 2) Acceptable Products:
 - a) Neutrik NCJ6FK-V.
 - b) Equivalent.
 - d. Unbalanced Input and Output Receptacles

- 1) Two-conductor 1/4" phone jacks with type J-4 single-closed circuit schematic, molded plastic enclosure, and insulating molded nylon bushing.
 - 2) Acceptable Products:
 - a) Switchcraft N112A or NL112A as required.
 - b) Equivalent.
 - e. Locking 1/4" Receptacles
 - 1) Two- or three-conductor 1/4" phone jacks with locking tab to prevent accidental removal of plug.
 - 2) Acceptable Products:
 - a) Switchcraft E111L (2-cond.) or E112BL (3-cond.) as required.
 - b) Neutrik NJ3FP6C.
 - c) Equivalent.
 - f. Unbalanced Input and Output Receptacles
 - 1) Female gender phono jacks (RCA jack) with closed circuit switching and non-grounding mount.
 - 2) Acceptable Products:
 - a) Switchcraft 3512.
 - b) Equivalent.
 - g. 3.5mm (1/8" Mini) Stereo Phone Jack
 - 1) Female gender, 3-conductor, open-circuit, enclosed, panel-mount, 3.5mm (1/8" mini) phone jack.
 - 2) Acceptable Products:
 - a) Switchcraft 35HD-series.
 - b) Equivalent.
 - h. Multipin Receptacles
 - 1) Multipin connectors compatible with microphone snakes supplied. Gender and channel capacity as shown on drawings and/or equipment schedule.
2. Microphone and Line Connectors (Cable Mount):
 - a. Balanced Input Connectors
 - 1) Female gender "XLR"-type connectors.
 - 2) Acceptable Products:
 - a) Switchcraft A3F.
 - b) Neutrik NC3FX.
 - b. Balanced Output Connectors
 - 1) Male gender "XLR" type connectors.
 - 2) Acceptable Products:
 - a) Switchcraft A3M.
 - b) Neutrik NC3MX.
 - c. 1/4" Phone Plug
 - 1) Two- or three-conductor 1/4" phone jacks.
 - 2) Acceptable Products:
 - a) Switchcraft 184 (2-cond.) or 190 (3-cond.) as required.
 - b) Neutrik NP-2C (2-cond.) or NP-3C (3-cond.) as required.
 - d. Unbalanced Line
 - 1) Two-conductor RCA plug or jack connector with steel shell and internal cable clamp. Provide with minimum 2" of rubberized shrink-wrap strain relief at each connector.
 - 2) Acceptable Products:
 - a) Switchcraft 3502 or 3503 as required.
 - b) Equivalent.
 3. Loudspeaker Connectors and Receptacles (4 conductor):

- a. General: Connector system specifically designed for high power loudspeaker signal distribution, with twist type locking device. Contacts nickel-gold alloy, 250 VAC, 30 amps continuous per contact.
 - b. Cable Connectors: Four contacts, wired separately per manufacturer's recommendation for bi-amplified applications, or with pins 1+ and 1- (pins 2+ and 2- not used) for single channel applications. Cable strain-relieved with chuck type retainer for cable diameters 5-15mm (.2-.6 inch). Cable conductors attached with screws (not soldered) to facilitate field repair. Cable conductor size AWG #10 maximum. Each pair for extension cables supplied complete with one in-line coupler to permit cable linking.
 - c. Acceptable Product: Neutrik "SPEAKON" Model NL4FC with NL4MM coupler.
4. Wall or Panel Receptacles: Airtight connector compatible with above cable connectors, size 26mm W x 3mm H. Contacts wired with Faston connectors (not soldered).
- a. Acceptable Product: Neutrik "SPEAKON" Model NL4MP with Faston connectors.
5. Video Receptacles:
- a. Insulated, feed-through BNC panel jack with beryllium copper outer conductor spring for use with Series 59-type cables.
 - b. Cable termination: BNC.
 - c. Acceptable Products:
 - 1) Trompeter UBJ28.
 - 2) Kings KC-99-54.
 - 3) ITT Pomona 3846.
 - 4) Canare BCJ-JR with IU-7/16 panel isolation bushing.
6. Recessed Video Receptacles:
- a. Insulated, feed-through BNC panel jack in recessed housing to resist damage to connector.
 - b. Impedance: 75 ohms.
 - c. Cable Termination: BNC
 - d. Acceptable Products:
 - 1) Canare BCJ-JRU.
 - 2) Equivalent.
7. BNC Video Cable Connectors:
- a. BNC type for terminating video cable in conduit or video extension cables. Crimp connector with beryllium copper outer conductor spring and captive center pin, exceeding MIL-C-39012,A.
 - b. For Belden 8281 type cable.
 - 1) Acceptable Products:
 - a) Kings KC-59-299 (use KTH-1000 crimp tool, KTH-2012 die, and KTJ-43 and KTD-30 trim jigs).
 - b) Belden BNC0081 (use 9CRT012 crimp die).
 - c) Trompeter UPL-220-016.
 - c. For Belden 8281A type cable.
 - 1) Acceptable Products:
 - a) Kings 755-48-9 (use KTH-1000 tool, KTH-2178 die, and KTJ-43 and KTD-406 trim jigs).
 - b) Belden BNC0082 (use 9CRT078 crimp die).
 - d. For Belden 8279 type cable.
 - 1) Acceptable Products:
 - a) Kings KC-59-397 (use KTH-6000 crimp tool, KTH-6029 die, and KTJ-134 and KTD-26 trim jigs).

- b) Belden BNC0079 (use 9CRT026 crimp die).
 - c) Trompeter UPL-220-019.
 - e. For Series 59-type cable.
 - 1) Acceptable Products:
 - a) Kings KC-59-294.
 - b) Belden BNC0041 (use 9CRT0022 crimp die).
 - c) Trompeter UPL-220-013.
 - d) Canare BCP-C4 with one TC-0 crimp tool and TC-D-4C die.
 - f. For Belden 1505A type cable.
 - 1) Acceptable Products:
 - a) Kings 2025-51-9.
 - b) Trompeter UPL-220-014.
 - g. For Belden 1506A type cable.
 - 1) Acceptable Products:
 - a) Kings 2025-53-9.
 - b) Trompeter UPL-220-023.
- 8. RCA type connector for Series 59-Type Video Cables:
 - a. 75 Ohm true impedance matched RCA type connector.
 - b. Crimps to any Series 59-type cable.
 - c. VSWR 1.1 or less to 200 MHz.
 - d. Fully captive gold-plated center pin.
 - e. Nickel plated brass body with Beryllium copper outer contacts.
 - f. Acceptable Products:
 - 1) Canare RP-C4 series with TC-1 Crimp tool and TCD-series crimp die.
 - 2) Equivalent.
- 9. Normalled Video Receptacle:
 - a. BNC panel jack with built-in switch activated by insertion of BNC connector.
 - b. Impedance: 75 ohms.
 - c. Acceptable Products:
 - 1) TE SVJ-2T.
 - 2) Equivalent.
- 10. "F" connector for Series 59-Type Video Cables:
 - a. 75 Ohm true impedance matched "F" connector compatible with the specified cable.
 - b. Acceptable Products:
 - 1) Gilbert
 - 2) Trompeter
 - 3) T&B
- 11. IP Control/Data/Audio and Video Transport Connectors:
 - a. RJ-45 Receptacle:
 - 1) Refer to Tel/Data specification for requirements.
 - 2) Acceptable Products:
 - a) Refer to Tel/Data specification for acceptable products.
 - b. RJ-45 Modular Plug:
 - 1) Refer to Tel/Data specification for requirements.
 - 2) Acceptable Products:
 - a) Refer to Tel/Data specification for acceptable products.
- 12. Hybrid Fiber Optic Connectors:
 - a. SMPTE 304 Receptacle
 - 1) Lemo EBW.3K.93C.TLC with fiber optic contacts
 - 2) Canare FCFR
 - 3) Approved equal.

- b. SMPTE 304 Plug
 - 1) Lemo FGW.3K.93C.CLMTxxZ with bend relief and fiber optic contacts
 - 2) Canare FCM
 - 3) Approved equal.
- 13. Singlemode Optical Fiber Connectors - LC:
 - a. Refer to Tel/Data specification for requirements. If none exist, use the following:
 - 1) Small form factor, fitting in the same size opening as an RJ-45 connector.
 - 2) Duplex, handling one pair (two elements) per connector.
 - 3) Blue in color.
 - 4) Compatible with both 900 micron buffered strands and 250 micron loose tube strands.
 - 5) Maximum insertion loss, of mated pair, less than 0.5 dB at acceptance.
 - 6) Minimum return loss of greater than or equal to 50 dB.
 - 7) Durability better than 500 matings, with a maximum increase in insertion loss of not more than 0.2 dB.
 - 8) Meets ANSI/TIA/EIA 568-C.3 and ISO 11801 standards.
 - b. Acceptable Products:
 - 1) Refer to Tel/Data specification for requirements. If none exist, use the following:
 - 2) Commscope
 - 3) Corning
 - 4) BerkTek
 - 5) Approved equal.
- 14. Singlemode Optical Fiber Connectors - ST:
 - a. Refer to Tel/Data specification for requirements. If none exist, use the following:
 - 1) Boot color: Blue in color.
 - 2) Nominal fiber outer diameter: 125 micron.
 - 3) Maximum insertion loss, of mated pair, less than 0.5 dB at acceptance.
 - 4) Minimum return loss of greater than or equal to 50 dB.
 - 5) Durability better than 500 matings, with a maximum increase in insertion loss of not more than 0.2 dB.
 - 6) Meets ANSI/TIA/EIA 568-C.3 and ISO 11801 standards.
 - b. Acceptable Products:
 - 1) Refer to Tel/Data specification for requirements. If none exist, use the following:
 - 2) Commscope
 - 3) Corning
 - 4) BerkTek
 - 5) Approved equal.
- 15. HDBaseT Copper Connectors:
 - a. Shielded RJ-45 compatible with Category 6A cable.
 - b. Acceptable Products:
 - 1) As recommended by the HDBaseT electronics manufacturer.
 - 2) Approved equal.
- 16. HDBaseT Fiber Connectors:
 - a. LC or as required by HDBaseT electronics.
 - b. Acceptable Products:
 - 1) As recommended by the HDBaseT electronics manufacturer.

- 2) Approved equal.

PART 3 EXECUTION

3.01 GENERAL

- A. All types of equipment installed by competent workers at locations shown on the drawings in strict accordance with approved shop drawings and manufacturer's instructions.
- B. All delivered equipment, except portable equipment, firmly fastened or held in place. "Delivered equipment" includes loudspeakers, enclosures, amplifiers, cables, etc. Apply a minimum safety factor of four (4) times the load for all equipment fastenings and supports.
- C. Take necessary precautions to prevent and guard against electro-magnetic and electro-static hum and to install the equipment to provide safety for the operator.
- D. Protect all equipment, including patch panels, connectors, receptacles, racks, consoles, and video projectors, from construction dust and debris until final acceptance of the system.

3.02 INTEGRATION/INSTALLATION

- A. Conformance to Existing Facility Standards
 1. Wherever possible provide equipment, finishes, and interfaces similar in nature to systems already in use by the Owner. Provide uniform functionality and operation to enhance ease of use and minimize instruction. Provide uniform finish and equipment to enhance the aesthetic unity of systems facility wide, and to improve end-user familiarity with equipment.
 2. Equipment Integration:
 - a. New Equipment: Unless otherwise specified, supply only new equipment (manufactured within 6-months of installation), parts and materials, and protect all equipment from construction dust and debris until final acceptance.
 - b. Equipment Handling and Wear: Operate specified equipment only as required for testing, as part of the installation procedure.
 - c. Single Source: The provision of all manufactured components, installation, wiring, and testing is the responsibility of a single audiovisual systems contractor.
 - d. All equipment and installations under this Specification shall conform to the following:
 - 1) ANSI/NFPA 70 - National Electrical Code.
 - 2) ANSI/IEEE C2 - National Electrical Safety Code
 - 3) ANSI/TIA Standards 568, 569 and 607
 - 4) IEEE/ANSI 142-2007 - Recommended Practice for Grounding of Industrial and Commercial Power Systems.
 3. Equipment Quantities:
 - a. Determine and provide the quantities of installed equipment based on the Bid Documents including the plans, functional diagrams, riser diagrams, and specification.
 - b. Quantities of portable equipment are indicated in schedules contained in the drawings or specifications.
 4. Engineering and Documentation:
 - a. The system drawings indicate the general layout of the various items of equipment and their functional relationships. Layout of equipment, accessories, and conduit systems are diagrammatic unless specifically detailed and do not necessarily indicate every item or parameter required for a complete installation.
 - b. The AV Contractor shall provide any incidental equipment needed in order to result in a complete and operable system even if not specified or shown on drawings without claim for additional payment.

B. Labels

1. Dry transfer, "Dymo", or other types of adhesive labels not acceptable
2. Except where otherwise specified, label each item of rack-mounted equipment and all switches, controls, and receptacles as shown on drawings and as specified.
3. Switch and Control Panels: Constructed of engraved and filled anodized aluminum plates. Minimum 1/8" plate thickness - Dry transfer or other types of adhesive labels not acceptable
4. Rack-Mounted Equipment: Labels constructed of engraved and filled plastic laminate engraving stock. Designate function and input and output line(s) or loudspeaker(s) served by labeled equipment. Key all designations to system functional and patch panel diagrams. Where possible, mount labels on blank panel directly above corresponding component. For modular equipment, provide label on inside of mainframe door identifying type of module for each slot (unless there is only one type) and gain setting as established at final checkout.
5. Identification Panel: See drawings for layout and nomenclature. AV Contractor is responsible for completing all bracketed items with the appropriate project-specific information.
6. Branding and Recognition: Identification of the contractor or use of contractor logos or similar "trademarks" or "signatures" (including but not limited to touch panel graphics and color schemes, silk-screened or engraved corporate logos, copyrighted fonts, and/or custom emblazoned panels) is strictly forbidden except where explicitly indicated within the bid documents. Any unauthorized use of these marks will be rejected.
7. Receptacles: Engrave and fill receptacle label directly on mounting plate as indicated on drawings.
8. Patch Panels: Labels for jacks constructed of engraved and filled plastic laminate engraving stock or printable composition material with clear plastic cover. Labels for jack rows constructed of engraved and filled plastic laminate engraving stock. Paper strips may be used as temporary labels only.
 - a. Label jacks with functional description of jack ("Main Cluster EQ Out", "Console Mic Input 4", etc.)
 - b. Color-code jack labels with different colors for microphone level jacks, input and output jacks for recording/playback equipment, miscellaneous devices such as pads or multiples, and other line-level jacks.
9. Identify all wires and cables at every termination and connection point in accordance with INFOCOMM F501.01:2015 Cable Labeling for Audiovisual Systems using the specified cable markers, unless otherwise instructed by the Owner. Use a numbering scheme that identifies all cables terminating at patch panel jacks with the patch bay row and jack designation; use A, B, and C suffixes to distinguish multiple cables terminating at the same jack. Submit proposed numbering scheme for approval prior to installation.
10. Identify switches, relays, terminal blocks, etc., with reference numbers keyed to the as-built wiring diagrams.
11. Room numbers appear on the contract documents for reference only. All labels shall reflect the Owner's final room designations.
12. All labels and legends shall be as approved on shop drawings.

C. Racks, Cables, Connectors, and Miscellaneous Equipment

1. Wiring and Interconnections:
 - a. General:

- 1) Exercise care in wiring to avoid damage to cables and equipment.
 - 2) Make all joints and connections with rosin-core solder or approved mechanical connectors, except mechanical connectors are NOT acceptable on microphone lines. Connections to transformer leads for distributed loudspeakers may be made using properly sized wire nuts or nylon-insulated pigtail crimp connectors such as Waldom CE series. Wire nuts are not acceptable except at individual loudspeakers.
 - 3) All connections to screw-type terminals shall be made using spade lugs. Bare or solder tinned wire is not acceptable.
 - 4) All connections to lugless compression-type screw terminals shall be made using bare wire only. Do not solder tin wire.
 - 5) All wiring executed in strict adherence to standard broadcast practices. This includes:
 - a) Dress cables in conveniently sized bundles, combed into parallel runs, either laced or banded with sufficient hook and loop (Velcro) ties.
 - b) For equipment mounted on glides, or otherwise requiring servicing from the front of the rack, incorporate a cable "service loop" of sufficient length to permit the equipment to be pulled forward from the rack for servicing.
 - c) Support cables and bundles with sufficient hook and loop (Velcro) ties and support bars to ensure that no strain is placed on any connections or connectors.
 - d) Organize cables and cable bundles behind patch bays to permit easy access to the patch panels to add or remove cables.
 - e) Place cable markers 3"-5" back from video connectors to permit easy viewing. Do not bind markers into cable bundles.
 - 6) All audio signal lines carried by twisted-pair cable and switched with two poles per line unless noted otherwise. Do not tie one side of audio line to other audio lines.
- b. Grounding:
- 1) Ground equipment, racks, and audio line shields to independent audio system ground ONLY as shown on drawings. If not shown on drawings, ground case of power striplines in equipment racks to the racks and directly to isolated ground buss in the power panel or to power system ground at the building AC service entry only.
 - 2) Ground all conduits ONLY to power system ground. Insulate all conduits and electrical boxes from sound system, including equipment racks and audio system ground.
 - 3) Insulate all conductors in conduit, including shields, from the conduit, back boxes, and from each other for the entire conduit length.
- c. Equipment Racks:
- 1) Install equipment in racks to permit access to all equipment for service. Transformers, relays, terminal blocks, etc., mounted in rear of racks behind other equipment shall not prevent access to equipment connections or shall be mounted on hinged panels to permit access.
 - 2) Wire all racks completely in the shop. No internal rack wiring to be done on the job site.

- 3) Install equipment in racks with ventilating panels as required to provide adequate ventilation and according to equipment manufacturer's recommendations.
 - 4) Connect all microphone, DC control, and line level cables to equipment racks via specified audio terminal blocks. External lines to patch bay terminated directly on patch bay terminal blocks.
 - 5) Connect loudspeaker lines with equipment racks via specified terminal blocks. Use spade lugs if barrier strips are used. Do not buss commons together. Do not ground.
 - 6) No signal or control lines shall leave a rack without connecting via terminal blocks.
 - 7) Provide unused panel space with blank or ventilating panels as shown on drawings.
 - 8) Locate free-standing racks as indicated and provide access to rear.
- d. Conduit:
- 1) Run all lines in metallic conduit or wireways unless otherwise indicated. Run microphone level, line level, loudspeaker level, and DC control wiring each in separate conduit.
 - 2) Do not locate AC power lines in conduit containing audio or video lines.
 - 3) Do not splice lines in conduit.
- e. Exposed Cables:
- 1) Line level or mic level lines exposed above countertops (such as those lines serving mixing consoles, program source equipment, etc.) shall be rubber-jacketed, AWG #20 two conductor with braided shield such as Belden 8412 or equivalent. Plastic or vinyl jacketed cables are not acceptable.
- f. Receptacles:
- 1) Provide finish sample for approval by Architect.
 - 2) Wall-mounted receptacles in metal boxes at building standard receptacle height unless otherwise indicated.
 - 3) Floor-mounted receptacles in flush floor boxes with flush lids.
- g. Video Receptacles:
- 1) Install feed-through receptacles to mounting plates with insulating washer and sleeve to electrically isolate the receptacle from the electrical box and conduit.
 - 2) Punch receptacles with "D" hole to prevent receptacle rotation within hole.
- D. Microphone Equipment
1. General:
 - a. Excluding wireless microphones, each portable microphone provided with case, stand adapter and min. 15-ft. cable with attached XLR-type connector.
 2. Cardioid Dynamic Hanging Microphone:
 - a. Locate in plan as shown on the drawings.
 - b. Locate to provide typical 6' working distance between microphone and talker; nominally <10' AFF.
 3. Wireless Microphone Systems:
 - a. Use frequency band, as required by local and national standards.
 - b. Coordinate specific transmission frequencies such that transmitters do not interfere with other wireless microphone systems within the building or other wireless systems.
 4. Beamtracking Microphones:

- a. Locate in plan as shown on the drawings or as recommended by the manufacturer to pick up talkers in the desired area.
 - b. Coordinate all network requirements including IP addresses, and VLAN and QoS requirements with the Owner's IT staff.
 - c. Configure microphone for auto-mixed output or individual channels, as shown on the drawings.
 - d. Configure lobes to cover seating area. Save presets for areas with multiple seating arrangements.
- E. Amplifiers and Signal Processors
1. Gain Control Security:
 - a. Power Amplifiers: Provide each power amplifier with calibrated, stepped controls, which are provided with tamper-resistant covers or are located on the back or inside of the chassis (contact manufacturers for gain control security options). Shaft locks or caps are NOT ACCEPTABLE. Verify acceptability of gain control security provisions with Audiovisual Systems Consultant BEFORE ordering the amplifiers.
 - b. Signal Processing equipment: Signal processing equipment with front panel controls which are to be permanently adjusted (not normally adjusted by the operator), such as equalizers, limiters, and audio delays, shall be furnished with security panels or sub panel mounted behind blank panels. Provide plastic vision panels for viewing of indicators such as meters or clipping indicators.
 2. Compressor/Limiters:
 - a. Adjust to protect loudspeaker components from overdrive damage, and to prevent amplifiers from clipping.
 3. Levelers/AGC
 - a. Adjust so that all speech inputs are normalized to the same nominal signal level. Do not apply AGC to inputs used in music performances.
 - b. Do not apply AGC to recorded content so that dynamics are preserved.
 4. Loudspeaker Management
 - a. Configure all filters, crossovers, delays, and gain controls using the loudspeaker manufacturer's supplied parameters.
- F. Loudspeaker Equipment
1. Stereo Playback Loudspeakers:
 - a. Provide detailed shop drawings for the opening dimensions and installation of loudspeakers and for the coordination of finish trades.
 - b. Mount in locations shown on drawings.
 - c. Coordinate with General Contract personnel to achieve aesthetic results as directed by the Owner or Architect.
 - d. Refer all questions and/or decisions regarding installation and finish methods to the Architect and Consultant.
 2. Ceiling Loudspeaker Assemblies
 - a. Loosely fill all enclosures with nominal 1-1/2 lb. per cu. ft. density fiberglass.
 - b. Ceiling Enclosures: Enclosures supported directly from ceiling structure in an approved manner. Support directly by acoustical ceiling tile is NOT ACCEPTABLE. Assemblies for 12" loudspeakers or larger to be supported directly from building superstructure.
 - c. Flush and Surface-Mounted Ceiling Enclosures: Provide enclosures as required, located as indicated on drawings.
 - d. Finish grilles and any exposed components per Architect's instructions.
 3. Flown Loudspeakers

- a. Provide detailed shop drawings for the installation of loudspeakers. Drawings must be stamped by a professional engineer registered in the project's jurisdiction and approved by the project structural engineer prior to installation.
 - b. Mount in locations shown on drawings.
 - c. Provide all clamps, aircraft cable, and miscellaneous hardware necessary to attach loudspeaker assemblies to building superstructure.
 - d. Coordinate with General Contract personnel to achieve aesthetic results as directed by the Owner or Architect.
 - e. Refer all questions and/or decisions regarding installation and finish methods to the Architect and Consultant.
4. Soundbars:
- a. Locate as shown on the drawings.
 - b. Provide with any hardware to wall mount, recess, or attach to top or bottom of video monitor, as required.
 - c. Ensure that all cabling is dressed neatly and either run in wireways, as shown on the drawings, or otherwise hidden from view.
- G. Video Projectors:
1. Verifications:
 - a. Indicate locations and elevations using manufacturer's throw distance and elevation formulas for proposed projector model.
 - b. Where projection screens are designed for multiple uses, verify mounting position which allows all sources to comply with specified image dimensions.
 2. Submittals:
 - a. Provide plan and section drawings verifying image width, lens-to-screen distances and mounting methods.
 - b. Provide detailed drawings of custom-fabricated or stock mounts and hardware.
 - c. Provide detailed drawings of millwork or finish items required for specified screen dimensions.
 3. Mounting:
 - a. DO NOT DISCARD ANY PROJECTOR SHIPPING OR PACKING MATERIALS. SHIPPING CONTAINERS AND MATERIALS SHOULD BE TURNED OVER TO OWNER.
 - b. Install projector mount and suspend projector at location and elevation indicated on approved shop drawings.
 - c. Projector mounts and motorized lifts must meet all applicable safety and code requirements for ceiling mounted equipment.
 - d. Fixed projector mounts must be rigid and completely free of sway or rotation deviation. Provide vibration isolation, as necessary, to ensure a stable image.
 - e. For ceiling mounted installations where screen surfaces are vertical, level projector at 0° front-to-back and side-to-side.
 - f. Position projector lens centered on screen centerline in plan.
 - g. Wherever possible, minimize hardware and cables visible from audience seating and presenter area viewpoints.
 - h. Paint exposed mounting hardware to match room interior or as instructed by Architect.
 - i. Where others provide structural mounts or millwork openings, verify correct positioning and dimensions before mounting projector. Provide written notification to the Owner or Architect of any discrepancies in mount positioning or stability deficiencies before projector installation.

- j. Provide all necessary projector brackets, fittings, pipes, miscellaneous hardware and wireways.
- 4. Alignment, Focus, and electronic testing:
 - a. Light Output: The total averaged light output from a projector, in lumens, shall be within plus-or-minus 10% of the manufacturer's published specification. Light output should be measured with a full calibrated, accepted and approved light meter.
 - b. Uniformity: The light falls off from the center of the projected image to all four corners, as measured at the projected image plane, should not exceed 50%. The light intensity should be measured at all five positions of the projected image after the projector has been adjusted to the light output as specified above.
 - c. Resolution: The projection system should be capable of producing images of the same or greater resolution as the video source equipment, up to the maximum specified resolution of the projector.
 - d. Distortion: Projected images shall not display any perceptible keystoneing or other distortion as evaluated using standard video alignment test patterns.
 - e. Contrast: The brightness ratio of the video image should be sufficient to produce good contrast as demonstrated by the even transition from black to white on the gray scale.
 - f. Adjust lensing for distortion free text.
 - g. For computer sources use approved test pattern generator.
 - h. For LCD projectors: verify color uniformity after 40 hours operation.
 - i. For Projectors containing XENON lamp systems: operate lamp for 40 hours prior to installation and color balancing/correction.
- H. Motorized Screens
 - 1. General:
 - a. Verify locations of control motors.
 - b. Where low-voltage power interfaces are specified, provide all Class-2 wiring required to interface with control systems.
 - c. Where low-voltage control interfaces have not been provided by others (even if such interfaces are defined as general contract equipment), provide low-voltage interface and all Class-2 wiring required to interface with control systems.
 - d. Control system switching shall not override or otherwise disable any local control switches provided by others.
- I. Video Monitors
 - 1. Verify that sufficient blocking has been provided by the General Contractor.
 - 2. Mount in locations shown on drawings using universal wall and ceiling mounts as specified.
 - 3. Coordinate power and wall box locations with Electrical Contractor so they are hidden from view.
 - 4. Neatly dress all cables to be hidden from view.
- J. Cameras
 - 1. Set for Auto-Iris.
 - 2. Set ABL (auto black level) off.
 - 3. Set color temperature filter to setting 1.
 - 4. Set Gain to 0 dB.

5. Determine a white-balancing procedure for normal use. Determine if an appropriate white area is available in each room or can be made available prior to each room use. If providing white surface for each day's use is difficult, evaluate the effect of using the preset 3200°K color temperature setting. Consult with Owner to confirm procedure suitability. Note that following camera shutdown, white balance, iris, and pedestal adjustments are stored in memory for a maximum of 12 hours. In the test results submission, report on findings.
 6. Set lens Macro to "OFF".
 7. Set horizontal and subcarrier phase for all cameras. Determine that all video signal parameters can be adjusted to within normal limits, with settings as described above.
 8. Coordinate pan/tilt/zoom preset requirements with Owner, and program as required.
- K. Videoconferencing Codecs
1. Securely mount hard codecs in equipment racks, as shown on the drawings.
 2. Assist Owner's IT staff in the installation and configuration of soft codecs, as required.
 3. Coordinate videoconferencing management server or software requirements with Owner's IT staff.
 4. Coordinate codec network requirements, including IP addresses and firewall configuration, with Owner's IT staff.
- L. Production Communication Equipment
1. Locate main station, remote stations, power supplies, wall stations, and speaker stations as shown on the drawings.
 2. Supply each wired belt pack with headset microphone and cable, as specified.
 3. Provide all interface devices (2-wire, 4-wire, IP, etc.) as specified or required.
 4. Verify that antennae for wireless systems will provide coverage throughout the intended areas. Notify the Audiovisual Systems Consultant immediately of any concerns.
 5. Configure master station, remote stations, and belt packs using local controls or the manufacturer's software application, per Owner's instructions or as required.
 6. Intercom-over-IP: Coordinate all network requirements including IP addresses, and VLAN and QoS requirements with the Owner's IT staff.
- M. Assistive Listening System
1. General:
 - a. Verify RF antennae, emitters, and induction loops will provide coverage throughout the intended areas. Notify the Audiovisual Systems Consultant immediately of any concerns.
 - b. Provide all receivers and accessories (ear speaker, neck loop, batteries, etc.), as specified. Coordinate turnover of all portable equipment with Owner.
 2. RF Systems:
 - a. Locate RF transmitters as shown on the drawings.
 - b. Use frequency band, as required by local and national standards.
 - c. Coordinate specific transmission frequencies such that RF transmitters do not interfere with other wireless systems within the building.
 3. IR Systems:
 - a. Locate IR emitters and modulators as shown on the drawings.
 - b. Provide detailed shop drawings for the installation of IR emitters/modulators.

- c. Verify specified emitter transmission frequency will not be adversely affected by local natural and manmade light.
 - 4. Induction Loop Systems:
 - a. Provide detailed shop drawings for installation of the induction loop.
 - b. Coordinate removal/installation of floor finishes with General Contractor.
 - N. Conference, Voting, and Simultaneous Interpretation Systems
 - 1. Confirm all microphone, button panel, and loudspeaker finishes with Architect. Locate all equipment as shown on the drawings.
 - 2. Coordinate any furniture cutout requirements with the millwork contractor. Provide cutout templates or equipment samples, as necessary.
 - 3. Neatly conceal and permanently mount all power supplies and other miscellaneous electronics, and cabling. Coordinate any access panel requirements with the millwork contractor to ensure that all components are accessible.
 - 4. Simultaneous Interpretation:
 - a. RF Systems:
 - 1) Locate RF transmitters as shown on the drawings.
 - 2) Use frequency band, as required by local and national standards.
 - 3) Coordinate specific transmission frequencies such that RF transmitters do not interfere with other wireless systems within the building.
 - b. IR Systems:
 - 1) Locate IR emitters and modulators as shown on the drawings.
 - 2) Provide detailed shop drawings for the installation of IR emitters/modulators.
 - 3) Verify specified emitter transmission frequency will not be adversely affected by local natural and manmade light.
 - 5. Coordinate turnover of all portable equipment, such as headphones and ear speakers, with Owner.
 - 6. Program all control and voting result pages as required by the Owner.
 - O. IPTV
 - 1. Coordinate server location with Owner's IT staff.
 - 2. Coordinate IP addresses, QoS, VLAN, and any other applicable data network requirements with the Owner's IT staff.
 - 3. Coordinate with the Owner's IT staff in configuring all encoder bit rates to provide the highest quality video signal with the least impact to the enterprise's data network.
 - 4. Locate all set top boxes as shown on the drawings or directed by the Architect.
 - 5. Provide media player software to Owner's IT staff. Assist in the installation and configuration of the player, as required.
 - 6. Configure channel guide in accordance with required channel lineup.
 - P. Digital Signage
 - 1. Coordinate server or software requirements with Owner's IT staff.
 - 2. Configure management and scheduling software, as required.
 - 3. Locate media players as shown on the drawings. Install players and wiring to be hidden from view while ensuring suitable ventilation and access.
 - 4. Coordinate all data network requirements with the Owner's IT staff and configure media players as required.
- 3.03 SOFTWARE
- A. Control System Software
 - 1. Graphical User Interface

- a. The Control System Graphical User Interface is the visual portion of the human interface of a touch control panel. This is the layout that the Owner and their users will operate the system by and use for navigating the various system features. Preview monitoring may also be contained in versions of the GUI.
 - b. Graphical User Interface (GUI) designs for all Audiovisual System control touch panels developed in accordance with the guidelines of the AVIXA / InfoComm International® “Dashboard for Controls Design Reference” and “Integrators Guide” for layout and flow principals.
 - c. Graphical User Interface designs shall conform to Owner’s graphic standards and guidelines for use of logos or other graphical treatments.
 - d. Coordinate and integrate requirements for lighting control presets with control panel scene recall where appropriate.
 - e. Coordinate and integrate requirements for motorized window covering and screen controls.
 - f. Set up of all video windowing software in multi-image processors whether in stand-alone units or within video projectors.
 - g. Set up of Codecs in coordination with the Owner’s videoconference and/or network support staff including any specific networking or line provisioning.
 - h. Coordinate with Owner’s data network administrator for all required IP address range and info for AV networked devices and supply any specific requirements for network parameters (MDO for switches, multicast for streaming, bandwidth, and port settings for videoconferencing, etc.). Configure and record all final IP address information and supply final listing of devices and their information to Owner’s data network administrator.
 - i. Configure all networked AV devices with appropriate settings and instruct Owner-designated personnel on how to access remotely for support of management. Tie all control system and networked AV peripherals into main Owner or specific management software package (either included in this scope or existing system) for remote control, management, and support.
2. Processor Configuration Code
 - a. The Control System Processor Configuration Code is the programming code that provides control communication between the Control System and all the Audiovisual Equipment components.
 - b. The Processor Configuration Code shall be developed by the Audiovisual Systems Integrator to enable Control System operation of all controllable device functions, whether or not those functions are made available through the GUI.
 3. Control System Software Programming
 - a. In order to develop Control System Software that is functional and understandable by the intended users, it will be necessary for the Audiovisual Systems Integrator to provide “working” copies of software as it is being developed for review and comment by the Owner.
 - b. The Control System software programming process must be an iterative process that includes a minimum of three (3) iterative submittals prior to first beneficial use.
 4. Programming Rights:
 - a. Provide all Control System Programming to the end users upon completion and approval of system installation and integration.

- b. Freely share programming graphics and blocks with the owner to ensure consistent facility-wide standards and system support. Project specific programming and graphics are not the exclusive property of the AV system contractor or programmer.
 - c. The Owner shall be granted a license in perpetuity for use.
 - d. All source code becomes the exclusive property of the Owner.
 - e. All source code changes must be fully documented. Updated programming (compiled and uncompiled hard and soft copy versions of code) must be updated and located at all equipment rack locations and for all equipment manuals.
 - f. Source code changes and/or additional programming will be warranted by the vendor for a period of 1 year with the Audiovisual Systems Integrator responsible for any required diagnosis and repair.
 - g. All manufacturers' software operating system updates, bug fixes, patches, etc., shall be installed as part of the periodic system maintenance during the Warranty period.
- B. Networked Audiovisual System Remote Management
- 1. Integrator shall coordinate with the Owner for accommodation with existing standards for remote management software to ensure compliance.
 - 2. Audiovisual Systems Integrator shall coordinate with both Owner and software manufacturer for configuration and let appropriate Owner representative manage the deployment of such software with the manufacturer.
- C. Archival System User Interface / Media Management
- 1. Archival System User Interfacing shall be required for management of locally and/or remotely stored recorded media content. This may include, but not limited to:
 - a. Configuring of FTP transfer of locally stored materials to the designated server.
 - b. Configuring the Video on Demand (VOD) server to display all managed media content by user.
 - c. Configuring the database and front-end control page(s) for content preparation and recording.
 - d. Configuring system encoders and decoders
- D. Web-Based Hardware Interfaces
- 1. Where applicable, Web-Based Hardware Interfaces may be required for remote management or configuration of Audiovisual System components. This may include digital audio mixing consoles, Web-Based camera controls, Web-Based GUI extensions. Integrator will provide technician level hardware interfaces customized for this project.
- 3.04 NETWORK CONNECTIVITY
- A. Requirements for Connection to the Owner's Network:
- 1. All IP endpoints will be provisioned using 802.1X certificate-based authentication (EAP-TLS) with a unique private certificate deployed to every device using an automated tool.
 - 2. The System shall natively support full dual-stack IPv4/6.
 - 3. If Multicast is required for the System, multicast shall be configured in PIM sparse-mode.
 - 4. All ethernet connections shall support full duplex 100/1000Mb. 10Mb half-duplex connections are not permitted.
 - 5. Any Power over Ethernet (PoE) requirements shall comply with 802.3af or 802.3at.
 - 6. Wi-Fi connections shall be compliant with at least one of the 802.11ac/ax standards. 802.11b shall not be supported.

7. All privileged/administrative user credentials shall be for named individuals. The use of shared/system accounts is prohibited except when justified by the system manufacturer and specifically authorized by the Owner.
8. Passwords for all accounts must be changed to adhere to the Owner's password policy. Contractor shall provide documentation, tools and direct support to assist the Owner in changing any passwords known to the Contractor to those only known by the Owner. Passwords must support the Owner's password policy.
9. Authentication to all System components shall be using the Owner's directory of record (e.g., Active Directory) and must support the Owner's multi-factor authentication (e.g., Azure AD MFA) and FIDO2.
10. All authentication attempts (passwords) must be encrypted at rest and in-transit using industry standard encryption mechanisms.
11. Actions by service and privileged accounts must be logged and auditable.
12. Authentication and authorization events must be captured and logged. Logs are to be sent in real-time to the Owner's log aggregation devices.
13. All Privileged access, user audit and important system and application logs must be sent to the Owner's Security Information and Event Management (SIEM) in real-time.
14. All System components shall be configured using the least-privilege model ensuring that only necessary communication is possible. Unnecessary services shall be disabled, and host-based firewalls shall be used to enforce traffic restrictions. Ingress/egress rules for System servers and handsets shall be applied to only allow only traffic that is required to ensure System functionality. Large port ranges are not to be allowed for Ingress. Ingress/Egress to the Internet shall be denied except to allow approved functionality.
15. Authorization is the determination of whether a user has permission to access particular information or applications. Proper authorization for use of an application usually requires the use of the appropriate attribute, group, and/or role as defined in the Owner's directory of record. The Contractor-provided service or application must be able to interface with the directory of record.
16. The Owner requires secure and role-based authorization for the functions and elements appropriate to the individual's role.
17. The Owner will provide any required physical or virtual servers or endpoint computers. Contractor shall provide requirements (including minimum and recommended configurations) for each System.
18. All System software, operating systems and firmware shall be the latest version and updates at the time of Substantial Completion.
19. All components must be manufacturer-supported as active products for at least 5 years after installation. The use of software in or expected to be "Extended Support" during the 5 years after installation is prohibited. Security updates must be installed for products under active support.
20. All system products must detail End-of-Sale, End-of-Support and End-of-Maintenance dates.
21. The Contractor shall configure the entire System to periodically generate backups of all system software, configuration, programming, messages, and content to an Owner-directed location.
22. All web interfaces are expected to support the current version of the following browsers including the mobile versions for iOS and Android:
 - a. Microsoft Edge (or current Microsoft browser)
 - b. Apple Safari
 - c. Mozilla Firefox

- d. Google Chrome
 23. System shall be configured in accordance with Center for Internet Security (CIS) Benchmarks. Documentation shall be provided representing how the System is configured to align with the CIS Benchmarks.
 24. The Owner limits the use of inherently insecure technologies, such as server- or client-side Java and Adobe Flash and requires that neither of these two technologies be used in or by any applications or interfaces.
 25. Application whitelisting and endpoint malware prevention shall be deployed on all endpoints. Information detailing and supporting allow-listing support must be provided by the Contractor. All provided hardware and software must be compatible without disabling or reducing the Owner's posture.
- B. Network Connectivity:
1. All network switch copper ethernet ports shall support 10Mb half-duplex as well as 10/100/1000Mb full duplex.
 2. Upon installation, Contractor shall provide a table of switch port to patch panel connections
 3. The network shall be provisioned such that each sub-system is on an isolated logical network (micro-segmentation). Dedicated and isolated segments will be setup for each connected system type and all traffic will be isolated to that logical network. Contractor will be responsible for coordinating with other project Contractors to document and configure the network in support of required firewall rules and ACLs. Where required for functionality or described in this specification, connections to other systems will be permitted but must be locked down to the minimum traffic required and approved by the Owner. Individual system Contractors are responsible for documenting and justifying any proposed approved traffic to any other system with specific sources, destinations, traffic types and port numbers (e.g., source: server 1, destination, server 1, traffic type https, TCP port 443). The Owner shall be the sole arbiter of what traffic is allowed between systems.
 4. Multicast PIM sparse-mode will be configured.
 5. Elevated or Administrative access shall be prohibited except via secure methods through an Owner bastion host.
 6. Authentication, authorization and accounting (AAA) shall be via the Owner's AAA directory of record.

3.05 REFERENCES

- A. The following documents provide information regarding audiovisual industry "best practices," including commonly accepted standards for design, installation, and performance of integrated audiovisual systems. The technical quality of the Audiovisual Systems Integrator's work and the resulting performance of the Audiovisual Systems installed in the Project will generally be measured against the standards and practices delineated in these References.

- B. Acknowledgement of Conformance to the Standard
- a. Acknowledgment of conformance to the Standard shall include the following written statement, authored and signed by the system verifier, stating that all requirements of this Standard have been completed, the date of completion, and that the handover of the completed, verified system is finalized.

“THE SYSTEM VERIFIER ACKNOWLEDGES THAT THE PERFORMANCE OF THIS AUDIOVISUAL SYSTEM HAS BEEN VERIFIED IN CONFORMANCE WITH ALL REQUIRED PROCESSES AND CONTAINS ALL REQUIRED ELEMENTS AS DOCUMENTED WITHIN INFOCOMM 10:2013 AUDIOVISUAL SYSTEMS PERFORMANCE VERIFICATION.”

SYSTEM VERIFIER

DATE

3.06 FINAL ADJUSTMENTS AND ACCEPTANCE TESTS

- A. Upon approval of the contractor's test report, and at a time set by the Owner or Owner's authorized representative, perform final system adjustments and acceptance tests. Provide all labor, material, tools, and measurement equipment necessary for these tests and adjustments, including the test equipment and material specified in Article 1.1, except as otherwise specified.
- B. The contractor's representatives performing these tests shall be thoroughly familiar with all details of the system and shall include the field supervisor in overall charge during the course of the installation work.
- C. Budget eight (8) working hours for the performance of these tests and adjustments. If final acceptance is delayed beyond this period because of installation not in accordance with these specifications, pay for all additional time and expenses of Owner-designated observers during any resultant extension of the acceptance testing period.
- D. Measurement of frequency response, distortion, noise, or other characteristics may be performed on any item or group of items deemed necessary to determine conformity with specifications.
- E. Adjustments: Adjust the system as instructed by the Audiovisual Systems Consultant.

3.07 TRAINING

- A. The Owner may assign personnel to participate with the contractor during installation. Without delaying the work, familiarize the Owner's personnel with the installation, equipment, and maintenance.
- B. During tests and adjustments, permit the Owner's personnel to observe. When feasible explain the significance of each test.
- C. After the completion of FINAL ADJUSTMENTS AND ACCEPTANCE TESTS, provide on-site training to the end-user to instruct them on the proper use of each system, including:
 1. Conduct a separate training session for each discreet system type installed.
 2. Explain operation of control systems and overall function of installed systems to staff selected by the Owner as “requiring general instruction”.

3. Explain operation of control systems, set-up and operation of individual pieces of equipment (including booth equipment), functions of overall systems, and rudimentary service guidelines to staff selected by the Owner as "requiring technician level instruction".
 4. If requested by the Owner, record these training sessions, and provide them to the Owner for future reference by the Owner's personnel.
 5. After successful training, a repair sequence (schedule of responsibility, response tree, etc.) should be established with any "technician level" staff, designated by the Owner as responsible for audiovisual systems operation and maintenance, to expedite service calls.
- D. Separate from the bid response quotation; provide an hourly cost for additional training.
- 3.08 WARRANTY
- A. Unless otherwise described in Division 01, provide for the warranty of each delivered system under the following terms and exclusions:
- B. Basic Warranty
1. Basic Warranty provided by the Audiovisual Systems Integrator shall include repair or replacement for one year from date of Final Acceptance on all Audiovisual Systems Equipment provided (including products having a manufacturer's warranty of less than one year) and all Audiovisual Systems Integrator workmanship. Basic Warranty shall be provided at no additional cost, except in case of obvious abuse. Consumable items such as lamps, batteries, tapes, etc. are not covered by Basic Warranty.
 2. Warrant all repairs to "existing" equipment for a period of ninety (90) days.
 3. During the Basic Warranty period the Audiovisual Systems Integrator shall:
 - a. Provide telephone support within 4 hours of a call requesting service.
 - b. Provide emergency service: Within 24 hours of a call requesting service not corrected by telephone support, restore the system to operation, replacing defective materials and repairing faulty workmanship. Make temporary repairs and provide loaner equipment at no charge if defective materials cannot be permanently replaced or repaired within this 24-hour time period. Repair or replace faulty items within 72 hours of on-site service or within manufacturers' specific repair program whichever is quicker.
 4. Audiovisual Systems Integrator shall not involve the Owner with removing, re-installing equipment, shipping or receiving equipment being repaired under Basic Warranty, nor shall the Owner be responsible for any shipping or freight charges associated with any item under warranty.
 5. The Owner shall be copied with all paperwork related to any and all warranty work during the Basic Warranty period.
 6. The Basic Warranty period will commence no sooner than the date of first beneficial use by the Owner and no later than the date of contract closeout.
 7. Paint and exterior finishes, fuses, lamps, projection lamps, and video picture tubes excluded from above warranties except when damage or failure results from defective materials or workmanship covered by warranty.
 8. The terms of individual equipment manufacturers' warranties are not diminished by the minimum warranty provisions specified above.
- C. Preventative Maintenance
1. Within the term of the one-year Basic Warranty period the Audiovisual Systems Integrator shall provide, at no additional cost, periodic Preventative Maintenance on the installed Audiovisual System to ensure proper ongoing maintenance and operation.
 2. A minimum of four (4) Preventive Maintenance visits shall be provided.
 3. Preventative Maintenance shall include, but not be limited to, the following:

- a. Adjustments to video displays
4. Reviewing control system functionality
 - a. Any other maintenance and adjustments necessary to ensure that the Audiovisual System is in proper working order
5. Any problems or issues noted by the users or other Owner representatives shall be documented and completely resolved at each of the scheduled visits.
6. Preventative Maintenance Schedule
 - a. 90 days (± 15 days) after the commencement of the Warranty Period.
 - b. 180 days (± 15 days) after the commencement of the Warranty Period.
 - c. 270 days (± 15 days) after the commencement of the Warranty Period.
 - d. 20 days (± 10 days) before the end of the Warranty Period.
- D. Extended Warranty
 1. The Audiovisual Systems Integrator may elect to propose to the Owner the offer of Extended Warranty coverage for the Audiovisual Systems. Extended Warranty shall be any optional warranty services offered by the Audiovisual Systems Integrator that expand on and complement the Basic Warranty coverage required by this Specification. Any provisions of Extended Warranty coverage shall not release the Audiovisual Systems Integrator from responsibility for performance of all requirements under the Basic Warranty coverage.
- E. Software Support
 1. The Bidder shall also offer an annual Software Maintenance contract. This shall cover all software provided as part of this system and/or written for this system and shall include routine upgrades to applications and operating systems. The Software Maintenance contract shall commence immediately after expiration of the warranty period and continue for three years. Maintenance visits will be four times per year and shall be scheduled to coincide with the periodic system maintenance of the system

SECTION 27 51 13

MASS NOTIFICATION SYSTEM

PART 1 GENERAL

1.01 DESCRIPTION

- A. Design, supply and install complete system equipment and cabling to deliver a fully operational Public Address / Overhead Paging system to meet the requirements of this specification.
1. The purpose of the Public Address Paging System (also known as the Overhead Paging System) is to be used in non-emergency application to direct staff to a location or to use in an event to aid and direct patients. It can also be used as a general-purpose communications system. It is not intended to be used as a life safety system.
 2. The option to provide background music in specific zones shall be available in the design for future expansion. An auxiliary input shall be provided with a channel to provide audio to specific zones as described later in this specification
 3. The system will allow speaker volume to be configured in day and night modes (reducing the volume at night) automatically and though out the facility. The range of volume and time of which the volume reduced shall be adjusted at the Paging System head end.
 4. The systems will be zoned so that pages can be made on a zone-by-zone basis as shown on the plans, for an entire floor or for the entire building. Pages will be made though the microphone station, phone by zone or from direct dialed extensions from facility VoIP phones. Microphone inputs will be provided as shown on plans.
 5. The system will be interfaced to the existing Public Address Paging Systems in the other campus facilities. This interface should be accomplished though the phone system, network and existing infrastructure. Upon contract award, bidder shall provide a field survey of the existing system to determine the integration requirements.
- B. Basic Services: Delivery of the work described in this specification shall include, but not be limited to, the following Basic Services:
1. Engineering and Design: The Contractor shall provide all system engineering and design necessary to develop the complete systems described herein. Engineering and Design shall include preparation of all necessary electronic schematics, hardware drawings, systems diagrams, schedules and lists. Additionally, final system design and configuration with the Owner, as well as on site coordination and infrastructure installation review with the General Contractor is required.
 2. Assembly: The Contractor shall procure and assemble all hardware and equipment and any additional materials as required to deliver a completely functioning System.
 3. Software Programming: The Contractor shall perform all required software setup, configuration, and programming required to develop a complete operating system in accordance with these specifications, including all control logic and push button component faceplate or interface programming.
 4. Installation: The Contractor shall install all equipment, cable, wiring, connectors, plates and other material at the Project site per the Integrator's approved designs.
 5. Testing and Adjustment: The Contractor shall perform all tests and adjustments, shall furnish all test equipment necessary and perform all work required to properly configure the systems and to verify their performance in accordance with the information in this specification and the Integrator's approved engineered designs.

1.02 PURPOSE AND COVERAGE

- A. The system shall deliver intelligible speech for notification purposes, to selectable zones and combinations of zones. Telephone handsets provided as part of the networked VoIP phone / Unified Communication system are used as the input devices, NIC. In specific locations, dedicated paging microphones will be provided for direct input into the system.

1.03 DEFINITION OF TERMS

- A. Definitions of terminology used in this Specification are as follows:
- B. Owner: Los Angeles City College / LACCD
- C. Construction Manager: BuildLACCD
- D. Technology Consultant: Vantage Technology Consulting Group
- E. Work: Design and provision of the Public Address and Mass Notification System and associated equipment for the Project.
- F. Specification: The complete set of documented designs, specifications, and performance and delivery requirements delineated in this document and all referenced project documentation.
- G. Bidder / Integrator: The contracted company responsible for carrying out the Work.
- H. Provide: Supply, deliver, install, configure, test and commission.
- I. Manufacturer: The original manufacturer of the individual technology equipment components.
- J. Commissioning Date: The date at which a system is formally accepted by the Owner.
- K. Owner Furnished Equipment (OFE): Electronic equipment and other material (new or existing) to be provided by the Owner and integrated as part of the Project.
- L. General Contractor:
- M. Architect:

1.04 PROJECT SCHEDULE

- A. The procurement, installation and commissioning of the Mass Notification System shall conform to the overall Project Schedule. The Bidder shall confirm that all schedule dates can be met. Any objections, qualifications, or exceptions must be clearly indicated with the submitted Bid. Refer to Specification Section III, A for additional scheduling requirements.

1.05 FUNCTION

- A. Users shall access individual paging zones or designated groups of paging zones through the telephone handset of a designated telephone, by dialing an access number.
- B. The system shall have automatic control gain to provide constant paging speech level.

1.06 LOCATION OF EQUIPMENT

- A. Equipment Rooms.
 - 1. Headend equipment shall be located in the MDF/IDF.

2. IDF rooms will be required to house the equipment serving the various elements of the Public Address Paging System.
3. Microphone Locations: One desktop microphone shall be located at the each of the following two locations: Operations Mnager and the Director's Office. One paging microphone shall be provided at the head end in the MDF.

1.07 WARRANTY

- A. The Integrator shall warrant the Mass Notification System to be free from faults and defects in system design and workmanship. This Basic Warranty coverage shall include all custom designed equipment and the overall Mass Notification System installation. Basic Warranty shall be effective for a period of three (3) years from the date of acceptance of the Mass Notification System acceptance by the Owner.
- B. The Integrator shall warrant that all equipment, materials and components installed are new at the time of installation. No used or reconditioned equipment shall be acceptable.
- C. If equipment modification by the Integrator voids the manufacturers' warranty, the Integrator shall assume the equivalent equipment warranty.
- D. Extended Warranty - The Integrator shall propose to the Owner the offer of Extended Warranty coverage for the Public Address Paging System. Extended Warranty shall be optional warranty services offered by the Integrator and accepted by the Owner that extend, expand on and/or complement the Basic Warranty coverage required by this Specification. Any provisions of Extended Warranty coverage shall not release the Integrator from responsibility for performance of all requirements under the Basic Warranty coverage.

1.08 PERMITS AND INSPECTIONS

- A. The Contractor shall obtain all permits and inspections required for the work. All permit and inspection costs will be borne by the Contractor.
- B. The Contractor shall perform all tests required herein, or as may be reasonably required to demonstrate conformance with the Specifications or with the requirements of any legal authority having jurisdiction.
- C. The Contractor shall obtain approvals from all authorities responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with all requirements of reference codes indicated herein and required by the appropriate jurisdiction. Make corrections, changes or additions as required and deliver certificates of acceptance, operation, and/or compliance with the "As-Built Records".

1.09 TRAINING

- A. On-Site Training
 1. The Contractor shall present, review and describe all equipment and materials to the Owner and Owner's operating personnel and fully demonstrate the operation and maintenance of the systems, equipment and devices specified.
 2. The training shall cover the overall system, each individual system, each subsystem, and each component. The training shall also cover procedures for normal operations, failure modes with response procedures for each failure and integration with other technologies. Each procedural item must be applied to each equipment level.
 3. Duration: Provide at least 8 hours of on-site training on the Public Address Paging System to designated representatives of the Owner.

4. Training to be digitally recorded by Integrator and provided to Owner on a DVD or USB drive.

1.10 SOFTWARE SPECIFICATIONS

A. Any software developed shall include, but not be limited to:

1. Control and/or monitoring of all equipment listed within the specification and as shown on the drawings. The functions shown on the drawings are for reference only and should not be considered exhaustive or final.
2. Uncompiled source code in both soft copy and printed out in hard copy documentation. Copies (hard and soft) of the software are to be included in the systems manuals.
3. As-built logic flow diagrams are to be provided with all copies of the operation manuals and at each equipment rack.
4. Zone logic and paging control tables and database

B. The following software requirements apply:

1. The Contractor may retain intellectual rights to the operating software.
2. The Owner shall be granted a license in perpetuity for use.
3. All source code becomes the exclusive property of the Owner.
4. All source code changes must be fully documented. Updated programming (compiled and pre-compiled hard and soft copy versions of code) must be updated and located at all equipment rack locations and for all equipment manuals.
5. Source code changes and/or additional programming will be warranted by the vendor for a period of 1 year with the Contractor responsible for any required diagnosis and repair.
6. All manufacturer's software operating system updates, bug fixes, patches, etc., shall be installed as part of the periodic system maintenance of the system during the warranty period.
7. An acceptance test will be performed at commissioning during which the software and any additional code changes or upgrades must perform accurately and be error free.

1.11 SPARE PARTS

- A. Unless otherwise noted herein, provide (2%), or a minimum of one (1), of the Contractor-provided quantity of each type of Mass Notification System device.
- B. The following items shall not require spare parts provision: Connectors, conductors, patch panels, mounting components, batteries, and devices for which the system already incorporates redundant components and components or devices whose total quantity is 3 or less and whose failure would not affect any other part of the system.
- C. Submit Spare Parts Material list to the Owner for approval prior to shipment.

1.12 CODES AND STANDARDS

- A. Comply with all relevant building and electrical codes, and comply with the codes and recommended practices or industry bodies related to the public address/paging industry. In particular, comply with relevant codes and standards issued by the FCC, the UL listing body and the Standards of the Electrical Industries Association.

1.13 SHOP DRAWING & EQUIPMENT SUBMITTAL

- A. The Contractor shall obtain backgrounds and prepare and submit shop drawings, in AutoCad format (latest version), which show details of all work to insure proper installation of the work using those materials and equipment specified or allowed under the contract plans and specifications. A complete Shop Drawing submittal package shall consist of Drawings, Equipment Submittals, Acceptance Testing Plan and Training Plan. The Contractor shall provide the following information.
- B. Shop Drawings:
1. Shop Drawings shall be numbered consecutively and shall accurately and distinctly present the following information:
 - a. Title Sheet
 - b. Reflected Ceiling Plans showing loudspeakers (including type) in their proposed locations.
 - c. Riser Diagram showing all conduit relationships between devices shown on the Floor Plans. Show all power sources.
 - d. Single-Line/Block Diagrams showing signal relationships of all controls and devices within the system.
 - e. Necessary details, including complete information for making connections between work under this Contract and work under other Contracts.
 2. Each drawing or page shall include:
 - a. Project name, Project Number and Drawing Name.
 - b. Submittal date and space for revision dates.
 - c. Identification of equipment, product or material.
 - d. Name of Contractor.
 - e. Name of Supplier / Manufacturer.
 - f. Physical dimensions, clearly identified, where applicable.
 - g. Specification references.
 - h. Identification of deviations from the Contract Documents, if necessary.
 - i. Contractor's stamp, initialed or signed, dated and certifying to review of submittal, certification of field measurements and compliance with Contract.
- C. Equipment Submittals
1. Provide a parts list, including system type, model numbers, quantities, and specification reference for equipment, materials, components and devices.
 2. Provide Manufacturers Specification Sheets with descriptive information for equipment, materials, components and devices. Clearly delineate on each specification sheet which model numbers, options and configurations are being proposed.

1.14 PROJECT COMPLETION SUBMITTALS

- A. Project Record Documents Submittal
- B. Within 30 days after Final Checkout, the Contractor shall submit complete Project Record Documents, based on the approved Preliminary Project Record Documents. These documents shall include the following:
1. Project Record Documents shall be provided digitally on a USB drive as well as uploaded to a networked accessible cloud-based portal and shall consist of:
 - a. Digital product Information which shall consist of the following information, with section dividers -
 - b. Title page and table of contents.
 - c. Warranty Statement.
 - d. Provide a three-year system warranty. Indicate warranty start and end dates, scope of warranty and conditional limitations. Indicate excluded items.

- e. Indicate procedure for obtaining telephone support and on-site service. Include a list indicating Contractor's name, address, e-mail address and service department telephone number.
 - f. Provide placeholder dates for the preventive maintenance service calls.
2. Equipment list
 - a. Final equipment list with serial numbers (and IP address as applicable) for each device. In addition, note the ending date of the manufacturer's warranty period for each product in editable spreadsheet format.
 - b. Digital equipment manuals
 - c. Alphabetically arrange manufacturer's operation manuals.
 3. Electrical and electronic test results.
 4. Hard copy half-size set of Record Drawings.
 5. Hard copy full-size Record Drawings.
 6. On a DVD or USB drive, provide electronic copies of the following:
 - a. Software-based (un-compiled) control system code (including user interface software and control program) – if applicable.
 - b. Owner shall retain copies of all custom or purpose-created software, including original source code, for future use with, and/or upgrades to, this project only.
 - c. All software shall be written with remark statements to document function of sub-routines, macro's and program requirements.
 - d. All control, DSP and specific device application software.
 - e. All DSP programing files.
 - f. All final software configuration and final set-up settings.
 - g. All software code shall be supplied in both compiled and pre(un)-compiled form.
 - h. Final equipment list with warranty and serial number information.
 - i. Record Drawings in PDF format.
 - j. Record Drawings in .dwg format.

C. Acceptance Testing Plan

1. Submit a written document for approval detailing the test procedures to be followed by the Contractor in evaluating and proving the installed system. Include the test forms to be used for each system and for each component of each system. Include all tests required by the equipment manufacturer and by this specification.

D. Training Plan

1. Submit a training plan to be followed by training the Hospital staff in the operation and maintenance of the installed system. The proposed training program shall be designed to provide a level of basic competence with the system for selected personnel.
2. The training plan shall cover the overall system, each individual system, each subsystem, and each component. The plan shall also cover procedures for database management, normal operations, and failure modes with response procedures for each failure and integration with other technology systems.

E. Verification

1. The Contractor shall check and acknowledge all shop drawings, and shall place his signature on all shop drawings submitted to the Owner. Contractor's signature shall constitute a representation that all quantities, dimensions, field construction criteria, materials, catalog numbers, performance criteria and similar data have been verified and that the submittal fully meets the requirements of the Contract Documents.

1.15 RELATED WORK BY OTHERS

- A. The Integrator shall be responsible for coordinating and assuring the compatibility of the Paging System with all related work, materials, and/or equipment being furnished and/or installed by others. This shall include, but not be limited to, the following:
- B. Cable Containment: All conduit, wireways, connection boxes, pull boxes, junction boxes, pathways, and other accommodations for routing of low voltage signal cabling, shall be supplied by others except where explicitly noted in this Specification.
- C. Technical Power Service: All electrical panels, power receptacles, lighting fixtures, dimmers, lighting controls, and interconnecting wiring shall be supplied by others.
- D. Equipment Support Structures: Design, fabrication and installation of all structural supports required for rigid connection of equipment items to the building structure shall be supplied by others. This does not relieve the Integrator from the responsibility for providing equipment mounting hardware and attachment to structural supports provided by others.
- E. Millwork and Cabinetry: All millwork and millwork modifications required to accommodate installation of Paging System, equipment and related cabling and connections, except as may be individually identified in this Specification, shall be provided by others.
- F. Owner Furnished Equipment (OFE): Some Paging System equipment may be provided and installed by others as part of the building construction. Such building related equipment shall be as described in the Project construction documents. Additionally, there may be equipment provided by the Owner or others (e.g., new equipment purchased by Owner, existing equipment to be reintegrated) that shall require installation and integration by the Integrator. Integrator shall be responsible to supply and install control and signal wiring between paging system and other OFE systems

1.16 ALTERNATES

- A. As an add/alternate, background audio will be provided in public waiting areas.

PART 2 PRODUCTS

2.01 GENERAL

- A. Modular Construction. The system shall be comprised of programmable modular solid-state components to provide flexibility, upgradeability, future adaptability and expansion.
- B. Telephone Port Interface. The System shall be fully compatible with the Owner's phone system. Interface shall incorporate a universal telephone port interface with selectable loop start, ground start, page start, analog station port. System access shall be from designated extensions. The designated extensions shall be identified by non-volatile programming.
- C. Paging Microphones: Provide paging microphones as listed below:
 - 1. Operations Manager office
 - 2. Director's office
 - 3. Public Address Paging System Head End
- D. Pre-announcement Chime. All announcements will be preceded by a pre-announcement chime. Provide at least four selectable pre-announce chimes with variable volume.

- E. Zones and zone selection. The system shall provide zones in each building as shown on the drawings. Provide selectable single zone paging, group zone paging, emergency zone group override, and emergency all-facility page override.
 - 1. Initial Zone requirements include:
 - a. Paging microphone shall page into Zone 2 as shown on drawings
 - b. VoIP paging shall include Zone 1, Zone 2 and All-Call.
- F. Auxiliary inputs: Inputs for background music sound generator shall be available in each zone with independent volume control and mute capability.
- G. Control of other systems - additional contacts. The system shall provide one Relay Driver and two C-form contact sets per zone to control other devices, and permit all-zone mute via an external interface.
- H. Clock Driven Automated Announcement. The system shall have the capability to provide replay of pre-recorded announcements from digital storage at specific times throughout the day. Provide two hours of non-volatile digital storage

2.02 SOFTWARE CONTROL

- A. The software shall provide:
 - 1. Operation on Microsoft Windows™ operating system
 - 2. The ability to adjust any individual speaker without affecting adjacent speakers
 - 3. The ability to define and adjust groups of speakers
 - 4. Paging volume and equalization
 - 5. The ability to route and mix network audio channels to any individual speaker
 - 6. The ability to create and adjust zones for paging and music
 - 7. Reporting of all system settings
 - 8. Backup and restore functions for all system settings
 - 9. Network diagnostics
 - 10. Panic button integration
 - 11. Scheduled classroom bell and notifications
 - 12. Live broadcasting of public announcements
 - 13. 911 Alerting
 - 14. Building lockdown, evacuation & emergency notification
 - 15. Pre-recorded announcements
- B. In addition to the provided software, all system functions shall be able to monitored via SNMP (simple network management protocol) to facilitate integration into other network monitoring solutions.

2.03 AMPLIFIER

- A. The power amplifier shall be a solid-state eight-channel model employing Multi-Mode® (AB+B) output circuitry. The amplifier shall contain protection from shorted, open and mismatched loads, general overheating, DC, high-frequency overloads, under/over voltage, and internal faults.

- B. The amplifier shall contain FIT (Fault Isolation Topology), which isolates channel-specific faults and prevents them from affecting remaining channels. If an amplifier channel starts to overheat, the Thermal Level Control (TLC) circuit shall engage that channel's input compressor in an amount proportional to the amount of overheating, in order to generate less heat. If the channel becomes too hot for safe operation, the channel shall shut off, and the Thermal Indicator for that channel shall flash brightly to alert the user that a state of thermal stress or overload has caused the channel to shut down.
- C. The front-panel control shall be a power switch. Rear-mounted controls shall include Channel Level Controls and a Mode Switch. The Mode Switch (used on each consecutive pair of channels) is a four-position switch which selects among Dual 8/4 ohms, Dual 70V, Bridge-Mono 16/8 ohms, and Bridge-Mono 100V. The recommended load impedance in Dual mode shall be 4/8 and 25 ohms (70V). The load impedance in Bridge-Mono mode shall be 8/16 ohms and 50 ohms (100V). The amplifier shall be safe when driving any kind of load, including highly reactive ones. Rear-mounted output connectors shall be one four-pole terminal strip for every two channels with a touch-proof cover. Rear-mounted input connectors shall be removable Phoenix-style barrier connectors for balanced input.
- D. The power amplifier shall meet or exceed the following performance criteria. Input sensitivity for rated output: 1.4 V. Rated output with eight channels driven in Dual mode with 0.1% THD (20 Hz to 20 kHz): 175 watts per channel into 4 ohms; 155 watts per channel into 8 ohms, and 185 watts per channel (70V). Rated output in Bridge-Mono mode with four channel pairs driven at 0.1% THD (20 Hz to 20 kHz): 350 watts per channel pair into 8 ohms; 310 watts per channel pair into 16 ohms, and 185 watts per channel pair (100V). Signal to Noise Ratio below rated power (20 Hz to 20 kHz): 100 dB unweighted. Phase Response: ± 35 degrees from 10 Hz to 20 kHz at 1 watt. Frequency Response: 20 Hz to 20 kHz, ± 0.5 dB at 1 watt into 8 ohms per channel in Dual mode. Damping Factor: greater than 180 from 10 to 400 Hz. Crosstalk (below rated power, 20 Hz to 1 kHz): greater than 80 dB. Intermodulation Distortion (60 Hz and 7 kHz at 4:1, from 163 milliwatts to full bandwidth power): less than 0.05% typical. Total Harmonic Distortion at 1 watt from 20 Hz to 20 kHz: less than 0.05%. Common Mode Rejection (20 Hz to 1 kHz): greater than 50 dB. DC Output Offset (shorted input): less than 5 mV. Maximum Input Level (before input compression): + 22 dBu rms. Power Draw at Idle (120 VAC mains, all channels in 4/8 ohm mode): 58 watts. Power Draw at Idle (120 VAC mains, all channels in 70V mode): 77 watts.
- E. The amplifier chassis shall be constructed of steel with a durable black finish and shall be designed for continuously variable-speed forced-air ventilation from the front panel to the back panel. The dimensions of the amplifier shall allow for 19 inch (48.3 cm) EIA standard (RS-310-B) rack mounting. The amplifier shall be 5.25 inches (13.3 cm) tall, and 16.25 inches (41.3 cm) deep behind the rack-mounting surface. The amplifier shall weigh 36 pounds, 6 ounces (16.5 kg).
- F. The amplifier shall be Crown CTs Series or approved equal. The actual model to be determined by the number of zones required from each location.

2.04 AUDIO DSP

- A. The DSP speaker processor shall provide balanced mic/line inputs and balanced line outputs on plug-in barrier-strip connectors. Inputs and outputs shall be analog, with internal 24-bit A/D & D/A converters operating at a sample rate of 48kHz. All internal processing shall be digital (DSP). Network, Dante™, etc. buss connections shall allow sharing of digital audio within multi-unit systems.
- B. Configure processor(s) to meet total quantity of inputs and outputs required day one plus 10% expansion capability. Day one quantity shall include optional background music zones for waiting areas.

- C. Software shall be provided for creating/connecting DSP system components within each hardware unit. Available system components shall include (but not be limited to) various forms of: mixers, equalizers, filters, crossovers, dynamics/gain controls, routers, delays, remote controls, meters, generators, and diagnostics. Ethernet communications shall be utilized for software control and configuration. After initial programming, processors may be controlled via dedicated software screens, third-party RS-232 control systems, and/or optional remote control devices. Software shall operate on a PC computer, with network card installed, running Windows® 2000/XP Professional. The DSP speaker processor shall be CE marked, UL listed, and shall incorporate AES48-2005 Grounding & EMC practices. The DSP speaker processor shall be compliant with EU Directive 2002/95/EC, the RoHS directive. Warranty shall be 5 years.
- D. The DSP speaker processor shall be a Biamp Tesira series or approved equal.

2.05 ZONE PAGING CONTROLLER

- A. The Paging Zone Controller shall be compatible with all standard analog port types: loop start trunk, ground start trunk, station access (analog ring-up), page port contact closure activation, and page port voice activation.
- B. The paging zone controller shall contain a zone module for up to three zones of paging with an audio output with level control per zone and shall be expandable from 3 to 12 zones. It shall also provide up to 24 programmable paging zone groups.
- C. The unit shall provide 1A @ 24V DC (+20 CU) for powering external equipment.
- D. The paging zone controller shall include two high impedance transformer-isolated background music inputs with volume control. Background music source shall be selectable per zone. The paging zone controller shall include an adjustable output limiter with threshold and active indicator. The controller shall provide override paging (using loop start trunk or page port contact closure activation) with zone group, an all-call paging zone group, an auto select paging zone group, night ringer (90V and contact closure activation) with zone group and two tone triggers (tone and duration selectable, closure activated) with individual zone groups. The unit shall include code calling with zone group.
- E. The controller shall include a flexible dialing plan for zone and zone group numbers, programmable from two to five digits. DTMF programming shall be available through the override input. It shall include DTMF block to help suppress DTMF tones from being heard over the paging system. The unit shall include programmable timers to control page duration (station and trunk) that can be inhibited.
- F. The unit shall include programmable pre-announce and confirmation tones that can be set to be heard at the speakers being paged or at the calling telephone or both, as well as a setup tone to assist in volume setting, both of which can be inhibited. The unit shall include a tone level control that sets the level for all tones. The unit shall include a night ring level control. The unit shall include a programming reset to return the system to the original factory default values.
- G. Each zone output shall provide a dual form contact rated at 2A @ 30V DC and 0.6A @ 125V AC that changes state when the zone is accessed.
- H. The unit shall allow the installer to program a number of different parameters to control the way in which the AUX relay contacts activate. The unit shall allow programming of which input events the AUX relay will respond to, whether it will respond to the event only or to a combination of the event and its place in the priority structure, and if it will respond during the event or after the event ends.
- I. It shall include non-volatile memory for setup data (no backup battery required)

- J. The unit shall be wall and rack mountable using reversible brackets included with the unit. The unit shall be C-UL approved (UL60950), FCC Part 68 Registered, FCC Part 15 Compliant, and Industry Canada CS-03.
- K. The Zone Paging Controller shall be the Bogen PCM2000 System Consisting of PCMCPU, PCMTIM, and PCMZPM modules as required or approved equals.

2.06 PAGING MICROPHONE

- A. The paging microphones shall be a dynamic desktop type microphone
- B. The microphone shall have a frequency response of 80 Hz to 15 kHz and an output level of -57 dBV/Pa.
- C. The microphone shall have a push to talk button and a separate control circuit for control of external relays.
- D. The networked paging station shall provide paging audio and control data via CobraNet®, and receive Power-Over-Ethernet (PoE), utilizing a single (CAT5) network cable to a rear panel RJ45 connector. Use of an external power supply shall be optional. A rotary encoder and LCD screen shall be provided on the front panel for programming and setup. Multiple networked paging stations may be connected to each DSP unit, by means of Ethernet switches, in either single-unit or multi-unit systems. Up to 16 simultaneous pages shall be allowed per DSP unit. Up to 16 paging priority levels shall be available, including override and lock-out capabilities. Each networked paging station shall have up to 32 programmable button operations assignable, and multiple announcement chime tone options shall be available.
- E. Networked paging stations shall be represented as functional blocks within the DSP software, which shall also include dedicated page zone routing blocks, for easy inclusion into system designs. The networked paging station shall be CE marked and shall be compliant with EU Directive 2002/95/EC, the RoHS directive.
- F. The networked paging station shall be a Biamp Networked Paging Station-1.

2.07 ANALOG TO IP AUDIO INTERFACE/GATEWAY:

- A. Each amplifier channel for zone shall include a parallel connection to an Analog to IP Audio Gateway to accommodate bridging onto the Owner network.
- B. Manufacturer to be Atlas IED, model #IP-ZCM1RMK (with rack shelf).
- C. Connect along with amplifier to accommodate high-output conditions for fields or large open public areas.
- D. Connect to trigger contact connections for notification signal start.
- E. Connect to Owner data network.

2.08 SIP VOIP PAGING SERVER

- A. Manufacturer to be Atlas IED, model #IPS-VPS (with rack shelf).
- B. Connect to trigger contact connections for notification signal start.
- C. Connect audio-in for live audio stream.
- D. Line-Out Connection to Support Analog Amps

- E. Connect to data network.

2.09 LOUDSPEAKER TYPES

- A. Provide ceiling mounted cone loudspeakers and baffles and weather/environmentally rated speakers as required throughout the areas to be covered. Provide all fixing materials and trim to suit ceiling types. Speaker located in exposed areas shall be mounted tight to the truss or ceiling location.
- B. Indoor Ceiling Loudspeakers:
 - 1. Ceiling loudspeakers shall be high quality with 4" cone drivers. Indoor loudspeakers shall provide the following minimum performance:
 - a. Nominal frequency response (+/- 7dB): 75 Hz – 20 kHz
 - b. Nominal sensitivity level: 88dB SPL (RMS), 1W @ 1m (3.3 ft)
 - c. Power handling: 16 Watts (RMS), 25 Watts (Peak)
 - d. Dispersion: 130° (2kHz, -6dB)
 - e. Nominal impedance: 8 Ohms
 - 2. Ceiling loudspeakers shall be fitted with a baffle plate for mounting in a suspended ceiling. The loudspeaker shall be supported from building structure above the finish ceiling. The Architect shall approve the grille and baffle finish.
 - 3. Ceiling loudspeakers shall be provided with all assembly accessories necessary for installation in a suspended ceiling, including, but not limited to, a rear enclosure (back can), baffle, front-mounting clips, and grille.
 - 4. Ceiling loudspeaker back cans shall have an internal volume of not less than 0.285 in³, and shall be lined with minimum 5/16" thick acoustic batting of minimum density 2 lbs./ft³.
 - 5. Ceiling loudspeakers shall also be provided with 70.7-volt line high quality audio transformers. These transformers shall have a minimum of 4 secondary tapings, with a ratio of at least 8:1 between the highest and the lowest tapings (9dB power factor). Tapings shall be clearly labeled with the wattages. Transformers shall have a maximum insertion loss of 1dB.
 - 6. Indoor Ceiling loudspeakers shall be Atlassound FAP42T or equal, with appropriate mounting hardware as required with appropriate mounting accessories and transformer as described above.
- C. Outdoor/Weatherized Paging Speakers:
 - 1. Outdoor loudspeakers shall be high quality constant directivity paging horns with integral compression driver. Outdoor loudspeakers shall provide the following minimum performance:
 - a. Nominal frequency response (+/- 6dB): 400 Hz – 7500 kHz
 - b. Nominal sensitivity level: 107dB SPL (RMS), 1W @ 1m (3.3 ft), 120 dB, 40W @ 1M
 - c. Power handling: 40 Watts (RMS),
 - d. Dispersion: 60x40° (+10 degrees)
 - e. Nominal impedance: 8 Ohms
 - 2. Loudspeaker shall be weather and UV resistant
 - 3. Loudspeakers shall be provided with all assembly accessories necessary for installation

4. Ceiling loudspeakers shall also be provided with 70.7-volt line high quality audio transformers. These transformers shall have a minimum of 6 secondary tapings, with a ratio of at least 8:1 between the highest and the lowest tapings (9dB power factor). Tapings shall be clearly labeled with the wattages. Transformers shall have a maximum insertion loss of 1dB.
 5. Outdoor loudspeakers shall be Atlassound APX40TN or equal, with appropriate mounting hardware as required with appropriate mounting accessories and transformer as described above.
- D. Indoor Ceiling Loudspeakers:
1. Manufacturer to be Valcom 8" round, model # VIP-160A-IC
 2. Speakers shall be connected to the LAMC data network for SingleWire InformaCast™ operation.
 3. Each ceiling networked speaker assembly shall provide:
 - a. A networked Power-over-Ethernet connection to the speaker controller with strain relief
 - b. An acoustically damped enclosure (plenum-rated as required) or A.C.T. suspended ceiling enclosure and speaker combined assembly
 - c. Eye-bolt for single point suspension and upward facing speaker orientation
 - d. Speaker sensitivity: 90 dBA@1Watt, 1 meter pink noise
 - e. Speaker power rating: 10 watts RMS
 - f. Speaker frequency response: 100-10,000 Hz
 - g. Device shall be ETL listed to conform to UL1480, UL2043, CSA C22.2 60065
 - h. Speakers grills shall be painted to match wall surface finish as required (if other than white). Coordinate finish with Architect prior to ordering.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install equipment and cabling to comply with manufacturers written instructions.
- B. Contractor shall provide equipment with manufacture's rack mounting equipment. Should the manufacture not provide rack mounting equipment, contractor shall mount equipment on DIN rails, blank panels, rack shelves or other means and methods to provide a securely mounted and neatly dressed installation.
- C. Provide plenum-rated twisted pair cable.
- D. All system cabling shall be neatly installed in cable tray. Cable tray provided by others as part of the project is as indicated on the drawings. Additional cable tray or cable containment, if required shall be provided and installed as part of the Public Address / Overhead Paging system.
- E. All cabling in exposed areas shall be run in conduits and shall be provided and installed as part of the Public Address / (Overhead) Paging System.
- F. Separate cabling and conductors by at least 12 inches from adjacent parallel power and telephone wiring.

- G. Make splices taps and terminations on numbered terminal strips in junction, pull and outlet boxes, terminal cabinets and equipment enclosures.
- H. Apply cable marking to designate media in coordination with system wiring diagrams.

3.02 COORDINATION

- A. This Contract involves coordination with the Phone System and the Data Network. Coordination with the Owner is critical. Do not interrupt any functioning system. Contractor shall give the Owner at least 7 calendar days notice of any requirement to shut off or interfere with existing alarm, regulating, computer or other service systems. The Owner will arrange and execute any shutdown. All work such as splicing, connections, etc., necessary to establish or re-establish any system shall be completed by Contractor in close coordination with the Owner.
- B. Contractor shall coordinate complete functionality between the phone system and the paging system.
- C. Coordinate the work with the Owner and all trades to assure that where this work interfaces to other trades, those interfaces are provided, complete and functional.
- D. Make sure work by others is scheduled in order that this work can be installed in a timely fashion.
- E. Verify all dimensions, and work by others that may be necessary to facilitate the work and coordinate with other trades. Assure that related work by others is coordinated with this work.
- F. Verify all field conditions. Regularly examine all construction and the work of others that may affect the work to ensure proper conditions are provided for the equipment and devices before their manufacture, fabrication or installation. Be responsible for the proper fitting of the systems, equipment, materials, and devices provided as part of this work.
- G. Required Resources: Become familiar with the available access and space for equipment and any potential interference requiring coordination. Coordinate with the Owner to assure that adequate electrical and HVAC, services are available. Provide the physical space for equipment, and ample access room for installation and maintenance of equipment.
- H. Positioning Members: Provide additional support or positioning members as required for the proper installation and operation of equipment, materials and devices provided as part of this work as approved by the Owner without additional expense.
- I. Interface Devices: Provide all items necessary to complete this work in conformance with the Contract Documents or the satisfaction of the Owner without any additional expense.
- J. All equipment shall be mounted with sufficient clearance to meet all applicable codes and facilitate observation and testing. Securely hang and/or fasten with appropriate fittings to ensure positive grounding, free of ground loops, throughout the entire system. Units shall be installed parallel and square to building lines.
- K. Installation shall comply with "Codes and Standards" section of this specification. Where more than one code or regulation is applicable, the more stringent shall apply.
- L. Install fire stopping for all penetrations in slabs and firewalls to meet code at the completion of work and prior to final testing demonstration to Owner.

- M. Verify the intended location(s) for equipment is suitable for the equipment. If any conditions such as temperature, humidity, dust level or the like require modification, make it known to the Owner immediately upon award of the contract. If any equipment requires strict environmental conditions (dust limitations, etc.), notify the Owner immediately upon award of the Contract. Failure to notify the Owner of such conditions shall constitute acceptance of the conditions and any later required modifications to the equipment or the environment shall be at the sole cost of the Contractor.

3.03 SEISMIC PROTECTION

- A. Public Address System equipment shall be protected from earthquakes by rigid structurally sound attachment to the load supporting structure. The design of all seismic protection shall be performed by a Registered California Structural Engineer.
- B. The Contractor shall be responsible for the design of his own seismic restraint systems, and shall supply all seismic calculations and details to the Owner for review.
- C. Equipment shall be installed in accordance with the following guidelines:
 - 1. SMACNA Publication: Guidelines for Seismic Restraints of Mechanical Systems
 - 2. California Code of Regulations (CCR), Title 24, Division 22.
 - 3. NUSIG – National Uniform Seismic Installation Guidelines
- D. Contractor shall submit shop drawings for the mounting of equipment, fixtures, cabinets, consoles, conduit and cable support racks. These drawings shall be prepared, stamped and signed by a Registered California Structural Engineer.

3.04 INSTALLATION PRACTICES

- A. Verify that all conduits have been installed, de-burred and properly joined, routed and terminated prior to pulling of cables.
- B. Wiring must be run in conduit or in electrical trays, and where otherwise shown on drawings, provided conductors are reasonably protected from mechanical and environmental damage.
- C. Equipment and devices shall be installed on approved electrical backboxes. Do not install equipment and devices directly on walls, ceilings or structural components without backboxes.
- D. Secure cables to cabinets, junction boxes, pull boxes and outlet boxes with approved cable clamps.
- E. In shared electrical trays, open ducts, and other cable runs without conduit, separate and strap Public Address cable so that it is clearly distinguishable from all other cables.
- F. Provide bushings, grommets and strain-relief for cables terminating at wall-mounted outlets and patch panels to ensure durable and robust connections. The bushings and grommets are intended to protect the cables from any sharp edges that present a risk to the cables. Ensure that all sharp edges are covered to protect the cables from damage.
- G. No cables shall be installed in a fashion that contravenes either the minimum installed or the minimum under-load bend radius of the cable.
- H. All cable shall run parallel or at right angles to building wall structures. Provide a support system for cable running in the ceiling void. Do not allow cable to rest on electrical or mechanical equipment. Do not tie cable to power or other foreign services. Support cable running in the vertical and horizontal direction in place at not more than 12" and 48" centers respectively.

- I. No cable is to be pulled through a conduit “L-bend” (condulets). In existing routes with L-bends, the cables are to be pulled to the L-Bend. The cable is then to be carefully pulled through the remainder of the conduit run.
- J. Install all cables in complete runs from end point to rack. In-line joints, splices, distribution points or other intermediate connections are not permitted unless specifically called out by this specification.
- K. At no point shall the cables be tied to power cables or other building services or their supports, or run in the same ducts, raceways, conduits or connection boxes as power cabling.
- L. Use plenum-rated tie wraps in plenum spaces.
- M. Reinstate all pull-wires in conduits and ducts after use to facilitate future addition of cables.
- N. Cables shall not be held so tightly with cable ties that the cable jackets are indented by the cable ties.
- O. Individually and properly ground all equipment cabinets, racks and ladder rack. Ground all metallic sheath communications cables entering the building per manufacturer specifications and NEC 770-33, 800-33 and 800-40.
- P. Ensure that all waste materials are disposed of in a safe manner. Pay particular attention to waste materials produced during the termination of optical fiber cabling. Ensure that all used components and fiber cut-offs are collected in purpose-made containers and disposed of properly.
- Q. Replace all moisture and fire barrier material in ducts, conduits and other penetrations disturbed during installation of communications cabling. Install barrier material in all fire-rated penetrations that have cabling running through them. The barrier material shall be installed so the final penetration has the same fire rating as the original wall/floor.
- R. Provide expansion plugs in all ducts/conduits entering the building. Seal all unused ducts/conduits with plugs that allow the pull-string to be tied off on the inside.
- S. Use purpose-built pulling grips during cable installation. Do not pull cables by attaching pull wires to cable jackets, elements or reinforcement. Use strain gauges or equivalent measures to ensure that the maximum tensile load rating of the cables is not exceeded during installation.
- T. The number of cables in each conduit shall be controlled to allow for future cable installation and to stay within the manufacturer’s maximum allowable cable pulling tension. Conduit fill ratios shall not exceed the current requirements of the NEC.
- U. Provide Velcro hook and loop ties to secure cabling running in the Telecom Closets. Provide straps at 3’ intervals. On completion of installation, neatly run and re-tie all cable bundles in the Closet.

3.05 LABELING

- A. Labels, tags or other permanent markings shall identify cables, wires, wiring forms, terminal blocks and terminals. The markings shall clearly indicate the function, source, or destination of all cabling, wiring and terminals. All cables and wires shall be identified, utilizing heat-shrink, machine-printed, labels. Note: Hand-written tags are not acceptable.

- B. All panels and rack-mounted equipment shall be provided with permanently attached engraved Lamacoid labels with identifying names and functions. Labels shall be consistent in form, color, and typeface throughout the system and all must contain the name of the system or subsystem as part of the label textual information. Design, color, font and layout shall be coordinated with, and approved by the Owner.

3.06 SYSTEM PERFORMANCE AND ACCEPTANCE TESTING

- A. Manufactures Field Inspection: Engage factory authorized service representative to inspect field assembled components and equipment installations, including connections and system programming. Prepare written report.
- B. System Programming: Fully describe the available programming options for Client selection. Prepare a written record of the Clients selected options and confirm implementation in writing.
- C. Operational Test: Demonstrate system by originating a page from each designated source location to each zone, zone combination, all call and all call priority groups. Verify routing, volume levels and freedom from noise and distortion. Frequency response test: Demonstrate a system performance with minimum frequency response 150Hz to 5000Hz (+/- 3dB).
- D. Distortion Test: Measure distortion at normal gain settings and rated power. Feed tones at frequencies between 150 Hz and 5000Hz into the system and record the output at the output of the paging amplifiers. Maximum acceptable distortion at any frequency shall be 2 percent total harmonic distortion. Maximum THD measured from input to output of any electronic component and gain stage shall be <0.1% at maximum continuous output.
- E. Acoustic output level and coverage uniformity test: Feed wideband (min. 100Hz to 5000Hz) pink noise into the system. Use a sound level meter to demonstrate continuous levels of not less than 98dB(A) +/- 3dB at 5' AFF throughout each shop zone and 80dB(A) +/- 3dB for each interior zone. System shall be engineered to provide a minimum 10dB of headroom at maximum output at every gain stage in the system.
- F. Use a sound level meter to measure ambient noise floors at peak and off- peak times. Adjust ambient noise sensor to provide paging SPL levels at 10dB above ambient noise up to the maximum SPL levels described in 3.06(E).
- G. Intelligibility test: Demonstrate a system performance with intelligibility not exceeding 15% ALCONS, and RASTI values not less than 0.45 throughout the covered areas.

3.07 OTHER WORK

- A. Cut and patch existing walls floors ceilings and other building finishes for installation. Repair, restore and refinish surfaces to original specification.

3.08 PHASED INSTALLATION

- A. Wherever phased installation is indicated in the project schedules, ensure that the system is fully operation at each stage of the phased installation, and compatible with the subsequent phases of installation.

SECTION 27 51 26
ASSISTIVE LISTENING SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

- A. The work includes the provision of Assistive Listening Systems (ALS) as part of the building project.
- B. Portable ALS shall be provided to the Owner, where specified.
- C. Reference California Building Code (CBC) 2019 sections 11B-219 and 11B-706.
In addition the system shall comply with:
 - 1. 2010 Americans with Disabilities Act (Section 706)
 - 2. 2018 International Building Code (Section 1108.2)
- D. Scope of Work: The work shall consist of the design, provision, termination, testing, and documentation of a complete and fully functional ALS. The instructions in this section are specific to the ALS installations and should be read in conjunction with other contract documents as applicable.
- E. Deliverables: Prior to ordering materials or commencing any construction activities, the contractor shall provide the Owner with a complete bill of materials, including all quantities of components, devices, equipment, and wiring required to complete this work.

PART 2 PRODUCTS

2.01 PRODUCT REQUIREMENTS

- A. ALS equipment to be manufactured by Listen Technologies or equal.
- B. Fixed/Permanent Systems: Provide one fixed system for each room with occupancy levels of 50 seats or greater as per ADA guidelines. Large Assembly Room #309.
- C. Wireless Networked Audio System: Provide one system in Large Assembly Room #309.
- D. Portable Systems: Provide a minimum of 3 complete portable systems for this building project (one per floor) with accessories as described below.
- E. Portable ALS Equipment

3. Provide the following Listen Technologies equipment for operation with the fixed voice reinforcement systems or portable systems as described below.
4. The transceiver and receivers shall be operating on a digital 1.9 GHz unlicensed PCS band utilizing Frequency-Hopping Spread Spectrum (FHSS) techniques allowing interference free one-way communication. The device shall employ a multiply layer security protocol consisting of a 40-bit (pin free) group subscription, 32-bit authentication and a 64-bit encryption scheme enabling secure conversations. It shall be easy to pair and form groups via Near-field communication (NFC), Docking Station or Software Suite. It shall be simple to operate with a Power and Volume Up and Down buttons. It shall allow up to 10 simultaneous groups to operate in the same area. It shall be powered via a removable non-proprietary rechargeable lithium-ion.
5. Transmitter/receiver set product – Listen Technologies ListenTALK #LKS-8-A1 including charging case.
6. 1 #LK-1 transmitter/transceiver and microphone and 3 #LKR-11 receiver units and headsets. Provide one additional #LKR-11 receiver unit for a total of 4 receivers as compliant with CBC.
7. Portable charging carrying case #LA-483 and one LA-423-01 4-port USB charger.
8. The receiver shall have 57 user-selectable, 72MHz FCC compliant, approved channels.
9. Provide for Each Portable Transmitter:
 - a. One #LA-365 Li-Ion Battery
 - b. One Headset with Boom Microphone #LA-451 or equal
 - c. Omni Conferencing Microphone #LA-277 or equal
 - d. One Line/Mic Y Cable #LA-263 or equal
10. Provide for Each Portable Receiver Pro:
 - e. One #LA-365 Li-Ion Battery
 - f. One Breakaway lanyard #LA-445-BK or equal
 - g. One Universal Ear Speaker #LA-401 or equal

F. Fixed ALS Equipment

11. Provide Listen Technologies digital FM equipment kit #LT-31-072-D for operation with the fixed voice reinforcement systems only as described below.
12. Base Station #LT-800-072-01 3-channel transmitter for fixed installations including the following with the additional accessories listed:
 - a. Twelve (2) total #LR-3200-072 intelligent digital receivers shall have 57 user-selectable, 72MHz FCC compliant, approved channels.
 - b. One (1) #LA423-01 4-port USB charger.
 - c. One (1) #LA-311 16-unit charging case.
 - d. One (1) Dante 1-channel output adapter.
13. The receiver shall have on/off, FM volume, Aux volume, Monitor volume, test tone on/off, Super Quiet Companding Technology on/off, Contour and channel up/down controls and an FM reception LED on the front panel. The front panel shall include a 2-digit channel LED display.
14. The receiver must have installer controls and ports on the back panel which include: antenna port; transmitter power settings; (2) mix outputs; (2) unbalanced audio inputs, selectable between +10 dBu and -10 dBu; (1) balanced XLR/¼” audio input, selectable between microphone, microphone with phantom power, and line level; and a separate DC jack to power the transmitter.

15. A minimum of 25% of all receivers (but no fewer than 2) shall be hearing aid compatible. Use neck-loop inductive lanyard #LA-430.
16. The channel display shall have an indicator light illuminated when the main power is off. The size of the receiver must be 20.3 (W) x 1.75 (H) x 20 (D) cm/8.0 (W) x 1.75 (H) x 8.0 (D) in. and weigh 1.4kg/3lbs.
17. The receiver must operate on 72MHz band, or other operating band approved by FCC for assistive listening devices.
18. Provide for Each Portable Receiver:
 - e. One #LA-365 Li-Ion Battery
 - f. One Breakaway lanyard #LA-445-BK or equal
 - g. One Universal Ear Speaker #LA-401 or equal
 - h. One Inductive Neck Loop #LA-430
19. Miscellaneous transmitter equipment to include the following:
 - i. Universal Transmitter Antenna – provide a standard or large area antenna as required to generate a signal to receivers located at any point in the instructional space covered by the dedicated transmitter. Listen #LA-122.

2.02 ACCESSORIES

- A. Provide (as required) in coordination with the project Architect, room signage for all locations supporting ALS for the building project.
- B. Provide for each Fixed system:
 20. Twelve-station charger #LA-381-01 with the following capabilities:
 - a. The charger must be capable of storing or recharging up to 12 transmitters or receivers at once.
 - b. The charger must have an external UL- and CSA-approved wall transformer that plugs directly into the charging unit itself. It must have a pocket to contain the power wall transformer during storage. There must be no on/off switch.
 - c. The charging circuitry must be fully automatic and be capable of recharging the transmitter/receiver batteries in 14 hours maximum when 500mA/Hr batteries are used.
 - d. The charger must be capable of recharging NiCad batteries without the need for removal of the batteries from the transmitter/receiver.
 - e. The charger must have a large, foam-lined storage space for accessories, a locking lid, and a handle.

PART 3 EXECUTION

3.01 EQUIPMENT INSTALLATION

- A. Assistive Listening transmitters shall be provided to the Owner in the following rooms:
 21. Each room with 50 seats or more shall receive a fixed and installed ALS transmitter system.
 22. Each room with a sound reinforcement system shall receive a fixed and installed ALS transmitter system.

23. If multiple transmitters are specified within a facility, it is recommended that the adjacent transmitter channels be at least 300MHz apart. If no interference, the following channels are recommended; 2C, 2D, 2E, 2F, 2G, 2H, 2J, 2K, 2L.
- B. Assistive Listening receivers shall be provided to the Owner as follows:
24. For sound reinforcing, per CBC Section 1104B.2, each room with 50 or more seats shall receive a quantity of ALS receivers that equals at least 4% of the number of seats in the room (rounding up to the nearest integer), but no less than two. (I.e. A classroom of 80 would receive 4 receivers.)
 25. Each portable system will be provided with 4 receivers.
- C. Fixed ALS transmitters will be located at AV Equipment rack positions dedicated to each room listed above, or where applicable in portable AV racks.
- D. Portable ALS transmitters and receivers will be given to the Owner for distribution.
- E. Equipment to be installed in accordance with manufacturer's instructions.

3.02 TESTING

- A. Following the installation of transmitters and antenna, each transmitter and receiver will be tested.
- B. Transmitters shall support signal distribution at all specified channels at any position in the instructional room to which its use is dedicated.
- C. Receivers shall be tested to verify function as specified by manufacturer.
- D. All transmitter/receiver sets will be tested simultaneously to ensure no channel conflicts occur.
- E. Each transmitter/receiver set will be labeled as to match each receiver to its base transmitter. Labeling shall include channel identifier.

END OF SECTION

SECTION 27 53 13
WIRELESS CLOCK SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. Work Included:
 - 1. Wireless Clocks

1.2 RELATED SECTIONS

- A. Contents of Division 27, Communications and Division 01, General Requirements apply to this Section.
- B. In addition, reference the following:
 - 1. Division 27 15 00 Structured Cabling System

1.3 REFERENCES AND STANDARDS

- A. References and Standards as required by Section 27 00 00, Communications Basic Requirements and Division 01, General Requirements.

1.4 SUBMITTALS

- A. Submittals as required by Section 27 00 00, Communications Basic Requirements and Division 01, General Requirements.
- B. In addition, provide:
 - 1. Product Data: Submit complete catalog data for each component, describing physical characteristics and method of installation. Submit brochure showing available colors and finishes of clocks.
 - 2. Samples: Submit one clock for approval. Tag and install approved sample at location directed.
 - 3. Manufacturer's instructions: Submit complete installation, set-up and maintenance instructions.

1.5 QUALITY ASSURANCE

- A. Quality assurance as required by Section 27 00 00, Communications Basic Requirements and Division 01, General Requirements.
- B. In addition, meet following:
 - 1. Warranty: Two year warranty on all components excluding batteries.
 - 2. Qualifications:
 - a. Installer: Company with documented experience in installation of commercial time systems.

1.6 WARRANTY

- A. Warranty of materials and workmanship as required by Section 27 00 00, Communications Basic Requirements and Division 01, General Requirements.

1.7 SYSTEM DESCRIPTION

- A. Wireless clock system continually synchronizes clocks throughout facility and is capable of clock readouts in multiple time zones where desired.
- B. System synchronizes clocks to each other, utilizes GPS technology to provide atomic time and automatically adjusts for Daylight Saving Time.
- C. No hard wiring required except for Ethernet patch cable.
- D. Analog Clocks:
 - 1. Synchronized to within ten milliseconds multiple times per day.
 - 2. Internal oscillator that maintains plus or minus one second per day between synchronization, so that clock accuracy does not exceed plus or minus 0.2 second.
- E. System includes an internal clock reference so that failure of GPS signal does not cause clocks to fail in indicating time.
- F. System incorporates a "fail-safe" design so that failure of any component does not cause failure of system. Upon restoration of power or repair of failed component, system resumes normal operation without need to reset system or any component thereof.
- G. Clock locations as indicated and fully portable, capable of being relocated at any time.
- H. Furnish equipment and components of manufacturer's latest model.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Clocks
 - 1. American Time & Signal SiteSync IQ Wireless Clocks

2.2 CLOCKS

- A. American Time & Signal SiteSync IQ Wireless Clock:
 - 1. Hallway: Model Number: Double Side Hallway Clocks. (Battery Operated).
 - 2. Classroom: 12-inch Round Plastic Case – Surface Mounted with Battery Booster Temper Resistant Security Brackets

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

- A. Examination: Verify construction is complete in spaces to receive equipment and that rooms are clean and dry.
- B. Adjusting: Prior to final acceptance, inspect each clock, adjust as required and replace parts which are found defective.
- C. Cleaning: Prior to final acceptance, clean exposed surfaces of clocks, using cleaning methods recommended by clock manufacturer. Remove temporary labels from clock faces. Do not remove labels from backs of clocks.
- D. System Startup: At completion of installation and prior to final acceptance, turn on equipment. Ensure that equipment is operating properly and clocks are functioning.
- E. Demonstration: Provide training to Owner on setting and adjusting clocks, replacing batteries and routine maintenance.
- F. Protection: Protect finished installation until final acceptance of project.

3.2 CLOCKS

- A. Reference 3.1, General Installation Requirements.
- B. Install per manufacturer's instructions and recommendations.

SECTION 28 00 00

SECURITY SYSTEMS BASIC REQUIREMENTS

PART 1 GENERAL

1.01 SUMMARY

- A. This section includes general administrative and procedural requirements for division 28 sections and supplements the requirements specified in Division 1.
- B. The requirements described herein include the following:
 - 1. References
 - 2. Definitions
 - 3. System Description and Existing Conditions
 - 4. Submittals
 - 5. Quality Assurance
 - 6. Permits and Inspections
 - 7. Coordination
 - 8. Project Management and Coordination Services
 - 9. Product Delivery, Storage, and Handling
 - 10. Warranty
 - 11. Maintenance
- C. Products Supplied But Not Installed Under This Section:
 - 1. None
- D. Products Installed But Not Supplied Under This Section:
 - 1. None
- E. Products Specified But Not Installed Under This Section:
 - 1. None
- F. Products Furnished and Installed Under another Section:
 - 1. 120V power
 - 2. Conduit, junction boxes, device boxes (essentially rough-in)
 - 3. Door hardware
- G. Related Sections:
 - 1. Consult other sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation.
 - 2. Section 280500, "Common Work Results for Electronic Security Systems"
 - 3. Section 280503, "Through Penetration Firestopping"
 - 4. Section 281300, "Access Control and Alarm Monitoring System"
 - 5. Section 282300, "Video Surveillance System"
 - 6. Division 27

7. Concrete Work: Include forming, steel bar reinforcing, cast-in- place concrete, finishing and grouting as required for underground conduit encasement, pedestal foundations, and curbs. [Also includes saw-cutting of existing slabs and grouting of conduits in saw-cut.]
8. Miscellaneous Metal Work: Include fittings, brackets, backing, supports, rods, welding and pipe as required for support and bracing of raceways, equipment enclosures, cameras, and similar devices.
9. Miscellaneous Lumber and Framing Work: Include wood grounds, nailers, blocking, fasteners, and anchorage for support of security materials and equipment. Refer to Division 6, Rough Carpentry.
10. Moisture Protection and Smoke Barrier Penetrations: Include membrane clamps, sheet metal flashing, counter flashing, caulking and sealant as required for waterproofing of conduit penetrations and sealing penetrations in or through fire walls, floors, ceiling slabs and foundation walls. Tape and make vapor tight penetrations through vapor barriers at slabs on grade.
11. Division 8 Locking Hardware: Include interface to electronic hardware and door controllers on security related doors.
12. Access Panels and Doors: Required in walls, ceilings, and floors to provide access to security devices and equipment.
13. Painting: Include surface preparation, priming and finish coating as required for security cabinets, exposed conduit, pull and junction boxes, and devices where indicated as field painted in this Division.

1.02 REFERENCES

- A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.
 - B. Codes: Perform work executed under this section in accordance with applicable requirements of the latest edition of governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not:
 1. California Code of Regulations (CCR):
 - a. Title 24, "California Building Standards Code"
 - 1) Part 1, "California Building Standards Administrative Code"
 - 2) Part 2, Volumes 1 and 2, "California Building Code" (CBC)
 - 3) Part 3, "California Electrical Code" (CEC)
 - 4) Part 11, "California Green Building Standards Code" (CALGreen)
 2. National Fire Protection Agency (NFPA)
 - a. NFPA 70, "National Electrical Code" (NEC)
 - b. NFPA 75, "Protection Of Information Technology Equipment"
 - c. NFPA 262, "Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces", 2007
- (OSHA)
- Regulations (Standards - 29 CFR)
 - a. Part 1910, "Occupational Safety and Health Standards"
 - b. Part 1926, "Safety and Health Regulations for Construction"

4. Code of Federal Regulations (CFR) Title 47 “Telecommunication”, Chapter I “Federal Communications Commission (FCC)”: a. International Building Code
 5. Other applicable national, state, and local binding building and fire codes
- C. Standards: Perform work and furnish materials and equipment in accordance with the latest editions of the following standards as applicable:
1. Underwriter’s Laboratories (UL): Applicable listing and ratings.
 - a. UL 294, “Access Control System Units”
 - b. UL 1076, “Proprietary Burglar Alarm Units and Systems”
 - c. UL 2044, “Commercial Closed-Circuit Television Equipment”

1.03 DEFINITIONS

- A. The Definitions of Division 1 apply to the sections of Division 28.
- B. In addition to those Definitions of Division 1, the following list of terms as used in this specification defined as follows:
1. “ACAMS”: Access Control & Alarm Monitoring System
 2. “As directed”: As directed or instructed by Owner, or their authorized representative
 3. “Cabling”: A combination of cables, wire, cords, and connecting hardware [e.g., cables, conductor terminations, connectors, outlets, patch panels, blocks, and labeling]
 4. “Connect”: To install required patch cords, equipment cords, cross connect wire, etc. to complete an electrical or optical circuit
 5. “Engineer”: TBD
 6. “Furnish”: To purchase, procure, acquire, and deliver complete with related accessories
 7. “IDS”: intrusion detection system
 8. “Install”: To set in place, join, unite, fasten, link, attach, set up or otherwise connect together and test before turning over to Owner, parts, items, or equipment supplied by Contractor or others. Complete installation and make ready for regular operation
 9. “Owner”: LACCD
 10. “Provide”: furnish and install
 11. “Security System”: the ACAMS, IDS, VSS, and Intercom systems collectively and integrated
 12. “SEC”: Security Equipment Enclosure
 13. “VSS”: video surveillance system

1.04 SYSTEM DESCRIPTION

- A. Overview
1. Security at the new facility consists of access control and alarm monitoring system (ACAMS) and video surveillance system (VSS). The ACAMS will automate opening and closing the buildings, control access through designated doors, and will restrict after-hours access to authorized cardholders.
 2. The new system will integrate with the Owner’s existing Security Systems over the Owner’s Network.
 3. Refer to individual sections for detailed description of systems.

B. Custom Device Requirements

1. General: Provide a high level of coordination services to ensure the proper installation and functioning of the security system. Coordinate the installation of the security system with other trades. This may include review of other trade's shop drawings, attendance at meetings, providing samples for mockup, and preparation & distribution of written documentation.

1.05 SUBMITTALS

- A. Submit required submittals in accordance with the requirements of section 013300 "Submittal Procedures".
- B. Required submittals include the following:
 1. Written detailed project description
 2. Project schedule as referenced in this section
 3. Product data sheets – clearly indicate by arrows or brackets precisely what is being submitted on and those optional accessories which are included and those which are excluded
 4. Estimated delivery lead times for products
 5. Voltage drop calculations demonstrating less than ten percent voltage loss to individual security devices
 6. Battery calculations showing backup support of security equipment and locks (except egress hardware with local power supplies) for 25 lock activations or 4 hours, whichever is greater.
- C. Complete submittals are comprised of shop drawings and product data sheets as detailed below and related sections (covering specific security systems). Incomplete or partial submittals will be rejected.
- D. Shop Drawings
 1. Shop drawings shall document Contractor's intent to execute the work and shall include the following:
 - a. Title sheet and index
 - b. Floor plans showing device locations, cable routing, and pathways
 - c. System block diagrams
 - d. Point-to-point wiring diagrams
 - e. Specific wiring details and device mounting/installation details
 - f. Schedules:
 - 1) Building/floor
 - 2) Unique device name/number
 - 3) Security controller/location
 - 4) Interfaces, interlocks
 - 5) IP address
 - 6) Master/substation intercom calling locations
 2. Upon award of contract, request CAD release forms from the architect so that electronic files may be released for Contractor's use. The architect will release floor plans with devices; The architect will not provide installation details and block diagrams (Contractor shall develop their own diagrams and details for the shop drawings submittal package).

- E. Format: Furnish submittal data in electronic copy including table of contents with each section bookmarked by specification section listing materials.
- F. Label each submittal with the specification section number and provide a cover letter or stamp stating that the submittal has been thoroughly reviewed by the Contractor and complies with the requirements of the contract documents. Failure to comply with this requirement will constitute grounds for rejection of the submittal.
- G. Resubmittals: Provide a cover letter with the resubmittal that lists the action taken and revisions made to each product submittal in response to submittal review comments. Failure to include this cover letter will constitute rejection of the resubmittal package and no review will occur.
- H. Drawings
 - 1. Prepare shop and as-built drawings using software compatible with Revit per project standard.
 - 2. Drawing requirements:
 - a. Sheet size: match the project's contract drawings size and use the project's title block
 - b. Text size: minimum 3/32 inches high when plotted at full size
 - c. Symbology: match the project's contract drawings symbols
 - d. Backgrounds: screen background information to allow pertinent drawing information to stand out.
 - e. Line Weights: Use appropriate line weights for devices, raceways, and text to stand out against background information.
 - f. Floor Plans: 1/8 inch scale floor and site plans showing the locations of devices and cable routing paths with cable types and quantity called out.
- I. Contractor Qualifications: Submit the following for review and comment at the beginning of the project.
 - 1. Resumes of the project manager, general foreman, and lead technician(s) indicating role, years of experience, product certifications and training, listing of similar projects the individual performed the role proposed for this project along with client contact information for each.
 - 2. Certification letters from manufacturers of major system components stating Contractor is an authorized reseller, installer, and extended warranty provider for the specified security systems.
- J. Samples
 - 1. Submit samples as required for proper coordination and installation of custom mounted equipment. Examples of samples that may be required include:
 - a. Screen shots showing graphical floor plan maps indicating:
 - 1) Active functional icons
 - 2) Secure areas/zones
 - b. Camera field of views
- K. Installation shall not begin until product data and shop drawings submittals have been approved by LACCD.

1.06 QUALITY ASSURANCE

- A. General

1. Provide new and unused materials, equipment, and parts comprising the units specified herein of current manufacturer and of highest grade.
 2. Only use products and applications listed in this Division on the project.
- B. Bid Discrepancies
1. In the event of discrepancies within the contract documents, notify Engineer within 5 days prior to the bid opening to allow the issuance of an addendum.
 2. If, in the event that time does not permit notification or clarification of discrepancies prior to the bid opening, the following applies: The drawings govern in matters of quantity, and the specifications govern in matters of quality. In the event of conflict within the drawings involving quantities, or within the specifications involving quantities, or within the specifications involving quality, the greater quantity and higher quality apply. Note such discrepancies and clarify in the bid. We will make no additional allowances because of errors, ambiguities, or omissions, which reasonably should have been discovered during the preparation of the bid.
- C. Substitutions
1. Shall be reviewed and approved by LACCD.
 2. Conform to the general requirements and procedure outlined in section 012500 "Substitution Procedures".
 3. Where products are noted as "or equal", a product of equivalent design, construction, and performance is considered. Include in the product data submittal: catalog cuts, product information, and pertinent test data required to substantiate that the product is in fact equivalent to that specified.
 4. Only one substitution allowed for each product specified. Do not provide substituted material, processes, or equipment without written authorization from Engineer. Assumptions on the acceptability of a proposed substitution, prior to acceptance by Engineer, are at the sole risk of Contractor.
 5. The burden of proof rest with Contractor that the substituted product is equivalent or better than the specified product. When Engineer accepts a substitution in writing, it is with the understanding that Contractor guarantees the substituted product, component, article, or material to be equivalent to the one specified and dimensioned to fit within the construction according to contract documents. Approved substitutions do not relieve Contractor of responsibilities for the proper execution of the work, or from provisions of the Specifications.
 6. Manufacturers' names and model numbers used in conjunction with materials, processes or equipment included in the contract documents are used to establish standards of quality, utility and appearance. Materials, processes or equipment that, in the opinion of Engineer, are equivalent in quality, utility and appearance will be approved as substitutions to that specified when "or equal" follows the manufacturers' names or model number(s).
 7. Whenever material, process or equipment is specified in accordance with a Federal specification, an ASTM standard, an ANSI specification, UL rating or other association standard, present an affidavit from the manufacturer certifying that the product complies with the particular standard specification. When requested by Engineer, submit support test data to substantiate compliance at no additional cost.
 8. Pay expenses, without additional charge to Owner, in connection with substitution materials, processes and equipment, including the effect of substitution on self, Subcontractor's or other Contractor's work.
- D. Electronic Control Systems Contractor Qualifications

1. A current, active, and valid and C7 or C10 license registered with the Contractors State License Board (CSLB)
 2. Minimum five years of experience in installation and service of access control, video surveillance, and intrusion detection systems
 3. Minimum five completed projects similar to scope and cost
 4. Evidence of technicians qualified for the work in the form of current manufacturer's training certification
- E. Materials
1. Provide new materials and equipment without defects.
 2. Provide only specified products and equipment, or products and equipment that have been approved in writing.
- F. Regulatory Requirements
1. Work and materials to conform to the latest rules of National Board of Fire Underwriters wherever such standards have been established and to the regulations of the State Fire Marshal, OSHA and the codes of the governing local municipalities. Perform work under these specifications confirming to the most stringent of the applicable codes.
 2. Provide the quality identified within these specifications and drawings when codes, standards, regulations, etc. allow Work of lesser quality or extent. The contract documents address the minimum requirements for construction.
- G. Drawings
1. Layout: Follow the general layout shown on the contract drawings except where other work may conflict with the contract drawings.
 2. Accuracy: The contract drawings show a diagrammatic representation of the system within the constraints of the symbology applied.
 3. Detail: The contract drawings represent the design intent and do not represent the entire installation for the System. Contract drawings indicate the layout and location of control panels, devices (i.e. card readers, door locks and contacts, and duress stations) and other components. The contract drawings do not show conduits, wire and cabling between every system component, equipment, or device.
 4. Complete the details necessary for point-to-point design. This allows the Contractor to attain the design intent while applying their own means and methods.
- H. Role of Engineer
1. During the construction phase of the project, Engineer will work with Contractor to provide interpretation and clarification of project contract documents, process and reply to relevant Requests for Information (RFI), and act as an interface between Contractor and Owner.
 2. Owner has retained Engineer's services to observe the work for general compliance with the contract documents.
 3. In summary, Engineer will perform the following specific services during the design phase:
 - a. Review product submittals and shop drawings for general compliance with the contract drawings and specifications.
 - b. Review changes as they arise and confirm that the proposed solutions maintain the intended functionality of the system.
 - c. Interpret field problems for Owner and translate into understandable language.
 - d. Review the testing procedures to confirm compliance with industry-accepted practices.

1.07 PERMITS AND INSPECTIONS

- A. Obtain and pay for permits and inspections required for the work.
- B. Furnish materials and workmanship for this work in conformance with applicable legal and code requirements.
- C. Perform tests required herein, or as may be reasonably required to demonstrate conformance with the Specifications or with the requirements of legal authority having jurisdiction.
- D. Obtain review from compliance officials responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with requirements of reference codes indicated herein.

1.08 PROJECT MANAGEMENT AND COORDINATION SERVICES

- A. Provide a project manager for the duration of the project to coordinate the security system work with other trades. Coordination services, procedures and documentation responsibility include at a minimum, the items listed in this section.
- B. Review of Shop Drawings prepared by Other Subcontractors:
 - 1. Obtain copies of shop drawings for equipment and systems provided by others that require connections or interface with the security system work. Thoroughly review those shop drawings to confirm compliance with the interface requirements.
 - 2. Document discrepancies or deviations:
 - a. Prepare memo summarizing the discrepancy.
 - b. Submit a copy of the specific shop drawing, indicating via cloud, the discrepancy.
 - 3. Prepare and maintain a shop drawing review log indicating the following information:
 - a. Shop drawing number and brief description of the system/material.
 - b. Date of your review.
 - c. Indication if follow-up coordination is required.
- C. Scheduling: Prepare work schedules for each floor indicating the following information:
 - 1. Submittals
 - 2. Cable Installation
 - 3. SEC Build Out
 - 4. Device Installation
 - 5. Programming
 - 6. Testing
 - 7. Training
 - 8. Other tasks included under the alternate work section of these specifications
- D. Job Conditions
 - 1. Protection: Keep conduits, junction boxes, outlet boxes and other openings closed to prevent entry of foreign matter. Cover equipment, devices, and apparatus to protect them against dirt, paint, water, chemical or mechanical damage, before and during construction period. Prior to final acceptance, restore to original condition fixture, apparatus or equipment damaged including restoration of damaged factory applied painted finishes. Protect bright finished surfaces and similar items until in service. No rust or damage will be permitted.

2. Supervision: Personally, or through an authorized and competent representative, supervise the work from beginning to completion and, within reason, keep the same foreman and workmen on the project throughout the project duration.
- E. Weekly Status Reports: Prepare weekly status reports throughout the entire course of the project containing the following information:
1. Current / up to date 2-week look ahead schedule
 2. Progress during prior week
 3. Work expected to be completed during the upcoming week
 4. Delivery dates for equipment
 5. Coordination status for each device requiring coordination with other subcontractors
 6. Summary of the information owed to Contractor, who is responsible for providing the information, and due date for the information
- F. Weekly Meetings: Conduct or attend weekly coordination meetings with the electrical and other specialty subcontractors to coordinate the installation of the security systems.
- 1.09 PRODUCT DELIVERY, STORAGE, AND HANDLING
- A. Delivery
1. Do not deliver security system components to the site until protected storage space is available.
 2. Replace equipment damaged during shipping and return to manufacturer at no cost to Owner.
- B. Storage
1. Store materials in a clean, dry, ventilated space free from temperature extremes. Storage outdoors covered by rainproof material (for example, a tarp) is not acceptable.
 2. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
 3. Provide heat where required to prevent condensation or temperature related damage.
- C. Handling
1. Handle in accordance with manufacturer's written instructions.
 2. Prevent internal component damage, breakage, denting and scoring. Do not install damaged equipment. Replace damaged equipment and return equipment to the manufacturer.
- 1.10 WARRANTY
- A. Provide the Security System as described in this specification with a one-year parts and service warranty at no additional cost to Owner.
- B. Include in the warranty package, at a minimum, the following:
1. Emergency maintenance service on regular working hour basis
 2. Service by factory trained and employed service representatives of system manufacturer
- C. Maintain regular service facilities and provide a qualified technician familiar with this work at the site within four hours of receipt of a notice of malfunction including weekends and holidays. Provide material, devices, equipment and personnel necessary for repairs. Install approved temporary, alternate equipment if required by Owner, complete and operational within 24 hours after notification of a malfunction, at no additional cost.

- D. Conduct warranty repairs and service at the job site unless in violation of manufacturer's warranty; in the latter event, provide substitute systems, equipment and/or devices, acceptable to Owner, for the duration of such off-site repairs. Transport warranty substitute and/or test systems, equipment, devices, material, parts and personnel to and from the job site at no additional cost.
- E. Warranty period shall commence upon written final acceptance by Owner or Owner's designated representative.

1.11 MAINTENANCE

A. Extra Materials

- 1. Deliver extra materials to a secured location determined by Owner.
- 2. Provide a complete bill of materials listing quantities, part numbers, and descriptions for each device for Owner to sign indicating receipt of equipment.
- 3. Provide new and unused spare parts in their original packing materials upon delivery.

B. Maintenance Service

- 1. For the first year of service, conduct quarterly system performance review meetings to review system operation problems and/or defects that occurred during the preceding 3 months. During these performance review meetings, perform the following:
 - a. Visual checks and operational tests of the central processor, local processors, monitors, keyboards, system printers, peripheral equipment, security equipment and devices, power supplies, and electrical and mechanical controls.
 - b. Clean system equipment, including interior and exterior surfaces.
 - c. Perform diagnostics on equipment.
 - d. Check and calibrate each device.
 - e. Run system software and correct diagnosed problems.
 - f. Resolve previous outstanding problems.
- 2. Provide software and firmware updates issued free of charge by the manufacturer.

PART 2 PRODUCTS

2.01 GENERAL

- A. Material and equipment specified herein have been selected as the basis of acceptable quality and performance and have been coordinated to function as components of the included systems. Where a particular material, device, equipment or system is specified directly, the current manufacturer's specification for same is a part of these specifications, as if completely elaborated herein.
- B. Use standard, regularly manufactured, materials and equipment for this and/or other similar systems, and not custom designed especially for this project. Provide systems and components thoroughly tested and proven in actual use. Provide subsystems of one manufacturer.

2.02 EQUIPMENT ENCLOSURES AND JUNCTION ENCLOSURES

- A. Application: For indoor use to house panels and equipment, and to house terminations, relays, and other components local to controlled doors and other field devices
- B. Type: NEMA type 1 enclosure
- C. Description:
 - 1. Solid steel enclosure with solid, continuous-hinged door
 - 2. Finish: ANSI 61 gray polyester powder paint finish inside and out

3. Lockable / equipped with a lock kit (lock kits shall be keyed alike with other security enclosures throughout the project)
4. Perforated back panel within enclosure (for mounting control boards, relays, terminal strips, etc.)
5. One tamper switch per enclosure
Manufacturer, or equal:
 1. Eaton Cooper B-Line
 - a. #36246-1PP; 36"L x 24"W x 6"D enclosure with back panel and lock kit
 - b. #12126-1PP; 12"L x 12"W x 6"D enclosure with back panel and lock kit
 2. Hoffman
 - a. #A36N24M; 36"L x 24"W x 6"D enclosure
 - b. #A36N24MPP back panel for 36" x 24" enclosure
 - c. #A12N126; 12"L x 12"W x 6"D enclosure
 - d. #A12N12PP; back panel for 12" x 12" enclosure
 - e. #AL12AR; lock kit
 3. Wiegmann
 4. SquareD

2.03 SLOTTED WIRING DUCT

- A. For indoor use inside equipment enclosures to manage/mind wiring.
- B. Description:
 1. Type: Lead-free PVC with narrow finger design
 2. Color: Light gray
- C. Manufacturer, or equal:
 1. Panduit Type-F narrow slot wiring duct
 2. Iboco #T1-1010 wiring duct

2.04 WIREWAYS

- A. For indoor use with equipment enclosures to manage and route wiring and cabling.
- B. Type: NEMA type 1 screw cover 'gutter' wireway and accessories
- C. Description:
 1. Wireways shall have open top assembly and closure plates/end caps (to secure end of wireway sections).
 2. Finish: ANSI 61 gray polyester powder paint finish inside and out
 3. Size: 4" x 4", minimum
- D. Manufacturer, or equal:
 1. Eaton Cooper B-Line #4448-G-NK; lay-in painted wireway without knockouts
 2. Hoffman #F44T148GVP lay-in painted wireway without knockouts

2.05 INTERFACE RELAYS

- A. Application: lock power switching and interfacing with other high-voltage powered equipment, i.e. gates, high-voltage locks, etc. (not for use at the output contacts on the access controllers since their rating is not adequate)

- B. Type: Standard industry control, plug-in type with LED indicator lights to indicate when the relay is energized.
- C. Contacts: Rated for 10 amps at 120VAC.
- D. Coil Operating Voltage: as required, with 24VDC as first choice
- E. Features:
 - 1. Color-coded test button
 - 2. Mechanical flag
 - 3. Snap-on label
 - 4. Pilot light
 - 5. 2mm test jacks
 - 6. Dual contact markings
 - 7. Snap-on number and letter markers
 - 8. Solid bus-bar socket construction
- F. Relay bases shall be mountable on standard mounting rails
- G. Manufacturer, or equal:
 - 1. Releco
 - 2. Idec

2.06 TAMPER RESISTANT HARDWARE

- A. Tamperproof hardware shall be used in locations below 10' exposed to the public.
- B. Hardware exposed in public spaces shall be pinned-allen type.
- C. Hardware used in specialty metal surfaces shall have a similar finish color.

2.07 WIRE CONNECTORS

- A. Wire connectors shall be heat activated; gel filled.
- B. Twist and solder/taped or wire nut connections are not acceptable.
- C. Manufacturer, or equal:
 - 1. Dolphin
 - 2. 3M Terminals
 - 3. Fastenal Sealed Crimp and Solder connector

PART 3 EXECUTION

3.01 EXAMINATION

- A. Conditions: Verify existing conditions, which have been previously provided under other sections, are acceptable for product installation in accordance with manufacturer's instructions.
- B. Pathways: Verify that pathways and supporting devices, which have been previously provided under other sections, are properly installed, and that temporary supports and devices have been removed.
- C. Field Measurements: Verify dimensions of pathways, including length of pathways. For example, "True Tape" the conduits to verify cable distances.

3.02 FIELD QUALITY CONTROL

- A. Staffing: Provide a qualified foreman who is in charge of the work and who is present at the job site at times work is being performed. Perform the work using skilled technicians under the direction of the foreman. Supervise the work force executing the work. Perform the installation within the restraints of the construction schedule. Do not change the supervisor during the project without prior written approval from Owner.
- B. Inspection: Perform inspection after installation. Keep areas of work accessible and notify code authorities, or designated inspectors, of work completion released for inspection. Document completion, and inspection as required.

3.03 INSTALLATION

- A. Perform this work in accordance with acknowledged industry and professional standards and practices and the procedures specified herein.
- B. Provide a complete operating system. Include devices specified including basic components and accessories, interconnecting wiring and other equipment and installation devices necessary for a complete system as specified.
- C. System Password Management:
 - 1. Change default passwords.
 - 2. Create a base administrator account for Owner's use/login.
 - 3. Install the latest security patches (for the operating system and each individual piece of equipment).
 - 4. Disable unused communication ports or protocols.
 - 5. Perform quarterly software security patch updates for the client during the warranty period.
 - 6. Contractor to turn over all source media including installation discs, manuals, drives, dongles, and licensing keys and codes.
- D. Manufacturer's Instructions:
 - 1. Comply with manufacturer's product data, including product technical bulletins, product catalog installation instructions, and product carton instructions for installation.
 - 2. Maintain jobsite file of Material Safety Data Sheets (MSDS) for each product delivered to jobsite.
- E. Boxes, Panels, and Enclosures
 - 1. Install boxes, panels, and enclosures square and plumb.
 - 2. Set flush-mounted units with the face of the cover, bezel, or escutcheon in the same plane as the surrounding finished surface.
 - 3. Mount boxes, panels, and trim so that there are no gaps, cracks, or obvious lines between the trim and the adjacent finished surface; ready them to receive final finish, as applicable.
 - 4. Install insulating terminations in signal circuit boxes, panels, wireways, or enclosures. F. Painting
 - 1. Custom paint devices as indicated on the drawings.

3.04 REPAIR/RESTORATION

- A. Replace or repair work completed by others that you deface or destroy, and at no cost to Owner.

- B. Punch List:
 - 1. Inspect installed work and develop a punch list for items needing correction.
 - 2. Submit punch list to Engineer for review prior to performing punch walk with Engineer.
- C. Re-Installation:
 - 1. Make changes to the system such that defects in workmanship are correct and cables and the associated termination hardware pass the minimum test requirements.
 - 2. Repair defects prior to system acceptance.
- D. Painting: Repaint surfaces altered during installation of the security system to match previous conditions.

3.05 CLEANING

- A. Remove temporary coverings and protection of adjacent work areas. Remove unused products, debris, spills, or other excess materials. Remove installation equipment.
- B. Leave finished work and adjacent surfaces in neat, clean condition with no evidence of damage.
- C. Repair or replace damaged installed products.
- D. Legally dispose of debris in an environmentally friendly manner.
- E. Clean installed products in accordance with manufacturer's instructions prior to Owner's acceptance.

END OF SECTION

SECTION 28 04 09

BASIC SECURITY SYSTEM REQUIREMENTS CONSTRUCTION SPECIFICATIONS

PART 1 GENERAL

1.01 SUMMARY

- A. The work shall consist of the design, provision, termination, testing, and documentation of a complete and fully functional environment of electronic security systems. The instructions in this section are specific to security system installations and should be read in conjunction with other contract documents as applicable.
- B. Related Documents:
 - 1. Drawings and general provisions of the Subcontract apply to this Section.
 - 2. Review these documents for coordination with additional requirements and information that apply to work under this Section.
- C. Related Sections:
 - 1. Division 01 Section 010000 "General Requirements"
 - 2. Division 01 Section 013500 "Special Procedures"
 - 3. Division 07 Section 078413 "Penetration Firestopping"
 - 4. Division 08 Section 087100 "Door Hardware"
 - 5. Division 26 Section 260500 "Common Work Results for Electrical"
 - 6. Division 26 Section 260501 "Inspections and Testing of Electrical Work"
 - 7. Division 26 Section 260523 "Low-Voltage Electrical Power Conductors and Cable"
 - 8. Division 26 Section 260526 "Secondary Grounding for Electrical Systems"
 - 9. Division 26 Section 260533 "Electrical Conduit"
 - 10. Division 26 Section 260533.13 "Boxes for Electrical Systems"
- D. Where there are discrepancies between the drawings and the specification, herein, and related specification's sections, the Contractor shall be responsible to providing the more onerous solution.

1.02 DESCRIPTION

- A. General Description: This specification section covers general requirements for the furnishing, installation, and testing of a complete expansion to the Owner's electronic access control and video surveillance system.
- B. Furnish and install Electric Access Control System (EACS) software programming, hardware devices, mounting brackets, power supplies, switches, equipment cabinets, controls, consoles, and other components of the system as shown and specified.
- C. Furnish and install Video Surveillance System (VSS) software programming, hardware devices, mounting brackets, power supplies, video servers, Network Video Recorders (NVR), and equipment enclosures, as shown and specified.

- D. Furnish and install electrified locking hardware, special power supplies, door and frame modifications, and other components and services of the locking mechanisms as shown and specified.
- E. Furnish and install outlets, junction boxes, pull boxes, conduits, connectors, wiring, and other accessories necessary to complete the system installation. Requirements shall be in accordance with Division 26, Electrical Work.

1.03 QUALIFICATIONS

A. General

1. The approved Contractor shall be responsible for satisfactory operation of the system and its certification.
2. Approval of the Owner is required of products or services of the proposed manufacturer, suppliers and installers and will be based upon conformance to the specifications.

B. Manufacturer Qualifications

1. System components shall be furnished by manufacturers of established reputation and experience who shall have produced similar equipment and who shall be able to refer to similar installations rendering satisfactory service.
2. The manufacturer's products shall have been in satisfactory operation on at least three similar installations for not less than three years. The contractor shall submit a list of similar installations.
3. Components including, but not limited to, card access controllers, cameras, intercoms, computers, and power supplies shall have been tested and listed by Underwriters Laboratories, Inc., Factory Mutual Systems, or another approved independent testing laboratory.
4. Components installed within a common enclosure shall be approved by an agency recognized by the local city Department of Building and Safety as an assembly.

C. Contractor Qualifications

1. Hold current legally required California State Contractor's licenses necessary to accomplish the installation and activation of the described system at the facilities indicated. The contractor shall submit copies of licenses to the Owner prior to the start of work.
2. Hold current legally required state registrations required to meet local requirements for submittal drawings.
3. Have manufacturers trained and certified engineering, field technicians and programming staff.
4. Indicate complete and total compliance with the provisions of these Specifications by letter or by submittal of the bid response forms, signed by an officer of the corporation, or a principal if other ownership exists. In addition, the letter or forms shall include a complete listing of exceptions, if any.

1.04 GENERAL CONDITIONS

- A. Contract Compliance: Provide the Systems and Services in accordance with the conditions and system descriptions as described in Part 1 of each specification section. Provide specified or Owner-approved equivalent alternate products as described in Part 2 of each specification section. Utilize specified procedures and practices as described in Part 3 of each specification section.

- B. Codes: Furnish material and workmanship for this work in conformance with applicable legal and code requirements.
- C. Inclusive Work: Provide sufficient time, material and manpower to verify, revise or refine the Bid Drawings as necessary to develop fully engineered Shop Drawings as required by the General Requirements, and in order for this work to realize complete, stable and safe operation.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

3.01 GENERAL

- A. Perform this work in accordance with acknowledged industry and professional standards and practices, and the procedures specified herein.
- B. Aesthetics are an important consideration in this installation. Components shall be installed so as to have aesthetically pleasing results per Owner and Architect requirements. Actual locations of visible components shall be coordinated in advance with the Owner and Architect.
- C. The Contractor shall insure that installation personnel understand the requirements of this Specification.

3.02 SOFTWARE UPGRADES

- A. If more recent versions of the operating system or application software are made available to or requested by the Owner prior to system acceptance, these updated versions shall be installed and verified by the Contractor.
- B. Before installing upgrade software, the Contractor shall ensure that existing database information is properly "backed up" prior to any installation action.

3.03 PRELIMINARY INSPECTION, ACCEPTANCE TESTING, AND COMMISSIONING

- A. A. Provide Preliminary Testing, Inspection, Acceptance Testing, Burn-In, and Commissioning Performance services for systems and equipment in accordance with Testing and Commissioning, Section 28 08 00.

3.04 FINAL PROCEDURES

- A. Portable Equipment: Furnish portable equipment specified herein to the Owner, along with complete documentation for the materials furnished. Portable equipment shall be presented in the original manufacturer's packing, complete with manufacturer's instructions, manuals, and documents. Testing of portable equipment shall have been previously conducted by the Contractor.
- B. Post Acceptance Work: Check, inspect and adjust systems, equipment, devices, and components specified, programming updates, at the Owner's convenience, approximately sixty (60) days after Acceptance of the Installation.

3.05 NOTICE OF COMPLETION

- A. When the performance and acceptance requirements described above, including the Final Acceptance Test, have been satisfactorily completed, the Owner shall issue a Letter of Completion to the Contractor indicating the date of such completion. The Notice of Completion shall be recorded by the Contractor upon receipt of the Owner completion letter. This date of record shall be the start of the warranty period.

END OF SECTION

SECTION 28 05 00

COMMON WORK RESULTS FOR ELECTRONIC SECURITY SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. The work shall consist of the design, provision, termination, testing and documentation of a complete and fully functional environment of electronic security systems. The instructions in this section are specific to security system installations and should be read in conjunction with other contract documents as applicable.
- B. Related Documents:
 - 1. Drawings and general provisions of the Subcontract apply to this Section.
 - 2. Review these documents for coordination with additional requirements and information that apply to work under this Section.
- C. Related Sections:
 - 1. Division 01 Section 010000 "General Requirements"
 - 2. Division 01 Section 013500 "Special Procedures"
 - 3. Division 07 Section 078413 "Penetration Firestopping"
 - 4. Division 08 Section 087100 "Door Hardware"
 - 5. Division 26 Section 260500 "Common Work Results for Electrical"
 - 6. Division 26 Section 260501 "Inspections and Testing of Electrical Work"
 - 7. Division 26 Section 260523 "Low-Voltage Electrical Power Conductors and Cable"
 - 8. Division 26 Section 260526 "Secondary Grounding for Electrical Systems"
 - 9. Division 26 Section 260533 "Electrical Conduit"
 - 10. Division 26 Section 260533.13 "Boxes for Electrical Systems"
- D. Where there are discrepancies between the drawings and the specification, herein, and related specification's sections, Contractor shall be responsible to providing the more onerous solution.

1.2 DESCRIPTION

- A. General Description: This specification section covers general requirements for the furnishing, installation, and testing of a complete expansion to the Owner' electronic access control and video surveillance system.
- B. Furnish and install Electric Access Control System (EACS) software programming, hardware devices, mounting brackets, power supplies, switches, equipment cabinets, controls, consoles and other components of the system as shown and specified.
- C. Furnish and install Video Surveillance System (VSS) software programming, hardware devices, mounting brackets, power supplies, video servers, Network Video Recorders (NVR), and equipment enclosures, as shown and specified.

- D. Furnish and install electrified locking hardware, special power supplies, door and frame modifications, and other components and services of the locking mechanisms as shown and specified.
- E. Furnish and install outlets, junction boxes, pull boxes, conduit, connectors, wiring, and other accessories necessary to complete the system installation. Requirements shall be in accordance with Division 26, Electrical Work.

1.3 QUALIFICATIONS

A. General

1. The approved Contractor shall be responsible for satisfactory operation of the system and its certification.
2. Approval of the Owner is required of products or services of the proposed manufacturer, suppliers and installers and will be based upon conformance to the specifications.

B. Manufacturer Qualifications

1. System components shall be furnished by manufacturers of established reputation and experience who shall have produced similar equipment and who shall be able to refer to similar installations rendering satisfactory service.
2. The manufacturer's products shall have been in satisfactory operation on at least three similar installations for not less than three years. Contractor shall submit a list of similar installations.
3. Components including, but not limited to, card access controllers, cameras, intercoms, computers, and power supplies shall have been tested and listed by Underwriters Laboratories, Inc., Factory Mutual Systems, or another approved independent testing laboratory.
4. Components installed within a common enclosure shall be approved by an agency recognized by the local city Department of Building and Safety as an assembly.

C. Contractor Qualifications

1. Hold current legally required California State Contractor's licenses necessary to accomplish the installation and activation of the described system at the facilities indicated. Contractor shall submit copies of licenses to Owner prior to the start of work.
2. Hold current legally required state registrations required to meet local requirements for submittal drawings.
3. Have manufacturers trained and certified engineering, field technicians and programming staff.
4. Indicate complete and total compliance with the provisions of these Specifications by letter or by submittal of the bid response forms, signed by an officer of the corporation, or a principal if other ownership exists. In addition, the letter or forms shall include a complete listing of exceptions, if any.

1.4 GENERAL CONDITIONS

- A. Contract Compliance: Provide the Systems and Services in accordance with the conditions and system descriptions as described in Part 1 of each specification section. Provide specified or Owner approved equivalent alternate products as described in Part 2 of each specification section. Utilize specified procedures and practices as described in Part 3 of each specification section.

- B. Codes: Furnish material and workmanship for this work in conformance with applicable legal and code requirements.
- C. Inclusive Work: Provide sufficient time, material and manpower to verify, revise or refine the Bid Drawings as necessary to develop fully engineered Shop Drawings as required by the General Requirements, and in order for this work to realize complete, stable and safe operation.

PART 2 - PRODUCTS

Not used. PART 3 - EXECUTION

3.1 GENERAL

- A. Perform this work in accordance with acknowledged industry and professional standards and practices, and the procedures specified herein.
- B. Aesthetics are an important consideration in this installation. Components shall be installed so as to have aesthetically pleasing results per Owner and Architect requirements. Actual locations of visible components shall be coordinated in advance with Owner and Architect.
- C. The Contractor shall insure that installation personnel understand the requirements of this Specification.

3.2 SOFTWARE UPGRADES

- A. If more recent versions of the operating system or application software are made available to or requested by the Owner prior to system acceptance, these updated versions shall be installed and verified by the Contractor.
- B. Before installing upgrade software, Contractor shall ensure that existing database information is properly "backed-up" prior to any installation action.

3.3 PRELIMINARY INSPECTION, ACCEPTANCE TESTING, AND COMMISSIONING

- A. Provide Preliminary Testing, Inspection, Acceptance Testing, Burn-In and Commissioning Performance services for systems and equipment in accordance with Testing and Commissioning, Section 28 08 00.

3.4 FINAL PROCEDURES

- A. Portable Equipment: Furnish portable equipment specified herein to the Owner, along with complete documentation for the materials furnished. Portable equipment shall be presented in the original manufacturer's packing, complete with manufacturer's instructions, manuals, and documents. Testing of portable equipment shall have been previously conducted by the Contractor.
- B. Post Acceptance Work: Check, inspect and adjust systems, equipment, devices, and components specified, programming updates, at the Owner's convenience, approximately sixty (60) days after Acceptance of the Installation.

3.5 NOTICE OF COMPLETION

- A. When the performance and acceptance requirements described above, including the Final Acceptance Test, have been satisfactorily completed, the Owner shall issue a Letter of Completion to the Contractor indicating the date of such completion. The Notice of Completion shall be recorded by Contractor upon receipt of the Owner completion letter. This date of record shall be the start of the warranty period.

END OF SECTION

SECTION 28 05 03

THROUGH PENETRATION AND FIRESTOPPING

PART 1 - GENERAL

The standards provided have been set forth for the Contractor, installer to follow for any future projects and or renovations. For a complete list of material for each campus where work is performed, please refer to Build LACCD campus standards web site:

<http://www.buildlaccd.org/contractors-bidders/standards-guidelines/quick-search-results?type=guidelines&category=12>

These standards are provided to serve as a guideline for contraction project to be completed correctly per latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

1.1 SECTION INCLUDES

A. This section includes firestopping for through-penetrations and joints in or between the following fire-resistance rated assemblies, including both blank openings, linear openings, and openings containing penetrating items:

1. Floor-ceiling assemblies.
2. Roof-ceiling assemblies.
3. Walls and partitions.
4. Smoke barriers.
5. Construction enclosing compartmentalized areas.

1.2 QUALITY ASSURANCE

- A. Manufacturer: Company specializing in manufacturing products specified in this Section.
- B. Installer: Individuals performing work shall be certified by the manufacturer of the system selected for installation.

1.3 REFERENCES

A. Underwriters Laboratories (UL) of Northbrook, IL "Fire Resistance Directory".

1. Through Penetration Firestop Systems (XHEZ)
2. Joint Systems (XHBN)
3. Perimeter Fire Containment Systems (XHDG)
4. Continuity Head-of-Wall Joint Systems (XHBO)

5. Fill, Void or Cavity Materials (XHHW)
 6. Firestop Devices (XHJI)
 7. Wall Opening Protective Materials (CLIV) B.
- B. All major building codes:
1. International Building Code published by ICC.
 2. (Note to specifier: Retain or delete the building codes listed above as applicable).
- C. National Fire Protection Association (NFPA) of Quincy, MA “NFPA 101: Life Safety Code”.
- D. National Fire Protection Association (NFPA) of Quincy, MA “NFPA 70: National Electrical Code”.
- E. Factory Mutual Approvals (FM) of Norwood, MA “FM 4991: Standard for Approval of Firestop Contractors”.
- F. Underwriters Laboratories (UL) of Northbrook, IL “UL Qualified Firestop Contractor Program”

1.4 PERFORMANCE REQUIREMENTS

- A. Provide products that upon curing do not re-emulsify, dissolve, leach, breakdown, or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water or other forms of moisture characteristic during and after construction.
- B. When intumescent products are used, provide products that do not contain sodium silicate or any other water-soluble intumescent ingredient in the formulation. C. Provide firestop products that do not contain ethylene glycol.
- D. Provide firestop sealants sufficiently flexible to accommodate motion such as pipe vibration, water hammer, thermal expansion and other normal building movement without damage to the seal.
- E. Pipe insulation shall not be removed, cut away or otherwise interrupted through wall or floor openings. Provide products appropriately tested for the thickness and type of insulation utilized.
- F. Fire rated pathway devices shall be the preferred product and shall be installed in all locations where frequent cable moves, add-ons and changes will occur. Such devices shall be:
1. Capable of retrofit around existing cables
 2. Designed such that two or more devices can be ganged together
 3. Maintenance free such that no action is required to activate the smoke and fire sealing mechanism

- G. When mechanical cable pathways are not practical, openings within walls and floors designed to accommodate voice, data and video cabling shall be provided with reenterable products specifically designed for retrofit.
- A. Subject to compliance with through-penetration firestop systems (XHEZ) and/or wall opening protective materials (CLIV) and/or joint systems (XHBN) and/or perimeter fire containment systems (XHDG) and/or continuity head-of-wall joint systems (XHBO) listed in Volume 2 of the UL Fire Resistance Directory, provide products of the following manufacturers as identified below:
1. Acceptable Manufacturer: Specified Technologies Inc., 210 Evans Way, Somerville, NJ 08876. Tel: (800) 992-1180, Fax: (908) 526-9623, Email: specseal@stifirestop.com, Website: www.stifirestop.com.
 2. Hilti, Inc., Tulsa, Oklahoma 800-879-8000 www.us.hilti.com
 3. Single Source: Obtain firestop systems for each type of penetration and construction condition indicated only from a single manufacturer.
 4. 3M Products
 5. Or approved equal

2.2 THROUGH PENETRATION FIRESTOP SYSTEMS

- A. General: LACCD standards should be to provide Kit Style assembly system and putty style fire blocking materials where possible. Use only firestopping products that have been tested for specific fire-resistance-rated construction conditions conforming to construction assembly type, penetrating item type or joint opening width and movement capabilities, annular space requirements, and fire-rating involved for each separate instance.
- B. Intumescent Sealants: Single component intumescent latex formulations containing no water-soluble intumescent ingredients capable of expanding a minimum 8 times, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSS Intumescent Sealant
 2. Specified Technologies, Inc. (STI) SpecSeal Series LCI Intumescent Sealant
- C. Endothermic Sealants: Single component latex formulations that upon cure do not reemulsify during exposure to moisture, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series LC Endothermic Sealant
- D. Elastomeric Sealants: Single component latex formulations that upon cure do not reemulsify during exposure to moisture and accommodate minimum ± 25 percent movement, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series AS Elastomeric Spray
 2. Specified Technologies, Inc. (STI) SpecSeal Series ES Elastomeric Sealant

- E. Firestop Devices: Factory-assembled steel collars lined with intumescent material capable of expanding a minimum 30 times sized to fit specific outside diameter of penetrating item, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSC Firestop Collars
 2. Specified Technologies, Inc. (STI) SpecSeal Series LCC Firestop Collars
- F. Fire Rated Cable Pathways: Gangable device modules capable of being retrofitted around existing cables and comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill and requiring no additional action in the form of plugs, twisting closure, putty, pillow, or sealant to achieve fire and leakage ratings, the following products are acceptable:
1. Specified Technologies Inc. (STI) EZ-Path Fire Rated Pathway
- G. Wall Opening Protective Materials: Intumescent, non-curing pads or inserts for protection of electrical switch and receptacle boxes to reduce horizontal separation to less than 24" (610 mm), the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSP Firestop Putty Pads
 2. Specified Technologies, Inc. (STI) SpecSeal Series EP PowerShield Insert Pads
- H. Firestop Putty: Intumescent, 100% solids, non-hardening, water resistant, butyl rubber based putties containing no solvents or silicone compounds, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSP Firestop Putty
- I. Wrap Strips: Single component intumescent elastomeric strips faced on both sides with a plastic film and capable of expanding a minimum 30 times, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series RED2 Wrap Strip
 2. Specified Technologies, Inc. (STI) SpecSeal Series BLU2 Wrap Strip
- J. Firestop Pillows: Re-enterable, non-curing, mineral fiber core encapsulated with an intumescent coating on all six sides contained in a flame retardant poly bag, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSB Firestop Pillows
- K. Mortar: Portland cement based dry-mix product formulated for mixing with water at Project site to form a non-shrinking, water-resistant, homogenous mortar, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series SSM Firestop Mortar

- L. Silicone Sealants: Moisture curing, single component, silicone elastomeric sealant for horizontal surfaces (pourable or nonsag) or vertical surface (nonsag), the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal SIL300 Silicone Firestop Sealant
 2. Specified Technologies, Inc. (STI) SpecSeal SIL300 SL Self-Leveling Silicone Firestop Sealant'
- M. All-Weather Coatings: Moisture curing, single component silicone copolymer elastomeric spray coatings for horizontal surfaces where greater water resistance is required or inclement weather is anticipated, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal FT305 Firestop Spray
- N. Silicone Foam: Multicomponent, silicone-based liquid elastomers, that when mixed, expand and cure in place to produce a flexible, non-shrinking foam, the following products are acceptable:
1. Specified Technologies, Inc. (STI) Pensil 200 Silicone Foam
- O. Composite Sheet: Intumescent material sandwiched between a galvanized steel sheet and steel wire mesh protected with aluminum foil capable of sustaining a minimum 2,500 lbs (1,134 kg) when subjected to load testing, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal CS Composite Sheet
- P. Cast-In-Place Firestop Device: Single component molded firestop device installed on forms prior to concrete placement with totally encapsulated, tamper-proof integral firestop system and smoke sealing gasket, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal CD Cast-In Firestop Device
- Q. Fire-Rated HVAC Retaining Angles: Steel angle system with integral intumescent firestop gasket for use on steel HVAC ducts, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal FyreFlange Firestop Angles
- R. Firestop Plugs: Re-enterable, foam rubber plug impregnated with intumescent material capable of expanding minimum 10 times with expansion beginning at 350°F (177°C) for use in blank openings and cable sleeves, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series FP Firestop Plug
- S. Fire-Rated T Rating Collar Device: Louvered steel collar system with synthetic aluminized polymer coolant wrap installed on metallic pipes where T Ratings are required by applicable building code requirements, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal T-Collar Device
- T. Fire-Rated Cable Grommet: Molded two-piece grommet made from plenum grade polymer with a foam inner core for sealing cable penetrations up to 0.53 in. (14 mm) diameter, the following products are acceptable:

1. Specified Technologies, Inc. (STI) EZ-Firestop Grommet (RFG1 or RFG2)
- U. Fire-Rated Closet Flange Gasket: Molded, single-component, intumescent gasket for use beneath a closet flange in floor applications, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series CF34 Closet Flange Firestop Gasket

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examination of Conditions: Examine areas and conditions under which work is to be performed and identify conditions detrimental to proper or timely completion.
- B. Surfaces to which firestop materials will be applied shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellents, and any other substances that may inhibit optimum adhesion.
- C. Provide masking and temporary covering to prevent soiling of adjacent surfaces by firestopping materials.
- D. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General Requirements: Install through-penetration firestop systems and fire-resistive joint systems in accordance with "Performance Criteria" Article and in accordance with the conditions of testing and classification as specified in the published design.
- B. Manufacturer's Instructions: Comply with manufacturer's instructions for installation of firestopping products.
 1. Seal all openings or voids made by penetrations to ensure an air and water resistant seal.
 2. Consult with mechanical engineer, project manager, and damper manufacturer prior to installation of through-penetration firestop systems that might hamper the performance of fire dampers as it pertains to duct work.
 3. Protect materials from damage on surfaces subjected to traffic.
 4. Apply a suitable bond-breaker to prevent three-sided adhesion in applications where this condition might occur such as the intersection of a gypsum wallboard/steel stud wall to floor or roof assembly where the joint is backed by a steel ceiling runner or track.
 5. Where joint application is exposed to the elements, fire-resistive joint sealant must be approved by manufacturer for use in exterior applications and shall comply with ASTM C-920, "Specification for Elastomeric Joint Sealants".

3.3 CLEANING AND PROTECTING

- A. Clean excess fill materials adjacent to openings as Work progresses by methods and with cleaning materials that are approved in writing by through-penetration firestop system manufacturers and that do not cause damage. Contractor shall be responsible to provide visual inspection at end of project and shall be responsible to correct any deficiencies prior to owner's visual verification. Where repairs find enough repairs are needed, contractor shall make repair at no addition cost.

- B. Provide final protection and maintain conditions during and after installation that ensure that through-penetration firestop systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, remove damaged or deteriorated through-penetration firestop systems immediately and install new materials to produce systems complying with specified requirements.

3.4 IDENTIFICATION

- A. Provide and install labels adjacent to each firestopping location. Label shall be provided by the firestop system supplier and contain the following information in a contrasting color:
 - 1. The words "Warning - Through Penetration Firestop System - Do Not Disturb. Notify Building Management of Any Damage."
 - 2. Firestop System Supplier; UL or listed by Intertek / Warnock Hersey system number; date installed; contractor name and phone number; manufacturer's representative name, address, and phone number.

3.5 INSPECTION

- A. All penetrations shall be inspected by the manufacturer's representative to ensure proper installation.
- B. Access to firestop systems shall be maintained for examination by the Authority Having Jurisdiction at their request.
- C. Proceed with enclosing through-penetration firestop system with other construction only after inspection reports are issued and firestop installations comply with requirements.

- D. The contractor shall allow for visual destructive review of 5% of installed firestop systems (minimum of one) to prove compliance with specifications and manufacturer's instructions and details. Destructive system removal shall be performed by the contractor and witnessed by the Architect/Engineer and manufacturer's factory representative. The Architect/Engineer shall have sole discretion of which firestop system installations will be reviewed. The contractor is responsible for all costs associated with this requirement including labor and material for removing and replacing the installed firestop system. If any firestop system is found to not be installed per manufacturer's specific instructions and details, all firestop systems are subject to destructive review and replacement at the Architect/Engineer's discretion and the contractor's expense.

END OF SECTION

SECTION 28 05 28

SECURITY BUILDING PATHWAYS

PART 1 - GENERAL

The standards provided have been set forth for the Contractor, and installer to follow for any future projects and or renovations. For a complete list of material for each campus where work is performed, please refer to the Build LACCD campus standards website:

<http://www.buildlaccd.org/contractors-bidders/standards-guidelines/quick-search-results?type=guidelines&category=12>

These standards are provided to serve as a guideline for contractor projects to be completed correctly per the latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to the start of any project. After the contractor accepts any bid, the contractor shall be responsible for providing their work per the Set Standards.

1.1 SECTION INCLUDES

A. This section includes fire stopping for through-penetrations and joints in or between the following fire-resistance-rated assemblies, including both blank openings, linear openings, and openings containing penetrating items:

1. Floor-ceiling assemblies.
2. Roof-ceiling assemblies.
3. Walls and partitions.
4. Smoke barriers.
5. Construction enclosing compartmentalized areas.

1.2 QUALITY ASSURANCE

- A. Manufacturer: Company specializing in manufacturing products specified in this Section.
- B. Installer: Individuals performing work shall be certified by the manufacturer of the system selected for installation.

1.3 REFERENCES

- A. Underwriters Laboratories (UL) of Northbrook, IL "Fire Resistance Directory".

1. Specified Technologies, Inc. (STI) SpecSeal SIL300 Silicone Firestop Sealant
 2. Specified Technologies, Inc. (STI) SpecSeal SIL300 SL Self-Leveling Silicone Firestop Sealant'
- M. All-Weather Coatings: Moisture curing, single component silicone copolymer elastomeric spray coatings for horizontal surfaces where greater water resistance is required or inclement weather is anticipated, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal FT305 Firestop Spray
- N. Silicone Foam: Multicomponent, silicone-based liquid elastomers, that when mixed, expand and cure in place to produce a flexible, non-shrinking foam, the following products are acceptable:
1. Specified Technologies, Inc. (STI) Pensil 200 Silicone Foam
- O. Composite Sheet: Intumescent material sandwiched between a galvanized steel sheet and steel wire mesh protected with aluminum foil capable of sustaining a minimum 2,500 lbs (1,134 kg) when subjected to load testing, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal CS Composite Sheet
- P. Cast-In-Place Firestop Device: Single component molded firestop device installed on forms prior to concrete placement with totally encapsulated, tamper-proof integral firestop system and smoke sealing gasket, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal CD Cast-In Firestop Device
- Q. Fire-Rated HVAC Retaining Angles: Steel angle system with integral intumescent firestop gasket for use on steel HVAC ducts, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal FyreFlange Firestop Angles
- R. Firestop Plugs: Re-enterable, foam rubber plug impregnated with intumescent material capable of expanding minimum 10 times with expansion beginning at 350°F (177°C) for use in blank openings and cable sleeves, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal Series FP Firestop Plug
- S. Fire-Rated T Rating Collar Device: Louvered steel collar system with synthetic aluminized polymer coolant wrap installed on metallic pipes where T Ratings are required by applicable building code requirements, the following products are acceptable:
1. Specified Technologies, Inc. (STI) SpecSeal T-Collar Device

- T. Fire-Rated Cable Grommet: Molded two-piece grommet made from plenum grade polymer with a foam inner core for sealing cable penetrations up to 0.53 in. (14 mm) diameter, the following products are acceptable:
 - 1. Specified Technologies, Inc. (STI) EZ-Firestop Grommet (RFG1 or RFG2)
- U. Fire-Rated Closet Flange Gasket: Molded, single-component, intumescent gasket for use beneath a closet flange in floor applications, the following products are acceptable:
 - 1. Specified Technologies, Inc. (STI) SpecSeal Series CF34 Closet Flange Firestop GasketPART

3 - EXECUTION

3.1 EXAMINATION

- A. Examination of Conditions: Examine areas and conditions under which work is to be performed and identify conditions detrimental to proper or timely completion.
- B. Surfaces to which firestop materials will be applied shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellents, and any other substances that may inhibit optimum adhesion.
- C. Provide masking and temporary covering to prevent soiling of adjacent surfaces by firestopping materials.
- D. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General Requirements: Install through-penetration firestop systems and fire-resistive joint systems in accordance with "Performance Criteria" Article and in accordance with the conditions of testing and classification as specified in the published design.
- B. Manufacturer's Instructions: Comply with manufacturer's instructions for installation of firestopping products.
 - 1. Seal all openings or voids made by penetrations to ensure an air and water resistant seal.
 - 2. Consult with mechanical engineer, project manager, and damper manufacturer prior to installation of through-penetration firestop systems that might hamper the performance of fire dampers as it pertains to duct work.
 - 3. Protect materials from damage on surfaces subjected to traffic.
 - 4. Apply a suitable bond-breaker to prevent three-sided adhesion in applications where this condition might occur such as the intersection of a gypsum wallboard/steel stud wall to floor or roof assembly where the joint is backed by a steel ceiling runner or track.
 - 5. Where joint application is exposed to the elements, fire-resistive joint sealant must be approved by manufacturer for use in exterior applications and shall comply with ASTM C-920, "Specification for Elastomeric Joint Sealants".

3.3 CLEANING AND PROTECTING

- A. Clean excess fill materials adjacent to openings as Work progresses by methods and with cleaning materials that are approved in writing by through-penetration firestop system manufacturers and that do not cause damage. The contractor shall be responsible to provide a visual inspection at the end of a project and shall be responsible to correct any deficiencies prior to the owner's visual verification. Where repairs find enough repairs are needed, the contractor shall repair at no additional cost.
- B. Provide final protection and maintain conditions during and after installation that ensure that through-penetration firestop systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, remove damaged or deteriorated through-penetration firestop systems immediately and install new materials to produce systems complying with specified requirements.

3.4 IDENTIFICATION

- A. Provide and install labels adjacent to each firestopping location. Label shall be provided by the firestop system supplier and contain the following information in a contrasting color:
 - 1. The words "Warning - Through Penetration Firestop System - Do Not Disturb. Notify Building Management of Any Damage."
 - 2. Firestop System Supplier; UL or listed by Intertek / Warnock Hersey system number; date installed; contractor name and phone number; manufacturer's representative name, address, and phone number.

3.5 INSPECTION

- A. All penetrations shall be inspected by the manufacturer's representative to ensure proper installation.
- B. Access to firestop systems shall be maintained for examination by the Authority Having Jurisdiction at their request.
- C. Proceed with enclosing through-penetration firestop system with other construction only after inspection reports are issued and firestop installations comply with requirements.
- D. The contractor shall allow for visual destructive review of 5% of installed firestop systems (minimum of one) to prove compliance with specifications and manufacturer's instructions and details. Destructive system removal shall be performed by the contractor and witnessed by the Architect/Engineer and manufacturer's factory representative. The Architect/Engineer shall have sole discretion of which firestop system installations will be reviewed. The contractor is responsible for all costs associated with this requirement including labor and material for removing and replacing the installed firestop system. If any firestop system is found to not be installed per manufacturer's specific instructions and details, all firestop systems are subject to destructive review and replacement at the Architect/Engineer's discretion and the contractor's expense.

END OF SECTION

SECTION 28 10 00

ACCESS CONTROL SYSTEM

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. The Architectural Drawing Package, marked for Bid, and any current revisions noted by project management.
- C. Security systems drawings and other attached appendices and tables.

1.2 DEFINITIONS OF TERMS

- A. Owner: shall refer to Los Angeles Community College District (LACCD), and all its subsidiaries and affiliates
- B. Architect: shall refer to TBD.
- C. Security Consultant (ACS Consultant, Consultant): shall refer to Vantage Technology Consulting Group. Refer to "PART 1, SUBMITTALS" for any specific identification.
- D. Project/Construction Manager (CM): TBD
- E. General Contractor (GC): TBD
- F. Bidder: shall refer to any party proposing to provide the services and material delineated in this Specification.
- G. Bid: shall refer to a Bidder's proposal to provide the services and material delineated in this Specification.
- H. Integrator (Security Contractor, Integrator, Contractor): shall refer to the awarded contractor for this scope of services.
- I. ACS Specification (Specification): shall refer to the complete set of designs, performance and delivery requirements delineated within this document and all referenced documents.
- J. ACS System (Security System): shall refer to the complete complement of equipment, software, and other material that upon completion of assembly, installation and configuration provides the full functionality and technical performance delineated in this Specification.
- K. ACS Equipment (Security Equipment): shall refer to all individual equipment items and equipment items supplied by Division 281300 Contractor installed as a part of the Access Control System.
- L. Work: Design and provision the ACS and associated equipment, software, and services for the Project.
- M. Construction Documents: shall include all documentation associated with the design and general construction of the Project, including this Specification.
- N. Provide: Supply (furnish), deliver, install, test, configure, label, and commission.
- O. Manufacturer: shall refer to the original manufacturer of any equipment provided as part of the Work

- P. Commissioning Date: shall refer to the date at which a system is formally accepted by the Owner.
- Q. OFE: Owner Furnished Equipment.
- R. OFCI: Owner Furnished, Contractor Installed.
- S. CFCl: Contractor Furnished, Contractor Installed.

1.3 SCOPE/DESCRIPTION OF WORK

- A. The work covered in this Specification consists of furnishing all labor, material, and services to install a complete ACS system as indicated on the project documentation, including this specification and related drawings.
- B. Access control system shall be extension of existing Lenel On-Guard access control system. Contractor shall be responsible for providing card reader licenses, adding, and programming new door controllers, card readers, local alarms to existing access control server.
- C. The Security System includes integration to the Fire/Life Safety system to disconnect power to magnetic door holders, disable electronic locks at doors on the path of egress (see sheets LS10X for egress path of travel on each floor), and automatically close doors after hours.
- D. Door access control system to comply with CBC 2016 sections 1010.1.9.11, Exception 2 and 403.5.3, governing stairway operation, to this project. Interior egress stair doors at levels other than at the level of discharge have card readers from the stairway side to prevent unauthorized entrance to patient care and non-public service levels. These doors will be openable by staff with electronic key card and will also be unlocked upon fire alarm activation and will also be required to have fire fighter "bypass" mushroom button key switch located in level 1 lobby area next to fire alarm control panel.
- E. Door access control system to comply with CBC 2016 sections 1010.1.9.7 governing delayed egress door operation to this project. All delayed egress locking systems will be deactivated upon fire alarm activation or loss of power and will also be required to have "delayed egress deactivation" mushroom button key switch located in fire command center and approved locations per AHJ.
- F. Contractor shall be responsible for providing card reader licenses for all card readers in in the project.
- G. The work described in this Specification shall include, but not be limited to, the following Basic Services:
 - 1. Engineering and Design: The Integrator shall provide all system engineering and design necessary to develop the complete systems described herein. Engineering and Design shall include preparation of all necessary electronic schematics, hardware drawings, systems diagrams, schedules, and lists.
 - 2. Procurement and Assembly: The Integrator shall procure and assemble all hardware and equipment and any additional materials as required to deliver completely functioning ACS.
 - 3. Software Programming: The Integrator shall perform all required software setup, configuration, and programming required to develop a complete operating system in accordance with this Specification, including all control logic and pushbutton component faceplate or interface programming.
 - 4. Installation: The Integrator shall install all equipment, cable, wiring, connectors, plates, and other material at the Project site per the Integrator's approved designs. The Integrator shall install any Owner Furnished Equipment identified in this document and calibrate it to work with the integrated systems.

5. Testing and Adjustment: The Integrator shall perform all tests and adjustments, furnish all test equipment necessary and perform all work required to properly configure the systems and to verify their performance in accordance with the information in this Specification and the Integrator's approved engineered designs.
6. Acceptance Testing: Prior to Owner acceptance and hand-over of the completed ACS, the Integrator shall demonstrate the operation of the complete systems, including all individual devices and specified control functions. Both subjective and objective tests may be required by the Owner to determine compliance with the information in this Specification and the Integrator's approved designs.
7. Training: The Integrator shall provide technical training of Owner's staff, instructing them on ACS operation, maintenance, and troubleshooting.
8. Warranty: The Integrator shall warranty the ACS in accordance with the terms of this Specification.
9. Specific Responsibilities:
 - a. Supply and install miscellaneous material, as necessary, to mount the ACS equipment.
10. Refer to "BID SUBMITTALS", Section 1.06 and "SUBMITTALS", Section 1.08. for additional information and requirements.

1.4 REGULATORY REQUIREMENTS

- A. All onsite labor must be in compliance with job-site union requirements.
- B. The Integrator must obtain any permits and shall pay all fees required by public agencies having jurisdiction over the Work.
- C. All products and materials provided shall be listed by Underwriters Laboratory (UL) and shall bear the UL label intended for the purpose specified and indicated. If UL has no published standards for a particular item, then other national independent testing standards shall apply, and such items shall bear those labels.
- D. All equipment and installations under this Specification shall conform to the latest editions of the following:
 1. NFPA 70 National Electrical Code.
 2. NFPA 72 – National Fire Alarm and Signaling Code
 3. IEEE C2 National Electrical Safety Code
 4. ANSI/TIA-568, -569 and -607 Telecommunications Standards
 5. IEEE 142 2007 Recommended Practice for Grounding of Industrial and Commercial Power Systems.
- E. The Integrator and its employees shall perform all work in compliance with current Occupational Safety and Health Administration (OSHA) guidelines and regulations and other safety and health requirements as may be mandated by the Owner, the General Contractor or other authorities.
- F. The Integrator shall have a thorough knowledge of governing codes and standards in effect and having jurisdiction over the Project. Lack of awareness of any of the relevant codes and standards will not be accepted as a reason for non-compliance.
- G. The Integrator shall be responsible for providing cable and materials that comply with applicable codes and requirements of regulating bodies. The cost for these materials shall be included in the Bid price, as the Owner shall not accept change orders for changes in materials.

1.5 COORDINATION OF RELATED WORK WITH OTHERS

- A. Related Work Specified Elsewhere: The Integrator shall coordinate with the General Contractor and other construction trades to ensure proper integration and operation of the ACS with the complete Project designs, building systems and all other elements of the Project. The Integrator should request from the Owner, General Contractor, or Architect complete project Construction Documents to help facilitate effective coordination of the Integrator's work with the work of others.
- B. Some components of the complete ACS will be provided by the GC, its sub-contractors, or the owner. It shall be the responsibility of the Integrator to coordinate with all parties whose work impacts the Integrator's work to ensure the complete coordination and successful implementation of the ACS. Related work by GC shall include, but may not be limited to, the following:
1. Electrical Work (Division 26):
 - a. Electrical (AC) Power Service and Connections:
 - 1) Technical Power Service: All electrical panels, power receptacles, lighting fixtures, dimmers, lighting controls, and interconnecting wiring shall be supplied by Electrical Contractor.
 - b. Low Voltage Cable Containment
 - 1) Low voltage cable containment, including raceways, conduits, and junction boxes, required to support ACS devices and interconnecting cabling shall be as specified in the Construction Documents and shall be provided by the Division 26 Contractor.
 - 2) Upon commencement of work on the Project, the Integrator shall review the Construction Documents to confirm that the infrastructure provided is sufficient to accommodate the ACS to be installed. Any conflicts or issues must immediately be brought to the attention of the Construction Manager or General Contractor, and the ACS Consultant.
 - 3) The Integrator shall provide blank cover plates or panels for all wall and ceiling boxes that are dedicated to the ACS but do not have devices and/or connectors at the time of ACS commissioning. Colors and types shall be coordinated with the Architect.
 2. Metals (Division 5)
 3. Rough Carpentry (061053)
 4. Joint Sealants (079200)
 5. Finishes (Division 9)
 6. Information Technology Systems: Unless otherwise specified, all data networking cabling shall be provided by Section 271300 and 271500 contractor(s) and the Owner. Unless otherwise specified, all active data networking electronics shall be provided by the Section 272000 contractor and the Owner. Patch cords to connect ACS equipment to a data network port shall be provided by the Integrator. The Integrator shall be responsible for coordinating with the Owner or the Owner's designated representative regarding connections between the ACS and the Owner's data network, including all client/server computing and peripherals, Internet, digital storage and other data/media distribution systems. Unless otherwise specified, equipment racks and cabinets, PDU's, and UPS's shall be provided by the Section 271100 contractor and/or the Owner. Coordinate with those entities to ensure space is available for any rack-mounted equipment.
 7. Other Systems: The Integrator shall be responsible for identifying and integrating with any other technology systems and services required to deliver the completely operating ACS.
 8. Equipment Mounting and Support:

- a. Structural support for ACS equipment shall be provided by General Contractor as noted and detailed in the Construction Documents. The Integrator shall coordinate with the General Contractor and other trades as necessary to ensure compatibility of the structural supports provided by others with the ACS Equipment provided by the Integrator.
 - b. The Integrator shall install all ACS Equipment, as indicated in this Specification and the Construction Documents. The Integrator shall verify location and structural suitability before attaching equipment and mounts. Any variations from the drawings and specifications or any question of structural integrity shall be brought to the attention of the General Contractor, Architect, and ACS Consultant before installing the equipment.
- C. Work Furnished by Others ("F.B.O.") but installed by the Contractor:
1. Owner Furnished Equipment (OFE): Some equipment that will become a part of or connect to the ACS may be provided by the Owner and shall be designated as Owner Furnished Equipment (OFE). Owner Furnished Equipment shall be supplied by the Owner to the Integrator for connection, installation and/or integration into the ACS as delineated in the construction documents and this Specification. This may include new or existing equipment. The Integrator shall be responsible for coordinating with the Owner's representative or Construction Manager to ensure that all Owner Furnished Equipment is fully operational and compatible with other ACS Equipment and that it is made available to the Integrator in a timeframe that does not delay the Integrator's work.

1.6 BID SUBMITTALS

- A. Examinations: Carefully examine the contract documents and the construction site to obtain first-hand knowledge of existing conditions. Contractors are not compensated for conditions that can be determined by examining documents or site and will not be relieved of any obligations with respect to bid.
- B. Questions: Submit all questions about the contract documents in writing. Replies requiring changes to the contract documents will be issued to all bidders as addenda and will become part of the Contract. The Architect and Owner may give, but will not be responsible for, oral clarifications. Questions received less than 10 days before bid date cannot be answered in writing.
- C. Equipment Availability: Verify with manufacturers' availability and cost of all equipment proposed, including equipment specified herein. No cost increases will be allowed for manufacturers' cost increases, or for substitutions required because of unavailability of proposed equipment.
- D. Basis of Bids: To be eligible for Bid consideration, submit bids in accordance with the following:
 1. Include a complete itemized list for each base-bid system indicating the manufacturer, model number, unit cost and total costs for all specified items.
Itemization of miscellaneous equipment such as cable, switches, and receptacles are not required.
 2. Clearly indicate the total cost, including all expenses, for each individual system to allow the Owner to select any or all to be included in the contract. Itemization of miscellaneous equipment such as cable, switches, and receptacles are not required.
 - a. Access Control
 3. Organize each list with the information presented, in the order that it appears in this specification, in 6 columns from left to right:

- a. Paragraph number as it appears in this specification.
 - b. Paragraph title as it appears in this specification.
 - c. Manufacturer and model number.
 - d. Quantity.
 - e. Unit Cost.
 - f. Extension (unit cost times quantity).
4. At the end of each list indicate the cost of all other items such as for miscellaneous equipment, engineering, installation labor, overhead, taxes, etc.
 5. On a separate list indicate costs of any specified add- or deduct-alternates with the information presented in the same manner as for the base-bid system.
 6. Include a listing of any voluntary alternates proposed by the bidder as substitutions or additions to the specified systems.
 7. Include any notes or comments if necessary, to qualify the bid.
 8. Identify any sub-contractors and indicate the work they are to do.
 9. Provide documentation of ability in installing similar systems. Furnish the names, addresses and telephone numbers of the System Designer, Architect, General Contractor and Owner on three projects similar in scope, which the Contractor has installed within the last 5 years.
 10. Identify the proposed project management, engineering, and installation staff. Include resumes for each individual indicating relevant experience and certifications.
 11. Include certification of ownership and full familiarity with the operation of the following minimum test equipment. Provide a list of the manufacturer, model, and serial number for each item of test equipment required, and the date of last calibration traceable to NIST, as applicable.
 - a. GENERAL CONTRACTING
 - 1) Multimeter.
 - 2) Cable Tester (Kopul CBT-MF or similar).
 - 3) Fiber-optic testing and field servicing equipment.
 - 4) Category 6 testing and field servicing equipment.
 12. Include certification of ownership and full familiarity with the operation of the following minimum software and analysis tools:
 - a. AutoCAD, version as required by the Owner (or .dwg compatible software, Stardraw not acceptable).
 - b. Revit, version as required by the Owner; or other BIM software, version as required by the Owner.
 13. BIDS NOT FULLY ITEMIZED OR NOT SUBMITTED IN THIS FORMAT WILL BE REJECTED. E. Delivery Schedule:
 1. Unless otherwise directed in Division 0, within 14 days of receipt of bid package provide:
 - a. Basis of bid documents, including:
 - 1) Itemized equipment costs for specified equipment or APPROVED substitutions.
 - 2) Qualifications/References
 - 3) Certifications (including certificate of bonding, if required) 4) Proposed payment terms.

1.7 QUALITY ASSURANCE

- A. Project Management: Maintain the same person in charge of work throughout installation. Engineering and construction supervisors shall be ESA CSI or approved equal.

- B. Contract Documents: always Maintain a complete set of system drawings and specifications at the site during installation.
- C. Fabrication and Installation: Fabricate all equipment enclosures and subassemblies, as required. Make field connections of control wiring, and control system circuits to equipment, equipment racks, and connection panels. Continuously supervise the installation and connections of cable and equipment.
- D. Contractor Qualifications: To be considered qualified for this work, bidders must meet the following standards:
 - 1. The Contracting firm is experienced in the provision of ACS similar in complexity to those required for this project.
 - 2. The Contractor's primary business is the provision, fabrication, and installation of professional ACS and related systems.
 - 3. The Contractor has been regularly engaged in the installation and service of professional ACS for a period of at least five years.
 - 4. The Contractor is an authorized dealer for the major products furnished.
 - 5. The proposed Project Engineer holds ESA CSSI certification or approved equal. The proposed installer holds ESA CVT certification or approved equal.
 - 6. The Contractor is certified by the manufacturer of the systems to install and configure all components of the system. The Contractor must assign a certified technician to conduct the work. Contractor must submit proof of certifications with the bid response.
 - 7. Additional certifications specific to project – manufacturer's certifications, etc.
 - 8. The Contractor is experienced in cloud-based control and management systems.
 - a. At the request of the Owner, Owner's representative, or Architect, demonstrate the following capabilities:
 - b. Adequate plant and equipment to complete the work in accordance with the project schedule.
 - c. Sufficient staff with appropriate technical experience to oversee and execute the work.

1.8 QUALITY ASSURANCE

- A. General:
 - 1. The Contractor has the burden of proving, at the Contractor's own cost and expense and to the satisfaction of the Architect, that the proposed product is similar and equal to the named product.
- B. Documentation:
 - 1. File a formal request for each substitution, documenting the conditions outlined below, including:
 - a. Complete data on the proposed substitution, substantiating compliance with the ACS Contract Documents, including:
 - 1) Specification Section and description of the equipment or service originally specified by the ACS Consultant.
 - 2) Product manufacturer, model, and description of the proposed substitution
 - 3) Performance specification and test data verifying the proposed substitution's compliance with ACS and installation requirements.
 - 4) References and samples, where applicable
 - 5) An itemized comparison of the proposed substitution with the item originally selected in the ACS Specification.

- 6) The impact of the proposed substitution on the Contract time schedule, system design, artistic effect (for changes in finish or dimension), and related contracts and trades
2. Submit item comparisons, coordination schedules, and design impact via addenda appended to manufacturer documentation. C. Basis:
- 1. Requests for acceptance of proposed equivalents made following the award of bid are considered only in the following cases:
 - a. The named products cannot be obtained by the Contractor because of strikes, lockouts, bankruptcies or discontinuance of manufacturer and the Contractor makes a written request for consideration of the proposed equivalent.
 - b. The proposed equivalent is approved as equal or superior to the named product and its use is to the advantage of the Owner. D. Consideration:
 - 1. A request for substitution is a representation by the Contractor that:
 - a. The Contractor has personally investigated the proposed substitution and determined that it is equal or superior in all respects to that specified.
 - b. The same warranty is provided for the substitution as the original equipment specified.
 - c. The cost data presented is complete and includes all related costs under this Contract but excludes costs under separate contracts and excludes Architect's re-design costs, and that the Contractor waives all claims for additional costs related to the substitution which subsequently becomes apparent.
 - d. Any cost impact on work by other trades is indicated.
 - e. Installation of the accepted substitute will be coordinated by the Contractor, making such changes as may be required for the Work to be complete in all respects.
 - 2. An accepted substitution shall be documented by Change Order, effectively modifying the ACS Specification. The Contract Price will be changed only if the substitution results in cost savings to the Owner.

1.9 CONSTRUCTION SUBMITTALS

- A. Coordinate all submittals with requirements set forth in Section 013300.
- B. Bill of Materials & Manufacturer Product Data Sheets:
 - 1. Organize the Bill of Materials with the information presented in the order and format that appears in this specification.
 - 2. After the Bill of Materials, include Catalog Data Sheets ("cut" sheets) for all specified products arranged in the order listed in the Bill of Materials.
 - 3. Clearly indicate all finishes, colors and, options for equipment.
 - 4. As an alternative, provide product data sheets in electronic .pdf format, or another approved file format. Datasheets shall be organized in a logical manner, such as per system, to allow efficient review of the design documents. C. Shop Drawings:
 - 1. Size: minimum 24" x 36" unless otherwise specified.
 - 2. Media: provide in electronic .pdf file format unless otherwise specified or directed by the Construction Manager.
 - 3. Prepare a drawing package on the approved Computer Aided Drafting (CAD) or Building Information Modeling (BIM) system, including: a. Integrator name, address, and phone number.
 - b. Block diagrams indicating proposed connections of all equipment and indicating equipment brand and model numbers.
 - c. Equipment/ control room layout and equipment rack and cabinet details

- d. Provide detailed drawings of custom-fabricated or stock mounts and hardware.
 - e. Other drawings and sketches as required by the Architect or ACS Consultant during project installation.
4. Design drawing files provided by the Architect and/or ACS Consultant as a courtesy in aiding the Integrator in preparing Shop Drawings must be modified to include the information specified above. Submitting design drawings without these modifications is not acceptable.
- D. Data Network Connectivity
1. Any system, or components of a system, provided in this specification section which are to be connected to the Owner's data network either via wired or wireless connections will conform to the requirements described in PART 3 - EXECUTION. Vendors shall review the requirements of this section and provide a statement of compliance for each item that either:
 - a. Confirms that the proposed System (or any applicable components of the System) is compliant with the requirements listed in the item, or
 - b. Explains why the proposed System (or any applicable components of the System) is not compliant, including any potential mitigation measures that may resolve the non-compliance issue.
- E. Project Plan
1. Provide a complete and detailed Schedule for the Integrator's work describing the major tasks, sequence of work, submittals, and other critical milestones. At a minimum, the tasks noted in the Schedule shall include all required submittals, rack assembly, and shop testing, on site cable installation, periodic shop and site visits, on site equipment installation, testing and commissioning, Substantial Completion and Project Completion. Indicate the sequence of installation and completion by area and/or system. The Schedule shall also include anticipated dates of acquisition of major equipment and their installation milestones.
 2. Provide a complete listing of the Integrator's project team, including the names and all contact information (email address, cell phone, etc.) for all personnel assigned to the Project. At a minimum, this Project Team Directory shall include the Integrator's executive in charge of the Project as well as the Project Manager, Lead Engineer, and Lead Installer. Include names and contact information for all subcontractors.
- F. Weekly Status Reports
1. If directed by the Construction Manager, the Integrator shall provide weekly progress updates to the Architect and ACS Consultant. Weekly Status Reports shall be submitted as directed by the Construction Manager via faxed hard copy or electronic means (i.e., email). Issuance of Weekly Status Reports shall commence from the date of the first submittal delivery and shall continue until contract closeout.
 2. The Weekly Status Report shall not be used as an official means of communicating Project issues. It does not replace any part of a required submittal, request for information, proposed change order, report of field conditions, schedule issues, etc. No official response will be given to the Weekly Status Report.
 3. A representative of the Integrator shall attend the weekly construction meeting at the job site. This representative shall be fully knowledgeable in all aspects of the Project and the Integrator's work and shall have the authority to make binding commitments on behalf of the Integrator.
- G. SUBSTANTIAL COMPLETION SUBMITTALS

Substantial Completion of the ACS System installation shall be the point at which all ACS Equipment has been installed, programmed, configured, and initially tested to confirm proper operation. The point of Substantial Completion shall be as mutually agreed between the Integrator and the ACS Consultant following discussion and observation. At the point of agreed Substantial Completion, the Integrator shall submit the following:

1. Test Reports:
 - a. Upon completion of SYSTEM PERFORMANCE TESTS AND ADJUSTMENTS specified in PART 3 - EXECUTION, submit for approval in writing test results including numerical values for all measurements.
 - b. Submit written certification that the installation conforms to specifications, is complete and operable, and is ready for FINAL ADJUSTMENTS AND ACCEPTANCE TESTS specified in PART 3 - EXECUTION.
 - c. The Owner or Owner's representative reserves the right to withhold the final site visit "check-out" and any final certification of project completion until receipt of test report documents, as outlined in this section (SECTION 1 – "Test Reports").
2. Preliminary Project Record Documents Submittal
 - a. Upon Substantial Completion, the Integrator shall submit Preliminary Project Record Documents to the ACS Consultant. Preliminary Project Record documents shall be submitted prior to the Preliminary Checkout.
 - b. Preliminary Project Record Documents shall include:
 - 1) Corrected/updated shop drawings.
 - 2) Updated Equipment List
 - 3) Half-size drawings modified to reflect the actual installation conditions.
 - 4) USB Flash Drive or other approved media with manufacturers' operation manuals arranged alphabetically and current drawings in .DWG format.
 - c. ACS Consultant's Preliminary Checkout will be scheduled after the Preliminary Project Record Documents and Test Reports have been approved.

H. Manufacturer's Owner's Manuals:

1. Archive all Manufacturers' Owner's Manuals for specified equipment in the following manner:
 - a. One original (not photocopy) manufacturer's owner's manual per equipment item.
 - b. Submit in a 3-ring binder including a cover page and spine insert identifying the project, site location, and submittal.
 - c. Arrange manuals in alphabetical order, by manufacturer.
 - d. Provide a table of contents and separate each section within the binder with tab dividers.
 - e. If approved by the Owner, provide all Manufacturer's Owner's Manuals in electronic .pdf format on USB Flash Drive or other approved media. Owner's Manuals shall be organized in a logical manner such as per system and/or alphabetical order, by manufacturer. I. User Operational Manual:
1. Intent: Prepare in the form of a system operations manual for use by Owner's personnel. System documentation shall be adequate such that a person trained on the System, but with no familiarity with this specific implementation, shall be able to understand the configuration and implementation of all major and minor systems as well as how these systems are integrated to form the overall System.
2. Cover: Identify each volume with typed or printed titles "SYSTEM OPERATING INSTRUCTIONS".

3. Format: Submit the User Operational Manual in the following format:
 - a. Size: 8-1/2" x 11", 20 lb. minimum weight white paper for typed pages, either manufacturer's printed data, or neatly typewritten.
 - b. Drawings: Provide reinforced punched binder tab, bind in with text. Fold larger drawings to the size of text pages.
 - c. If approved by Owner, provide Operational Manual in electronic .pdf format on CD-ROM or other approved media.
4. Content of Manuals: Prepare the User Operational Manual with the following content:
 - a. Neatly typewritten table of contents for each volume arranged in systematic order. Identify each product-by-product name and other identifying symbols as set forth in Contract Documents.
 - b. Contractor name of responsible principal, address, and telephone number
 - c. Certificate of Warranty
 - d. Service Contract: Include a preliminary schedule for the specified semiannual site visits.
 - e. Complete as-built diagrams for systems.
 - f. Receptacle Location Plan
 - g. Shop drawings of all custom-fabricated items
 - h. Control Setting Schedule.
 - i. Documentation of all touch-panel screens both in the form of data files on CD-ROM, or other approved media, and graphical printouts.
 - j. ACS control system configuration files on USB Flash Drive, or other approved media, for the management and control system, or other software required for re-configuring the ACS management and control system.
 - J. System Diagrams:
 1. Provide sufficiently clear and complete information that a technician of average skill may efficiently troubleshoot and service the system, even if unfamiliar with the installation, based on diagrammatic representations of the installed system.
 2. Provide drawings showing all terminal blocks, connectors, relays, switches, equipment, components, and wires.
 3. Provide layout drawings of panels and other custom assemblies containing switches, relays, terminal blocks, receptacles, etc., using reference numbers to identify physical locations of devices or label devices with reference numbers in a location visible while viewing cable terminations.
 4. On wiring diagrams, label all conductors within cables for insulation color or other identifier.
 5. Label connectors, barrier strips, switches, relay sockets, etc., for terminal number.
 6. If device does not provide terminal designations, provide key diagram for reference.
 7. Label all devices with manufacturer, model number, and reference number (e.g., "SW 15", "TB 6"); reference numbers shall be consistent across all drawings with no repetitions.
 8. Provide labels for cables continued onto another drawing, indicating termination device, terminal numbers, and drawing sheet on which the termination is shown.
 9. Illustrate all receptacles, patch panel jacks, and switches.
 10. Receptacle Location Plan: Plan drawing of area showing locations and designations of all receptacles.
 - K. Forward all submittals to:
 1. The Project Manager, or as directed.

1.10 JOB CONDITIONS

- A. Sequencing and Scheduling:

1. Coordinate work with adjacent work of other trades to facilitate construction and prevent conflicts.
 2. Afford other trades reasonable opportunity for installation of work and for the storage of materials.
 3. Staff the job to keep pace with the other Trades; otherwise, the project manager will require an increase in force or overtime work without additional expenses to the Owner.
 4. Abide by the decision of the project manager in case of conflict or interference by other trades.
 5. Remove all refuse from the job site to the satisfaction of the Owner's representative.
- B. Do not install equipment in dusty conditions or allow dust to accumulate in or on installed ACS Equipment.
- C. Protect all work and equipment from damage by other subcontractors.
- D. Protect all existing work-in-place by other subcontractors from damage by the Integrator, the Integrator's agents and/or sub-contractors, or any employees or vendors. The Integrator will be solely responsible for any/all damage to work-in-place by other subcontractors.
- E. Keep areas around and inside of each piece of equipment and each rack free from dust, dirt, and debris throughout the project. Equipment that is not properly maintained during installation shall be replaced at no cost to the Owner before final payment is made to the Integrator.
- F. Storage and Staging:
1. The Contractor is ultimately responsible for acquiring secure storage at the job site. Coordinate with project management and/or Owner to determine the location and size of the storage area.
 2. All Integrator equipment and materials and all owner furnished equipment turned over to the Integrator stored at the Integrator's facility(s) or stored and/or installed at the Project site will remain the property of the Integrator unless ownership is legally transferred and accepted in writing by the Owner. The Integrator shall be solely responsible for the protection of all equipment from damage, theft, or vandalism regardless of cause, until the work described herein is accepted by the Owner at the time of Final Checkout.
- G. Refuse and Repair:
1. Upon completion of work remove all associated debris, waste, refuse, and rubbish from premises. Leave all areas and equipment within the scope of this contract clean, free of blemishes, and operational.
 2. Repair any damage to the premises, at no cost to the Owner, caused by the Contractor, its agents, and/or subcontractors.
- H. Adhere to the safety standards established by the General Contractor while performing work on site.
- I. All employees of the Integrator shall wear identification clearly indicating the Integrator's company name while on site.
- J. All employees of the Integrator shall comply with rules and policies established by the Owner and/or the General Contractor.
- K. All vehicles of the Integrator or employees shall be parked in areas designated by the Owner and/or the General Contractor.
- L. Environmental Impact Considerations
1. The Integrator is expected to comply with project specific practices and environmental considerations to comply with any LEED objectives and local environmental regulations.
 2. The Integrator is encouraged to utilize environmentally sustainable materials and work practices in the delivery of the Work. This may consist of (but not be limited to):
 - a. Energy Efficiency/Conservation

- b. Waste Reduction/Recycling
 - c. Water Conservation
 - d. Pollution Prevention
 - e. Employee Education Programs
 - f. Transportation Planning
 - g. Utilization of Renewable Materials
 - h. Minimize Emission of Greenhouse Gases
3. Upon request, the Integrator shall supply documentation on in-house policies for recycling and environmental offset goals. M. Promotion/Publication:
- 1. The contractor does not have the rights to use any information or images, relative to this contractor installation, for publication or in promotional materials without the express written permission of the Owner, Architect, and Vantage Technology Consulting Group. Upon approval, the contractor must disclose full credit to the Architect and Consultant for facilities and system design.
- N. Insurances on the work of this specialty trade shall be provided as specified in relevant project documentation.
- O. Inspection
- 1. Notify the Architect of any defects in work by other trades affecting installation.
- P. Packaging: Material and equipment manufacturers shall demonstrate efforts to reduce packaging waste and/or to use environmentally preferable packaging materials. Examples include, but are not limited to, the following:
- 1. Reusable and/or returnable pallets or crates
 - 2. FSC-certified wood or salvaged wood pallets or crates
 - 3. High recycled-content cardboard, paper, steel, or plastic packaging
 - 4. Bio-based foam packing materials.
- 1.11 DESCRIPTION OF SYSTEMS
- A. Functional Requirements of Systems
- 1. Access Control
 - a. Real-time access event monitoring
 - 1) Control and response, including acknowledge, clear, and annotate.
 - 2) Tracking and muster view/report generated by event or demand. 3) Guard tour by point or card read.
 - b. Manual override of system functions and schedules
 - 1) Door modes: Lockout, Lockdown, PIN Only, Card Only
 - c. Reporting
 - 1) Predefined or customized reports
 - 2) Event triggered Muster/Tracking report
 - 3) Schedule email of predefined reports 4) Export in HTML or delimited format
 - d. Elevator call and control
 - e. Anti-passback processing
 - 1) Hard or Soft per reader 2) Learn mode override.

- f. Dynamic floor plans
 - 1) Control access devices
 - 2) Floor plan linking
- g. Toggle lock during unlock schedule - lunch hour mode.
- h. Toggle lock outside of schedule - after hours meeting mode.
- i. Card database lookup
- j. User defined procedures per event/ schedule
- k. 3-Holiday types
- l. Prioritized Alarm Events
- m. Integrate access control with video Surveillance and intrusion systems.
- n. Arm or disarm per card read
 - 1) Record and playback access, intrusion or video events and alarms
 - 2) Define video presets per event.
 - 3) Alarm video popup and user verification
 - 4) Synchronized video playback with access, intrusion, or video events
 - 5) Define and extract video clips.
- o. Dynamic floor plans
 - 1) Control access, intrusion, and video devices
- p. Manual override of system functions and schedules
 - 1) Arm/disarm partitions and zone.
 - 2) Bypass/un-bypass zones

PART 2 PRODUCTS

2.1 ENGINEERING AND DESIGN

- A. Engineering and other pre-site services included in this Specification are considered furnished goods delivered to the site in a similar manner to physical materials. PART 2 of the ACS specifications is for review by the contractor's engineering department. The contractor is responsible for reviewing the specification and drawings and providing an ENGINEERED fixed-price quotation covering the cost of all equipment and labor to install, program, warranty, and service the systems described.
- B. The contractor is responsible for attending all pre-bid meetings and reviewing and understanding the systems design, functionality, and intent.
- C. The owner assumes that all contractors providing bid responses have included all the necessary equipment, parts, cabling, labor, engineering, programming, project management, testing and training costs, and will not approve any additional fees or costs, unless shown and approved to be beyond the scope of the specification and drawings.
- D. The equipment identified below provides examples of the level of quality and functionality required. These are predominantly major or unusual items and do not represent a complete list of equipment. The contractor is responsible for providing all equipment necessary for fully functioning turnkey systems.
- E. Where the equipment described includes "or approved equal", the contractor shall provide all documentation as indicated in paragraph 1.08 Substitutions to allow the owner or owner's representative to decide prior to bid submittal.

- F. Where the equipment described includes “or equal”, the contractor shall provide all documentation as indicated in paragraph 1.08 Substitutions as part of the product data submittal package delivered after award of contract.
- G. Where the equipment described does not include “or approved equal” or “or equal”, the contractor shall provide only the product specified. No substitutions will be accepted.

2.2 ACCESS CONTROL

A. Integrated Security Software:

1. Access control system shall be extension of existing Lenel On-Guard access control system. The contractor shall be responsible for providing card reader licenses, adding and programming new door controllers, card readers, local alarms to existing access control server. B. Door Controller:

1. Single Reader Interface Module: Lenel LNL-1300-S3
2. Dual Reader Interface Module: Lenel LNL-1320-S3
3. 16 Input Control Module: Lenel LNL-1100-S3
4. 16 Output Control Module: LNL-1200-S3
5. Compatible with specified card readers C. Intelligent System Controller:

1. Sized for number of door controllers and I/O modules located at the system controller, or as shown on the drawings.
2. Communications: Dual path onboard TCP/IP and RS-485.
3. OSDP (Open Supervised Device Protocol) for secure communications between Intelligent System controller and door controller.
4. Non-volatile storage of 50,000 events, minimum
5. 12 or 24 VDC input power
6. 32,000 access level permissions, maximum
7. 255 holidays, with grouping
8. Elevator control support 9. Alarm masking
10. Individual extended held open and strike times, per ADA.
11. 9-digit user PIN, max
12. Dedicated inputs for tamper and power failure status
13. TLS1.1 (with AES256 support) communication to the integrated security software.
14. Acceptable Products:
 - a. Lenel LNL-X4420 D.

Access Control Enclosures:

1. Provide and install high density enclosure.
2. All cables shall be run within an approved cable management system and shall be neatly dressed and labeled at the point of termination.
3. All labels shall be clearly visible without the need to remove any wire way covering or wire management device.
4. Furnish and install tamper switches on each access control panel enclosure. Tamper switches shall be wired to monitor points on the access control panel and shall be configured for twenty-four-hour alarm supervision.
5. Acceptable Products:
 - 1) LifeSafety Power
 - 2) Altronix

E. Door Hardware Power Supply:

- a. Applies to all integrated locksets and magnetic locks.
- b. 115 VAC input

- c. Dual-voltage output, 24 VDC/12VDC
- d. Amperage as required by lockset.
- e. Form C contacts for supervision
- f. Provide enough quantity of power supplies with factory-installed power distribution modules to permit simultaneous continuous-duty activation of all door locks with an additional minimum 20 percent capacity on each supply.
- g. Calculate voltage drop to locks and size lock control wiring to provide proper lock operation.
- h. Provide battery back-up enough for eight (8) hours standby plus twentyfive activations for all DC locks.
- i. Monitor the AC fail relay for power failure and the low battery relay for low battery. These alarms shall have individual monitor points on the access control system.
- j. Furnish and install tamper switches on each power supply enclosure. Tamper switches shall be wired to monitor points on the access control panel and shall be configured for twenty-four-hour alarm supervision.
- k. Provide and install cabinet locks on each power supply enclosure. Security Contractor to provide locks keyed alike for all power supply enclosures.
- l. UL 294 and 603 listed
- m. Acceptable Products:
 - 1) Lifesafety Power
 - 2) Altronix F. Card

Reader (Wall-Mount):

- 1. 125 kHz and 13.56MHz card reader
- 2. Bluetooth-BLE HID mobile access.
- 3. OSDP interface
- 4. 5" read range
- 5. 5-16 VDC input power
- 6. Two-piece, weatherproof design 7. Size of a 1-gang faceplate 8. Acceptable Products:
 - a. HID Signo Readers model 20 (Mullion mount), model 40 (single gang wall mount) readers.

G. Door Position Switch: Interlogix SPDT 1076/1078 series or approved equal. Coordinate finish with Architect. H. Request-to-Exit:

- 1. Request to exit sensors are integrated into electrified door hardware. Contractor to provide wiring to door hardware integrated request to exit devices.
 - 2. In some instances where integrated request to exit are not part of electrified door hardware provide dedicated Bosch DS160REX Series High Performance Request-to-Exit Detectors or approved equal. I. Local Door Alarm:
 - 1. Provide DSI Model ES4200-K0-T1 local alarm locations shown on the Drawings.
 - 2. Device shall include alarm sounder, alarm output for forced door connected to the Access Control System panel, and bypass output connected to the Access Control System.
 - 3. Configure an individual point on the Access Control System to monitor the bypass status of each local alarm. Configure an individual output on the Access Control System to remotely reset the door alarm and or bypass the door alarm.
 - 4. Provide Altronix AL300ULX 2.5 amp, 24VDC power supply, Altronix PD8ULCB, and 7Ah batteries in enclosure to power the local alarms.
- H. Lockdown button: STISS2475LD-EN

1. Lockdown button to be installed at all exterior entrances. Any door leading into a classroom. Refer to the room data sheets for more information.
2. Lockdown button to integrate with access control panel to override any door schedule to lockdown any card reader preventing any user access. Further coordination with LACCD is required.

2.3 GENERAL EQUIPMENT AND MISCELLANEOUS

A. Cabling, and Misc.

1. Use plenum-rated versions of the cables listed below in accordance with the NEC and all local codes.
2. Cables (Non-Plenum Applications):
 - a. Ethernet cable to PoE networked Door I/O controller.
 - 1) Windy City CAT6A UTP
 - b. Power (Electrified door lock):
 - 1) Twisted pairs, 18/2 AWG. 2) Windy City or equal.
 - c. OSDP Composite access control cable
 - 1) Windy City OSDP access control cable
 - d. RS-485:
 - 1) two twisted pairs with shield, 24 AWG, 120 ohms, 23 pF 2) Windy City or equal.
 - e. Alarm Input:
 - 1) Twisted pair, 30 ohms, max. 2) Windy City or equal.

PART 3 EXECUTION

3.1 GENERAL

- A. All types of equipment installed by competent workers at locations shown on the drawings in strict accordance with approved shop drawings and manufacturer's instructions.
- B. All delivered equipment, except portable equipment, firmly fastened or held in place. Apply a minimum safety factor of four (4) times the load for all equipment fastenings and supports.
- C. Take necessary precautions to prevent and guard against electro-magnetic and electrostatic hum and to install the equipment to provide safety for the operator.
- D. Protect all equipment, including patch panels, connectors, receptacles, enclosure, and backup battery, from construction dust and debris until final acceptance of the system.

3.2 INTEGRATION/INSTALLATION

- A. Conformance to Existing Facility Standards
 1. Wherever possible provide equipment, finishes, and interfaces similar in nature to systems already in use by the Owner. Provide uniform functionality and

operation to enhance ease of use and minimize instruction. Provide uniform finishes and equipment to enhance the aesthetic unity of systems facility wide, and to improve end-user familiarity with equipment.

2. Equipment Integration:
 - a. New Equipment: Unless otherwise specified, supply only new equipment, parts, and materials, and protect all equipment from construction dust and debris until final acceptance.
 - b. Equipment Handling and Wear: Operate specified equipment only as required for testing, as part of the installation procedure.
 - c. Single Source: The provision of all manufactured components, installation, wiring, and testing is the responsibility of a single Contractor.
 - d. All equipment and installations under this Specification shall conform to the latest edition of the following:
 - 1) ANSI/NFPA 70 - National Electrical Code.
 - 2) ANSI/IEEE C2 - National Electrical Safety Code
 - 3) ANSI/TIA Standards 568, 569 and 607
 - 4) IEEE/ANSI 142-2007 - Recommended Practice for Grounding of Industrial and Commercial Power Systems.
 - 5) Standard for Access Control Units
 - e. The Contractor shall not install any card reader, keypad, request-to-exit, or any other component located in exposed areas until a walkthrough has been scheduled for visual placement with final approval from the design team. The locations shown on the drawings are for reference purposes only, the Architect and Owner shall sign off on all final locations prior to the installation of the final devices with possible relocations based upon site conditions, these services shall be included in the contractor's base bid.
 - f. Equipment subject to public contact shall be installed with a torx head or equal security fasteners unless protected by a factory supplied cabinet lock.
 - g. Junction boxes, utility boxes, or other electrical enclosures housing system wiring not protected by factory supplied locks shall be installed with a torx head or equal security fastener.
 - h. Interior mounted equipment shall be installed after room finishes have been completed to protect the equipment from contamination.
3. Equipment Quantities:
 - a. Determine and provide the quantities of installed equipment based on the Bid Documents including the plans, functional diagrams, riser diagrams, and specification.
 - b. Quantities of portable equipment are indicated in schedules contained in the drawings or specifications.
4. Engineering and Documentation:
 - a. The system drawings indicate the general layout of the various items of equipment and their functional relationships. The layout of equipment, accessories, and conduit systems are diagrammatic unless specifically detailed and do not necessarily indicate every item or parameter required for a complete installation.
 - b. The Contractor shall provide any incidental equipment needed to result in a complete and operable system even if not specified or shown on drawings without claim for additional payment.

B. Labels

1. Dry transfer, "Dymo", or other types of adhesive labels not acceptable
 2. Except where otherwise specified label as shown on drawings, and as specified, each item of rack-mounted equipment and all switches, controls, and receptacles.
 3. Switch and Control Panels: Constructed of engraved and filled anodized aluminum plates. Minimum 1/8" plate thickness.
 4. Rack-Mounted Equipment: Labels constructed of engraved and filled plastic laminate engraving stock. Designate function and input and output line(s) or loudspeaker(s) served by labeled equipment. Key all designations to system functional and patch panel diagrams. Where possible, mount labels on blank panel directly above corresponding component. For modular equipment, provide label on inside of mainframe door identifying type of module for each slot (unless there is only one type) and gain setting as established at final checkout.
 5. Identification Panel: See drawings for layout and nomenclature. The contractor is responsible for completing all bracketed items with the appropriate projectspecific information.
 6. Branding and Recognition: Identification of the contractor or use of contractor logos or similar "trademarks" or "signatures" (including but not limited to touch panel graphics and color schemes, silk-screened or engraved corporate logos, copyrighted fonts, and/or custom emblazoned panels) is strictly forbidden except where explicitly indicated within the bid documents. Any unauthorized use of these marks will be rejected.
 7. Receptacles: Engrave and fill receptacle label directly on mounting plate as indicated on drawings.
 8. Identify all wires and cables at every termination and connection point in accordance with the Owner's standards using the specified cable markers, unless otherwise instructed by the Owner. Use a numbering scheme that identifies all cables terminating at patch panel jacks with the patch bay row and jack designation; use A, B, and C suffixes to distinguish multiple cables terminating at the same jack. Submit proposed numbering scheme for approval prior to installation.
 9. Identify switches, relays, terminal blocks, etc., with reference numbers keyed to the as-built wiring diagrams.
 10. Room numbers appear on the contract documents for reference only. All labels shall reflect the Owner's final room designations.
 11. All labels and legends shall be as approved on shop drawings.
- C. Racks, Cables, Connectors, and Miscellaneous Equipment
1. Wiring and Interconnections:
 - a. General:
 - 1) Exercise care in wiring to avoid damage to cables and equipment.
 - 2) Make all joints and connections with rosin-core solder or approved mechanical connectors.
 - 3) All wiring is executed in strict adherence to standard security practices. This includes:
 - a) Dress cables in conveniently sized bundles, combed into parallel runs, either laced or banded with sufficient plastic ties.
 - b) For equipment mounted on glides, or otherwise requiring servicing from the front of the rack incorporate a cable "service loop" of sufficient length to permit the equipment to be pulled forward from the rack for servicing.

- c) Support cables and bundles with sufficient plastic ties and support bars to ensure that no strain is placed on any connections or connectors.
 - d) Organize cables and cable bundles behind patch bays to permit easy access to the patch panels to add or remove cables.
- b. Grounding:
- 1) If not shown in drawings, ground case of power strip lines in equipment racks to the racks and directly to isolated ground buss in the power panel or to power system ground at the building AC service entry only.
 - 2) Ground all conduits ONLY to power system ground. Insulate all conduits and electrical boxes from ACS, including equipment racks.
 - 3) Insulate all conductors in conduit, including shields, from the conduit, back boxes, and from each other for the entire conduit length.
- c. Equipment Racks:
- 1) Install equipment in racks to permit access to all equipment for service. Relays, terminal blocks, etc., mounted in rear of racks behind other equipment shall not prevent access to equipment connections or shall be mounted on hinged panels to permit access.
 - 2) Where racks or cabinets are provided under this Section, wire all racks completely in the shop. No internal rack wiring is to be done on the job site.
 - 3) Install equipment in racks with ventilating panels as required to provide adequate ventilation and according to equipment manufacturer's recommendations.
 - 4) Where racks or cabinets are provided under this Section, provide unused panel space with blank or ventilating panels as shown on drawings.
 - 5) Locate free-standing racks as indicated and provide access to rear.
- d. Conduit:
- 1) Run all lines in metallic conduit or wireways unless otherwise indicated.
 - 2) Do not splice lines in conduit.
- e. Receptacles:
- 1) Provide a finished sample for approval by Architect.
 - 2) Wall-mounted receptacles in metal boxes at building standard receptacle height unless otherwise indicated.
- D. Wiring
- 1. Install systems wiring in accordance with the latest edition of local codes.
 - 2. Any miscellaneous Ethernet cabling required, but not installed under Division 27, must be installed in accordance with Division 27.
 - 3. Low voltage and coax cabling above access ceilings shall be grouped and supported every 3' (and within 6" of terminations) with clips intended for this use. Low voltage and coax cabling in new wall construction shall be run in EMT sized to no more than 40% fill capacity. Low voltage and coax cabling along interior existing walls shall be run in surface metal raceway. Minimize use of surface metal raceway by routing vertically into ceiling spaces.
 - 4. Label and color code wiring systems with labeling and coding shown on shop drawings.
 - a. Use white conductors only for neutral conductors and green only for grounding conductors.

- b. Group conductors within junction boxes, pull boxes and equipment enclosures and lace with nylon tie straps with identification tags in individual sets, serving individual locks or groups. Conductor group shall be identified on the tag with respect to room or area served.
 5. Standard wire shall be terminated with solderless, crimp-on, or insulated lugs properly sized for the gauge of wire and screw or push-on connection. The use of clamp type terminal connections is permitted. Pigtail and wire-nut connections are only permitted when equipment is supplied by the manufacturer in that manner as the only means of connection.
 6. Point-to-point wiring less than 1,000 feet shall be installed with no splices. If wire runs exceed 1,000 feet, splices are acceptable in accessible junction or pull boxes.
- E. Integrated Security Software (ISS)
1. Coordinate ISS workstation hardware requirements with Owner.
 2. Install the ISS software on an Owner-furnished computer.
 3. Add Users, configure the system, add devices and groups, configure event management, and create and add E-maps, as directed by the Owner.
 4. Integrate alarms with the building's e-call system, as required.
 5. Integrate the ISS with the video surveillance system using the video management system's API, if available.
 6. Provide copies of all configuration and support files to allow the Owner to reconfigure the system.

3.3 SYSTEM PERFORMANCE TESTS AND ADJUSTMENTS

- A. Test all equipment to verify conformance with manufacturer's performance specifications and with this specification.
- B. At a minimum, the following items shall be verified:
- C. Cable Management, Termination, and Labeling Verification Item Numbers and Descriptions
 1. CABL-100 – Cable Bend Radius
 - a. Verify that cables are not bent beyond their minimum bend radius as specified in cable data sheet to maintain signal integrity as defined in the project documentation.
 2. CABL-101 –Connector Plate Input and Output Labeling
 - a. Verify that all ACS connector plate inputs and outputs are labeled as defined in the project documentation.
 3. CABL-102 –Connector Seating
 - a. Verify that all ACS connectors are correctly keyed, seated, and latched to respective connection points as defined in the project documentation. Conditions where physical parameters exceed the connector's ability to maintain full seating should be resolved as defined in the project documentation.
 4. CABL-103 –Connector Verification
 - a. Verify that all ACS cable terminations are made securely and meet the recommendations of the connector and cable manufacturer(s), published standards, and requirements defined in the project documentation.
 5. CABL-104 –Equipment Power Cable Management

- a. Verify that all ACS equipment power cables are managed as defined in the project documentation. Verify that cables are managed in a uniform and acceptable manner so as not to compromise safety/OEM warranty, ACS signal quality, and/or future field service.
6. CABL-105 – ACS Cable Labeling
 - a. Verify that all ACS cables are identified by a unique ID as defined in the project documentation. Verify that this unique ID is displayed permanently at both ends of the cable, is legible, and is positioned where it can be seen without undue disturbance.
7. CABL-106 – Cable Separation
 - a. Verify that both site and rack cables have appropriate separation according to signal type and level as defined in the project documentation.
8. CABL-107 – Cable Supports
 - a. Verify that all cables are supported throughout their lengths as defined in the project documentation.
9. CABL-108 – Cable Ties
 - a. Verify that, where appropriate, cable ties are used to secure the cables, are correctly tensioned, and that the correct type of cable tie(s) is used as defined in the project documentation.
10. CABL-109 – Cables Bundled by Type
 - a. Verify that cables are only bundled together when their construction, signal type, and signal level are compatible and will not cause measurable crosstalk or interference between cables.
11. CABL-110 – Cables Dressed
 - a. Verify that cables are dressed to ensure that all rack and site cables are installed to provide serviceability, safety, and aesthetics as defined in the project documentation.
12. CABL-111 – Patch Panel Configuration
 - a. Verify that all patch panels have been correctly wired and configured as defined in the project documentation.
13. CABL-112 – Patch Panel Labeling
 - a. Verify that all patch panels have been labeled as defined in the project documentation. Verify that all labeling is machine-printed, consistent, durable, accurate, and legible.
14. CABL-113 – Termination Stress
 - a. Verify that all cable terminations have been completed and adequately supported to minimize stress on the termination point and/or connector.
15. CABL-114 – Connector Plate Consistent Labeling
 - a. Verify that ACS connector plates have consistent labeling throughout the project as defined in the project documentation.
16. CABL-115 – ACS Cabling Verification
 - a. Verify that all cabling is the correct type and routed correctly from point to point as defined in the project documentation.

17. CABL-116 – Cable Length Required for Serviceability
 - a. Verify that sufficient cabling is available so the device can be placed in a serviceable location as defined in the project documentation.
- D. Control Performance Reference Verification Item Numbers and Descriptions
 1. CON-100 – Control System Communications
 - a. Verify that all control communications are tested from endpoint to endpoint via the appropriate midpoint(s) for operation and functionality as defined in the project documentation.
 2. CON-101 – Interfacing and Control of External Devices and Systems
 - a. Verify that ACS control system interfaces to and from control systems provided by Division 281300 Contactor conform to requirements as defined in the project documentation.
 3. CON-102 – Mobile Device Integration
 - a. Verify that mobile devices that are to be supported are integrated and operating as defined in the project documentation.
 4. CON-103 – System Response to Event Condition(s)
 - a. Verify that any required response of the installed ACS in the event of a configured event operates as defined in the project documentation.
 5. CON-104 – Control System Automated Functions
 - a. Verify that all time-dependent or automated functions executed by the control system conform to requirements as defined in project documentation.
 6. CON-105 – Control System User Interface Performance
 - a. Verify that the control system is implemented in a manner consistent with the requirements as defined in the project documentation.
- E. System and Record Documentation Reference Verification Item Numbers and Descriptions
 1. DOC-100 – Final Inventory of ACS Equipment
 - a. Verify that all equipment has been delivered as defined in the project documentation.
 2. DOC-101 – Approval of Samples
 - a. Verify that samples of all equipment to be used as defined in the project documentation have been submitted for approval.
 3. DOC-102 – Delivered Product Against Samples
 - a. Where samples of products have been required for approval, verify that the products that are delivered are the same and of the same quality.
 4. DOC-104 – Consultant's Testing
 - a. Verify that any consultant's testing requirements defined in the project documentation have been performed and approved.
 5. DOC-105 – General Contractor's Testing
 - a. Verify that any general contractor's testing requirements defined in the project documentation have been performed and approved.

6. DOC-106 – Integrator’s Testing
 - a. Verify that any integrator’s testing requirements have been performed and approved as defined in the project documentation.
7. DOC-107 – Manufacturer’s Testing
 - a. Verify that any manufacturer’s testing requirements defined in the project documentation have been performed and approved.
8. DOC-108 – Owner’s Testing
 - a. Verify that any owner’s testing requirements defined in the project documentation have been performed and approved.
9. DOC-109 – Third-Party Testing
 - a. Verify that any third-party testing requirements have been performed and approved as defined in the project documentation.
10. DOC-110 – Substantial/Practical Completion
 - a. Verify that a conditional acceptance of the project has been issued by the owner or owner’s representative, acknowledging that the project or a designated portion is substantially/practically complete and ready for use by the owner, however some requirements and/or deliverables defined in the project documentation may not be complete.
11. DOC-111 – As-Built Drawings Complete
 - a. Verify that a complete set of accurate as-built drawings indicating all ACS devices, ACS device locations, mounting details, system wiring and cabling interconnects, and all other details has been provided as defined in the project documentation.
12. DOC-113 – Control System Test Reporting
 - a. Verify that the control system test report has been completed and issued as defined in the project documentation.
13. DOC-114 – Final Commissioning Report and System Turnover
 - a. Verify that the final commissioning report has been completed, issued to the proper entity, and accepted as defined in the project documentation.
14. DOC-115 – Required Closeout Documentation
 - a. Verify that a complete set of as-built system documentation has been provided as defined in the project documentation.
15. DOC-116 – Software Licensing
 - a. Verify that the usage and ownership rights have been assigned as defined in the project documentation.
16. DOC-117 – User Manuals
 - a. Verify that manufacturer’s user manuals are delivered to the owner in a format defined in the project documentation (e.g., binders, PDFs), or dispose of the manuals in a responsible manner (recycling) if the owner specifies that they do not wish to receive the manuals.
 - b. Integrator- or programmer-created manuals and documentation shall be delivered to the owner in a format defined in the project documentation.
17. DOC-119 – Warranties

- a. Verify that all warranties are activated and that all warranty details have been passed to the owner as defined in the project documentation.
18. DOC-120 – Final Acceptance
 - a. Verify that a final acceptance of the project has been issued by the owner or owner’s representative, acknowledging that the project is 100% complete, that all required deliverables, services, project-specific verification lists, testing, verification and signoffs have been received, and that all requirements defined in the project documentation have been satisfied and completed.
- F. Electrical Reference Verification Item Numbers and Descriptions
1. ELEC-100 – ACS Equipment Connected to Proper Circuit
 - a. Verify that all ACS equipment is powered from the designated power circuit and outlet as defined in the project documentation. No additional (non-ACS) equipment should be connected unless permitted in the project documentation.
 2. ELEC-101 – Grounding/Earthing
 - a. Verify that all elements of the ACS are correctly bonded to an electrical ground/earth in accordance with the requirements of the regulatory authority and as defined in the project documentation.
 3. ELEC-102 – Mains Voltage Sub-Distribution Integrity
 - a. Verify that all electrical sub-distribution systems provided by the Contractor in equipment racks, consoles, and similar structures meet local regulatory requirements for electrical integrity.
 4. ELEC-103 – Power Sources
 - a. Verify that the sources of mains voltage AC power to be used for the supply of ACS equipment are correct as defined in the project documentation and have been tested to the outlet in accordance with local electrical standards.
 5. ELEC-104 – Power Sequencing
 - a. Verify that the power sequencing of devices is correct as defined in the project documentation.
 6. ELEC-105 – UPS Operation
 - a. Verify that the uninterruptible power supply (UPS) is performing to the specifications as defined in the project documentation.
 7. ELEC-106 – DC Power Distribution
 - a. Verify that all DC powered devices are receiving the proper voltage and current for normal operation.
 8. ELEC-107 – Power Loss Recovery
 - a. Verify that the ACS resume normal operation on the restoration of power following a hard electrical power outage. Power loss recovery shall include verification of the resumption state on power recovery. Resumption state shall be the control system start-up condition/start page (where applicable) and resetting all devices to a known state as defined in the project documentation.
- G. Operations and Support Reference Verification Item Numbers and Descriptions
1. OP-100 – Software

- a. Verify that all control programming code, configuration files, and any other associated software have been provided as defined in the project documentation.
- H. Physical Environment Verification Item Numbers and Descriptions
- 1. PHYSE-101 – Human Factors, Usability, and Ergonomics
 - a. Verify that ergonomics and usability elements for system users are installed and configured as defined in the project documentation.
 - 2. PHYSE-104 – Backing/Blocking/Framing
 - a. Verify that installed backing, blocking, and framing meets project documentation requirements and industry standards for installation means and methods.
 - 3. PHYSE-105 – Clean Building Handover
 - a. Verify that the area is clean, free of dust, and suitable for equipment installation and that no further work is planned that will release contaminants into any ACS equipment area.
 - b. Verify that the area released is isolated from any areas not yet released.
 - 4. PHYSE-106 – Coordinated Construction Elements
 - a. Verify that the elements (including but not limited to spatial requirements and building services) required by the ACS that are coordinated with other disciplines have been provided as defined in the project documentation.
 - 5. PHYSE-107 – Device Enclosures
 - a. Verify that device enclosures accommodate the intended device and that all necessary environmental controls (e.g., heating, cooling, humidity) are incorporated into the enclosure as defined in the project documentation.
 - 6. PHYSE-108 – Finishes
 - a. Verify ACS equipment, furniture, fixtures, and accessories against the project documentation.
 - 7. PHYSE-109 –Wall Boxes/Ceiling Boxes
 - a. Verify that installed wall and ceiling boxes meet project documentation and regulatory authority requirements.
 - 8. PHYSE-112 – Structural Mounting
 - a. Verify configuration and compatibility of structural accommodations and all mounting hardware based on the intended application. All equipment mounting hardware shall be installed in the manner specified by the hardware manufacturer.
 - 9. PHYSE-113 – Protection of Installed Equipment
 - a. Verify that all elements of the ACS are free of damage.
 - 10. PHYSE-114 – Accessibility
 - a. Verify that all systems are accessible in accordance with regulatory requirements.
- I. Physical Installation Reference Verification Item Numbers and Descriptions
- 1. PHYSI-100 – Cable Containment/Conduit
 - a. Verify that installed containment/conduit capacity and routes meet project documentation requirements, industry standards, and regulatory requirements for installation means and methods.
 - b. Verify that installed containment/conduit is serviceable and free of contaminants.

2. PHYSI-102 – Equipment Security
 - a. Verify that equipment is secured as defined in the project documentation.
 - b. Verify that all security systems, devices, and manufacturer security accessories are installed and verified to be operating as defined in project documentation.
 - c. Verify that keyed devices have been keyed as defined in the project documentation and devices requiring configuration have been configured as defined in the project documentation and are verified to be operating within specification.
3. PHYSI-103 – ACS Equipment Labeling
 - a. Verify that all ACS equipment has been labeled in accordance with the requirements of the project documentation. All labeling must be consistent, durable, accurate, and visible without dismantling of sub-assemblies.
4. PHYSI-104 – Plumb and Level/Square
 - a. Verify that all ACS equipment has been installed, aligned, or angled correctly as defined in the project documentation. Level and plumb are the default requirement unless particular angles or other alignments are defined in the project documentation.
5. PHYSI-105 – Site Security
 - a. Verify that all elements of the ACS are free from loss, damage, or tampering.
6. PHYSI-106 – ACS Equipment Location
 - a. Verify that ACS equipment is installed at the location and/or in the rack or enclosure as defined in the project documentation. Equipment is installed per the elevation or other specification provided by the project documentation or the manufacturer's specification.
7. PHYSI-107 – ACS Rack Cleanliness
 - a. Verify that all components installed in ACS equipment racks are free from dirt, dust, water, or any other element that would compromise the performance and/or longevity of the ACS.
8. PHYSI-108 – Non-End-User Controls Protection
 - a. Verify that installed items with user-facing controls that are not intended for end-user access have been covered, disabled, or otherwise secured to prevent end-user operation.
9. PHYSI-110 – Handling of Accessories Otherwise Undefined
 - a. Verify that all items that are pre-packaged with primary system equipment but have no documented/planned use in the ACS(s) are managed in accordance with the project documentation.
10. PHYSI-111 – Turnover of Accessory System Elements
 - a. Verify that any equipment that may be considered portable and/or otherwise not specifically incorporated into the installed ACS(s) has been set up, configured, and tested.
 - b. Serviceability Reference Verification Item Numbers and Descriptions
11. SERV-100 – Access Panels
 - a. Verify that any access panels that have been installed to provide access to any type of ACS equipment are properly sized and positioned as detailed in the project documentation.

12. SERV-101 – Ability to Maintain and Service Equipment
 - a. Verify that all equipment is accessible and capable of being maintained, serviced, cleaned, or adjusted, as necessary.
 - b. Verify that all equipment requiring regular cleaning or maintenance is accessible without requirement for special equipment or tools that would disrupt the normal use of the facility and systems therein.
 13. SERV-102 – Input and Output Panel Accessibility
 - a. Verify that all input and output panels are accessible and meet all requirements for user access and placement.
 14. SERV-103 – Rack Clearance
 - a. Verify rack placement and use for physical stability in accordance with the project documentation and regulatory authority.
- J. Acknowledgement of Conformance to the Requirements

Acknowledgment of conformance to the Requirements shall include the following written statement, authored and signed by the system verifier, stating that all requirements of this Section have been completed, the date of completion, and that the handover of the completed, verified system is finalized.

“The system verifier acknowledges that the performance of this ACS has been verified in conformance with all required processes and contains all required elements as documented within this Section.

SYSTEM VERIFIER

DATE

3.4 FINAL ADJUSTMENTS AND ACCEPTANCE TESTS

- A. Upon approval of the contractor's test report, and at a time set by the Owner or Owner's authorized representative, perform final system adjustments and acceptance tests. Provide all labor, material, tools, and measurement equipment necessary for these tests and adjustments, including the test equipment and material specified, except as otherwise specified.
- B. The contractor's representatives performing these tests shall be thoroughly familiar with all details of the system and shall include the field supervisor in overall charge during the installation work.
- C. Budget eight (8) working hours for the performance of these tests and adjustments. If final acceptance is delayed beyond this period because of installation not in accordance with these specifications, pay for all additional time and expenses of Owner-designated observers during any resultant extension of the acceptance testing period. D. Adjustments: Adjust the system as instructed by the ACS Consultant.

3.5 TRAINING

- A. The Owner may assign personnel to participate with the contractor during installation. Without delaying the work, familiarize the Owner's personnel with the installation, equipment, and maintenance.
- B. During tests and adjustments, permit the Owner's personnel to observe. When feasible explain the significance of each test.
- C. After the completion of FINAL ADJUSTMENTS AND ACCEPTANCE TESTS, provide on-site training to the end-user to instruct them on the proper use of each system, including:
 - 1. Explain operation of control systems and overall function of installed systems to staff selected by the Owner as "requiring general instruction".
 - 2. Explain operation of control systems, set-up, and operation of individual pieces of equipment, functions of overall systems, and rudimentary service guidelines to staff selected by the Owner as "requiring technician level instruction".
 - 3. If requested by the Owner, record these training sessions, and provide them to the Owner for future reference by the Owner's personnel.
 - 4. After successful training, a repair sequence (schedule of responsibility, response tree, etc.) should be established with any "technician level" staff, designated by the Owner as responsible for ACS operation and maintenance, to expedite service calls.
- D. Separate from the bid response quotation; provide an hourly cost for additional training.

3.6 WARRANTY

- A. Unless otherwise described in Division 01, provide for the warranty of the delivered system under the following terms and exclusions:
- B. Basic Warranty
 - 1. Basic Warranty provided by the Integrator shall include repair or replacement for one year from date of Final Acceptance on all ACS Equipment provided (including products having a manufacturer's warranty of less than one year) and all Integrator workmanship. Basic Warranty shall be provided at no additional cost, except in case of obvious abuse.
 - 2. During the Basic Warranty period the Integrator shall:
 - a. Provide telephone support within 4 hours of a call requesting service.
 - b. Provide emergency service: Within 24 hours of a call requesting service not corrected by telephone support, restore the system to operation, replace defective materials and repairing faulty workmanship. Make temporary repairs and provide loaner equipment at no charge if defective materials cannot be permanently replaced or repaired within this 24-hour period. Repair or replace faulty items within 72 hours of on-site service or within manufacturers' specific repair program whichever is quicker.
 - 3. Integrator shall not involve the Owner with removing, re-installing equipment, shipping, or receiving equipment being repaired under Basic Warranty, nor shall the Owner be responsible for any shipping or freight charges associated with any item under warranty.
 - 4. The Owner shall be copied with all paperwork related to all warranty work during the Basic Warranty period.
 - 5. The Basic Warranty period will commence no sooner than the date of first beneficial use by the Owner and no later than the date of contract closeout.
 - 6. Paint and exterior finishes, and batteries and other consumables excluded from above warranties except when damage or failure results from defective materials or workmanship covered by warranty.
 - 7. The terms of individual equipment manufacturers' warranties are not diminished by the minimum warranty provisions specified above.

C. Preventative Maintenance

1. Within the term of the one-year Basic Warranty period the Integrator shall provide, at no additional cost, periodic Preventative Maintenance on the installed ACS to ensure proper ongoing maintenance and operation.
2. A minimum of four (4) Preventive Maintenance visits shall be provided.
3. Preventative Maintenance shall include, but not be limited to, the following:
 - a. Reviewing control system functionality
 - b. Any other maintenance and adjustments necessary to ensure that the ACS is in proper working order.
4. Any problems or issues noted by the users or other Owner representatives shall be documented and completely resolved at each of the scheduled visits.
5. Preventative Maintenance Schedule
 - a. 90 days (± 15 days) after the commencement of the Warranty Period.
 - b. 180 days (± 15 days) after the commencement of the Warranty Period.
 - c. 270 days (± 15 days) after the commencement of the Warranty Period.
 - d. 20 days (± 10 days) before the end of the Warranty Period.

D. Extended Warranty

1. The Integrator may elect to propose to the Owner the offer of Extended Warranty coverage for the ACS. Extended Warranty shall be any optional warranty services offered by the Integrator that expand on and complement the Basic Warranty coverage required by this Specification. Any provisions of Extended Warranty coverage shall not release the Integrator from responsibility for performance of all requirements under the Basic Warranty coverage.

E. Software Support

1. The Bidder shall also offer an annual Software Maintenance contract. This shall cover all software provided as part of this system and/or written for this system and shall include routine upgrades to applications and operating systems. The Software Maintenance contract shall commence immediately after expiration of the warranty period and continue for three years. Maintenance visits will be four times per year and shall be scheduled to coincide with the periodic system maintenance of the system.

END OF SECTION

SECTION 28 16 00
INTRUSION DETECTION

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Intrusion detection system requirements.
- B. Alarm control panel.
- C. Keypads.
- D. Initiating devices.
- E. Accessories.

1.02 RELATED REQUIREMENTS

- A. Section 28 13 00 - Access Control: For interface with the intrusion detection system.
- B. Section 28 23 00 - Video Surveillance: For interface with the intrusion detection system.
- C. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.03 REFERENCE STANDARDS

- A. NECA 1 - Standard for Good Workmanship in Electrical Construction.
- B. NFPA 70 - National Electrical Code.
- C. UL 609 - Local Burglar Alarm Units and Systems.
- D. UL 634 - Connectors and Switches for Use with Burglar-Alarm Systems.
- E. UL 639 - Intrusion-Detection Units.
- F. UL 1076 - Proprietary Burglar Alarm Units and Systems.
- G. UL 1610 - Central-Station Burglar-Alarm Units.

1.04 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate compatibility of devices for the installed locations with work provided under other sections or by others.
 - 2. Coordinate the placement of sensors and keypads with millwork, furniture, equipment, etc. installed under other sections or by others.
 - 3. Coordinate the work with other installers to provide communication lines required for alarm control unit connection to central station.
 - 4. Notify Architect of any conflicts with or deviations from Contract Documents.
Obtain direction before proceeding with work.
- B. Preinstallation Meeting: Conduct meeting with facility representative and other related equipment manufacturers to discuss intrusion detection system interface requirements.

- C. Sequencing:
 - 1. Do not install sensors and keypads until final surface finishes and painting are complete.

1.05 SUBMITTALS

- A. See Section 01 33 00 - Submittal Procedures, for submittal procedures.
- B. Product Data: Provide manufacturer's standard catalog pages and data sheets for each system component. Include ratings, configurations, standard wiring diagrams, dimensions, finishes, service condition requirements, and installed features.
 - 1. Motion Detectors: Include detailed motion detection coverage range diagrams.
- C. Shop Drawings: Include plan views indicating locations of system components and proposed size, type, and routing of conduits and/or cables. Include system interconnection schematic diagrams. Include requirements for interface with other systems.
- D. Design Data: Include standby battery calculations.
- E. Certify that proposed system design and components meet or exceed specified requirements.
- F. Evidence of qualifications for installer.
- G. Evidence of qualifications for maintenance contractor (if different entity from installer).
- H. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and operation of product.
- I. Manufacturer's detailed field-testing procedures.
- J. Field quality control test reports.
- K. Operation and Maintenance Data: Include detailed information on system operation, equipment programming and setup, replacement parts, and recommended maintenance procedures and intervals.
 - 1. Include contact information for entity that will be providing contract maintenance and trouble call-back service.
- L. Warranty: Submit sample of manufacturer's warranty and documentation of final executed warranty completed in LACCD's name and registered with manufacturer.
- M. Maintenance contracts.
- N. Project Record Documents: Record actual locations of system components and installed wiring arrangements and routing.
- O. Software: One copy of software not resident in read-only memory.
- P. Maintenance Materials: Furnish the following for LACCD's use in maintenance of project.
 - 1. See Section 01 60 00 - Product Requirements, for additional provisions.
 - 2. Extra Fuses: Two for each type and size installed.
 - 3. Extra Initiating Devices: One for each type installed.

1.06 QUALITY ASSURANCE

- A. Comply with requirements of NFPA 70.
- B. Maintain at the project site a copy of each referenced document that prescribes execution requirements.

- C. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this section with a minimum of three years documented experience.
- D. Installer Qualifications: Company specializing in performing the work of this section with minimum three years documented experience with intrusion detection systems of similar size, type, and complexity and providing contract maintenance service as a regular part of their business; authorized representative of control unit manufacturer.
Maintenance Contractor Qualifications: Same entity as installer.
- F. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Receive, inspect, handle, and store products in accordance with manufacturer's instructions.
- B. Store products in the manufacturer's unopened packaging, keep them dry and protect them from damage until ready for installation.

1.08 FIELD CONDITIONS

- A. Maintain field conditions within the manufacturer's required service conditions during and after installation.

1.09 WARRANTY

- A. See Section 01 77 00 - Closeout Procedures, for additional warranty requirements.
- B. Provide minimum two-year manufacturer warranty covering repair or replacement due to defective materials or workmanship.

PART 2 - PRODUCTS

2.01 INTRUSION DETECTION SYSTEM REQUIREMENTS

- A. Provide new intrusion detection system consisting of all required equipment, conduit, boxes, wiring, connectors, hardware, supports, accessories, software, system programming, etc. as necessary for a complete operating system that provides the functional intent indicated.
- B. Arm/Disarm Keypads
 - 1. Placement:
 - a. In areas/zones requiring IDS sensors, but with undetermined regular monitoring hours for automatic arming/disarming.
- C. In areas/zones needing individual control of arming/disarming outside of scheduled monitoring times.
- D. Magnetic Contacts
 - 1. Placement:
 - a. All exterior building doors.
 - b. Any doors with controlled access via PACS.
 - c. Access hatches or doors leading to potentially hazardous areas lacking PACS or video surveillance coverage.
 - d. Ground floor operable windows allowing entry without using a door.

- E. Glass Break Sensors
 - 1. Placement:
 - a. Areas/zones housing highly valuable assets accessible from the building's exterior through glass breakage.
- F. Dual-Technology Motion Detectors
 - 1. Placement:
 - a. Areas/zones where privacy concerns prevent mounting video surveillance cameras but require motion detection.
 - b. Areas/zones with valuable assets benefiting from both cameras and dedicated motion sensors.
- G. Duress (Panic) Buttons
 - 1. Placement:
 - a. Areas/zones where significant cash amounts are handled.
 - b. Areas/zones used for disciplinary activities.
 - c. Offices of executive staff members.
- H. These placement guidelines ensure comprehensive coverage for the Intrusion Detection System (IDS) within LACCD facilities, enhancing security and response capabilities as per established standards and needs. Alarm Notification and Reporting Requirements:
 - a. Activate alarm notification at alarm control unit and associated keypads/annunciators with appropriate zone information displayed.
 - b. Transmit alarm report to LACCD Public Safety Office.
 - 1. Primary Communication Means: Digital cellular communications.
 - 2. Secondary Communication Means: Internet/intranet (IP addressing).
- I. All intrusion functionalities shall be monitored and controlled from within Alarm Monitoring in OnGuard. Interface with Access Control:
 - a. Provide products compatible with Lenel OnGuard requiring interface with intrusion detection system.
 - b. Interface with access control system as specified in Section 28 13 00.
 - 1. Capable of affecting access for designated doors for selected intrusion detection system events.
 - 2. Capable of affecting intrusion detection system status for selected access control system events.
 - 2. Interface with video surveillance system as specified in Section 28 23 00.
 - a. Capable of activating video surveillance system and controlling camera inputs/video outputs for selected intrusion detection system events.
 - 3. Interface with electrically operated door hardware as specified in Section 08 71 00.
 - a. Capable of locking/unlocking/releasing designated doors for selected intrusion detection system events.
- J. Provide products listed, classified, and labeled as suitable for the purpose intended.
 - a. Local Alarm Units and Systems: Listed and labeled as complying with UL 609.
 - b. Central Station Alarm Units: Listed and labeled as complying with UL 1610.
 - c. Proprietary Alarm Units and Systems: Listed and labeled as complying with UL 1076.
- K. Electromagnetic Interference/Radio Frequency Interference (EMI/RFI) Limits: Comply with FCC requirements of 47 CFR 15, for Class B, consumer application.

2.02 ALARM CONTROL UNIT

- A. Alarm Control Panel: Modular construction.
1. Manufacturer product to be Bosch.
 2. Enclosure: Lockable; provide tamper protection.
 3. Power Supply:
 - a. Primary Power: 120 VAC; provide suitable transformer/power supply; supervised for loss of AC power.
 - b. Secondary Power: Standby battery; provide suitable capacity for minimum standby time required by listing requirements, applicable codes, and authority having jurisdiction, but not less than four hours; provide suitable battery charger; supervised for low battery condition; protected from accidental reversal of battery leads.
- B. Alarm Initiating Circuits: Supervised.
1. Hardwired Zones: Supports both normally closed and normally open conventional (non-addressable) initiating devices.
 2. Addressable Zones: Supports addressable initiating devices and modules using multiplexed polling loops.
 3. Wireless Zones: Supports wireless devices using wireless receivers and repeaters.
 4. Minimum Number of Zones Supported: Equivalent to basis of design.
- C. Alarm Notification Circuits: Supervised.
- D. Communications Interfaces: Supervised.
1. Supports system reporting to central station receivers via integral interface or accessory interface modules using:
 - a. Telephone lines.
 - b. Digital cellular network.
 - c. Internet/intranet (IP addressing).
 - d. Long-range radio (LRR).
 2. Supported Reporting Format(s): Compatible with central station.
 3. Supports split reporting.
- E. Keypads: Supervised.
1. Minimum Number of Keypads Supported: Equivalent to basis of design.
 - a. Bosch Keypad
- F. Peripheral Devices: Supervised; provide tamper protection.
- G. Output Relays:
1. Relay Modules: Form C relays (normally open and normally closed); provide tamper protection.
 2. Programmable to respond to system events, according to defined scheduling, or by manual activation from keypad.
- H. User Codes:
1. Each user code to be individually assignable to any defined authority level for configurable access to system features and functions.
 2. Minimum Number of User Codes Supported: Equivalent to basis of design.
- I. Partitions:
1. Each partition to operate independently with individually programmable annunciation, control, and reporting functions.

2. Supports common partition shared by other assigned partitions.
 3. Each zone to be individually assignable to any partition.
 4. Each keypad to be individually assignable to any partition.
 5. Each output relay to be individually assignable to any partition.
 6. Each user code to be individually assignable to any partition.
 7. Minimum Number of Partitions Supported: Equivalent to basis of design.
- E. Scheduling:
1. Provide time/calendar-based scheduling capability for automated system control.
 2. Supports open/close schedules for control of arming/disarming and reporting.
 3. Supports timed events including, but not limited to:
 - a. Point bypass/unbypass.
 - b. Relay activate/deactivate.
 4. Supports automatic adjustment for daylight savings time.
 5. Supports holiday schedules.
- F. Event Log:
1. Stores system events including time, date, partition, zone, and user code where applicable.
 2. Supports viewing of event log on keypads.
 3. Supports viewing of event log on remote PC.
 4. Minimum Number of Events Stored: Equivalent to basis of design.
- G. Features:
1. Capable of being programmed locally or remotely.
 2. Capable of being armed via key switch.
 3. Supports panic/duress codes.
 4. Supports user interface via:
 - a. Telephone.
 - b. Web browser.
 - c. Mobile device.
 - d. Personal wireless device.

2.03 KEYPADS

- A. Manufacturer: Bosch.
- B. Provides interface to alarm control unit for system control and remote annunciation.
- C. Provides visual notification of system status and zone information.
- D. Provides audible notification to indicate system status, entry/exit delay, and alarm situations; provide separate distinguishable sounds for alarm and trouble conditions.
- E. Keypad Type: LED, LCD, or graphic touch screen keypads are acceptable.
- F. Graphic Touch Screen Keypads: Displays system status and zone information using plain English on graphic display; touch screen interface.
- G. LCD Keypads: Displays system status and zone information using plain English on alphanumeric display; illuminated keys.

- H. LED Keypads: Displays system status and zone information using LED indicators; illuminated keys.
- I. Keypad Color: To be selected by Architect from manufacturer's available standard colors.

2.04 INITIATING DEVICES

- A. Manufacturers: Same as manufacturer of alarm control units where possible.
- B. General Requirements:
 - 1. Provide devices suitable for intended application and location to be installed.
 - 2. Outdoor Units: Weather resistant, suitable for outdoor use.
 - 3. Addressable Systems:
 - a. Addressable Devices: Individually identifiable by control unit.
 - b. Provide suitable addressable modules for connection to conventional (nonaddressable) devices and other components that provide a dry closure output.
 - 4. Wireless Devices:
 - a. Reports sensor status to control panel via self-contained or separate accessory wireless transmitter.
 - b. Sends periodic check-in signals to control panel for reporting of missing devices.
 - c. Reports low battery condition before its battery becomes too discharged to power the transmitter.
 - d. Provide tamper protection.
- C. Contacts (Door):
 - 1. Manufacturer product to be GE 1078/1078CW
 - 2. Listed and labeled as complying with UL 634.
 - 3. Magnetic Contacts: Encapsulated reed switch(es) and separate magnet; designed to monitor opened/closed position of doors or windows.
 - a. Use standard security contacts (not balanced magnetic type) unless otherwise indicated.
 - b. High Security Contacts: Balanced magnetic type; designed to activate upon attempts to defeat contact through external magnetic tampering.
 - 4. Contact Color: To be selected by Architect from manufacturer's available standard colors.
- D. Motion Detectors:
 - 1. Manufacturer product to be Bosch
 - 2. Listed and labeled as complying with UL 639.
 - 3. Dual Technology PIR/Microwave Motion Detectors: Designed to detect intruder using combination of passive infrared technology (by sensing movement of thermal energy between zones) and microwave technology (by sensing frequency shifts in emitted and reflected high frequency microwave signals).
- E. Glass Break Detectors:
 - 1. Manufacturer product to be Bosch.
 - 2. Listed and labeled as complying with UL 639.
 - 3. Suitable for the glass type to be monitored.
 - 4. Accurately discriminates false alarms from true glass break events.
 - 5. Furnished with selectable sensitivity.

6. Acoustic Glass Break Detectors: Designed to analyze ambient sound and activate upon detection of specific audio patterns representative of the sound of breaking glass.
7. Acoustic/Shock Dual Technology Glass Break Detectors: Designed to detect breaking glass using a combination of ambient sound and vibration analysis.

2.05 PANELS

- A. Manufacturer product to be Bosch.

2.06 ACCESSORIES

- A. Provide components as indicated or as required for connection of alarm control unit to devices and other systems indicated.
- B. Provide wireless receivers and repeaters as indicated or as required for communication between wireless devices and alarm control unit; provide tamper protection.
- C. Provide cables as indicated or as required for connections between system components.
- D. Provide end-of-line resistors (EOLR) as required for supervision of hardwired zones.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify that field measurements are as indicated.
- B. Verify that ratings and configurations of system components are consistent with the indicated requirements.
- C. Verify that mounting surfaces are ready to receive system components.
- D. Verify that branch circuit wiring installation is completed, tested, and ready for connection to system.
- E. Verify that conditions are satisfactory for installation prior to starting work.

3.02 INSTALLATION

- A. Perform work in accordance with NECA 1 (general workmanship).
- B. Install products in accordance with manufacturer's instructions.
- C. Wiring Method: Unless otherwise indicated, use cables (not in conduit).
 1. Use listed plenum rated cables in spaces used for environmental air.
 2. Install wiring in conduit where required for rough-in, where required by authority having jurisdiction, and where exposed to damage.
 3. Conduit: Comply with Section 26 05 33.13.
 4. Conceal all cables unless specifically indicated to be exposed.
 5. Cables in the following areas may be exposed, unless otherwise indicated:
 - a. Equipment closets.
 - b. Within joists in areas with no ceiling.
 6. Route exposed cables parallel or perpendicular to building structural members and surfaces.

- D. Provide grounding and bonding in accordance with Section 26 05 26.
- E. Install firestopping to preserve fire resistance rating of partitions and other elements, using materials and methods specified in Section 07 84 00.
- F. Identify system wiring and components in accordance with Section 26 05 53.

3.03 FIELD QUALITY CONTROL

- A. See Section 01 40 00 - Quality Requirements, for additional requirements.
- B. Provide services of a manufacturer's authorized representative to observe installation and assist in inspection and testing. Include manufacturer's detailed testing procedures and field reports with submittals.
- C. Prepare and start system in accordance with manufacturer's instructions.
- D. Inspection and testing to include, at a minimum:
 - 1. Test each initiating device for proper response by alarm control unit.
 - a. Test glass break detectors using only manufacturer's recommended glass break simulation test units.
 - 2. Test for proper operation of alarm notification appliances.
 - 3. Test for proper operation of output relays.
 - 4. Test for proper operation of communication interfaces and central station reporting.
 - 5. Test for proper interface with other systems.
- E. Correct defective work, adjust for proper operation, and retest until entire system complies with Contract Documents.

Submit detailed reports indicating inspection and testing results and corrective actions taken.

3.06 CLOSEOUT ACTIVITIES

- A. See Section 01 77 00 - Closeout Procedures, for closeout submittals.
- B. See Section 01 79 00 - Demonstration and Training, for additional requirements.
- C. Demonstration: Demonstrate proper operation of system to LACCD, and correct deficiencies or make adjustments as directed.
- D. Training: Train the University's personnel on operation, adjustment, and maintenance of system.
 - 1. Use operation and maintenance manual as training reference, supplemented with additional training materials as required.
 - 2. Provide minimum of four hours of training.
 - 3. Instructor: Manufacturer's authorized representative.
 - 4. Location: At project site.

SECTION 28 20 00

VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. The Architectural Drawing Package, marked for Bid, and any current revisions noted by project management.
- C. Security systems drawings and other attached appendices and tables.

1.2 DEFINITIONS OF TERMS

- A. Owner: shall refer to LACCD, and all subsidiaries and affiliates
- B. Architect: shall refer to TBD.
- C. Consultant: shall refer to Vantage Technology Consulting Group. Refer to "PART 1, SUBMITTALS" for any specific identification.
- D. Project/Construction Manager (CM): TBD
- E. General Contractor (GC): shall refer to the lowest responsive GC awarded the construction contract.
- F. Bidder: shall refer to any party proposing to provide the services and material delineated in this Specification.
- G. Bid: shall refer to a Bidder's proposal to provide the services and material delineated in this Specification.
- H. Integrator: shall refer to the awarded contractor for this scope of services.
- I. CCTV Specification (Specification): shall refer to the complete set of designs, performance and delivery requirements delineated within this document and all referenced documents.
- J. CCTV System (Security System): shall refer to the complete complement of equipment, software, and other material that upon completion of assembly, installation and configuration provides the full functionality and technical performance delineated in this Specification.
- K. CCTV Equipment (Security Equipment): shall refer to all individual equipment items and equipment items supplied by Division 282300 Contractor installed as a part of the Video Surveillance System.
- L. Work: Design and provision the CCTV Systems and associated equipment, software, and services for the Project.
- M. Construction Documents: shall include all documentation associated with the design and general construction of the Project, including this Specification.
- N. Provide: Supply (furnish), deliver, install, test, configure, label, and commission.
- O. Manufacturer: shall refer to the original manufacturer of any equipment provided as part of the Work
- P. Commissioning Date: shall refer to the date at which a system is formally accepted by the Owner.

- Q. OFE: Owner Furnished Equipment.
- R. OFCI: Owner Furnished, Contractor Installed.
- S.
- T. CFCI: Contractor Furnished, Contractor Installed.

1.3 SCOPE/DESCRIPTION OF WORK

- A. The work covered in this Specification consists of furnishing all labor, material, and services to install a complete CCTV system as indicated on the project documentation, including this specification and related drawings.
- B. Contractor shall be responsible to program and to provide new IP cameras with associated licenses for NVR and network video recorder at campus MDF with existing LACCD standard Enterprise video management system (VMS). New NVR shall be extension of the existing LACCD standard Mileston VMS solution on campus.
- C. The work described in this Specification shall include, but not be limited to, the following Basic Services:
 - 1. Engineering and Design: The Integrator shall provide all system engineering and design necessary to develop the complete systems described herein. Engineering and Design shall include preparation of all necessary electronic schematics, hardware drawings, systems diagrams, schedules, and lists.
 - 2. Procurement and Assembly: The Integrator shall procure and assemble all hardware and equipment and any additional materials as required to deliver completely functioning CCTV Systems.
 - 3. Software Programming: The Integrator shall perform all required software setup, configuration, and programming required to develop a complete operating system in accordance with this Specification, including all control logic and push-button component faceplate or interface programming.
 - 4. Installation: The Integrator shall install all equipment, cable, wiring, connectors, plates, and other material at the Project site per the Integrator's approved designs. The Integrator shall install any Owner Furnished Equipment identified in this document and calibrate it to work with the integrated systems.
 - 5. Testing and Adjustment: The Integrator shall perform all tests and adjustments, furnish all test equipment necessary and perform all work required to properly configure the systems and to verify their performance in accordance with the information in this Specification and the Integrator's approved engineered designs.
 - 6. Acceptance Testing: Prior to Owner acceptance and hand-over of the completed CCTV Systems, the Integrator shall demonstrate the operation of the complete systems, including all individual devices and specified control functions. Both subjective and objective tests may be required by the Owner to determine compliance with the information in this Specification and the Integrator's approved designs.
 - 7. Training: The Integrator shall provide technical training of Owner's staff, instructing them on CCTV Systems operation, maintenance, and troubleshooting.
 - 8. Warranty: The Integrator shall warranty the CCTV Systems in accordance with the terms of this Specification.
 - 9. Specific Responsibilities:
 - 10. The Preliminary Schedule below identifies critical Project milestones and delivery expectations currently anticipated. This information is provided for Bidder planning purposes only. The actual Schedule for delivery of the work shall be coordinated with the Owner's representative or Construction Manager.
 - 11. Refer to "BID SUBMITTALS", Section 1.06 and "SUBMITTALS", Section 1.08 .A for additional information and requirements.

1.4 REGULATORY REQUIREMENTS

- A. All onsite labor must be in compliance with job-site union requirements.
- B. The Integrator must obtain any permits and shall pay all fees required by public agencies having jurisdiction over the Work.
- C. All products and materials provided shall be listed by Underwriters Laboratory (UL) and shall bear the UL label intended for the purpose specified and indicated. If UL has no published standards for a particular item, then other national independent testing standards shall apply, and such items shall bear those labels.
- D. All equipment and installations under this Specification shall conform to the latest editions of the following:
 - 1. NFPA 70 National Electrical Code.
 - 2. NFPA 72 – National Fire Alarm and Signaling Code
 - 3. IEEE C2 National Electrical Safety Code
 - 4. ANSI/TIA-568, -569 and -607 Telecommunications Standards
 - 5. IEEE 142 2007 Recommended Practice for Grounding of Industrial and Commercial Power Systems.
- E. The Integrator and its employees shall perform all work in compliance with current Occupational Safety and Health Administration (OSHA) guidelines and regulations and other safety and health requirements as may be mandated by the Owner or other authorities.
- F. The Integrator shall have a thorough knowledge of governing codes and standards in effect and having jurisdiction over the Project. Lack of awareness of any of the relevant codes and standards will not be accepted as a reason for non-compliance.
- G. The Integrator shall be responsible for providing cable and materials that comply with applicable codes and requirements of regulating bodies. The cost for these materials shall be included in the Bid price, as the Owner shall not accept change orders for changes in materials.

1.5 COORDINATION OF RELATED WORK WITH OTHERS

- A. Related Work Specified Elsewhere: The Integrator shall coordinate with the Contractor and other construction trades to ensure proper integration and operation of the CCTV Systems with the complete Project designs, building systems and all other elements of the Project. The Integrator should request from the Owner, Contractor, or Architect complete project Construction Documents to help facilitate effective coordination of the Integrator's work with the work of others.
- B. Some components of the complete CCTV Systems will be provided by the Contractor, or Owner. It shall be the responsibility of the Integrator to coordinate with all parties whose work impacts the Integrator's work to ensure the complete coordination and successful implementation of the CCTV Systems. Related work by Contractor shall include, but may not be limited to, the following:
 - 1. Electrical Work (Division 26):
 - a. Electrical (AC) Power Service and Connections:
 - 1) Technical Power Service: All electrical panels, power receptacles, lighting fixtures, dimmers, lighting controls, and interconnecting wiring shall be supplied by Contractor.
 - b. Low Voltage Cable Containment

- 1) Low voltage cable containment, including raceways, conduits, and junction boxes, required to support CCTV System devices and interconnecting cabling shall be as specified in the Construction Documents and shall be provided by the Division 26 Contractor.
 - 2) Upon commencement of work on the Project, the Integrator shall review the Construction Documents to confirm that the infrastructure provided is sufficient to accommodate the CCTV Systems to be installed. Any conflicts or issues must immediately be brought to the attention of the Construction Manager, and the Consultant.
 - 3) The Integrator shall provide blank cover plates or panels for all wall and ceiling boxes that are dedicated to the CCTV Systems but do not have devices and/or connectors at the time of CCTV System commissioning. Colors and types shall be coordinated with the Architect.
2. Metals (Division 5)
 3. Rough Carpentry (061053)
 4. Joint Sealants (079200)
 5. Finishes (Division 9)
 6. Information Technology Systems : Unless otherwise specified, all data networking cabling shall be provided by Section 271300 and 271500 contractor(s) and the Owner. Unless otherwise specified, all active data networking electronics shall be provided by the Section 272000 contractor and the Owner. Patch cords to connect CCTV equipment to a data network port shall be provided by the Integrator. The Integrator shall be responsible for coordinating with the Owner or the Owner's designated representative regarding connections between the CCTV Systems and the Owner's data network, including all client/server computing and peripherals, Internet, digital video storage and other data/media distribution systems. Unless otherwise specified, equipment racks and cabinets, PDU's, and UPSs shall be provided by the Section 271100 contractor and/or the Owner. Coordinate with those entities to ensure space is available for any rackmounted equipment.
 7. Other Systems: The Integrator shall be responsible for identifying and integrating with any other technology systems and services required to deliver the completely operating CCTV Systems.
 8. Equipment Mounting and Support:
 - a. Structural support for CCTV system equipment shall be provided by Division 2823000 Contractor as noted and detailed in the Construction Documents. The Integrator shall coordinate with the Contractor and other trades as necessary to ensure compatibility of the structural supports provided by others with the CCTV Equipment provided by the Integrator.
 - b. The Integrator shall install all CCTV Equipment, including all camera and video monitor mounts, as indicated in this Specification and the Construction Documents. The Integrator shall verify location and structural suitability before attaching equipment and mounts. Any variations from the drawings and specifications or any question of structural integrity shall be brought to the attention of the Contractor, Architect, and Consultant before installing the equipment.

1.6 BID SUBMITTALS

- A. Examinations: Carefully examine the contract documents and the construction site to obtain first-hand knowledge of existing conditions. Contractors are not compensated for conditions that can be determined by examining documents or site and will not be relieved of any obligations with respect to bid.

- B. Questions: Submit all questions about the contract documents in writing. Replies requiring changes to the contract documents will be issued to all bidders as addenda and will become part of the Contract. The Architect and Owner may give, but will not be responsible for, oral clarifications. Questions received less than 10 days before bid date cannot be answered in writing.
- C. Equipment Availability: Verify with manufacturers' availability and cost of all equipment proposed, including equipment specified herein. No cost increases will be allowed for manufacturers' cost increases, or for substitutions required because of unavailability of proposed equipment.
- D. Basis of Bids: To be eligible for Bid consideration, submit bids in accordance with the following:
1. Include a complete itemized list for each base-bid system indicating the manufacturer, model number, unit cost and total costs for all specified items. Itemization of miscellaneous equipment such as cable, switches, and receptacles are not required.
 2. Clearly indicate the total cost, including all expenses, for each individual system to allow the Owner to select any or all to be included in the contract. Itemization of miscellaneous equipment such as cable, switches, and receptacles are not required.
 - a. CCTV System
 3. Organize each list with the information presented, in the order that it appears in this specification, in 6 columns from left to right:
 - a. Paragraph number as it appears in this specification.
 - b. Paragraph title as it appears in this specification.
 - c. Manufacturer and model number.
 - d. Quantity.
 - e. Unit Cost.
 - f. Extension (unit cost times quantity).
 4. At the end of each list indicate the cost of all other items such as for miscellaneous equipment, engineering, installation labor, overhead, taxes, etc.
 5. On a separate list indicate costs of any specified add- or deduct-alternates with the information presented in the same manner as for the base-bid system.
 6. Include a listing of any voluntary alternates proposed by the bidder as substitutions or additions to the specified systems.
 7. Include any notes or comments, if necessary, to qualify the bid.
 8. Identify any sub-contractors and indicate the work they are to do.
 9. Provide documentation of ability in installing similar systems. Furnish the names, addresses and telephone numbers of the System Designer, Architect, Contractor and Owner on three projects similar in scope, which the Contractor has installed within the last 5 years.
 10. Identify the proposed project management, engineering, and installation staff. Include resumes for each individual indicating relevant experience and certifications.
 11. Include certification of ownership and full familiarity with the operation of the following minimum test equipment. Provide a list of the manufacturer, model, and serial number for each item of test equipment required, and the date of last calibration traceable to NIST, as applicable.
 - a. GENERAL CONTRACTING
 - 1) Multimeter.
 - 2) Cable Tester (Kopul CBT-MF or similar).
 - b. VIDEO
 - 1) Multi-frequency computer test pattern generator with DVI output.
 - 2) Photometer with luminance and illuminance probes.

- 3) Fiber-optic testing and field servicing equipment.
 - 4) Category 6A F/UTP testing and field servicing equipment.
12. Include certification of ownership and full familiarity with the operation of the following minimum software and analysis tools:
- a. AutoCAD, version as required by the Owner (or .dwg compatible software, Stardraw not acceptable).
 - b. Revit, version as required by the Owner; or other BIM software, version as required by the Owner.

13. BIDS NOT FULLY ITEMIZED OR NOT SUBMITTED IN THIS FORMAT WILL BE REJECTED.

E. Delivery Schedule:

1. Unless otherwise directed in Division 0, within 14 days of receipt of bid package provide:
 - a. Basis of bid documents, including:
 - 1) Itemized equipment costs for specified equipment or APPROVED substitutions.
 - 2) Qualifications/References
 - 3) Certifications (including certificate of bonding, if required) 4) Proposed payment terms.

1.7 QUALITY ASSURANCE

- A. Project Management: Maintain the same person in charge of work throughout installation. Engineering and construction supervisors shall be ESA CSI or approved equal.
- B. Contract Documents: always Maintain a complete set of system drawings and specifications at the site during installation.
- C. Fabrication and Installation: Fabricate all equipment racks and subassemblies, as required. Make field connections of all video and control wiring including video, and control system circuits to equipment, equipment racks, and connection panels. Continuously supervise the installation and connections of cable and equipment.
- D. CCTV System Contractor Qualifications: To be considered qualified for this work, bidders must meet the following standards:
 1. The Contracting firm is experienced in the provision of CCTV systems similar in complexity to those required for this project.
 2. The Contractor's primary business is the provision, fabrication, and installation of professional CCTV and related systems.
 3. The Contractor has been regularly engaged in the installation and service of professional CCTV systems for a period of at least five years.
 4. The Contractor is an authorized dealer for the major products furnished.
 5. The proposed Project Engineer holds ESA CSSI certification or approved equal. The proposed installer holds ESA CVT certification or approved equal.
 6. The Contractor is certified by the manufacturer of the systems to install and configure all components of the system. The Contractor must assign a certified technician to conduct the work. Contractor must submit proof of certifications with the bid response.
 7. Additional certifications specific to project – manufacturer's certifications, etc.
 8. The Contractor is experienced in cloud-based control and management systems.
 - a. At the request of the Owner, Owner's representative, or Architect, demonstrate the following capabilities:

- b. Adequate plant and equipment to complete the work in accordance with the project schedule.
 - c. Sufficient staff with appropriate technical experience to oversee and execute the work.
- E. Subcontractors: The Contractor may arrange for sub-contract field and special shop work to be done by others.
- F. Prime Contractors: Any other installer who intends to bid on this work as the Prime Contractor and does not meet the "Contractor Qualifications" described above shall employ the services of a single "CCTV Systems Contractor" who does meet these requirements. The CCTV System Contractor shall Furnish and Install the equipment. The Prime Contractor shall clearly identify the CCTV Systems Contractor and submit complete qualification information for the CCTV Systems Contractor in the Bid. Failure to do so will be cause for rejection of the Bid.

1.8 QUALITY ASSURANCE

A. General:

1. The Contractor has the burden of proving, at the Contractor's own cost and expense and to the satisfaction of the Architect, that the proposed product is similar and equal to the named product. B. Documentation:

1. File a formal request for each substitution, documenting the conditions outlined below, including:
 - a. Complete data on the proposed substitution, substantiating compliance with the CCTV Systems Contract Documents, including:
 - 1) Specification Section and description of the equipment or service originally specified by the Consultant
 - 2) Product manufacturer, model, and description of the proposed substitution
 - 3) Performance specification and test data verifying the proposed substitution's compliance with CCTV System and installation requirements.
 - 4) References and samples, where applicable
 - 5) An itemized comparison of the proposed substitution with the item originally selected in the CCTV Specification
 - 6) The impact of the proposed substitution on the Contract time schedule, system design, artistic effect (for changes in finish or dimension), and related contracts and trades

2. Submit item comparisons, coordination schedules, and design impact via addenda appended to manufacturer documentation. C. Basis:

1. Requests for acceptance of proposed equivalents made following the award of bid are considered only in the following cases:
 - a. The named products cannot be obtained by the Contractor because of strikes, lockouts, bankruptcies or discontinuance of manufacturer and the Contractor makes a written request for consideration of the proposed equivalent.
 - b. The proposed equivalent is approved as equal or superior to the named product and its use is to the advantage of the Owner. D. Consideration:
 1. A request for substitution is a representation by the Contractor that:
 - a. The Contractor has personally investigated the proposed substitution and determined that it is equal or superior in all respects to that specified.
 - b. The same warranty is provided for the substitution as the original equipment specified.

- c. The cost data presented is complete and includes all related costs under this Contract but excludes costs under separate contracts and excludes Architect's redesign costs, and that the Contractor waives all claims for additional costs related to the substitution which subsequently becomes apparent.
 - d. Any cost impact on work by other trades is indicated.
 - e. Installation of the accepted substitute will be coordinated by the Contractor, making such changes as may be required for the Work to be complete in all respects.
2. An accepted substitution shall be documented by Change Order, effectively modifying the CCTV Systems Specification. The Contract Price will be changed only if the substitution results in cost savings to the Owner.

1.9 CONSTRUCTION SUBMITTALS

- A. Coordinate all submittals with requirements set forth in Section 013300.
- B. Bill of Materials & Manufacturer Product Data Sheets:
 1. Organize the Bill of Materials with the information presented in the order and format that it appears in this specification.
 2. After the Bill of Materials, include Catalog Data Sheets ("cut" sheets) for all specified products arranged in the order listed in the Bill of Materials.
 3. Clearly indicate all finishes, colors and, options for equipment.
 4. As an alternative, provide product data sheets in electronic .pdf format, or other approved file format. Datasheets shall be organized in a logical manner, such as per system, to allow efficient review against the design documents. C. Shop Drawings:
 1. Size: minimum 24" x 36" unless otherwise specified.
 2. Media: provide in electronic .pdf file format unless otherwise specified or directed by the Construction Manager.
 3. Prepare a drawing package on the approved Computer Aided Drafting (CAD) or Building Information Modeling (BIM) system, including:
 - a. Integrator name, address, and phone number.
 - b. Block diagrams indicating proposed connections of all equipment and indicating equipment brand and model numbers.
 - c. Equipment/ control room layout and equipment rack and cabinet details
 - d. Provide detailed drawings of custom-fabricated or stock mounts and hardware.
 - e. Video display arrangements.
 - f. Other drawings and sketches as required by the Architect or Consultant during project installation.
 4. Design drawing files provided by the Architect and/or Consultant as a courtesy in aiding the Integrator in preparing Shop Drawings must be modified to include the information specified above. Submitting design drawings without these modifications is not acceptable.
- D. Data Network Connectivity
 1. Any system, or components of a system, provided in this specification section which are to be connected to the Owner's data network either via wired or wireless connections will conform to the requirements described in PART 3 - EXECUTION. Vendors shall review the requirements of this section and provide a statement of compliance for each item that either:
 - a. Confirms that the proposed System (or any applicable components of the System) is compliant with the requirements listed in the item, or

- b. Explains why the proposed System (or any applicable components of the System) is not compliant, including any potential mitigation measures that may resolve the non-compliance issue.

E. Project Plan

1. Provide a complete and detailed Schedule for the Integrator's work describing the major tasks, sequence of work, submittals, and other critical milestones. At a minimum, the tasks noted in the Schedule shall include all required submittals, rack assembly, and shop testing, on site cable installation, periodic shop, and site visits, on site equipment installation, testing and commissioning, Substantial Completion and Project Completion. Indicate the sequence of installation and completion by area and/or system. The Schedule shall also include anticipated dates of acquisition of major equipment and their installation milestones.
2. Provide a complete listing of the Integrator's project team, including the names and all contact information (email address, cell phone, etc.) for all personnel assigned to the Project. At a minimum, this Project Team Directory shall include the Integrator's executive in charge of the Project as well as the Project Manager, Lead Engineer, and Lead Installer. Include names and contact information for Contractor.

F. Weekly Status Reports

1. If directed by the Construction Manager, the Integrator shall provide weekly progress updates to the Architect and Consultant. Weekly Status Reports shall be submitted as directed by the Construction Manager via faxed hard copy or electronic means (i.e. email). Issuance of Weekly Status Reports shall commence from the date of the first submittal delivery and shall continue until contract closeout.
2. The Weekly Status Report shall not be used as an official means of communicating Project issues. It does not replace any part of a required submittal, request for information, proposed change order, report of field conditions, schedule issues, etc. No official response will be given to the Weekly Status Report.
3. A representative of the Integrator shall attend the weekly construction meeting at the job site. This representative shall be fully knowledgeable in all aspects of the Project and the Integrator's work and shall have the authority to make binding commitments on behalf of the Integrator.

G. Substantial Completion Submittals

Substantial Completion of the CCTV System installation shall be the point at which all CCTV Equipment has been installed, programmed, configured, and initially tested to confirm proper operation. The point of Substantial Completion shall be as mutually agreed between the Integrator and the Consultant following discussion and observation. At the point of agreed Substantial Completion, the Integrator shall submit the following:

1. Test Reports:
 - a. Upon completion of SYSTEM PERFORMANCE TESTS AND ADJUSTMENTS specified in PART 3 - EXECUTION, submit for approval in writing test results including numerical values for all measurements.
 - b. Submit written certification that the installation conforms to specifications, is complete and operable, and is ready for FINAL ADJUSTMENTS AND ACCEPTANCE TESTS specified in PART 3 - EXECUTION.
 - c. The Owner or Owner's representative reserves the right to withhold the final site visit "check-out" and any final certification of project completion until receipt of test report documents, as outlined in this section (SECTION 1 – "Test Reports").
2. Preliminary Project Record Documents Submittal
 - a. Upon Substantial Completion, the Integrator shall submit Preliminary Project Record Documents to the Consultant. Preliminary Project Record documents shall be submitted prior to the Preliminary Checkout.
 - b. Preliminary Project Record Documents shall include:
 - 1) Corrected/updated shop drawings
 - 2) Updated Equipment List
 - 3) Half-size drawings modified to reflect the actual installation conditions
 - 4) USB Flash Drive or other approved media with manufacturers' operation manuals arranged alphabetically and current drawings in .DWG format
 - c. Consultant's Preliminary Checkout will be scheduled after the Preliminary Project Record Documents and Test Reports have been approved.

H. Manufacturer's Owner's Manuals:

1. Archive all Manufacturers' Owner's Manuals for specified equipment in the following manner:
 - a. One original (not photocopy) manufacturer's owner's manual per equipment item.
 - b. Submit in a 3-ring binder including a cover page and spine insert identifying the project, site location, and submittal.
 - c. Arrange manuals in alphabetical order, by manufacturer.
 - d. Provide a table of contents and separate each section within the binder with tab dividers.
 - e. If approved by Owner, provide all Manufacturer's Owner's Manuals in electronic .pdf format on USB Flash Drive or other approved media. Owner's Manuals shall be organized in a logical manner such as per system and/or alphabetical order, by manufacturer. I. User Operational Manual:

1. Intent: Prepare in the form of a system operations manual for use by Owner's personnel. System documentation shall be adequate such that a person trained on the System, but with no familiarity with this specific implementation, shall be able to understand the configuration and implementation of all major and minor systems as well as how these systems are integrated to form the overall System.
2. Cover: Identify each volume with typed or printed titles "SYSTEM OPERATING INSTRUCTIONS".
3. Format: Submit the User Operational Manual in the following format:
 - a. Size: 8-1/2" x 11", 20 lb. minimum weight white paper for typed pages, either manufacturer's printed data, or neatly typewritten.
 - b. Drawings: Provide reinforced punched binder tab, bind in with text. Fold larger drawings to size of text pages.
 - c. If approved by Owner, provide Operational Manual in electronic .pdf format on USB Flash Drive or other approved media.
4. Content of Manuals: Prepare the User Operational Manual with the following content:
 - a. Neatly typewritten table of contents for each volume arranged in systematic order. Identify each product by product name and other identifying symbols as set forth in Contract Documents.
 - b. Contractor name of responsible principal, address, and telephone number
 - c. Certificate of Warranty
 - d. Service Contract: Include a preliminary schedule for the specified semi-annual site visits.
 - e. Complete as-built diagrams for systems.
 - f. Receptacle Location Plan
 - g. Shop drawings of all custom-fabricated items
 - h. Control Setting Schedule.
 - i. Documentation of all touch-panel screens both in the form of data files on USB Flash Drive, or other approved media, and graphical printouts.
 - j. CCTV control system configuration files on USB Flash Drive, or other approved media, for the management and control system, or other software required for reconfiguring the CCTV management and control system. J. System Diagrams:
 1. Provide sufficiently clear and complete information that a technician of average skill may efficiently troubleshoot and service the system, even if unfamiliar with the installation, based on diagrammatic representations of the installed system.
 2. Provide drawings showing all terminal blocks, connectors, relays, switches, equipment, components, and wires.
 3. Provide layout drawings of panels and other custom assemblies containing switches, relays, terminal blocks, receptacles, etc., using reference numbers to identify physical locations of devices or label devices with reference numbers in a location visible while viewing cable terminations.
 4. On wiring diagrams, label all conductors within cables for insulation color or other identifier.
 5. Label connectors, barrier strips, switches, relay sockets, etc., for terminal number.
 6. If device does not provide terminal designations, provide key diagram for reference.
 7. Label all devices with manufacturer, model number, and reference number (e.g. "SW 15", "TB 6"); reference numbers shall be consistent across all drawings with no repetitions.

8. Provide labels for cables continued onto another drawing, indicating termination device, terminal numbers, and drawing sheet on which the termination is shown.
9. Illustrate all receptacles, patch panel jacks, and switches.
10. Receptacle Location Plan: Plan drawing of area showing locations and designations of all receptacles.

K. Forward all submittals to:

1. The Project Manager, or as directed.

L. Sustainable Building Submittals

1. Sustainable Building Submittals are required to verify compliance with the "Sustainable Building Performance Criteria" defined in this section.
2. Refer to Division 1 Section "Sustainable Design and Construction," for detailed descriptions of the submittal documents listed below.
3. Green Building Materials Certification Form (GMF): Submit a completed GMF for the materials included in this section (blank copy is appended to Division 1 Section "Sustainable Design and Construction"). The following information shall be provided:
 - a. Itemized material costs for the Green Building Focus Material (GBFMs) identified under the "Sustainable Building Performance Criteria" heading of this section.

1.10 JOB CONDITIONS

A. Sequencing and Scheduling:

1. Coordinate work with adjacent work of other trades to facilitate construction and prevent conflicts.
2. Afford other trades reasonable opportunity for installation of work and for the storage of materials.
3. Staff the job to keep pace with the other Trades; otherwise, the project manager will require an increase in force or overtime work without additional expenses to the Owner.
4. Abide by the decision of the project manager in case of conflict or interference by other trades.
5. Remove all refuse from the job site to the satisfaction of the Owner's representative.

B. Do not install equipment in dusty conditions or allow dust to accumulate in or on installed CCTV Equipment.

C. Protect all work and equipment from damage by others.

D. Protect all existing work-in-place by others from damage by the Integrator, any employees or vendors. The Integrator will be solely responsible for any/all damage to work-in-place by others.

E. Keep areas around and inside of each piece of equipment and each rack free from dust, dirt, and debris throughout the project. Equipment that is not properly maintained during installation shall be replaced at no cost to the Owner before final payment is made to the Integrator. F.

Storage and Staging:

1. The Contractor is ultimately responsible for acquiring secure storage at the job site. Coordinate with project management and/or Owner to determine the location and size of the storage area.

2. All Integrator equipment and materials and all owner furnished equipment turned over to the Integrator stored at the Integrator's facility(s) or stored and/or installed at the Project site will remain the property of the Integrator unless ownership is legally transferred and accepted in writing by the Owner. The Integrator shall be solely responsible for the protection of all equipment from damage, theft, or vandalism regardless of cause, until the work described herein is accepted by the Owner at the time of Final Checkout. G. Refuse and Repair:
 1. Upon completion of work remove all associated debris, waste, refuse, and rubbish from premises. Leave all areas and equipment within the scope of this contract clean, free of blemishes, and operational.
 2. Repair any damage to the premises, at no cost to the Owner, caused by the Contractor. H. Adhere to the safety standards established by the Contractor while performing work on site.
 - I. All employees of the Integrator shall wear identification clearly indicating the Integrator's company name while on site.
 - J. All employees of the Integrator shall comply with rules and policies established by the Owner and/or the Contractor.
 - K. All vehicles of the Integrator or employees shall be parked in areas designated by the Owner and/or the Contractor.
 - L. Environmental Impact Considerations
 1. The Integrator is expected to comply with project specific practices and environmental considerations to comply with any LEED objectives and local environmental regulations.
 2. The Integrator is encouraged to utilize environmentally sustainable materials and work practices in the delivery of the Work. This may consist of (but not be limited to): a. Energy Efficiency/Conservation
 - b. Waste Reduction/Recycling
 - c. Water Conservation
 - d. Pollution Prevention
 - e. Employee Education Programs
 - f. Transportation Planning
 - g. Utilization of Renewable Materials
 - h. Minimize Emission of Greenhouse Gases
 3. Upon request, the Integrator shall supply documentation on in-house policies for recycling and environmental offset goals. M. Promotion/Publication:
 1. The contractor does not have the rights to use any information or images, relative to this contractor installation, for publication or in promotional materials without the express written permission of the Owner, Architect, and Vantage Technology Consulting Group. Upon approval, the contractor must disclose full credit to the Architect and Consultant for facilities and system design.
- N. Insurances on the work of this specialty trade shall be provided as specified in relevant project documentation.
- O. Inspection

1. Notify the Architect of any defects in work by other trades affecting installation.
- P. Packaging: Material and equipment manufacturers shall demonstrate efforts to reduce packaging waste and/or to use environmentally-preferable packaging materials. Examples include, but are not limited to, the following:
1. Reusable and/or returnable pallets or crates
 2. FSC-certified wood or salvaged wood pallets or crates
 3. High recycled-content cardboard, paper, steel, or plastic packaging
 4. Bio-based foam packing materials

1.11 QUALITY ASSURANCE

A. Project Description

1. The project concerns the installation of new video surveillance systems in renovated spaces at the name of project in location, as described below and shown on the drawings.

B. Functional Requirements of Systems

1. CCTV System

- a. Interior and exterior IP cameras to capture video of sufficient quality for recognition of individuals.
- b. All cameras and video management software must be ONVIF compliant to ensure interoperability with future adds or changes.
- c. Recording to be motion-based, 24/7, with 30-second pre-record. Provide storage for 30 days at a minimum of 30 fps, 1080p resolution from cameras.
- d. Video to be reviewed at existing security viewing stations in the Hospital. Cameras will not be monitored 24/7. Configure system for remote access so that video can be reviewed by the Owner's corporate headquarters, or other locations as directed.

PART 2 - PRODUCTS

2.1 ENGINEERING AND DESIGN

- A. Engineering and other pre-site services included in this Specification are considered furnished goods delivered to the site in a similar manner to physical materials. PART 2 of the CCTV specifications is for review by the Contractor. The contractor is responsible for reviewing the specification and drawings and providing an ENGINEERED fixed-price quotation covering the cost of all equipment and labor to install, program, warranty, and service the systems described.
- B. The contractor is responsible for attending all pre-bid meetings and reviewing and understanding the systems design, functionality, and intent.
- C. The owner assumes that all contractors providing bid responses have included all of the necessary equipment, parts, cabling, labor, engineering, programming, project management, testing and training costs, and will not approve any additional fees or costs, unless shown and approved to be beyond the scope of the specification and drawings.

- D. The equipment identified below provides examples of the level of quality and functionality required. These are predominantly major or unusual items and do not represent a complete list of equipment. The contractor is responsible for providing all equipment necessary for fully functioning turnkey systems.
- E. Where the equipment described includes “or approved equal”, the contractor shall provide all documentation as indicated in paragraph 1.08 Substitutions to allow the owner or owner’s representative to make a determination prior to bid submittal.
- F. Where the equipment described includes “or equal”, the contractor shall provide all documentation as indicated in paragraph 1.08 Substitutions as part of the product data submittal package delivered after award of contract.
- G. Where the equipment described does not include “or approved equal” or “or equal”, the contractor shall provide only the product specified. No substitutions will be accepted.

2.2 CAMERAS

- A. Indoor/Outdoor Camera (Fixed view): The minimum resolution of camera shall be (2592x1944) 5 MP and ONVIF compatible: Axis P3267-LV (indoor) P3267-LVE (outdoor). Cameras shall be provided with housing and mounting accessories as appropriate for installation location and environment.
- B. Indoor/Outdoor 180-degree multi-lens Camera (Panoramic view): The minimum resolution of camera shall be 14 MP and ONVIF compatible: Axis Q3819-PVE (Ceiling/wall mounted); Cameras shall be provided with housing and mounting accessories as appropriate for installation location and environment.
- C. Exterior/Interior 360-Degree Camera : The minimum resolution of camera shall be 4X2 MP and ONVIF compatible: Axis P3727-PLE (Ceiling/wall mounted); Cameras shall be provided with housing and mounting accessories as appropriate for installation location and environment.
- D. Pan, Tilt, Zoom (PTZ) camera –The minimum resolution of camera shall be 5 MP and ONVIF compatible: AXIS Q series (Ceiling/wall mounted/pendant mounted); Cameras shall be provided with housing and mounting accessories as appropriate for installation location and environment.
- E. License Plate Recognition Camera – The minimum resolution of camera shall be 2 MP and ONVIF compatible: Axis Q1700-LE (exterior wall mounted); Cameras shall be provided with housing and mounting accessories as appropriate for installation location and environment.
- F. Elevator camera –Indoor fixed lens camera (Panoramic view): The minimum resolution of camera shall be 2 MP and ONVIF compatible: Axis P91 Series (wall mounted); Cameras shall be provided with housing and mounting accessories as appropriate for installation location and environment.
- G. Provide CAT 6A F/UTP cabling (Windy City or equal) from IP cameras to IDF room. Terminate CAT6A F/UTP cables at rack mounted dedicated RJ-45 patch panel. Coordinate location of patch panels with structured cabling contractor and LACCD IT.

2.3 NETWORK VIDEO RECORDER

- A. Provide network video recorder server with LACCD standard video management software.

- B. The NVR server shall have recording resolutions of CIF, 2CIF, D1 and 1080p and shall be user selectable for each individual camera attached to the server. H.265 video compression format shall be used for all video recording. Video recording shall be available at up to 30 frames per second per input channel.
- C. The NVR shall have Video Surveillance Management System (VSMS) software for viewing live and recorded video from IP cameras and video encoders connected to a local and wide area network. The VSMS software shall have a Client-Server based architecture that can be configured as a standalone VSMS system with the Client software running on the server hardware and/or the Client running on any network connected TCP/IP PC workstation. Multiple client workstations shall be capable of simultaneously viewing live and/or recorded video from a single or multiple server. Multiple servers shall also be able to simultaneously provide live and/or recorded video to a single or multiple workstation(s). Included in the cost of the software are an unlimited number of client software applications.
- D. The VSMS software running on the NVR shall have an open architecture supporting IP cameras and encoders from multiple manufacturers providing best of breed solutions from low-cost entrylevel features to high resolution megapixel features.
- E. Provide a minimum of 20 minutes UPS battery backup for Network Video Recording server.
- F. Programming Parameters
 1. System Name: Shall be the abbreviated building name (followed by a number, if multiple NVRs are in the building)
 2. Network Settings: NVR shall be connected to the LACCD LAN network. IP address will need to be obtained through LACCD IT.
 3. Camera setup and recording camera resolutions shall vary depending on the cameras selected and added to the NVR server. Cameras shall be set to record on motion-based, 24/7, with 30-second pre-record. Provide storage for 30 days at 15 fps and full resolution from cameras. Alarm parameters shall be set to mask motions other than intended targets. LACCD shall provide camera naming conventions. All cameras must be named prior to placing system into operation.
 4. Programming of the system shall include the following tasks:
 5. Programming system configuration parameters (hardware and software, camera location/number, communication parameters)
 6. Other programming tasks required by the Owner. These additional programming requirements shall be coordinated between the Owner and the Contractor.

2.4 VIDEO MANAGEMENT SYSTEM

- A. Video Management System: Expand existing Milestone Video Management System on campus. Integrate fully with Lenel OnGuard.

PART 3 - EXECUTION

3.1 GENERAL

- A. All types of equipment installed by competent workers at locations shown on the drawings in strict accordance with approved shop drawings and manufacturer's instructions.
- B. All delivered equipment, except portable equipment, firmly fastened or held in place. "Delivered equipment" includes cameras, video monitors, etc. Apply a minimum safety factor of four (4) times the load for all equipment fastenings and supports.

- C. Take necessary precautions to prevent and guard against electro-magnetic and electro-static hum and to install the equipment to provide safety for the operator.
- D. Protect all equipment, including patch panels, connectors, receptacles, racks, and consoles, from construction dust and debris until final acceptance of the system.

3.2 INTEGRATION/INSTALLATION

A. Conformance to Existing Facility Standards

1. Wherever possible provide equipment, finishes, and interfaces similar in nature to systems already in use by the Owner. Provide uniform functionality and operation to enhance ease of use and minimize instruction. Provide uniform finish and equipment to enhance the aesthetic unity of systems facility wide, and to improve end-user familiarity with equipment.
2. Equipment Integration:
 - a. New Equipment: Unless otherwise specified, supply only new equipment, parts, and materials, and protect all equipment from construction dust and debris until final acceptance.
 - b. Equipment Handling and Wear: Operate specified equipment only as required for testing, as part of the installation procedure.
 - c. Single Source: The provision of all manufactured components, installation, wiring, and testing is the responsibility of a single contractor.
 - d. All equipment and installations under this Specification shall conform to the latest edition of the following:
 - 1) ANSI/NFPA 70 National Electrical Code.
 - 2) ANSI/IEEE C2 National Electrical Safety Code
 - 3) ANSI/TIA Standards 568, 569 and 607
 - 4) IEEE/ANSI 142 2007 Recommended Practice for Grounding of Industrial and Commercial Power Systems.
3. Equipment Quantities:
 - a. Determine and provide the quantities of installed equipment based on the Bid Documents including the plans, functional diagrams, riser diagrams, and specification.
 - b. Quantities of portable equipment are indicated in schedules contained in the drawings or specifications.
4. Engineering and Documentation:
 - a. The system drawings indicate the general layout of the various items of equipment and their functional relationships. Layout of equipment, accessories, and conduit systems are diagrammatic unless specifically detailed and do not necessarily indicate every item or parameter required for a complete installation.
 - b. The Contractor shall provide any incidental equipment needed to result in a complete and operable system even if not specified or shown on drawings without claim for additional payment.

B. Labels

1. Dry transfer, "Dymo", or other types of adhesive labels not acceptable

2. Except where otherwise specified label as shown on drawings, and as specified, each item of rack-mounted equipment and all switches, controls, and receptacles
 3. Switch and Control Panels: Constructed of engraved and filled anodized aluminum plates. Minimum 1/8" plate thickness.
 4. Rack-Mounted Equipment: Labels constructed of engraved and filled plastic laminate engraving stock. Designate function and input and output line(s) or loudspeaker(s) served by labeled equipment. Key all designations to system functional and patch panel diagrams. Where possible, mount labels on blank panel directly above corresponding component. For modular equipment, provide label on inside of mainframe door identifying type of module for each slot (unless there is only one type) and gain setting as established at final checkout.
 5. Identification Panel: See drawings for layout and nomenclature. Contractor is responsible for completing all bracketed items with the appropriate project-specific information.
 6. Branding and Recognition: Identification of the contractor, or use of contractor logos or similar "trademarks" or "signatures" (including but not limited to touch panel graphics and color schemes, silk-screened or engraved corporate logos, copyrighted fonts, and/or custom emblazoned panels) is strictly forbidden except where explicitly indicated within the bid documents. Any unauthorized use of these marks will be rejected.
 7. Receptacles: Engrave and fill receptacle label directly on mounting plate as indicated on drawings.
 8. Patch Panels: Labels for jacks constructed of engraved and filled plastic laminate engraving stock or printable composition material with clear plastic cover. Labels for jack rows constructed of engraved and filled plastic laminate engraving stock. Paper strips may be used as temporary labels only.
 - a. Label jacks with functional description of jack ("Camera 1", "Console Input 4", etc.).
 - b. Color-code jack labels with different colors for video level jacks, input and output jacks for recording/playback equipment, and other line-level jacks.
 9. Identify all wires and cables at every termination and connection point in accordance with the Owner's standards using the specified cable markers, unless otherwise instructed by the Owner. Use a numbering scheme that identifies all cables terminating at patch panel jacks with the patch bay row and jack designation; use A, B, and C suffixes to distinguish multiple cables terminating at the same jack. Submit proposed numbering scheme for approval prior to installation.
 10. Identify switches, relays, terminal blocks, etc., with reference numbers keyed to the asbuilt wiring diagrams.
 11. Room numbers appear on the contract documents for reference only. All labels shall reflect the Owner's final room designations.
 12. All labels and legends shall be as approved on shop drawings.
- C. Racks, Cables, Connectors, and Miscellaneous Equipment
1. Wiring and Interconnections:
 - a. General:
 - 1) Exercise care in wiring to avoid damage to cables and equipment.
 - 2) Make all joints and connections with rosin-core solder or approved mechanical connectors.
 - 3) All wiring executed in strict adherence to standard security practices. This includes:

- a) Dress cables in conveniently sized bundles, combed into parallel runs, either laced or banded with sufficient plastic ties.
 - b) For equipment mounted on glides, or otherwise requiring servicing from the front of the rack incorporate a cable "service loop" of sufficient length to permit the equipment to be pulled forward from the rack for servicing.
 - c) Support cables and bundles with sufficient plastic ties and support bars to ensure that no strain is placed on any connections or connectors.
 - d) Organize cables and cable bundles behind patch bays to permit easy access to the patch panels to add or remove cables.
 - e) Place cable markers 3"-5" back from video connectors to permit easy viewing. Do not bind markers into cable bundles.
- b. Grounding:
- 1) If not shown on drawings, ground case of power strip lines in equipment racks to the racks and directly to isolated ground buss in the power panel or to power system ground at the building AC service entry only.
 - 2) Ground all conduits ONLY to power system ground. Insulate all conduits and electrical boxes from CCTV system, including equipment racks.
 - 3) Insulate all conductors in conduit, including shields, from the conduit, back boxes, and from each other for the entire conduit length.
- c. Equipment Racks:
- 1) Install equipment in racks to permit access to all equipment for service. Relays, terminal blocks, etc., mounted in rear of racks behind other equipment shall not prevent access to equipment connections or shall be mounted on hinged panels to permit access.
 - 2) Where racks or cabinets are provided under this Section, wire all racks completely in the shop. No internal rack wiring to be done on the job site.
 - 3) Install equipment in racks with ventilating panels as required to provide adequate ventilation and according to equipment manufacturer's recommendations.
 - 4) Where racks or cabinets are provided under this Section, provide unused panel space with blank or ventilating panels as shown on drawings.
 - 5) Locate free-standing racks as indicated in the Telecom drawings and to provide access to rear.
- d. Conduit:
- 1) Run all lines in metallic conduit or wireways unless otherwise indicated.
 - 2) Do not locate AC power lines in conduit containing video lines. 3) Do not splice lines in conduit.
- e. Receptacles:
- 1) Provide finish sample for approval by Architect.

- 2) Wall-mounted receptacles in metal boxes at building standard receptacle height unless otherwise indicated.

f. Video Receptacles:

- 1) Install feed-through receptacles to mounting plates with insulating washer and sleeve to electrically isolate the receptacle from the electrical box and conduit.
- 2) Punch receptacles with "D" hole to prevent receptacle rotation within hole.

D. Wiring

1. Install systems wiring in accordance with the latest edition of local codes.
2. Any miscellaneous Ethernet cabling required, but not installed under Division 27, must be installed in accordance with Division 27.
3. Low voltage cabling above access ceilings shall be grouped and supported every 3' (and within 6" of terminations) with clips intended for this use. Low voltage cabling in new wall construction shall be run in EMT sized to no more than 40% fill capacity.
4. Label and color code wiring systems with labeling and coding shown on shop drawings.
 - a. Use white conductors only for neutral conductors and green only for grounding conductors.
 - b. Group conductors within junction boxes, pull boxes and equipment enclosures and lace with nylon tie straps with identification tags in individual sets, serving individual locks or groups. Conductor group shall be identified on the tag with respect to room or area served.

E. Cameras

1. The Contractor shall not install any camera in the field until a walkthrough has been scheduled for visual placement of the cameras with final approval from the design team, the locations shown on the drawings are for reference purposes only, the Architect and Owner shall sign off on all final locations prior to the installation of the final devices with possible relocations based upon site conditions, these services shall be included in the contractors base bid.
2. Set for Auto-Iris.
3. Set ABL (auto black level) off.
4. Set color temperature filter to setting 1.
5. Set Gain to 0 dB.
6. Determine a white-balancing procedure for normal use. Determine if an appropriate white area is available in each room or can be made available prior to each room use. If providing white surface for each day's use is difficult, evaluate the effect of using the preset 3200°K color temperature setting. Consult with Owner to confirm procedure suitability. Note that following camera shutdown, white balance, iris, and pedestal adjustments are stored in memory for a maximum of 12 hours. In the test results submission, report on findings.
7. Set lens Macro to "OFF".
8. Set horizontal and subcarrier phase for all cameras. Determine that all video signal parameters can be adjusted to within normal limits, with settings as described above.
9. Coordinate pan/tilt/zoom preset requirements with Owner, and program as required.
10. Cameras with Built-In Microphones: Disable microphones, unless otherwise instructed by the Owner.

11. IP Cameras: Coordinate network requirements, switch PoE requirements, IP addresses, VLANs, QoS, etc., with Owner's IT staff.
12. Configure camera frame rate, bit rate, resolution, and any other available parameters in accordance with the construction documents, unless otherwise instructed by the Owner or Consultant.

F. Network Video Recorders

1. Rack-mount each recorder in existing data center. Coordinate location with LACCD IT.
2. Coordinate network requirements, IP addresses, VLANs, QoS, etc. with Owner's IT staff.
3. Provide recorder with storage, as indicated in the Telecom Drawings, to achieve the desired capacity with the recording policies, resolution, bit rate, etc.

G. Video Management System (VMS)

1. Install the VMS software on NVR server.
2. Add Users, configure the system, add devices and groups, configure event management, and create and add E-maps, as directed by the Owner.
3. Integrate the VMS with the access control system using the VMS's API, if available.
4. Provide copies of all configuration and support files to allow the Owner to re-configure the system.

3.3 SYSTEM PERFORMANCE TESTS AND ADJUSTMENTS

A. Test all equipment to verify conformance with manufacturer's performance specifications and with this specification.

B. At a minimum, the following items shall be verified:

C. Video System Performance Verification Item Numbers and Descriptions

1. VP-110 – Test Video Routes
 - a. Verify that all video routes are tested from endpoint to endpoint via the appropriate midpoint(s) for operation and routing required by the project documentation.
2. VP-111 – Video Camera Image and Operation
 - a. Verify that cameras, lenses, and pan/tilt systems operate as defined in the project documentation. Inspect the camera image through the full lens operation.

D. Cable Management, Termination, and Labeling Verification Item Numbers and Descriptions

1. CABL-100 – Cable Bend Radius
 - a. Verify that cables are not bent beyond their minimum bend radius as specified in cable data sheet to maintain signal integrity as defined in the project documentation.
2. CABL-101 –Connector Plate Input and Output Labeling
 - a. Verify that all CCTV connector plate inputs and outputs are labeled as defined in the project documentation.
3. CABL-102 –Connector Seating
 - a. Verify that all CCTV connectors are correctly keyed, seated, and latched to respective connection points as defined in the project documentation. Conditions

where physical parameters exceed the connector's ability to maintain full seating should be resolved as defined in the project documentation.

4. CABL-103 –Connector Verification
 - a. Verify that all CCTV cable terminations are made securely and meet the recommendations of the connector and cable manufacturer(s), published standards, and requirements defined in the project documentation.
5. CABL-104 –Equipment Power Cable Management
 - a. Verify that all CCTV equipment power cables are managed as defined in the project documentation. Verify that cables are managed in a uniform and acceptable manner so as not to compromise safety/OEM warranty, CCTV signal quality, and/or future field service.
6. CABL-105 – CCTV System Cable Labeling
 - a. Verify that all CCTV system cables are identified by a unique ID as defined in the project documentation. Verify that this unique ID is displayed permanently at both ends of the cable, is legible, and is positioned where it can be seen without undue disturbance.
7. CABL-106 – Cable Separation
 - a. Verify that both site and rack cables have appropriate separation according to signal type and level as defined in the project documentation.
8. CABL-107 – Cable Supports
 - a. Verify that all cables are supported throughout their lengths as defined in the project documentation.
9. CABL-108 – Cable Ties
 - a. Verify that, where appropriate, cable ties are used to secure the cables, are correctly tensioned, and that the correct type of cable tie(s) is used as defined in the project documentation.
10. CABL-109 – Cables Bundled by Type
 - a. Verify that cables are only bundled together when their construction, signal type, and signal level are compatible and will not cause measurable crosstalk or interference between cables.
11. CABL-110 – Cables Dressed
 - a. Verify that cables are dressed to ensure that all rack and site cables are installed to provide serviceability, safety, and aesthetics as defined in the project documentation.
12. CABL-111 – Patch Panel Configuration
 - a. Verify that all patch panels have been correctly wired and configured as defined in the project documentation.
13. CABL-112 – Patch Panel Labeling

- a. Verify that all patch panels have been labeled as defined in the project documentation. Verify that all labeling is machine-printed, consistent, durable, accurate, and legible.
 - 14. CABL-113 – Termination Stress
 - a. Verify that all cable terminations have been completed and adequately supported to minimize stress on the termination point and/or connector.
 - 15. CABL-114 –Connector Plate Consistent Labeling
 - a. Verify that CCTV connector plates have consistent labeling throughout the project as defined in the project documentation.
 - 16. CABL-115 –CCTV System Cabling Verification
 - a. Verify that all cabling is the correct type and routed correctly from point to point as defined in the project documentation.
 - 17. CABL-116 – Cable Length Required for Serviceability
 - a. Verify that sufficient cabling is available so the device can be placed in a serviceable location as defined in the project documentation.
- E. Control Performance Reference Verification Item Numbers and Descriptions
- 1. CON-100 – Control System Communications
 - a. Verify that all control communications are tested from endpoint to endpoint via the appropriate midpoint(s) for operation and functionality as defined in the project documentation.
 - 2. CON-101 – Interfacing and Control of External Devices and Systems
 - a. Verify that CCTV control system interfaces to and from control systems provided by others conform to requirements as defined in the project documentation.
 - 3. CON-102 – Mobile Device Integration
 - a. Verify that mobile devices that are to be supported are integrated and operating as defined in the project documentation.
 - 4. CON-103 – System Response to Event Condition(s)
 - a. Verify that any required response of the installed CCTV system in the event of a configured event operates as defined in the project documentation.
 - 5. CON-104 – Control System Automated Functions
 - a. Verify that all time-dependent or automated functions executed by the control system conform to requirements as defined in project documentation.
 - 6. CON-105 – Control System User Interface Performance
 - a. Verify that the control system is implemented in a manner consistent with the requirements as defined in the project documentation.
- F. System and Record Documentation Reference Verification Item Numbers and Descriptions
- 1. DOC-100 – Final Inventory of CCTV Equipment

- a. Verify that all equipment has been delivered as defined in the project documentation.
2. DOC-101 – Approval of Samples
 - a. Verify that samples of all equipment to be used as defined in the project documentation have been submitted for approval.
3. DOC-102 – Delivered Product Against Samples
 - a. Where samples of products have been required for approval, verify that the products that are delivered are the same and of the same quality.
4. DOC-104 – Consultant’s Testing
 - a. Verify that any consultant’s testing requirements defined in the project documentation have been performed and approved.
5. DOC-105 –Contractor’s Testing
 - a. Verify that any contractor’s testing requirements defined in the project documentation have been performed and approved.
6. DOC-106 – Integrator’s Testing
 - a. Verify that any integrator’s testing requirements have been performed and approved as defined in the project documentation.
7. DOC-107 – Manufacturer’s Testing
 - a. Verify that any manufacturer’s testing requirements defined in the project documentation have been performed and approved.
8. DOC-108 – Owner’s Testing
 - a. Verify that any owner’s testing requirements defined in the project documentation have been performed and approved.
9. DOC-109 – Third-Party Testing
 - a. Verify that any third-party testing requirements have been performed and approved as defined in the project documentation.
10. DOC-110 – Substantial/Practical Completion
 - a. Verify that a conditional acceptance of the project has been issued by the owner or owner’s representative, acknowledging that the project or a designated portion is substantially/practically complete and ready for use by the owner, however some requirements and/or deliverables defined in the project documentation may not be complete.
11. DOC-111 – As-Built Drawings Complete
 - a. Verify that a complete set of accurate as-built drawings indicating all CCTV devices, CCTV device locations, mounting details, system wiring and cabling interconnects, and all other details has been provided as defined in the project documentation.
12. DOC-113 – Control System Test Reporting

- a. Verify that the control system test report has been completed and issued as defined in the project documentation.
 - 13. DOC-114 – Final Commissioning Report and System Turnover
 - a. Verify that the final commissioning report has been completed, issued to the proper entity, and accepted as defined in the project documentation.
 - 14. DOC-115 – Required Closeout Documentation
 - a. Verify that a complete set of as-built system documentation has been provided as defined in the project documentation.
 - 15. DOC-116 – Software Licensing
 - a. Verify that the usage and ownership rights have been assigned as defined in the project documentation.
 - 16. DOC-117 – User Manuals
 - a. Verify that manufacturer’s user manuals are delivered to the owner in a format defined in the project documentation (e.g., binders, PDFs), or dispose of the manuals in a responsible manner (recycling) if the owner specifies that they do not wish to receive the manuals.
 - b. Integrator- or programmer-created manuals and documentation shall be delivered to the owner in a format defined in the project documentation.
 - 17. DOC-118 – Video System Test Reporting
 - a. Verify that the video system test report has been completed and issued as defined in the project documentation.
 - 18. DOC-119 – Warranties
 - a. Verify that all warranties are activated and that all warranty details have been passed to the owner as defined in the project documentation.
 - 19. DOC-120 – Final Acceptance
 - a. Verify that a final acceptance of the project has been issued by the owner or owner’s representative, acknowledging that the project is 100% complete, that all required deliverables, services, project-specific verification lists, testing, verification and signoffs have been received, and that all requirements defined in the project documentation have been satisfied and completed.
- G. Electrical Reference Verification Item Numbers and Descriptions
- 1. ELEC-100 – CCTV Equipment Connected to Proper Circuit
 - a. Verify that all CCTV equipment is powered from the designated power circuit and outlet as defined in the project documentation. No additional (non-CCTV) equipment should be connected unless permitted in the project documentation.
 - 2. ELEC-101 – Grounding/Earthing
 - a. Verify that all elements of the CCTV system are correctly bonded to an electrical ground/earth in accordance with the requirements of the regulatory authority and as defined in the project documentation.
 - 3. ELEC-102 – Mains Voltage Sub-Distribution Integrity

- a. Verify that all electrical sub-distribution systems provided by the contractor in equipment racks, consoles, and similar structures meet local regulatory requirements for electrical integrity.
 - 4. ELEC-103 – Power Sources
 - a. Verify that the sources of mains voltage AC power to be used for the supply of CCTV equipment are correct as defined in the project documentation and have been tested to the outlet in accordance with local electrical standards.
 - 5. ELEC-105 – UPS Operation
 - a. Verify that the uninterruptible power supply (UPS) is performing to the specifications as defined in the project documentation.
 - 6. ELEC-106 – DC Power Distribution
 - a. Verify that all DC powered devices are receiving the proper voltage and current for normal operation.
 - 7. ELEC-107 – Power Loss Recovery
 - a. Verify that the CCTV systems resume normal operation on the restoration of power following a hard electrical power outage. Power loss recovery shall include verification of the resumption state on power recovery. Resumption state shall be the control system start-up condition/start page (where applicable) and resetting all devices to a known state as defined in the project documentation.
- H. Operations and Support Reference Verification Item Numbers and Descriptions
 - 1. OP-100 – Software
 - a. Verify that all control programming code, configuration files, and any other associated software have been provided as defined in the project documentation.
- I. Physical Environment Verification Item Numbers and Descriptions
 - 1. PHYSE-101 – Human Factors, Usability, and Ergonomics
 - a. Verify that ergonomics and usability elements for system users are installed and configured as defined in the project documentation.
 - 2. PHYSE-104 – Backing/Blocking/Framing
 - a. Verify that installed backing, blocking, and framing meets project documentation requirements and industry standards for installation means and methods.
 - 3. PHYSE-105 – Clean Building Handover
 - a. Verify that the area is clean, free of dust, and suitable for equipment installation and that no further work is planned that will release contaminants into any CCTV equipment area.
 - b. Verify that the area released is isolated from any areas not yet released.
 - 4. PHYSE-106 – Coordinated Construction Elements
 - a. Verify that the elements (including but not limited to spatial requirements and building services) required by the CCTV system that are coordinated with other disciplines have been provided as defined in the project documentation.
 - 5. PHYSE-107 – Device Enclosures

- a. Verify that device enclosures accommodate the intended device and that all necessary environmental controls (e.g., heating, cooling, humidity) are incorporated into the enclosure as defined in the project documentation.
 - 6. PHYSE-108 – Finishes
 - a. Verify CCTV equipment, furniture, fixtures, and accessories against the project documentation.
 - 7. PHYSE-109 –Wall Boxes/Ceiling Boxes
 - a. Verify that installed wall and ceiling boxes meet project documentation and regulatory authority requirements.
 - 8. PHYSE-112 – Structural Mounting
 - a. Verify configuration and compatibility of structural accommodations and all mounting hardware based on the intended application. All equipment mounting hardware shall be installed in the manner specified by the hardware manufacturer.
 - 9. PHYSE-113 – Protection of Installed Equipment
 - a. Verify that all elements of the CCTV system are free of damage.
 - 10. PHYSE-114 – Accessibility
 - a. Verify that all systems are accessible in accordance with regulatory requirements.
- J. Physical Installation Reference Verification Item Numbers and Descriptions
- 1. PHYSI-100 – Cable Containment/Conduit
 - a. Verify that installed containment/conduit capacity and routes meet project documentation requirements, industry standards, and regulatory requirements for installation means and methods.
 - b. Verify that installed containment/conduit is serviceable and free of contaminants.
 - 2. PHYSI-101 – CCTV Rack Air Flow and Temperature Performance
 - a. Verify that the CCTV rack(s) provides the air flow as required in the project documentation.
 - b. Verify that the temperature in the CCTV rack has been measured and is within tolerances defined by manufacturers' guidelines.
 - 3. PHYSI-102 – Equipment Security
 - a. Verify that equipment is secured as defined in the project documentation.
 - b. Verify that all security systems, devices, and manufacturer security accessories are installed and verified to be operating as defined in project documentation.
 - c. Verify that keyed devices have been keyed as defined in the project documentation and devices requiring configuration have been configured as defined in the project documentation and are verified to be operating within specification.
 - 4. PHYSI-103 – CCTV Equipment Labeling
 - a. Verify that all CCTV equipment has been labeled in accordance with the requirements of the project documentation. All labeling must be consistent, durable, accurate, and visible without dismantling of sub-assemblies.

5. PHYSI-104 – Plumb and Level/Square
 - a. Verify that all CCTV equipment has been installed, aligned, or angled correctly as defined in the project documentation. Level and plumb are the default requirement unless particular angles or other alignments are defined in the project documentation.
 6. PHYSI-105 – Site Security
 - a. Verify that all elements of the CCTV system are free from loss, damage, or tampering.
 7. PHYSI-106 – CCTV Equipment Location
 - a. Verify that CCTV equipment is installed at the location and/or in the rack or enclosure as defined in the project documentation. Equipment is installed per the elevation or other specification provided by the project documentation or the manufacturer's specification.
 8. PHYSI-107 – CCTV Rack Cleanliness
 - a. Verify that all components installed in CCTV equipment racks are free from dirt, dust, water, or any other element that would compromise the performance and/or longevity of the CCTV system.
 9. PHYSI-108 – Non-End-User Controls Protection
 - a. Verify that installed items with user-facing controls that are not intended for end-user access have been covered, disabled, or otherwise secured to prevent end-user operation.
 10. PHYSI-109 – Optical Components Cleanliness
 - a. Verify that all optical components, such as lenses and mirrors, are free from dirt, dust, damage, or markings that would compromise the optical performance of those system components.
 11. PHYSI-110 – Handling of Accessories Otherwise Undefined
 - a. Verify that all items that are pre-packaged with primary system equipment but have no documented/planned use in the CCTV system(s) are managed in accordance with the project documentation.
 12. PHYSI-111 – Turnover of Accessory System Elements
 - a. Verify that any equipment that may be considered portable and/or otherwise not specifically incorporated into the installed CCTV system(s) has been set up, configured, and tested.
- K. Serviceability Reference Verification Item Numbers and Descriptions
1. SERV-100 – Access Panels
 - a. Verify that any access panels that have been installed to provide access to any type of CCTV equipment are properly sized and positioned as detailed in the project documentation.
 2. SERV-101 – Ability to Maintain and Service Equipment

- a. Verify that all equipment is accessible and capable of being maintained, serviced, cleaned, or adjusted, as necessary.
 - b. Verify that all equipment requiring regular cleaning or maintenance is accessible without requirement for special equipment or tools that would disrupt the normal use of the facility and systems therein.
3. SERV-102 – Input and Output Panel Accessibility
- a. Verify that all input and output panels are accessible and meet all requirements for user access and placement.
4. SERV-103 – Rack Clearance
- a. Verify rack placement and use for physical stability in accordance with the project documentation and regulatory authority.
- L. Acknowledgement of Conformance to the Requirements

ACKNOWLEDGMENT OF CONFORMANCE TO THE REQUIREMENTS SHALL INCLUDE THE FOLLOWING WRITTEN STATEMENT, AUTHORED AND SIGNED BY THE SYSTEM VERIFIER, STATING THAT ALL REQUIREMENTS OF THIS SECTION HAVE BEEN COMPLETED, THE DATE OF COMPLETION, AND THAT THE HANDOVER OF THE COMPLETED, VERIFIED SYSTEM IS FINALIZED.

“THE SYSTEM VERIFIER ACKNOWLEDGES THAT THE PERFORMANCE OF THIS CCTV SYSTEM HAS BEEN VERIFIED IN CONFORMANCE WITH ALL REQUIRED PROCESSES AND CONTAINS ALL REQUIRED ELEMENTS AS DOCUMENTED WITHIN THIS SECTION.

	SYSTEM VERIFIER	DATE
3.4	FINAL ADJUSTMENTS AND ACCEPTANCE TESTS	
A.	Upon approval of the contractor's test report, and at a time set by the Owner or Owner's authorized representative, perform final system adjustments and acceptance tests. Provide all labor, material, tools, and measurement equipment necessary for these tests and adjustments, including the test equipment and material specified in Article 1.1, except as otherwise specified.	
B.	The contractor's representatives performing these tests shall be thoroughly familiar with all details of the system and shall include the field supervisor in overall charge during the installation work.	
C.	Budget eight (8) working hours for the performance of these tests and adjustments. If final acceptance is delayed beyond this period because of installation not in accordance with these specifications, pay for all additional time and expenses of Owner-designated observers during any resultant extension of the acceptance testing period.	
D.	Adjustments: Adjust the system as instructed by the Consultant.	

3.5	TRAINING	
A.	The Owner may assign personnel to participate with the contractor during installation. Without delaying the work, familiarize the Owner's personnel with the installation, equipment, and maintenance.	
B.	During tests and adjustments, permit the Owner's personnel to observe. When feasible explain the significance of each test.	

- C. After the completion of FINAL ADJUSTMENTS AND ACCEPTANCE TESTS, provide on-site training to the end-user to instruct them on the proper use of each system, including:
1. Explain operation of control systems and overall function of installed systems to staff selected by the Owner as "requiring general instruction".
 2. Explain operation of control systems, set-up, and operation of individual pieces of equipment, functions of overall systems, and rudimentary service guidelines to staff selected by the Owner as "requiring technician level instruction".
 3. If requested by the Owner, record these training sessions, and provide them to the Owner for future reference by the Owner's personnel.
 4. After successful training, a repair sequence (schedule of responsibility, response tree, etc.) should be established with any "technician level" staff, designated by the Owner as responsible for CCTV systems operation and maintenance, to expedite service calls. D. Separate from the bid response quotation; provide an hourly cost for additional training.

3.6 WARRANTY

- A. Unless otherwise described in Division 01, provide for the warranty of the delivered system under the following terms and exclusions:
- B. Basic Warranty
1. Basic Warranty provided by the Integrator shall include repair or replacement for one year from date of Final Acceptance on all CCTV Systems Equipment provided (including products having a manufacturer's warranty of less than one year) and all Integrator workmanship. Basic Warranty shall be provided at no additional cost, except in case of obvious abuse.
 2. During the Basic Warranty period the Integrator shall:
 - a. Provide telephone support within 4 hours of a call requesting service.
 - b. Provide emergency service: Within 24 hours of a call requesting service not corrected by telephone support, restore the system to operation, replacing defective materials and repairing faulty workmanship. Make temporary repairs and provide loaner equipment at no charge if defective materials cannot be permanently replaced or repaired within this 24-hour period. Repair or replace faulty items within 72 hours of on-site service or within manufacturers' specific repair program whichever is quicker.
 3. Integrator shall not involve the Owner with removing, re installing equipment, shipping, or receiving equipment being repaired under Basic Warranty, nor shall the Owner be responsible for any shipping or freight charges associated with any item under warranty.
 4. The Owner shall be copied with all paperwork related to all warranty work during the Basic Warranty period.
 5. The Basic Warranty period will commence no sooner than the date of first beneficial use by the Owner and no later than the date of contract closeout.
 6. Paint and exterior finishes excluded from above warranties except when damage or failure results from defective materials or workmanship covered by warranty.
 7. The terms of individual equipment manufacturers' warranties are not diminished by the minimum warranty provisions specified above.
- C. Preventative Maintenance

1. Within the term of the one-year Basic Warranty period the Integrator shall provide, at no additional cost, periodic Preventative Maintenance on the installed CCTV System to ensure proper ongoing maintenance and operation.
 2. A minimum of four (4) Preventive Maintenance visits shall be provided.
 3. Preventative Maintenance shall include, but not be limited to, the following:
 - a. Adjustments to camera configurations
 - b. Reviewing control system functionality
 - c. Any other maintenance and adjustments necessary to ensure that the CCTV System is in proper working order
 4. Any problems or issues noted by the users or other Owner representatives shall be documented and completely resolved at each of the scheduled visits.
 5. Preventative Maintenance Schedule
 - a. 90 days (± 15 days) after the commencement of the Warranty Period.
 - b. 180 days (± 15 days) after the commencement of the Warranty Period.
 - c. 270 days (± 15 days) after the commencement of the Warranty Period.
 - d. 20 days (± 10 days) before the end of the Warranty Period.
- D. Extended Warranty
1. The Integrator may elect to propose to the Owner the offer of Extended Warranty coverage for the CCTV Systems. Extended Warranty shall be any optional warranty services offered by the Integrator that expand on and complement the Basic Warranty coverage required by this Specification. Any provisions of Extended Warranty coverage shall not release the Integrator from responsibility for performance of all requirements under the Basic Warranty coverage.
- E. Software Support
1. The Bidder shall also offer an annual Software Maintenance contract. This shall cover all software provided as part of this system and/or written for this system and shall include routine upgrades to applications and operating systems. The Software Maintenance contract shall commence immediately after expiration of the warranty period and continue for [three] years. Maintenance visits will be [four] times per year and shall be scheduled to coincide with the periodic system maintenance of the system.

END OF SECTION

SECTION 28 26 00

EMERGENCY CALL BOXES

PART 1 GENERAL

1.01 DESCRIPTION

- A. This specification section covers the furnishing and installation of Emergency Phones at the Los Angeles Community College District (LACCD).
- B. The contractor shall furnish and install hardware devices, mounting brackets, power supplies, switches, controls, and other components of the system as shown and specified.
- C. Furnish and install outlets, junction boxes, conduit, connectors, wiring, and other accessories necessary to complete the system installation. Requirements shall be in accordance with Division 26, Electrical.

1.02 PRECEDENCE

- A. Obtain, read, and comply with General Conditions and applicable sub-sections of the contract specifications. Where a discrepancy may exist between any applicable sub-section and directions as contained herein, this section shall govern.

1.03 GENERAL CONDITIONS

- A. In accordance with Section 28 00 00, Security Systems Basic Requirements

1.04 RELATED WORK

- A. In accordance with Section 28 00 00 Security Systems Basic Requirements
- B. In accordance with Section 28 04 00, Security System General Requirements.

1.05 OPERATING AND MAINTENANCE MANUALS

- A. In accordance with Section 28 00 00 Security Systems Basic Requirements.

1.06 SERVICE AND MAINTENANCE

- A. In accordance with Section 28 00 00 Security Systems Basic Requirements

1.07 TRAINING

- A. In accordance with Section 28 00 00 Security Systems Basic Requirements

1.08 WARRANTY

- A. In accordance with Section 28 00 00 Security Systems Basic Requirements

1.09 TECHNICAL REQUIREMENTS, EMERGENCY PHONE SYSTEM

- A. General The following information is provided to establish the required system performance for a complete operating Emergency Phone System for the [site and/or facility]. Some functions and performance requirements noted herein are supported and supplied by existing systems in concert with new equipment which shall be provided by the Contractor under this scope of work. The contractor shall provide

equipment, wiring, and programming at all sites as necessary to provide a complete system as described herein and as shown on the drawings.

1. Components provided under this scope of work shall be compatible with the UC communications phone system and connected to the EACS portion of this project.
 2. The contractor shall be responsible for providing equipment and connections to achieve specified system performance.
- B. Purpose: The system is designed to allow communication from the device to the programmed responding location allowing the responder to assist the caller.
1. Attributes
 - a. General
 - 1) Emergency phones with visual locating devices are located in the elevator lobbies.
 - b. Elevator Lobby Emergency Phones
 - 1) Emergency phones utilize the campus phone system dialing automatically to call a monitoring location.
 - 2) Each device shall be equipped with a red button identifying the location of activation.
 - 3) Each device shall be equipped with a single pushbutton which will activate the calling function.
 - 4) Emergency phones shall be provided in a wall-mounted configuration, as indicated on the plans.

PART 2 PRODUCTS

2.01 GENERAL

- A. Product Acceptability: The Products section contains lists of acceptable products. If product substitutions are proposed, they must be made based upon a comparison of equivalence to the product specified and compatible with the existing LACCD Emergency Phone System system. Considerations may include but shall not be limited to functional, physical, aesthetic, and/or interface aspects. The Owner shall be the sole judge of whether a submitted substitution is deemed to be "equivalent" to that specified. The contractor may not use contractor proprietary interface modules for connections between the field and controller.
- B. Equipment shall have a UL-listed mark on the product.
- C. Assemblies shall be approved by a recognized agency acceptable to the City of Los Angeles.

2.02 EMERGENCY PHONE

- A. Provide Emergency Phones in the following configurations. Phones shall incorporate communication compatible with the Owner's communications system.
1. Interior Wall Phone
 - a. Provide "Talk-A-Phone" model AOR-IP-CSE Phone

- 1) Stainless Steel faceplate
- 2) Single push button activation
- 3) LED indicator for hearing impaired
- 4) Built-in auto-dialer
- 5) Auto-Answer
- 6) Second number dial on the first number no answer
- 7) UL listed

b. Provide [indicate] surface/flush mounting enclosure to match the phone.

2.03 WIRE AND CABLE

- A. General: Cables that are not installed in conduit shall be a version of the specified cable rated for use in plenums.
- B. System cable: Provide cable as shown below, or as recommended by the Manufacturer.
 1. Emergency Phone: Category 6A UTP cable by Windy City, or equal.
- C. Cable installed below grade shall be rated for immersion in water.
- D. Refer to the LACCD Telecommunications/IT standards for termination and routing requirements for the telecommunications cable.

PART 3 EXECUTION

3.01 GENERAL

- A. In accordance with Section 28 04 00, Security System General Requirements.

3.02 EMERGENCY PHONE INTEGRATION

- A. Provide access control system integration equipment, and software programming, in accordance with Section 28 13 00, Access Control. In addition, provide specific integration schemes noted.

3.02 GROUNDING PROCEDURES

- A. Provide grounding of all systems and equipment in accordance with Section 28 04 00, Security System General Requirements.

3.03 WIRE AND CABLE INSTALLATION PRACTICES

- A. Provide wire and cable installation in accordance with Section 28 05 13, Security System Cabling Requirements.

3.04 START-UP RESPONSIBILITY

- A. Provide start-up services for all systems and equipment in accordance with Electronic Safety and Security, Section 28 05 00.

3.05 PRELIMINARY INSPECTION AND TESTING

- A. Provide preliminary inspection and testing services for systems and equipment in accordance with Testing and Commissioning, Section 28 00 00.

3.06 SYSTEM PERFORMANCE TESTING AND ADJUSTING PROCEDURES

- A. Provide performance testing and adjusting of systems and equipment in accordance with Testing and Commissioning, Section 28 00 00.
- B. Emergency Phone
 1. Verify phone indicator is on
 2. Verify phone indicator flashes when activated.
 3. Verify voice communication with called station
 4. Verify visual indicator is on during normal operation
 5. Verify visual indicator strobe function is activated during use.

3.07 BURN-IN PERFORMANCE PERIOD

- A. Provide a burn-in performance period to demonstrate the stability of the system, in accordance with Testing and Commissioning, Section 28 00 00.

3.08 COMMISSIONING AND VALIDATION

Provide commissioning and validation services to prove and improve the effectiveness of the system, in accordance with Testing and Commissioning, Section 28 08 00.

3.09 TRAINING

- A. Provide training requirements of Security System General Requirements Section 28 00 00

3.10 FINAL PROCEDURES

- A. Perform final procedures in accordance with section 28 00 00, Security System General Requirements.

END OF SECTION

SECTION 28 26 05

RESCUE ASSISTANCE COMMUNICATION SYSTEM

PART 1 GENERAL

1.01 DESCRIPTION

- A. The standards provided have been set forth for the Contractor, installer to follow for any future projects and or renovations. For a complete list of material for each campus where work is performed, please refer to BuildLACCD campus standards web site:

<http://www.build-laccd.org/contractors-bidders/standards-guidelines/quick-search-results?type=guidelines&category=13>

These standards are provided to serve as a guideline for contraction project to be completed correctly per latest district requirements. Contractors are to confirm any discrepancies between their scope of work and these specs prior to start of any project. After contractor accepts any bid, the contractor shall be responsible to provide their work per the Set Standards.

- B. The Area of rescue system shall be provided and installed per latest ADA and LACCD district standards for buildings of 2 stories or more. The purpose of providing such system is to assist individuals in case of emergency where these cannot leave a given floor.
1. Furnish all labor, materials, tools, equipment and services for a complete area of Rescue Assistance Communication System as indicated in Contract Documents and as required by the American Disabilities Act (ADA).
 2. Completely coordinate with work of all other trades.
 3. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete installation.

1.02 QUALITY ASSURANCE

- A. Transistors, capacitors, resistors, integrated circuits and other components shall not be operated to exceed their rated values. Design systems for 24 hour continuous operation.

1.03 SUBMITTALS (REFER TO SECTION 26 05 00)

A. Product Data:

1. Technical data on each product including finishes.
2. Description of system operation.
3. Riser diagrams and system data.
4. Equipment design considerations for future expansion when indicated.
5. Materials list and backbox schedule (including unique backboxes).

B. Project Data:

1. Operating and Maintenance Data

- a. Factory-prepared operation and service manual for each system.
- b. Include operation details, schematics, wiring diagrams, color coding, terminal numbers and component values for printed-circuit boards.
- c. Owner Instruction Reports: Refer to Section 26 05 00.

1.04 OPERATION

- A. General: Provide two way audible/visual communication between a master annunciator station and the area of refuge, area of rescue assistance and/or elevator landing communication stations.

1.05 SYSTEM OPERATION

- A. With the system in standby mode, all LED's are extinguished and no alarms are heard. A momentary actuation of a Rescue Assistance Call Switch will illuminate the switch and sound a local tone confirming activation. Simultaneously, the associated LED at the Rescue Assistance Annunciator Panel will illuminate and initiate a repeating audio alarm.
- B. The Fire Department, or appropriate local authority, can acknowledge receipt of the call by momentarily depressing the associated switch on the Rescue Assistance Annunciator Panel. This will flash both the annunciator LED and the calling stations LED. In addition, a repeating audible signal will begin at the calling station indicating that help is on the way. Actuating the acknowledge switch a second time will cancel the call and return that zone to the standby mode. The repeating audio alarm at the annunciator panel will continue until all calls have been acknowledged or cancelled.
- C. A yellow LED will illuminate at the remote annunciator panel if there is a line fault.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Cornell #A4200 Series.
- B. Housing Devices, Inc. #ADA-1000 Series.

2.02 EQUIPMENT

- A. Master Remote Annunciator shall consist of a modular arrangement of intercom 'ON' and flashing red zone LED indicators in multiples of four zones. The annunciator panel shall include a "push to talk" and an audible alarm device with a sound level of not less than 90 dB at 30 cm. The panel shall be constructed of .125" thick clear anodized aluminum. Permanent silk-screened zone designations shall be provided on the panel as well as a designation strip. Backbox and panel dimensions will vary depending upon system configuration and number of zones required.
- B. Power source shall be a transformer rated for total system devices with an optional battery-backed DC power supply with battery supply for continuous operation of 15 90 minutes 4 hours.
- C. Wiring to call station shall be supervised. In the event of a wire fault, a yellow LED zone indicator on the annunciator shall illuminate and a repeating audio alarm shall sound.
- D. Remote Rescue Assistance Call Station shall consist of one momentary switch with LED, incandescent lamp not acceptable, and one audible alarm device with a minimum sound level of not less than 70 dB at 30 cm all mounted on a one gang stainless steel plate. Permanent silk-screened designations shall be provided on the plate.

- E. Wiring shall consist of 22 gauge (minimum) wire or as indicated on drawings. Three conductors plus one shielded pair are required between each Rescue Assistance Call Station and the annunciator panel not to exceed 3,000 feet. Power wire shall be 12 gauge (minimum). Two conductors are required between the power supply or transformer and the annunciator panel.

2.03 INSTALLATION

- A. Install all components and complete system as indicated and in accord with manufacturer's recommendations and instructions.
- B. Install all wiring in conduit from wall outlet to corridor cable tray above accessible corridor ceiling.
- C. Contractor is to provide and install a typewritten list in a Plexiglas frame permanently fastened to the wall next to the Master Rescue Assistance Annunciator Panel to indicate the building location of each of the remote area of Rescue Assistance Call Stations and to which annunciator zone and LED they correspond.
- D. Contractor is to provide a typewritten list of area of Rescue Assistance Communication Instructions in a Plexiglas frame permanently fastened to the wall next to each remote switch and the annunciator panel to explain the operation of the system.

2.04 SYSTEM TESTING

- A. Test each component and complete system for proper operation, including all modes. Perform correctional work when required. Testing shall be done in the presence of the Owner's Representative(s).

2.05 OWNER PERSONNEL INSTRUCTION

- A. Instruct maintenance and staff personnel in complete operation, including actual staff use of system, by authorized distributor personnel. Arrange timing of the session in writing to best coordinate with Owner's working hours. Allow four (4) hours of training. This training session shall be videotaped by the Contractor.

2.06 WARRANTY SERVICE

- A. Warrant all Work of this Section to be free from defects in materials and workmanship for a minimum of 1 year from the date of Owner acceptance of the Work of this Section.
- B. All manufacturers' equipment warranties shall be activated in the Owner's name and shall commence on the date of system acceptance. In the case of Contractor modified equipment, the manufacturer's warranty may be voided. In such cases, provide a warranty equivalent to that of the original manufacturer.
- C. Response Time: Provide a qualified technician familiar with the system at the Project Site within 12 hours after receipt of a notice of malfunction. Provide the Owner with the telephone number attended 8 hours a day, 5 days a week, and an answering service or equivalent facility attended 24 hours a day, 7 days a week, to be called in the event of a malfunction. Provide repairs at no expense to the Owner and at the Owner's request, alternate facilities, services and systems for the duration of the repairs to any defective work of this Section. Provide a complete and operational System, within 48 hours after notification of a malfunction.
- D. All work requested due to warranty issues shall be performed during regular working hours unless the Owner agrees to pay the difference in labor rates for overtime or night time work.
- E. The Contractor shall use qualified service personnel to respond to all warranty issues or calls.

- F. Off Site Service: Conduct all warranty repairs and services at the Project Site, unless in violation of manufacturer's standard product warranty. Provide substitute system equipment, and/or devices acceptable to the Owner for the duration of off-site repairs. Provide transportation for substitute and/or test systems, equipment, devices, materials, parts and personnel to and from the Project Site.

END OF SECTION

SECTION 28 31 01

FIRE ALARM AND DETECTION SYSTEMS (ADDRESSABLE)

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Fire Alarm and Detection Systems
- B. Campus Fire Alarm Network Connections
- C. One-way emergency communications system with voice notification within-building, wide- area, and distributed recipient coverage (Mass Notification)

1.02 RELATED WORK

- A. Section 26 05 53 – Electrical Identification: Refer to electrical identification for color and identification labeling requirements.

1.03 QUALITY ASSURANCE

- A. Manufacturer: Company specializing in smoke detection and fire alarm systems with a minimum of ten years experience.
- B. Installer: A factory-authorized Electrical or Security Contractor licensed with the State and local jurisdiction with a minimum of five years' experience in the design, installation, and maintenance of fire alarm systems by that manufacturer.
- C. Qualifications: The person managing/overseeing the preparation of shop drawings and the system installation/programming/testing shall be trained and certified by the system manufacturer and shall be Fire Alarm Certified by NICET, minimum Level3. This person's name and certification number shall appear on the start-up and testing reports.

1.04 REFERENCES

- A. ASME A17.1 - Safety Code for Elevators and Escalators
- B. NFPA 20 - Standard for Centrifugal Fire Pumps
- C. NFPA 70 - National Electrical Code
- D. NFPA 72 - National Fire Alarm and Signaling Code
- E. NFPA 101 - Life Safety Code
- F. UL 2017 – General Purpose Signaling Devices and Systems
- G. UL 2572 - Control and Communication Units for Mass Notification Systems
- H. California Fire Code (CFC)

1.05 SUBMITTALS

- A. Provide product catalog data sheets as shop drawings.
 - 1. Provide a product catalog data sheet for each item shown on the Electrical Symbols List and for each piece of equipment that is not shown on the drawings, but required for the operation of the system.
 - 2. Where a particular Electrical Symbols List item has one or more variations (such as those denoted by subscripts, etc.) a separate additional product catalog data sheet shall be provided for each variation that requires a different part number to be ordered. The corresponding Electrical Symbols List symbol shall be shown on the top of each sheet.
 - 3. Where multiple items and options are shown on one data sheet, the part number and options of the item to be used shall be clearly denoted.
- B. About all fire alarm circuits, provide the following: manufacturer's wiring requirements (manufacturer, type, size, etc.) and voltage drop calculations.
- C. Provide manufacturer letter and certification indicating proposed method of fire alarm system monitoring and campus system interface.
- D. Provide installation and maintenance manuals under provisions of Section 26 05 00.
- E. Submit manufacturer's certificate that system meets or exceeds specified requirements.
- F. Provide information on the system batteries as follows: total battery capacity, total capacity used by all devices on this project, total available future capacity.
- G. Voice Alarm Communication System: Submit equipment rack or console layout, grounding schematic, amplifier power calculations, and wiring diagram.
- H. Submit photocopy proof of NICET certification of the person overseeing the preparation of drawings and installation/testing.
- I. When required to comply with local or state regulatory reviews, the fire alarm submittal shall have a Professional Engineer's stamp and signature of the state in which the project is completed. NOTE: The Architect/Engineer cannot stamp and seal submittal drawings not prepared under their supervision.
- J. All fire alarm devices are to be tested to NFPA 72E and report delivered to the Facilities Director prior to acceptance of system.
- K. Fire alarm provider shall hire a low voltage contractor to install the system. Installer must be certified for the system being installed. Contractor must provide proof of certification.

1.06 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Provide quantity equal to 2 percent (2%) of amount of each type installed, but no less than two (2) units of each type.
 - a. Smoke and heat detectors, manual pull stations, duct smoke detectors, monitor modules, control modules and relays.

- b. Notification appliances: Speakers, speaker strobes, and strobes.
 - c. In addition to the above, an additional 5% of component parts shall be provided as added stock.
- 2. Keys: The installing contractor shall collect all equipment spare keys provided with each lockable or resettable device/cabinet [minimum of one (1) set each] and shall turn over to the Owner upon completion.
 - 3. All spare parts shall be housed in metal cabinet labeled "Fire Alarm Spare Parts."
 - 4. Trouble shooting and cleaning kits shall be provided.

1.07 REGULATORY REQUIREMENTS

- A. System: UL or FM Global listed.
- B. Conform to requirements of NFPA 72.
- C. Conform to requirements of CBC and CFC.
- D. Conform to requirements of Americans with Disabilities Act (ADA).
- E. Conform to UL 864 Fire Alarm, UL 1076 Security, UL2017 General Signaling, and UL 2572 Mass Notification Communications.

1.08 SYSTEM DESCRIPTION

- A. Performance Statement: This specification section and the accompanying fire alarm specific design documents describe the minimum material quality, required features, and operational requirements of the system. These documents do not convey every wire that must be installed and every equipment connection that must be made. Based on the equipment described and the performance required of the system, as presented in these documents, the Vendor and the Contractor are solely responsible for determining all wiring, programming and miscellaneous equipment required for a complete and operational system.
- B. This section of the specifications includes the furnishing, installation and connection of the microprocessor controlled, intelligent reporting, fire alarm equipment required to form a complete coordinated system that is ready for operation. It shall include, but is not limited to, alarm initiating devices, voice evacuation equipment, control panels, auxiliary control devices, annunciators, power supplies, and wiring as indicated on the drawings and specified herein.
- C. Integrating the existing fire alarm system: Provide all items, components, devices, hardware, software, programming, expansion components, conduit, wiring etc. needed to integrate the existing fire alarm system and campus network with the new fire alarm system. This includes, but is not limited to, additional power supplies, initiating devices and circuits, signaling devices and circuits, monitoring devices and circuits, auxiliary control and related devices such as, door holders and their control, smoke damper control, fan shutdown, etc. The existing fire alarm system and network shall be integrated with the new fire alarm system such that the existing fire alarm system's functionality, integrity and annunciation shall be equivalent to pre- construction conditions unless noted otherwise. The functionality and integrity shall be maintained during construction. The entire system shall be able to be completely reset from any single reset location point.
- D. The entire system shall be annunciated at any annunciation location.

- E. Fire Alarm System: NFPA 72; Automatic and manual fire alarm system, non-coded, analog-addressable with automatic sensitivity control of certain detectors, multiplexed signal transmission.
- F. Campus Ethernet IP Network: A complete fire alarm and mass notification network shall be provided based on the Campus Standards on which the project is located. The network shall be Class X, that shall be able to operate with any single break and self-restoring network communications. Each building shall contain an independent building fire alarm / voice communications system, with full command and control from the campus command center. In no case shall read only network annunciation be acceptable as the only networking function.
- G. Voice Communication: The facility shall have an emergency voice alarm communication system. The digitized recorded voice message shall notify occupants that a fire condition has been reported. Emergency manual voice override shall be provided.
- H. Firefighter Phone System: A two-way talk path shall be provided for the fire department's use from the voice command center to the secondary fire alarm attack entrances, elevator lobbies, primary and backup power rooms and the entrance to all enclosed stairways.
- I. Emergency Communication System (ECS): A system capable of reproduction of prerecorded, synthesized, or live messages with voice intelligibility to indicate the existence of an emergency situation and communicating information necessary to facilitate an appropriate response and action. The system shall provide alerting in the building, wide-area notification on the campus and interface with distributed recipient mass notification system.
- J. System Supervision: Provide electrically supervised system, with supervised Signal Line Circuit (SLC) and Notification Appliance Circuit (NAC). Occurrence of single ground or open condition in initiating or signaling circuit places circuit in TROUBLE mode. Component or power supply failure places system in TROUBLE mode.
- K. Alarm Reset: Key-accessible RESET function resets alarm system out of ALARM if alarm initiating circuits have cleared.
- L. Lamp Test: Manual LAMP TEST function causes alarm indication at each zone at fire alarm control panel and at annunciator panels.
- M. Drawings: Only device layouts and some equipment have been shown on the contract drawings. Wiring and additional equipment to make a complete and functioning system has not been shown, but shall be submitted on the shop drawings.
- N. Fire alarm systems and components shall be of the latest technology.
 - 1. The model shall be the latest version put out by the manufacturer.
 - 2. Parts must be readily available for five (5) years.
 - 3. System shall be supported by the manufacturer for five (5) years.
- O. System must have the capability to be viewed remotely. The remote viewing shall be Web based.
- P. Any contractor that modifies the fire alarm system data base takes full responsibility for the entire fire alarm system data base.

1.09 PROJECT RECORD DOCUMENTS

- A. Include location of end-of-line devices.
- B. Provide a CAD drawing of each area of the building (minimum scale of 1/16" = 1'-0") showing each device on the project and its address. The devices shall be shown in their installed location and shall be labeled with the same nomenclature as is used in the fire alarm panel programming.
- C. Submit test results of sound pressure level (dBA) and intelligibility (STI) with the rooms tested designated on the floor plan. Notification devices shall have the tap wattage designated.
- D. Contractor shall develop and submit a campus map showing the entire system, including the location of all devices.
- E. Contractor shall provide a list of the location of all devices. In addition, all fire alarm devices shall be tagged.
- F. System be integrated with college drawings and match current room number signage.
- G. Copies of the video training shall be supplied.
- H. The Fire Alarm System must pass commissioning prior to acceptance.
- I. Four (4) hours of in-person training shall be provided.

1.10 OPERATION AND MAINTENANCE DATA

- A. Include operating instructions, and maintenance and repair procedures.
- B. Include results of testing of all devices and functions.
- C. Include manufacturer's representative's letter stating that system is operational.
- D. Include the CAD floor plan drawings.
- E. Include shop drawings as reviewed by the Architect/Engineer and the local Authority Having Jurisdiction.

1.11 DOCUMENT STORAGE CABINET

- A. The cabinet shall have all fire alarm system documents, including record drawings, wiring diagrams, operation manuals, etc. A legend sheet permanently attached to the door shall contain system passwords and inspection logs. The enclosure shall also provide two (2) key ring holders for system keys and a location for a standard size business card with service contact information. The cabinet will have, permanently and securely mounted inside, a digital flash memory device with a minimum of 4 GB of storage capacity and a standard USB B connector for uploading and downloading electronic versions of record documents and system programming information.
- B. The cabinet shall be red in color with an identification label reading "FIRE ALARM DOCUMENTS". Refer to Identification Section 26 05 53. The cabinet shall be lockable.
- C. The final version of the system database program shall be stored within the cabinet.

1.12 WARRANTY

- A. Provide one (1) year warranty on all materials and labor from Date of Substantial Completion.

- B. Warranty requirements shall include furnishing and installing all software upgrades issued by the manufacturer during the one (1) year warranty period.

1.13 ANNUAL INSPECTION/TESTING AND SERVICE CONTRACT

- A. Provide cost to furnish service, inspect, and test all devices of the fire alarm system per the requirement of NFPA for one (1) year, starting one year after the Date of Substantial Completion. Submit written reports of inspection testing per NFPA 72, Chapter 14.
- B. Provide an alternate cost for a complete inspection/testing and service/maintenance contract for the fire alarm system for one (1) year two (2) years, starting one year after the Date of Substantial Completion. Submit sample contract terms and conditions for review with shop drawings.
- C. The Owner may enter into a contract directly with the vendor after shop drawing submittals. This specification is not a contract between the Owner and the vendor to perform these services.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS BY COLLEGE – NO SUBSTITUTIONS

- A. City – Edwards EST
- B. East – Edwards EST
- C. Harbor – Edwards EST integrated into PA system
- D. Mission – Notifier
- E. Pierce – Silent Knight
- F. Southwest – Simplex
- G. Trade Tech – Edwards EST
- H. Valley – Simplex
- I. West – Siemens

2.02 FIRE ALARM CONTROL PANEL (FACP)

- A. Control Panel: Modular, power-limited electronic design. Provide surface wall-mounted enclosure as shown on plans. Enclosure shall be minimum 0.060 steel with provisions for electrical conduit connections into the sides and top. The door shall provide a key lock and shall include a glass or other transparent opening for viewing of all indicators.
- B. Each Signaling Line Circuit (SLC loop) shall not be loaded over 80% of the maximum device capacity. For example, in the minimum system capacity column listed below, if the fire alarm manufacturer's system capacity of analog sensors per loop is 99 devices, then no more than 79 devices shall be wired on that loop. The minimum system capacity shall be as follows:

Minimum Total Addressable Points: 250 500 2000

Minimum Total SLC loops

(including board, ready for field connections): 1 2 4 6 8 10

Panel Expansion Capability, Minimum Total SLC loops: 1

Minimum Node capacity for Network System: 10

C. Signal Line Circuit (SLC) and Notification Appliance Circuit (NAC) Boards:

1. Each board shall communicate directly with each addressable analog sensor and binary input to determine normal, alarm, or trouble conditions. Analog signals would be used for automatic test and determination of maintenance requirements.
2. Each board shall contain its own microprocessor and shall be provided to monitor addressable inputs and to control addressable outputs (addressable relays). The board shall communicate and provide power to all devices on its loop over a single pair of wires, except where 4-wire devices require a separate power circuit.

D. Interconnection of Multiple Fire Alarm Panels:

1. The pathways of interconnected fire alarm panels or systems shall be as follows:
2. Pathway Class X: Circuits with redundant pathways capable of transmitting an alarm signal during an open or a non-simultaneous single ground fault on a circuit conductor wiring system. Wiring of outgoing and return conductors shall be physically separated by a minimum of 50 feet or by a two-hour rated enclosure.
3. Fire Alarm System shall be connected to the central panel.
 - a. No stand-alone systems.
 - b. All systems and stations must register on the main panel.
4. System shall be installed with a fiber network.
5. New buildings must be integrated into the existing campus system.
6. Provision shall be made for future interconnection and monitoring of new systems at the LACCD SOC. Proposed future interconnection methodology shall be clearly stated on the fire alarm system design submittal documentation.

E. Central Processing Unit:

1. The central processing unit (CPU) shall communicate with the monitor and control all other modules in the panel. Removal, disconnection or failure of any control panel module shall be detected and reported to the CPU.
2. The CPU shall execute all control-by-event programs for specific action to be taken if a designated situation is detected in the system. A real-time system clock for time annotations on the display and printer shall be included.
3. All power for the unit shall be supervised and supplied by the FAP.

F. Display:

1. The board shall provide all controls and indicators used by the system operator and may also be used to program all control panel parameters.
2. The board shall provide an alphanumeric array for display of custom alphanumeric labels for all addressable points. It shall also provide indicators for AC Power, System Alarm, System Trouble, Display Trouble and Signal Silence.

3. Displayed descriptions of addressable points shall include actual room names/numbers selected by the Owner. This information shall be obtained prior to programming. Room names/numbers shown on floor plans shall not be used.
 4. The board shall provide a touch key-pad with control capability to command all system functions and entry of any alphanumeric information. Twenty different passwords with four levels of security shall be supported to prevent unauthorized manual control or programming.
 5. System shall indicate if a fire damper is open or closed, and the location of the damper, on the fire alarm display.
- G. Memory: The CPU and display interface board shall be augmented by non-volatile field programmable memory. EPROM memory will also be allowed provided the memory is burned in with minimum expansion capability equal to the total system capacity of the panel. Memory shall not be lost upon primary and secondary power failure.
- H. Serial Interface Board: The board shall provide interfaces to a printer, LCD display and other monitoring devices through RS-232 connections. The minimum operational distance between the board and the peripheral devices shall be 500 feet. Up to three (3) RS-232 outputs shall be supported.
- I. Power Supply:
1. Input power shall be 120 VAC, 60 Hertz. Output power shall be as noted on the device specifications and drawings. Each component of the fire alarm system requiring 120 VAC input power shall be served from a dedicated emergency branch circuit. Provide two #12 conductors and one #12 ground in 3/4" conduit to a dedicated 20A/1P circuit breaker with a red handle and a manufacturer's standard handle lock-on device. Identify/label breaker and branch circuit in accordance with NFPA requirements and Specification Section 26 05 53.
 2. Adequate to supply 125% of all control panel and peripheral power needs as well as 125% of power required for all external audio-visual devices. The power supply may be increased as needed by adding additional modular expansion power supplies. Over-current protections shall be provided on all power outputs.
 3. All power supplies shall be designed and installed to meet UL and NFPA requirements for power-limited operation on all external initiating and indicating circuits.
 4. The power supply shall provide integral charger for use with internal batteries. Battery capacity shall be sufficient for operation of the entire system for 24 hours in a non-alarm state followed by alarm mode for 15 minutes, plus 25% spare capacity for future devices.
- J. Surge Protection:
1. All fire alarm control panels, NAC panels, etc. shall be provided with a surge protection device (SPD). The SPD shall be UL listed to Standard 1449 Rev 3. The unit should be clearly labeled in accordance with Identification Section 26 05 53. The SPD shall have thermal fuses to protect against fire in short circuit conditions. The unit shall provide visual indication that the unit is protecting and functioning.
 2. Any communications or signaling circuits associated with the fire alarm system, which leave or enter a facility, shall be provided with a surge protection device. The devices shall be as recommended by the fire alarm system manufacturer.

K. Digital Communicator:

1. Provide dual phone line interface capable of fire alarm notification to the local fire department, fire protection agency, or monitoring service. Communicator shall report in SIA and most major communication formats, with the capability of transmitting each device address point in a format compatible with the central station receiver.
2. Communicator shall be fully supervised and shall operate on loop start phase lines ahead of the building PBX system.
3. Communicator shall be FCC registered. Contractor shall provide two RJ31X jacks. Contractor to provide connection of communicators to Owner's telephone system.
4. Approvals: UL listed - UL 864/NFPA 72, FM approved.
5. The communicator shall be provided integral to the fire alarm panel as furnished by the fire alarm panel manufacturer. If the panel construction requires a separate unit, the unit shall be as manufactured by Silent Knight, Ademco, or fire alarm panel manufacturer approved equal.

L. Digitized Voice Command Center (VCC):

1. The Digitized Voice Command Center (VCC) shall contain all equipment required for all audio control, firefighter phone system control, signaling, and supervisory functions. This shall include digital voice units and microphones.
2. Function: The Voice Command Center equipment shall perform the following functions:
 - a. Operate as a supervised single channel automatic digitized voice evacuation system with manual emergency voice communication system.
 - b. Audibly and visually annunciate the active or trouble condition of every signal circuit and firefighter phone circuit.
 - c. Audibly and visually annunciate any trouble condition of tone generators and digital voice units required for normal operation of the system.
 - d. Provide all-call activities through activation of a single control switch.
 - e. Provide automatic, digitally recorded voice messages and tones.
3. Audio Amplifiers:
 - a. The audio amplifiers will provide a single channel audio power at 25/70 volts RMS for distribution to speaker circuits.
 - b. Provide multiple audio amplifiers mounted in the transponder or in the main fire alarm control panel, either to supply incremental audio power, or to function as an automatically switched backup amplifier(s).
 - c. The audio amplifier shall include an integral power supply, and shall provide the following controls and indicators:
 - 1) Normal Audio Level LED
 - 2) Incorrect Audio Level LED
 - 3) Battery Trouble LED
 - 4) Amplifier Trouble LED
 - 5) Audio Amplifier Gain Adjust

- d. Includes audio input and amplified output supervision backup input.
4. Audio Message Generator (Digitized Voice):
- a. Each initiating zone or intelligent device shall interface with an emergency voice communication system capable of transmitting a digitized voice message to all speakers in the building.
 - b. Actuation of any alarm initiating device shall cause a digitized message to sound over the speakers. The message shall be repeated four (4) times.
 - c. A built-in microphone shall be provided to allow paging through speaker circuits.
 - d. The audio message generator shall have the following controls and indicators to allow for proper operator understanding and control:
 - 1) All Call LED
 - 2) On-Line LED
 - 3) All Call Switch
5. Voice Messages:
- a. A pre-programmed custom digital voice message shall be used for notification appliance speaker circuits. The messages shall be approved by the Authority Having Jurisdiction (AHJ). Voice messages shall be from a male voice. The messages shall be provided in the multi-lingual language of the predominant building population.
 - b. Message shall be preceded by a tone and message shall be repeated four times until silenced.
 - c. Messages shall be annunciated by a single channel in all evacuation signal zones throughout the building.
 - d. Primary messages shall be annunciated in the zone of fire alarm and adjoining areas' evacuation signaling zones, and the secondary message in all other evacuation signaling zones.
 - e. Message shall be as shown in the following table. These messages are not intended to specify the exact wording required, but to specify the minimum information conveyed by the message:

Alarm Type	NAC Area	Preceding Tone	Message
Fire Alarm	Single Channel-all areas	Three Chimes	May I have your attention please? A fire emergency has been reported in the building. Proceed calmly to the nearest exit and leave the building immediately. Do not use the elevators. Use stairwells where necessary. Occupants that are unable to use stairways shall report to designated Areas of Rescue Assistance.
Fire Alarm	Dual Channel- Primary Message Area of alarm and adjoining evacuation signaling zones	Three Chimes	May I have your attention please? A fire emergency has been reported in the building. Please evacuate to a different area or floor of the building and await further instructions. Occupants that are unable to use stairways shall report to designated Areas of Rescue Assistance.
Fire Alarm	Dual Channel- Primary Message Area of alarm and adjoining evacuation signaling zones	Three Chimes	May I have your attention please? A fire emergency has been reported in the building. Proceed calmly to the nearest exit and leave the building immediately. Do not use the elevators. Use stairwells where necessary. Occupants that are unable to use stairways shall report to designated Areas of Rescue Assistance.
Fire Alarm	Dual Channel- Secondary Message All other evacuation signaling zones	Three Chimes	May I have your Attention please? A fire emergency has been reported in another area of the building. Please stand by for further instructions. Please do not use elevators
Test	All areas	One Chime	"May I have your attention please? May I have your attention please? This is a test of the building emergency alarm system. This is only a test."
All Clear	All areas	One Chime	"May I have your attention please? May I have your attention please? The reported emergency has been investigated and normal conditions have been restored. You may return to all areas of the building."

6. Speaker Circuit Control Switches/Indicators:
 - a. The speaker circuit control switches/indicators shall include visual indication of active and trouble status for each speaker circuit in the system.
 - b. The speaker circuit control panel shall include switches to manually activate or deactivate each speaker circuit in the system.
 - c. Buttons shall be provided on the voice command center to manually activate all auxiliary messages. (i.e. all clear, severe weather, homeland security warning, custom message)

2.03 EMERGENCY TELEPHONE DEVICES

A. Portable Emergency Telephone Handset Jack:

1. Flush mounted on stainless steel plate at locations indicated on plans.
2. Insertion of the remote handset plug into a jack shall send a signal to the fire command center and shall sound a ring indication in the handset.

B. Fixed Emergency Telephone Handset:

1. Recessed telephone cabinet painted red and clearly labeled EMERGENCY TELEPHONE at locations indicated on plans.
2. Lifting of the handset cradle shall send a signal to the fire command center and shall sound a ring indication in the handset.

2.02 SIGNALING LINE CIRCUIT DEVICES

A. Smoke Detectors:

1. Analog Photoelectric Type Sensor: Shall use the photoelectric principle to measure smoke density and send data to the control panel representing the analog level of smoke density measured.
2. Analog Ionization Type Sensor: Shall use the dual chamber ionization principle to measure smoke density and send data to the control panel representing the analog level of smoke density measured.
3. Each smoke detector shall connect directly to an SLC loop.
4. Each detector shall be mounted, where shown on the drawings, on a twist-lock base with all mounting hardware provided. Provide a two-piece head/base design.
5. Each detector shall have a manual switching means to set the internal identifying code (address) of that detector, which the control panel shall use to identify its address with the type of sensor connected.
6. Dual alarm and power indicators shall be provided that flash under normal conditions and remain continuous under alarm or trouble conditions. Remote indicator terminals shall be provided. Provide a remote LED indicator device if detector is not visible from a floor standing position.
7. A test means shall be provided to simulate an alarm condition.

8. Where operation is noted as required below 32°F and/or above 120°F, a conventional device shall be installed with a unique monitor module located in the nearest available location with maintained temperatures between 32°F and 120°F.
 9. A subscript is used to identify the device with a specific sequence of operation as follows: E=Elevator Recall, D=HVAC Control, SW=Stairwell, CR=Computer Room, SD=Smoke Dampers, DH=Door Hold Release, FD= Fire Door Release.
- B. Projected Beam Type Detectors:
1. This device shall utilize photoelectric analog smoke sensor technology. Provide with transmitter and associated receiver. Microprocessor-based detector shall provide a minimum of eight sensitivity levels, temperature and dirt compensation, and automatic gain control. Sensor to contain beam alignment adjustments and receiver calibration.
 2. Detector shall connect directly to an SLC loop or shall be provided with multiple monitor modules, as required, to connect to the SLC loop and for monitoring alarm and trouble output contacts. The detector shall be provided complete with all mounting hardware provided and installed where indicated on the drawings.
 3. Dual alarm and power indicators shall be provided that flash under normal conditions and remain continuous under alarm or trouble conditions. Remote indicator terminals shall be provided.
 4. Provide with remote indicator panel providing LED indications of alarm and trouble.
- C. Duct Smoke Detectors:
1. Duct-type smoke detectors shall use the same analog photoelectric ionization sensor technology, with the same features specified for standard smoke detectors, except with additional features as specified below.
 2. Provide sampling tubes and mounting hardware to match the duct to which it is attached. Where the detector housing is larger than the duct height, the Contractor shall fabricate a mounting bracket for the detector and attach according to the fire alarm manufacturer's recommendations.
 3. Provide a remote alarm LED indicator device if detector is not visible from a floor- standing position. If detector is located above a suspended ceiling, mount remote indicator in ceiling directly below detector with a white single-gang faceplate labeled: Duct Smoke Detector.
- D. In-Duct Smoke Detectors:
1. Analog Photoelectric Type Sensor: Shall use the photoelectric principle to measure smoke density and send data to the control panel representing the analog level of smoke density measured.
 2. Analog Ionization Type Sensor: Shall use the dual chamber ionization principle to measure smoke density and send data to the control panel representing the analog level of smoke density measured.
 3. Low Flow Type: Listed for use in duct with 0-2000 feet per minute velocity.
 4. Each smoke detector shall connect directly to an SLC loop.

5. Each detector shall be mounted, where shown on the drawings, on a twist-lock base with all mounting hardware provided to match the duct application. Provide a two-piece head/base design.
 6. Each detector shall have a manual switching means to set the internal identifying code (address) of that detector, which the control panel shall use to identify its address with the type of sensor connected.
 7. Provide a remote LED indicator device mounted in ceiling directly below detector with a single-gang faceplate labeled: Duct Smoke Detector.
- E. Manual Pull Stations:
1. Manual stations shall match the description on the drawings (refer to the General Electrical Equipment Schedule). The stations shall be mounted where shown on the drawings and be provided with all necessary mounting hardware. Use surface mount only on precast concrete or structure.
 2. Addressable, single action with plastic breakrod, reset key lock, semi-flush mount, red high abuse plastic or cast metal construction with white lettering.
 3. Addressable, single action with plastic breakrod, reset key lock, semi-flush mount, red high abuse plastic or cast metal construction with white lettering. Provide device with clear Lexan tamper resistant cover with integral 9V battery powered alarm that sounds when shield is lifted.
 4. Manual stations shall connect directly to an SLC loop. Stations shall provide address setting means using rotary decimal or DIP switches.
- F. Heat Detectors:
1. Combination rate of rise and 135°F fixed temperature analog thermal type sensor. Factory programmed to alarm at 135°F and at 15°F per minute rate-of-rise. Sensor shall measure heat level and send data to the control panel representing the analog level of thermal measurement and rate-of-rise.
 - a. A subscript is used to identify the device with a specific sequence of operation as follows: E=Elevator Shutdown.
 2. Provide a two-piece head/base design, with a manual switching means to set the internal identifying code (address) of that detector, which the control panel shall use to identify its address with the type of sensor connected.
 3. Heat detectors shall connect directly to SLC loops. Where fixed temperature or explosion proof detectors are used, one monitor module may be used to monitor all detectors in one room/area as shown on the drawings.
 4. Detectors shall be mounted, where shown on the drawings, on a twist-lock base with all mounting hardware provided.
 5. Provide a remote LED indicator device if detector is not visible from a floor- standing position.
 6. Dual alarm and power indicators shall be provided that flash under normal conditions and remain continuous under alarm or trouble conditions. A connection for attachment of a remote indicator shall be provided.

7. A test means shall be provided to simulate an alarm condition.

G. Carbon Monoxide/Heat/Smoke Combination Detector:

1. Multi-criteria sensor for photoelectrical smoke sensing, heat and carbon monoxide (CO) detection. Carbon monoxide electrolytic sensing module shall provide toxic gas sensing to UL2034 and UL2075 standards.
2. The combined photoelectric smoke detection/heat/CO module shall have separate sensors that adjust the detection profile in response to the input from the sensors.
3. The combined photoelectric smoke detection / CO module shall have selectable modes of operation for OSHA compliant toxic gas sensing, enhanced fire sensing, and nuisance alarm reduction mode.
4. The detector shall use only one address on the SLC.
5. CO sensor cartridge element shall be field replaceable.

H. Monitor Modules:

1. Monitor Module shall connect directly to an SLC loop and receive power from a separate 24 VDC circuit. It shall interface initiating devices with the control panel using Style D or Style B circuits. Contractor option: Use an interface module (2- wire operation) for Style B circuits connected to normally-open dry contacts, such as a flow switch.
2. The module shall be mounted in an enclosure located in an accessible service location as near as possible to the device(s) being monitored, or where shown on the drawings. All mounting hardware shall be provided.
3. The module shall supply the required power to operate the monitored device(s).
4. The module shall provide address setting means using rotary decimal or DIP switches.

I. Addressable Relays:

1. Relay that represents an addressable control point used primarily for the control of auxiliary devices as indicated on the drawings. Contractor to provide additional slave relay(s), as required, rated for the electrical load being controlled (contractor to match voltage, amps, etc.).
2. Relay shall connect directly to an SLC loop and receive power from a separate 24 VDC circuit.
3. The relay shall be mounted in an enclosure located in an accessible service location as near as possible to the device(s) being controlled, unless otherwise shown on the drawings. All mounting hardware shall be provided.
4. The relay shall supply 24 VDC power to the device(s) being controlled, unless otherwise indicated on the drawings.

2.02 NOTIFICATION APPLIANCE DEVICES

A. Device Color:

1. Wall Mounted: White housing with red lettering.

2. Ceiling Mounted: White housing with red lettering.
 3. WG subscript indicates wire guard is required.
- B. Visual Alarm Devices:
1. Wall mounted.
 2. Ceiling mounted.
 3. High intensity (candela rating as scheduled on the drawings) xenon strobe or equivalent under a lens. Candela rating shall be visible from exterior of the device.
 - a. Candela Ratings: V1=15, V3=30, V7=75, VH=110, VS=177.
 4. The maximum pulse duration shall be 0.2 seconds with a maximum duty cycle of 40%. The flash rate shall be 1 Hz. Where more than two strobes are visible from any one location, the fire alarm visual devices shall be synchronized.
 5. Device, housing, and backbox shall be UL listed for fire alarm/emergency applications.
- C. Audio Horn Alarm Devices:
1. Wall mounted.
 2. Ceiling mounted.
 3. Sound Rating: 85 dB at 10 feet. Sound levels for alarm signals shall not exceed 120 dBA in the occupied area.
 4. Device shall be capable of a high and low dB level setting. Unless noted otherwise, the device shall be set to the high setting at building completion.
 5. Device, housing, and backbox shall be UL listed for fire alarm/emergency applications.
- D. Audio (Speaker) Alarm Devices - Wall Mounted:
1. Sound rating shall be dependent on the tap (wattage) setting. Tap settings shall be available in 3 dBA increments. A minimum of four (4) tap settings should be available to allow field adjustment of the sound output across a minimum range of 78 to 87 dBA, 400Hz to 4KHz (6 dBA cutoff) frequency range.
 2. Speakers shall operate on a 25V RMS system, unless otherwise noted on drawings.
 3. Speakers shall clearly reproduce a signal consisting of a live or prerecorded human voice with voice intelligibility.
 4. Speaker, housing, and backbox shall be UL listed for fire alarm/emergency applications.
- E. Audio (Speaker) Alarm Devices - Ceiling Mounted:
1. 4" speaker, round housing, flush mounted (provide tile bridge where applicable).

2. Sound rating shall be dependent on the tap (wattage) setting. Tap settings shall be available in 3 dBA increments. A minimum of four (4) tap settings should be available to allow field adjustment of the sound output across a minimum range of 78 to 87 dBA, 400Hz to 4KHz (6 dBA cutoff) frequency range. Speakers shall operate on a 25V RMS system, unless otherwise noted on drawings.
 3. Speakers shall clearly reproduce a signal consisting of a live or prerecorded human voice and background music with voice intelligibility.
 4. Speaker, housing, and backbox shall be UL listed for fire alarm/emergency applications.
- F. Combination Audio Horn and Visual Notification Device:
1. Wall mounted.
 2. Ceiling mounted.
 3. Combine horn and visual components into a single device. Refer to the corresponding paragraphs above for requirements of each component.
- G. Combination Audio (Voice) and Visual Notification Device:
1. Wall mounted.
 2. Ceiling mounted.
 3. Combine speaker and visual components into a single device. Refer to the corresponding paragraphs above for requirements of each component.
- H. Weatherproof Visual Notification Device:
1. High intensity strobe, square housing, 75 candela rating, suitable for wet locations. Provide with weatherproof back box.
 2. Mounting: Semi-flush wall.
 3. Conduit shall not be exposed.
- I. Weatherproof Audio/Visual Notification Device:
1. Electronic horn with high intensity strobe, square housing, 75 candela, suitable for wet locations. Provide with weatherproof back box.
 2. Mounting: Semi-flush wall.
 3. Conduit shall not be exposed.
- OR**
- J. Weatherproof Voice/Visual Notification Device:
1. Speaker with high intensity 75 candela rated strobe. 25 VRMS with a minimum of four (4) tap settings which shall allow field adjustment of the sound output across a minimum range of 78 to 87 dBA (UL 1480), 400 Hz to 4 KHz (6dBA cutoff) frequency range.
 2. Mounting: Semi-flush wall.

3. Conduit shall not be exposed.
- K. Mini-Horn Audio Notification Device:
1. Electronic horn.
 2. Mounting: single-gang flush wall.
- L. Emergency Communication Message Display (CMD):
1. LED illuminated text sign operating in response to fire alarm control panel inputs. Two independently illuminated text messages (ANNOUNCEMENT and EVACUATE). Messages shall be either static or flashing.
- 2.02 ELEVATOR SHAFT DAMPER CONTROL
- A. Smoke detectors in the hoistway or elevator lobbies shall open the elevator hoistway vent automatic damper upon detection of smoke.
- 2.03 NAC EXTENDER PANELS (NEP)
- A. As shown on the plans or as a Contractor's option if not shown, furnish and install NAC extender panels as necessary to provide remote power supply for notification appliance circuits (NAC).
- B. Each NEP shall be self-contained remote power supply with batteries, and battery charger mounted in a surface lockable cabinet. Battery capacity shall be sufficient for operation for 24 hours in a non-alarm state followed by alarm for 15 minutes, plus 25% spare capacity for future devices. Each NEP provides a minimum of up to 4 outputs, 2A continuous, or 6A full load total capacity.
- C. Power for each NEP shall be from a local 120 VAC emergency circuit. Provide two #12 conductors and one #12 ground in 1/2" conduit to each NEP from a dedicated 20A/1P circuit breaker with a red handle and a manufacturer's standard handle lock-on device.
- D. Mounting: Surface.
- 2.04 ANNUNCIATION
- A. Color Graphics Network Annunciation System:
1. The annunciator shall provide custom color graphics displays for the control panel to annunciate the status of the panel and every peripheral device. It shall record and display system historical information on an LCD flat panel display.
 2. The annunciator shall have the ability to display a minimum of 256 custom screens and shall be fully field programmable. The fire alarm vendor shall develop screens from DXF or DWGCAD files provided by the Owner.
 3. Operator control shall be via an attached keyboard and mouse.
 4. The annunciator shall store all alarms, troubles and operator activity to an internal hard drive and shall have a capacity of 10,000 events without data loss.
 5. Events shall have a time and date stamp.
 6. Graphics shall contain eight (8) different colors from a palette of sixty-four (64).

7. Graphics software shall be provided to display on single or multiple screens, the status of every device located on a floor plan of the building. Alarms shall be audio and visual and shall annunciate regardless of the screen that is currently visible. Text on screens shall be a minimum of 1/10" high. Coordinate with the Owner, the floor plan on each screen prior to programming.
 8. Provide TROUBLE ACKNOWLEDGE, DRILL, and ALARM SILENCE capability at the color graphics annunciation location.
 9. The systems shall operate on the most current UL 864 listed computer system. The system shall be supplied by the fire alarm vendor and be listed for fire alarm use.
 10. Provide an uninterruptible power supply (UPS) to provide a minimum of 10 minutes of operating power for the computer graphic annunciator upon loss of normal power.
 11. All equipment for the color graphics network annunciator shall be suitable for locating on a desk, provided by the Owner. When multiple workstations are required (multiple locations within a facility or multiple buildings on a campus), they shall be server/client based configuration.
 12. Remote Client Workstations: All workstations shall have the same user functionality. User shall have the ability to take over network control functionality from any station as follows:
 - a. Request to take control
 - b. Accept/deny control request
 - c. Restore command center to normal operation
 - d. Priority request override
 13. PC computer workstation shall have the following minimum operating system requirements:
 - a. Operating system shall be a minimum of Microsoft Windows 7.
 - b. 3.0 GHz processor (server workstation)
 - c. 128 GB RAM installed (server workstation)
 - d. i7 Intel processor (client workstation)
 - e. 32 GB RAM installed (client workstation)
 - f. 500 GB hard drive
 - g. 22-inch LCD monitor minimum
- B. Printer:
1. Printer shall be UL 864 listed and shall be the automatic type with code, time, date, location, category and condition.
 2. The printer shall provide hard copy printout of all changes in status of the system and shall time-stamp such printouts with the current time of day and date. The printer shall be standard carriage with 80 characters per line and shall use standard bond paper. The printer shall be enclosed in a separate enclosure, suitable for placement on desk or countertop. The printer shall communicate with the control panel using an interface complying with Electrical Industries Association Standard EIA-232D. Power to the printer shall be 120 VAC, 60 Hertz.

3. The printer shall be connected to the graphics annunciator PC and shall have all interfaces in place to be connected to the Fire Command Center and all transponders in case of network or hardware failure.

C. Remote LCD Annunciators:

1. Auxiliary annunciators shall indicate alarm and trouble conditions visually and audibly as shown on the drawings. Provide local TROUBLE ACKNOWLEDGE, TEST, and ALARM SILENCE capability. Minimum 80-character display.
2. Communications and power to the annunciators shall be supervised. The annunciator shall receive power from the fire alarm control panel.
3. A single key switch shall enable all switches on the annunciator.
4. Mounting: Flush.

D. Facility Management Control System (FMCS) Interface:

1. Provide addressable relays to report the following to the FMCS via dry contact monitoring on the FMCS:
 - a. General Alarm
 - b. System Trouble
 - c. Supervisory Alarm
 - d. Other Alarms (if applicable)

OR
2. Provide BACnet IP interface for fire alarm panel to communicate status with the FMCS. Provide list of points and descriptions to FMCS supplier.
 - a. UL listed to Standard 864. Provide RJ45 connection and cable.

E. Fire Alarm Remote Indicator:

1. Red LED type.
2. Mounts flush to a single gang box.

F. Fire Alarm Remote Indicator and Test Switch:

1. Red LED type.
2. Key switch test selector.
3. Mounts flush to a single gang box.

2.02 ETHERNET NETWORK

- A. Campus Ethernet IP Network: A complete fire alarm and mass notification Ethernet network shall be provided. The network shall be Class X wiring, Resilient Ethernet Protocol (REP) 100BaseTX / 100 Mbps that shall be able to operate with any single break and restore network communications.

- B. The IP network shall be fiber optic cable, single or multi-mode fiber. The TCP/IP network switches shall be industrial grade managed switching hubs. Network switches shall be UL864 listed, shall provide a minimum of four (4) or a maximum of eight (8) 10/100 Mbps shielded RJ-45 connectors for Ethernet connections, and selectable multi-mode or single-mode fiber ports. The switches shall operate on a nominal 24 VDC supplied from a battery backed up fire alarm control panel or booster power supply to ensure power to the switch is always available. Switches shall provide LED indicators for data rate, activity/link integrity, power, and loop detection.
- C. IP Monitor and Relay Module: The IP relay/input module shall have a minimum of four (4) dry contact inputs and four (4) dry contact outputs. The relay output shall be rated at
- D. 0.5 amps at 24 VDC. This unit shall be monitored and controlled by the graphics workstation to operate functions and/or operations/activations on any fire alarm network system connected to the GEGW. The module shall be UL2572 and UL864 listed.
- E. Voice Over IP Module Encoder/Decoder: Each control panel audio source connected to the LAN/WAN network interface shall consist of a supervised audio decoder capable of decoding MP3, WMA, G.700, and PCM data streams in HTTP, UDP, or RTP format. Audio decoder shall operate on filtered-regulated 24 VDC power derived from the panel power supply. Power shall be supplied directly from the FACP to ensure reliable and monitored power. UL 2572 and UL864 listed.

2.03 CONNECTIONS TO AUXILIARY DEVICES PROVIDED BY OTHERS

- A. Smoke Damper:
 - 1. Motorized type, 120 VAC, furnished and installed by MC. Fire alarm control and power connections by EC. A subscript is used to identify the device with a specific air handler or zone for its sequence of operation.
- B. Smoke or Fire/Smoke Damper Controller:
 - 1. Provide an enclosure and equipment for interface of dampers with the fire alarm system and temperature control system
- C. Hoistway Damper (Elevator Shaft Damper):
 - 1. Motorized type, 120 VAC, furnished and installed by MC. Fire alarm control and power connections by EC. A subscript is used to identify a hoistway damper with a specific elevator or bank of elevators.
- D. Duct Smoke Detector and Smoke Damper Control:
 - 1. Sampling type duct detector in ducts 18" and larger. In-duct smoke detector in ducts less than 18". Detector shall be mounted within 5' of smoke damper. Motorized type 120 VAC, smoke damper furnished and installed by MC. Fire alarm control and power connections by EC. Remote indicator mounted in visible location. Provide auxiliary relay base or addressable control module. The smoke damper shall close upon activation of the detector, and a supervisory signal shall be sent to the fire alarm control panel.
- E. Flow Switch:
 - 1. Connection to flow switch to monitor fire protection flow switch or discharge output contacts. Normally open dry contacts for fire alarm interface. Furnished and installed by MC; wired by EC.

F. Monitor Switch:

1. Connection to monitor switch to monitor fire protection system supervisory switches or output contacts. Normally open dry contacts for fire alarm interface. Furnished and installed by MC; wired by EC.

G. Post Indicator Valve:

1. Connection to post indicator valve for sprinkler system supervisory notification. Normally open dry contacts for fire alarm interface. Furnished and installed by MC; wired by EC. Provide surge protection device as recommended by the fire alarm system manufacturer on line entering/leaving the facility.

H. Electronic Bell:

1. Electronic bell for sprinkler alarm, electro-mechanical type, 120 VAC. Furnished and installed by MC. Fire alarm control and power connections by EC.

I. Door Hold Open Device:

1. Integral with door hardware, 120 VAC. Furnished and installed by GC. Fire alarm control and power connections by EC.

J. Hold Open Override:

1. Hold open override connection to GC-provided power door operator. EC shall intercept the hold open switch wiring (unless specific contacts for this purpose are provided on the door) and connect addressable relay to override this switch and allow the door to close. All modifications to the power door operator shall be coordinated with the GC.

K. A/V Amplification System Shutdown

1. Connection to A/V Amplification power supply to result in AV System shutdown upon fire alarm system activation.

2.02 WIRING

A. Fire alarm wiring/cabling shall be furnished and installed by the Contractor in accordance with the manufacturer's recommendations and pursuant to National Fire Codes. Cabling shall be UL listed and labeled as complying with NFPA 70, Article 760 for power-limited fire alarm signal service.

B. All network wiring shall be fiber and installed in conduit.

END OF SECTION

DIVISION 31

EARTHWORK

This page intentionally left blank

SECTION 31 10 00

SITE CLEARING

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes the following:
1. Protecting existing trees, shrubs, groundcovers, plants, and grass to remain.
 2. Removing existing trees, shrubs, groundcovers, plants, and grass.
 3. Clearing and grubbing.
 4. Stripping and stockpiling topsoil.
 5. Removing above- and below-grade site improvements.
 6. Disconnecting, capping or sealing, and removing site utilities, and abandoning site utilities in place.
 7. Temporary erosion and sedimentation control measures.

1.02 MATERIAL OWNERSHIP

- A. Except for stripped topsoil or other materials indicated to remain Owner's property, cleared materials shall become Contractor's property and shall be removed from Project site.

1.03 PROJECT CONDITIONS

- A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during site-clearing operations.
1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
 2. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
- B. Salvageable Improvements: Carefully remove items indicated to be salvaged and store on Owner's premises where indicated.
- C. Utility Locator Service: Notify utility locator service for area where Project is located before site clearing.
- D. Do not commence site-clearing operations until temporary erosion and sedimentation control measures are in place.

PART 2 PRODUCTS (NOT APPLICABLE)

PART 3 EXECUTION

3.01 PREPARATION

- A. Protect and maintain benchmarks and survey control points from disturbance during construction.
- B. Locate and clearly flag trees and vegetation to remain or to be relocated.
- C. Protect existing site improvements to remain from damage during construction.
 - 1. Restore damaged improvements to their original condition, as acceptable to Owner.

3.02 TEMPORARY EROSION AND SEDIMENTATION CONTROL

- A. Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to erosion- and sedimentation-control Drawings and requirements of authorities having jurisdiction.
- B. Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.
- C. Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

3.03 TREE PROTECTION

- A. Erect and maintain temporary fencing around tree protection zones before starting site clearing. Remove fence when construction is complete.
- B. Do not excavate within tree protection zones, unless otherwise indicated.
- C. Repair or replace trees and vegetation indicated to remain that are damaged by construction operations, in a manner approved by Architect.

3.04 EXISTING UTILITIES

- A. Locate, identify, disconnect, and seal or cap off utilities indicated to be removed or abandoned per plan.
 - 1. Arrange with utility companies to shut off indicated utilities.
- B. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
 - 1. Notify Architect not less than two days in advance of proposed utility interruptions.
 - 2. Do not proceed with utility interruptions without Architect's written permission.

3.05 CLEARING AND GRUBBING

- A. Fill depressions caused by clearing and grubbing operations with satisfactory soil material unless further excavation or earthwork is indicated.
 - 1. Place fill material in horizontal layers not exceeding a loose depth of eight inches and compact each layer to a density equal to adjacent original ground, unless noted otherwise per project Geotechnical Report or project specific Specification Section.

3.06 TOPSOIL STRIPPING

- A. Remove sod and grass before stripping topsoil.
- B. Strip topsoil to whatever depths are encountered in a manner to prevent intermingling with underlying subsoil or other waste materials.
- C. Stockpile topsoil away from edge of excavations without intermixing with subsoil. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust and erosion by water.

3.07 SITE IMPROVEMENTS

- A. Remove existing above- and below-grade improvements as indicated and as necessary to facilitate new construction.

3.08 DISPOSAL

- A. Disposal: Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials including trash and debris, and legally dispose of them off Owner's property.
- B. Separate recyclable materials produced during site clearing from other nonrecyclable materials. Store or stockpile without intermixing with other materials and transport them to recycling facilities.

END OF SECTION

This page intentionally left blank

SECTION 31 22 00

GRADING

PART 1 GENERAL

1.01 SUMMARY

A. This Section Includes:

1. General exterior grading, cutting and filling, including grading for building area, paving, planting areas, banks and hillsides.

1.02 PROJECT REQUIREMENTS

A. General:

1. Before grading, contact Underground Service Alert of Southern California (USASC) for information on public buried utilities and pipelines. Retain the services of an underground utility locator for on-site utilities.

1.03 QUALITY ASSURANCE

- A. Standard Specifications: Comply with the Standard Specifications for Public Works Construction (SSPWC), latest edition and supplements for rock materials. The Standard Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and payment sections do not apply to this document.

1.04 DEFINITIONS

A. Backfill: Soil material used to fill an excavation.

1. Type "B" Material: Backfill placed beside pipe in a trench, including haunches to support sides of pipe.
2. Initial Backfill: Backfill placed over pipe in a trench.
3. Final Backfill: Backfill placed over initial backfill to fill a trench.

B. Base Course: Course placed between the subgrade and hot-mix asphalt or concrete paving.

C. Bedding Course: Course placed over the excavated subgrade in a trench before laying pipe.

D. Borrow Soil: Satisfactory soil imported from off-site for use as fill or backfill.

E. Classified Excavation: Removal and disposal of materials not defined as rock

F. Drainage Course: Course supporting the slab-on-grade that also minimizes upward capillary flow of pore water.

G. Excavation: Removal of material encountered above subgrade elevations and to lines and dimensions indicated.

1. Authorized Additional Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions as directed by Architect. Authorized additional excavation and replacement material will be paid for according to Contract provisions changes in the Work.
 2. Unauthorized Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions without direction by Architect. Unauthorized excavation, as well as remedial work directed by Architect, shall be without additional compensation.
- H. Fill: Soil materials used to raise existing grades.
- I. Structures: Buildings, footings, foundations, retaining walls, slabs, tanks, curbs, mechanical and electrical appurtenances, or other man-made stationary features constructed above or below the ground surface.
- J. Subgrade: Surface or elevation remaining after completing excavation, or top surface of a fill or backfill immediately below base, drainage fill, or topsoil materials.
- K. Unclassified Excavation: Removal and disposal of materials encountered regardless of nature of materials, including rock.
- L. Utilities: On-site underground pipes, conduits, ducts, and cables, as well as underground services within buildings.

1.05 PROTECTION

- A. Soils Consultant: A geotechnical consultant shall advise on Construction techniques involved in work, including design, checking and approving of temporary bracing, sheeting, shoring, underpinning and other items pertinent to work, and encountered during prosecution of work. Consultant shall be primarily concerned with construction methods, which will prevent settlement or damage to surrounding structures, sidewalks, embankments, utilities and roads on Owner's property and adjoining properties.
- B. Existing Facilities: Protect and maintain in satisfactory manner, existing pavements, curbs, gutters, structures, conduits, fences, walls and other facilities to remain above and below grade. Restore facilities damaged by construction operations.

PART 2 PRODUCTS

2.01 SOIL MATERIALS

- A. General: Provide borrow soil materials when sufficient satisfactory soil materials are not available from excavations.
- B. Satisfactory Soils: Sand, gravel, friable earth, or non-expansive clays, subject to Testing Laboratory's approval. Fill and backfill material shall be free of organic material, slag, cinders, expansive soils, trash or rubble and stones having maximum dimension greater than six inches.
- C. Unsatisfactory Soils: Expansive and other soils as defined in the project's geotechnical investigation report.
1. Unsatisfactory soils also include satisfactory soils not maintained within two percent of optimum moisture content at time of compaction.

- D. Base Course: Material conforming to SSPWC section 200-2.2, Crushed Aggregate Base or SSPWC section 200-2.4 Crushed Miscellaneous Base.
- E. Engineered Fill: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; with at least 90 percent passing a one and one-half-inch sieve and not more than 12 percent passing a No. 200 sieve.

PART 3 EXECUTION

3.01 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.
- B. Preparation of subgrade for earthwork operations including removal of vegetation, topsoil, debris, obstructions, and deleterious materials from ground surface is specified in Division 2 Section "Site Clearing" or "Demolition."
- C. Protect and maintain erosion and sedimentation controls, which are specified in Division 2 Section "Site Clearing" or "Demolition," during earthwork operations. Protect and maintain installed stakes until their removal is required for the Work. Provide replacement grade or location stakes lost or disturbed.
- D. Install grade stakes and compare to indicated grades. If discrepancies are found between existing grades and grades indicated on Drawings, do not proceed until discrepancies are resolved.

3.02 ROUGH, (REMEDIAL) AND FINE GRADING

- A. Rough grade area sufficiently high to require cutting by fine grading:
 - 1. Grade area for bituminous surfacing and other paving to the indicated grades, equal to the section of the indicated base and pavement.
 - 2. Slope banks to required finish grades as cut progresses or leave cuts full and finish grade by mechanical equipment to provide grades and soil densities indicated on the Drawings.
 - 3. Rough grade, fill and compact banks beyond indicated finish grades. Finish grade banks and slopes to indicated grades and specified soil densities.
 - 4. Grade Only Areas: In areas not indicated to receive pavement, rough grade to approximate finish grades and then scarify, moisten and roll to obtain required density and indicated finish grades.
 - 5. Tolerances: Finish grades shall be within a tolerance of 0.05 inch per foot above or below grades indicated. Provide an average grade as indicated.
- B. Soils import requirement
 - 1. The contractor must provide test report, at his own cost, to indicate the soils is clean based on the requirements in EPA standards and subset DTSC "Clean Imported Fill Material", October 2001.
 - 2. The contractor shall ensure that the import soil submittal complies with Greenbook standards.

3. The contractor shall obtain paperwork from the LOR or a District Environmental agency confirming that the import fill material is characterized, handled, and documented in accordance with EPA and State of California regulations.

C. Base:

1. After subgrade has been constructed to approximate required grades, scarify to a depth of at least 6 inches:
 - a. After scarifying, process loosened material to a finely divided condition and adjust moisture content to optimum condition by addition of water, addition and blending of dry suitable material, or by drying of existing material.
 - b. Install base course in accordance with Specifications.
2. Tolerance of completed grades of base or subgrade shall not vary more than 0.03 inch per foot from grades indicated. Provide an average grade as indicated.

3.03 EXCAVATION

- A. Unclassified Excavation: Excavate to subgrade elevations regardless of the character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions. No changes in the Contract Sum or the Contract Time will be authorized for rock excavation or removal of obstructions.
 1. If excavated materials intended for fill and backfill include unsatisfactory soil materials and rock, replace with satisfactory soil materials.

3.04 EXCAVATION FOR STRUCTURES

- A. Excavate to indicated elevations and dimensions within a tolerance of plus or minus one inch. If applicable, extend excavations a sufficient distance from structures for placing and removing concrete formwork, for installing services and other construction, and for inspections.
 1. Excavations for Footings and Foundations: Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work.

3.05 SHORING

- A. Provide shoring as necessary to properly and safely support earth sides of excavations, and existing curbs, sidewalks, gutter, drives and stairs, against movement and collapse.
- B. Design and Calculations: Provide in accordance with requirement of Cal OHSA.
- C. Remove shoring upon completion of the Work of this section or when no longer needed unless required otherwise by authorities having jurisdiction.

3.06 EXCESS MATERIAL DISPOSAL

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.07 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 31 23 16

EXCAVATION AND FILL FOR PAVING

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes the following:
 - 1. Preparing subgrades for slabs-on-grade, walks, pavements, lawns and grasses, and exterior plants.
 - 2. Drainage course for slabs-on-grade.
 - 3. Base course for concrete walks pavements.
 - 4. Base course for asphalt paving.

1.02 PROJECT REQUIREMENTS

- A. Import and Export of Earth Materials:
 - 1. Fees: Pay as required by authorities having jurisdiction over the area.
 - 2. Bonds: Post as required by authorities having jurisdiction over the area.
 - 3. Haul Routes and Restrictions: Comply with requirements of authorities having jurisdiction over the area.

1.03 SUBMITTALS

- A. Imported Soils: A geotechnical engineer, retained by the Owner as an Owner Consultant, shall obtain initial product Sample for testing in accordance with the terms of Article 3.05 of this section.

1.04 QUALITY ASSURANCE

- A. Standard Specifications: Comply with the Standard Specifications for Public Works Construction (SSPWC), latest edition and supplements for rock materials. The Standard Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and payment sections do not apply to this document.

1.05 PROTECTION

- A. Soils Consultant: A geotechnical consultant shall advise on Construction techniques involved in work, including design, checking and approving of temporary bracing, sheeting, shoring, underpinning and other items pertinent to work, and encountered during prosecution of work. Consultant shall be primarily concerned with construction methods, which will prevent settlement or damage to surrounding structures, sidewalks, embankments, utilities and roads on Owner's property and adjoining properties.
- B. Existing Facilities: Protect and maintain in satisfactory manner, existing pavements, curbs, gutters, structures, conduits, fences, walls and other facilities to remain above and below grade. Restore facilities damaged by construction operations.

- C. Pumping and Draining: Excavate areas in such manner as to afford adequate drainage. Control grading in vicinity of excavated areas so ground surface will slope to prevent water running into excavated areas. Until work is completed, remove water from areas of construction that may interfere with proper performance of work or that may result in damage to the soil subgrade and provide sumps, pumps, well points, electric power and attendance required for this purpose on a 24-hour basis if necessary. Protect construction from water during construction, including prevention of erosion of completed work during construction and until permanent drainage and erosion controls are operational. Repair adjoining properties, facilities and streets damaged due to improper protection.

PART 2 PRODUCTS

2.01 BASE MATERIALS

- A. Concrete Slabs on Grade: Provide "Crushed Aggregate Base "as specified in the Standard Specifications for Public Works Construction, Section 200: "Rock Materials," with $\frac{3}{4}$ inch maximum size aggregates. Provide 4"-inch thick base, unless noted otherwise.
- B. Bituminous Surfacing: As indicated on Drawings.

2.02 FILL AND BACKFILL MATERIALS

- A. Fill and backfill materials shall be previously excavated materials or imported fill material, free of clods and stones larger than 3-inch, foreign materials, vegetable growths, sod, expansive soils, rubbish and debris. Material shall conform to these specified requirements and related sections.
- B. Fill material exhibiting a wide variation in consistency and moisture content shall be blended or aerated to stabilize and upgrade the material.
- C. Imported Fill Material:
1. Provide suitable materials obtained from Project site excavations for earthwork and fill materials. If excavated materials are not of suitable quality or sufficient quantity, import additional materials as necessary.
 2. Imported fill shall be a granular material with sufficient binder to form a firm and stable unyielding subgrade and shall not have more than 60 percent of fines passing 200 mesh sieves. Material shall have a coefficient of expansion of not more than 2 percent from air dry to optimum moisture content and not more than 6 percent from air dry to saturation. Imported material shall be clean and free of rubbish, debris, and toxic or hazardous contaminants. Adobe or clay soils are not permitted.
- D. Other Fill Materials: Brick rubble and broken concrete originating from the Project site may be legally disposed of off the Project site or incorporated in fill, if reviewed by a geotechnical engineer, retained by the Owner as an Owner Consultant. Unless otherwise required, no such materials may be imported from outside the Project site.
- E. Permeable Backfill:
1. Provide permeable backfill material behind retaining structures consisting of gravel, crushed gravel, crushed rock, natural sands, manufactured sand, or combinations of these materials conforming to the following gradations:

Sieve Size:	Percentage Passing:
3/4 inch (19mm)	100

3/8 inch (10mm)	80 to 100
No. 100	0 to 8
No. 200	0 to 3

2. Those portions of fill material passing a No. 4 sieve shall provide a sand equivalent of at least 60.
3. Provided backing for weep holes shall consist of two cubic feet of aggregate in burlap sacks, securely tied. Aggregate shall conform to requirements for No. 3 concrete aggregate as specified in subsection 200-1.4 of the Standard Specifications for Public Works Construction.
4. Permeable Backfill Alternate Materials: Instead of the materials specified for retaining structures backfill, a drainage matting system, Miradrain by Mirafi, Inc., or equal, may be provided if reviewed by the Architect.

PART 3 EXECUTION

3.01 SITE PREPARATION

- A. Clear the Project site as required in Section 31 1000 - Site Clearing.

3.02 PROTECTION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.
- B. Protect and maintain erosion and sedimentation controls, which are specified in Division 2 Section "Site Clearing" or "Demolition," during earthwork operations. Protect and maintain installed stakes until their removal is required for the Work. Provide replacement grade or location stakes lost or disturbed.

3.03 EXISTING UTILITY LINES

- A. Protect existing utility lines from damage or displacement.
- B. Remove conduits or pipes not in service, exposed during Work, unless a minimum cover of 2 feet is provided. Remove concrete, clay or other non-metallic pipe over 8 inches in diameter, unless otherwise indicated.

3.04 EXCAVATION FOR WALKS AND PAVEMENTS

- A. Excavate surfaces under walks and pavements to indicated lines, cross sections, elevations, and subgrades.

3.05 FILL

- A. Unclassified Fill and Compaction: Comply with the Standard Specifications for Public Works Construction, Section 300: "Earthwork," except as modified herein.
- B. Provide fill materials as specified in Part 2 - Products. If excavated materials from the Project site are not of required quality or sufficient quantity, import additional materials as necessary.
- C. Soils import requirement

1. The contractor must provide test report, at his own cost, to indicate the soils is clean based on the requirements in EPA standards and subset DTSC "Clean Imported Fill Material", October 2001.
 2. The contractor shall ensure that the import soil submittal complies with Greenbook standards.
 3. The contractor shall obtain paperwork from the LOR or a District Environmental agency confirming that the import fill material is characterized, handled, and documented in accordance with EPA and State of California regulations.
- D. Imported fill materials shall be sampled by a geotechnical engineer, retained by the Owner as an Owner Consultant, for compliance with the requirements of Part 2 of this Section.
- E. The geotechnical engineer, retained by the Owner as an Owner Consultant, shall submit samples to a DSA approved independent approved testing laboratory for testing.
- F. Initial sampling shall be performed by the geotechnical engineer, retained by the Owner as an Owner Consultant, before importing material to the Project site. Identify the location of the source site in addition to the address, name of the person and/or entity responsible for the source site. The geotechnical engineer, retained by the Owner as an Owner Consultant, shall obtain both the initial and additional samples from the identified site and shall submit samples to the approved independent testing laboratory for testing.
- G. The geotechnical engineer, retained by the Owner as an Owner Consultant, shall perform additional sampling during import operations. If the total quantity of import is determined to be greater than 1,000 cubic yards of material, one sample shall be obtained and submitted for testing tested for each 250 cubic yards of imported material. If the total quantity of import is determined to be less than 1,000 yards, one sample shall be obtained and submitted for testing for each 100 cubic yards of imported material.
- H. The independent approved testing laboratory shall perform the required tests and report results of tests noting if the tested material passed or failed such tests and shall furnish copies to the Project Inspector, Architect, OAR, DSA, Contractor, and others as required. Report shall state tests were conducted under the responsible charge of a licensed State of California professional engineer and the material was tested in accordance with applicable provisions of the Contract Documents, CBC, and the DSA. Upon completion of the Work of this section, the independent testing laboratory and geotechnical engineer shall submit a verified report to the DSA as required by CBC.
- I. Bills of lading or equivalent documentation will be submitted to the Project Inspector on a daily basis.
- J. Upon completion of import operations, provide the OAR a certification statement attesting that imported material has been obtained from the identified source site.

3.06 INSTALLATION OF MATERIALS

- A. Fill or backfill materials shall be installed in horizontal layers of 6 inches, unless otherwise required. Each layer shall be evenly placed and moistened or aerated as necessary. Unless otherwise reviewed by the geotechnical engineer, retained by the Owner as an Owner Consultant, each layer of fill material shall cover the length and width of the area to be filled before the next layer of material is installed. Top surface of each layer shall be installed to an approximate level with a crown or crossfall of at least 1 in 50, but no more than 1 in 20. Provide adequate drainage at all times during construction of the Work of this section.

3.07 COMPACTING

- A. Each layer of fill material shall be compacted by tamping, sheepsfoot rollers, or pneumatic-tired rollers to provide specified relative compaction. At inaccessible locations, provide specified compaction by manually held, operated and directed compaction equipment.
- B. Unless otherwise indicated, compact each layer of earth fill to a relative compaction of at least ninety percent where placed in non-structural areas, landscaping areas and utility trenches. Jetting or flooding of backfill should not be permitted. The upper 24" of subgrade supporting pavements should be compacted to at least ninety five percent relative compaction.
- C. When fill materials, or a combination of fill materials, are encountered or provided which develop densely packed surfaces as a result of installation or compacting operations, scarify each compacted layer before installing the next succeeding layer.

3.08 INSPECTION AND TESTING

- A. The geotechnical engineer, retained by the Owner as an Owner Consultant, will inspect and test excavations, sample material quality as required in Part 2, and observe installation and compaction of fill materials.
- B. The geotechnical engineer, retained by the Owner as an Owner Consultant, will sample imported fill materials from their designated source before delivery to the Project site.
- C. Installation of backfill shall be observed by the geotechnical engineer, retained by the Owner as an Owner Consultant.
- D. The geotechnical engineer, retained by the Owner as an Owner Consultant, will inspect and test excavation Work before the installation of fill and/or other materials.
- E. Testing agency will test compaction of soils in place according to ASTM D 1556, ASTM D 2167, ASTM D 2922, and ASTM D 2937, as applicable.

3.09 PROTECTION

- A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.
- B. Repair and reestablish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.
- C. Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.
- D. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.10 CLEANING

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

This page intentionally left blank

SECTION 31 23 23

EXCAVATION AND FILL FOR UTILITIES

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Excavating, backfilling, and compacting utility trenches such as water, gas, irrigation, storm drain, sewer lines, concrete-encased conduits, and manholes, vaults, valve boxes, catch basins, underground tanks, thrust blocks, yard boxes, pull boxes and other utility appurtenances.

1.02 PROJECT REQUIREMENTS

A. Import and Export of Earth Materials:

1. Fees: Pay as required by authorities having jurisdiction over the area.
2. Haul Routes and Restrictions: Comply with requirements of authorities having jurisdiction over the area.
3. Examine site, Drawings, records of existing utilities and construction, record of test borings, and subsurface exploration report available from Owner. Records of test borings are for information only and are not guaranteed to represent all conditions that will be encountered.

1.03 SUBMITTALS

- A. Imported Soil: A geotechnical engineer, retained by the Owner as an Owner Consultant, shall obtain initial product Sample for testing in accordance with the terms of Article 3.05 of this section.

1.04 QUALITY ASSURANCE

- A. Standard Specifications: Comply with the Standard Specifications for Public Works Construction (SSPWC), latest edition and supplements for rock materials. The Standard Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and payment sections do not apply to this document.

1.05 PROTECTION

- A. Soils Consultant: A geotechnical consultant shall advise on Construction techniques involved in work, including design, checking and approving of temporary bracing, sheeting, shoring, underpinning and other items pertinent to work, and encountered during prosecution of work. Consultant shall be primarily concerned with construction methods, which will prevent settlement or damage to surrounding structures, sidewalks, embankments, utilities and roads on Owner's property and adjoining properties.
- B. Existing Utilities:

1. Maintain existing utilities that are to remain in service. Before excavating over or adjacent to existing utilities, notify utility Owner to ensure protective work will be coordinated and performed in accordance with utility Owner's requirements. If existing service lines, utilities and utility structures, which are to remain in service, are uncovered or encountered during these operations, safeguard and protect from damage.
2. Within limits of excavation, remove existing piping, subsoil drainage systems, conduit, manholes and relocated items, which are to be abandoned. Plug open ends of utilities to remain with concrete.
3. Re-route existing subsoil drains which obstruct work around new constructions or incorporate them into new drainage systems.
4. Consult Architect immediately for directions, should uncharted or incorrectly charted piping or other utilities be encountered during excavation. Cooperate with Owner and public and private utility companies in keeping their respective services, utilities and facilities in operation. If damaged, repair utilities to satisfaction of Architect and utility Owner.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Bedding material from trench bottom to one foot above the pipe:
 1. Sand, gravel, crushed aggregate or native free-draining granular material providing a sand equivalent of at least 30 or a coefficient of permeability greater than 1.4 inches per hour.
 2. Sand complying with the Specifications for cement concrete aggregates.
- B. Backfill Materials:
 1. Excavated trench material to be installed for backfilling shall be clean, free of large clods, and stones larger than 2 ½-inch in any dimension.
 2. Cement-sand slurry shall be provided with one sack of cement per cubic yard of the mixture.
 3. Imported Fill Material: Imported fill material shall be a granular material with sufficient binder to form a firm and stable unyielding subgrade and shall not have more than 60 percent of fines passing a 200 mesh sieve. Material shall provide a coefficient of expansion of not more than two percent from air dry to optimum moisture content and not more than six percent from air dry to saturation. Imported materials shall be clean and free of rubbish, debris, and toxic or hazardous contaminants. Adobe or clay soils are not permitted.

2.02 ACCESSORIES

- A. Warning Tape: Acid- and alkali-resistant polyethylene film warning tape manufactured for marking and identifying underground utilities, six inches wide and four mils thick, continuously inscribed with a description of the utility. Refer to Section 22 00 00 Plumbing System Design Criteria, Section 1.1.L for tracer wire specifications.

PART 3 EXECUTION

3.01 GENERAL

- A. Before excavation, contact the "Underground Service Alert of Southern California" (USASC) for information on buried public utilities and pipelines. For on-site utilities retain an underground locating service.
- B. Barricade trenches, ditches, pits, sumps, and similar Work outside the barricaded working area with chain link fence as specified in Section 01 50 00 - Construction Facilities and Temporary Controls, and in accordance with Cal-OSHA standards and requirements.
- C. Saw-cut concrete or bituminous paving for trench installation.
- D. Trenches over 5 feet in depth shall conform to the Cal-OSHA.
- E. Where indicated and required to excavate in lawn areas, protect adjoining lawn areas outside of the Work area. Replace or install removed sod upon completion of backfill by installing sod level with adjacent lawns. If installation of removed sod fails, furnish sod and install to match existing lawns.
- F. Backfill over excavations to the required elevations with earth, gravel, sand, or concrete and compact as required. Provide excavations free from standing water by pumping, draining, or providing protection against water intrusion. Slope adjacent grades away from excavations to minimize entry of water.
- G. Do not install piping lengthwise under concrete walks without review by the Architect.
- H. Do not excavate trenches parallel to footings closer than 18 inches from the face of the footing or below a plane having a downward slope of two horizontal to one vertical, from a line 9 inches above bottom of footings.
1. Unless otherwise indicated on Drawings, depth of excavations outside the buildings shall allow for a minimum coverage above top of pipe, tank, or conduit measured from the lowest adjoining finished grade, as follows:

Steel Pipe	24	inches	below
finished grade Copper Water Tube	18	inches	below
finished grade Cast-Iron Pressure Pipe	36	inches	below
finished grade Plastic Pipe (other than waste)	30	inches	
below finished grade Tanks or other structures	36	inches	
below finished grade			
Soil, Sewer & Storm Drain	minimum 18 inches below finished grade, and as required for proper pitch and traffic load. (Install polypropylene sewer pipe with at least 24 inches coverage)		
Irrigation Pipe:	nonpressure pipe 12 inches, pressure pipe 24 inches		
 2. Trench width shall provide ample space for fitting and joining. Excavate for piping bells and fittings, bell and spigot pipe and other fittings.
 - I. Unless indicated otherwise, excavate trenches to the required depths for utilities, such as pipes, conduit and tanks, with minimum allowances of 6 inches at the bottom and 6 inches at the sides for bedding of unprotected piping or as required for concrete encasement of conduits as indicated on Drawings. Grade bottom of trenches to a uniform smooth surface. Remove loose soil from the excavation before installing sand bedding or concrete encasement.

- J. Provide excavations free from standing water by pumping, draining, or providing protection against water intrusion. If soil becomes soft, soggy, or saturated, excavate to firm undisturbed soil and fill as required. Slope adjacent grades away from excavations to minimize entry of water.
- K. Provide a minimum clear dimension of 2 inches from sides of wall excavation to outer surfaces of buried pipes or conduits installed in the same trench or outside surfaces of containers and tanks.
- L. Do not install backfill until required inspections and testing is completed.
- M. Backfill electrical or other excavated utility trenches located outside of barricaded installation areas within 24 hours after inspection by the Project Inspector.
- N. Install backfill materials in layers not exceeding 4 inches in thickness and compact to 90 percent of the maximum density. Jetting or flooding of backfill should not be permitted.
- O. If materials excavated from the Project site are not permitted for trench backfill in paved areas, backfill trenches with a cement-sand slurry mix. Install backfill to an elevation of the existing undisturbed grade plus one inch.
- P. Install and compact sand bedding to provide a uniform full length bearing under piping and conduits.
- Q. Where portions of existing structures, walks, paving, or other improvements are removed or cut for piping or conduit installation, replace the material with equal quality, finished to match adjoining existing improvements. Repair pavement as specified in Section 32 0117 - Pavement Repair.

3.02 IMPORT/EXPORT OF MATERIALS

- A. Provide fill materials as specified in Part 2- Products. If excavated materials from the Project site are not of required quality or sufficient quantity, import additional materials as necessary.
- B. Soils import requirement
 1. The contractor must provide test report, at his own cost, to indicate the soils are clean based on the requirements in EPA standards and subset DTSC "Clean Imported Fill Material", October 2001.
 2. The contractor shall ensure that the import soil submittal complies with Greenbook standards.
 3. The contractor shall obtain paperwork from the LOR or a District Environmental agency confirming that the import fill material is characterized, handled, and documented in accordance with EPA and State of California regulations.
- C. Imported fill materials shall be sampled by a geotechnical engineer, retained by the Owner as an Owner Consultant, for compliance with the requirements of Part 2 of this section.
- D. The geotechnical engineer, retained by the Owner as an Owner Consultant, shall perform the tests by utilizing an independent approved testing laboratory.

- E. Initial sampling shall be performed by the geotechnical engineer, retained by the Owner as an Owner Consultant, before importing material to the Project site. Identify the location of the source site in addition to the address, name of the person and/or entity responsible for the source site. The geotechnical engineer, retained by the Owner as an Owner Consultant, shall obtain both the initial sample and additional samples from the identified site and shall submit all samples to the approved independent testing laboratory.
- F. The geotechnical engineer, retained by the Owner as an Owner Consultant, shall perform additional sampling during import operations. If the total quantity of import is determined to be greater than 1,000 cubic yards of material, one sample shall be obtained and submitted for testing for each 250 cubic yards of imported material. If the total quantity of import is determined to be less than 1,000 yards, one sample shall be obtained and submitted for testing for each 100 cubic yards of imported material.
- G. The independent approved testing laboratory shall perform the required tests and report results of all tests noting if the tested material passed or failed such tests and shall furnish copies to the Project Inspector (IOR), Architect, OAR, DSA, Contractor, and others as required. Report shall state tests were conducted under the responsible charge of a licensed State of California professional engineer and the material was tested in accordance with applicable provisions of the Contract Documents, CBC and the DSA. Upon completion of the Work of this section, the independent testing laboratory and geotechnical engineer shall submit a verified report to the DSA as required by CBC.
- H. Bills of lading or equivalent documentation will be submitted to the Project Inspector on a daily basis.
- I. Upon completion of import operations, provide the IOR a certification statement attesting that imported material has been obtained from the identified source site.

3.03 INSPECTION AND TESTING

- A. The geotechnical engineer, retained by the Owner as an Owner Consultant, will inspect and test excavations, sample material quality as required in Part 2, observe installation and compaction of fill materials.
- B. Compaction test shall be performed in accordance with ASTM D1557, method "C."

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

This page intentionally left blank

DIVISION 32
EXTERIOR IMPROVEMENTS

This page intentionally left blank

SECTION 32 01 30

OPERATION AND MAINTENANCE OF SITE IMPROVEMENTS

PART 1 GENERAL

1.01 SCOPE OF WORK

- A. Work Specified in this Section: Furnish all labor, material, equipment, and services required to maintain the landscape in an attractive condition as specified herein for a period of 90 calendar days.
- B. Related Work Specified in Other Sections:
 - 1. Section 32 84 00: Planting Irrigation
 - 2. Section 32 84 13: Drip Irrigation
 - 3. Section 32 90 00: Planting
 - 4. Section 32 92 19: Seeding
- C. Definition: The word Architect as used herein shall refer to the Landscape Architect or the Owner's authorized representative.

1.02 QUALITY ASSURANCE

- A. The Contractor's representatives and employees shall be experienced in landscape maintenance.

1.03 90 CALENDAR DAY MAINTENANCE PERIOD

- A. The Contractor shall continuously maintain all areas involved in this Contract during the progress of work. Maintenance period shall not start until all elements of construction, planting, and irrigation for the entire project are in accordance with Plans and specifications.
 - 1. A prime requirement is that all lawn and groundcover areas shall have been planted and that all lawn areas shall show an even, healthy stand of grass seedlings or sod, either of which shall have been mowed twice. The Maintenance Period will not be shortened when this criterion is met, but may be lengthened if not met.
 - 2. The Contractor's Maintenance Period will be extended if the provisions required within the Plans and specifications are not fulfilled. Project may not be segmented into maintenance phases.
 - 3. The Contractor shall request a Pre-Maintenance inspection by the Owner and Architect at the completion of the installation process.
 - 4. The Maintenance Period shall begin upon successful completion of the Pre-Maintenance walk-through punch list and acceptance of the landscape installation by the Owner.
 - 5. If such criteria are met to the satisfaction of the Owner, a field notification will be issued to the Contractor to establish the effective beginning date of the Maintenance Period.
- B. The Maintenance Period continues for 90 calendar days until final acceptance of the work by the Owner. Improper maintenance or poor condition of planting at the termination of the scheduled Maintenance Period may cause postponement of the final completion date of the Contract.

- C. Any day when the Contractor fails to adequately maintain planting, replace unsuitable plants or do weed control or other work, as determined necessary by the Owner, will not be credited as one of the Maintenance Period working days.

1.04 GUARANTEE AND REPLACEMENT

- A. Guarantee: All plant material installed under the contract shall be guaranteed for a period of one year from the start of the Maintenance Period. Plants found to be dead or in poor condition due to faulty materials or workmanship, as determined solely by the Architect, shall be replaced by the Contractor at his expense.
 - 1. Replacement: Materials found to be dead, missing, or in poor condition during the Maintenance period shall be replaced immediately.
 - 2. The Architect shall be the sole judge as to the condition of material.
 - 3. The Contractor shall replace material rejected during the Guarantee period within fifteen (15) days of written notification by the Owner.

1.05 OBSERVATION VISITS

- A. The Contractor shall request progress visits from the Architect at least 72 hours in advance of anticipated visits. Normal observation visits are as follows:
 - 1. Immediately prior to the commencement of the work in this section.
 - 2. Completion of first 90 days of maintenance.
 - 3. Final acceptance.

1.06 FINAL ACCEPTANCE OF THE PROJECT

- A. Prior to the date of the final observation visit, the Contractor shall acquire from the Architect-approved reproducible Plans and record (from the job record set) all changes made during construction, label these Plans "Record Drawings", and deliver to the Architect for review and approval.
- B. Prior to the date of final inspection, the Contractor shall deliver to the Architect a written "Landscape and Irrigation Guarantee" as required herein.

PART 2 PRODUCTS

2.01 MATERIALS

- A. All materials used shall either conform to landscape specifications in other sections or shall otherwise be acceptable to the Owner.
- B. The Owner shall be given a monthly record of all herbicides, insecticides, and disease control chemicals used. Failure to provide such a record will continue Maintenance Period until compliance occurs.

PART 3 EXECUTION

3.01 MAINTENANCE

- A. Maintenance shall be performed according to the following standards:

1. All areas shall be weeded and cultivated at intervals of not more than ten (10) days.
2. Watering, mowing, rolling, edging, trimming, fertilization, spraying, and pest and rodent control, as may be required, shall be included in the Maintenance Period.
3. Street gutters shall be cleaned as part of the maintenance program.
4. The Contractor shall be responsible for maintaining adequate protection of the area.
 - a. Damaged areas shall be repaired at the Contractor's expense.
5. Between the 15th day and the 20th day of the Maintenance Period, the Contractor shall reseed and re-sod all spots or areas within the lawn where normal turf growth is not evident.

- B. The Contractor shall be responsible for reporting to the Owner conditions beyond his control that prevent or have a negative impact on the work required herein.

3.02 TREE AND SHRUB CARE

A. Watering

1. Apply enough irrigation water so that moisture penetrates throughout root zone and only as frequently as necessary to maintain healthy growth.
 - a. Do not maintain soil in a constantly wet condition.
 - b. Contractor shall be responsible for familiarizing himself with the water requirements for the various plantings and shall be responsible for setting and maintaining the automatic controller to optimum minimum levels.
 - c. Damage to the plantings caused by over-watering or under-watering shall be the responsibility of the Contractor to replace at no cost to Owner.
2. Maintain a water basin around newly planted plants so that water can be applied to moisturize throughout the root zone. At the end of the Maintenance Period these basins shall be flattened out to match surrounding grades.
3. If hand-watering, use a fan spray nozzle to break the water force.

B. Tree Pruning

1. Nursery grown trees will not normally require pruning for the first year. Prune trees only if directed by Architect or Owner, and only for these purposes:
 - a. selection and development of permanent scaffold branches that have a vertical spacing of from 18" to 48" and radial orientation so as not to cross each other,
 - b. elimination of diseased or damaged growth,
 - c. elimination of narrow V-shaped branch forks that lack strength,
 - d. reduction of toppling and wind damage by thinning out crowns,
 - e. maintenance of growth within space limitations,
 - f. maintenance of natural appearance,
 - g. Balancing of crown-to-root ratio.
2. Under no circumstances will stripping of lower branches ("rising up") of young trees be permitted.
 - a. Lower branches shall be retained in a "tipped-back" or pinched condition with as much foliage as possible to promote caliper trunk growth (tapered trunk).

- b. Lower branches can be cut flush with trunk only after the tree is able to stand erect without staking or other support.
 3. Evergreen trees shall be thinned out and shaped when necessary to prevent wind and storm damage. The primary pruning of deciduous trees shall be done during the dormant season. Damaged trees or those that constitute health or safety hazards shall be pruned at any time of the year as required.
- C. Shrub Pruning
1. The objectives of shrub pruning are the same as for trees. Shrubs shall not be clipped into balled or boxed forms unless such is required by the design.
 2. All pruning cuts shall be made to lateral branches or buds or flush with the trunk. "Stubbing" will not be permitted.
- D. Staking and Guying: Stakes and guys shall remain in place until final acceptance and are to be continuously inspected and adjusted to prevent girdling of trunks or branches and to prevent rubbing that causes bark wounds and to allow trees to sway freely. Stakes and guys are to be removed when trees become sufficiently well rooted or after one year. When stakes or guys are removed, tree heads may be thinned to reduce wind load.
- E. Weed Control: Keep all areas, including basins and areas between plants, free of weeds.
1. Use recommended legally approved herbicides only when mechanical removal methods are not feasible.
 2. Avoid frequent soil cultivation next to trees or shrubs that destroys shallow roots.
 3. Use mulches to help prevent weed seed germination.
- F. Pest and Disease Control: Maintain control of insect and rodent infestations. The preferred method of control shall be biological control, or with non-toxic, biodegradable, organic materials. If stronger materials are needed, only materials that are recommended by a licensed Pest Control Advisor and are EPA approved and regulated shall be used. Only registered and licensed Pest Control Operators shall apply insecticide or chemical applications. Notify Owner a minimum of five (5) working days before chemical applications.
- G. Fertilization
1. Fertilize all planting areas at 30-day intervals, with fertilizer and at rate as recommended by Soils Report.
 - a. Avoid applying fertilizer to root balls and bases of main stems.
 - b. Spread fertilizer evenly around plants to drip line.
 - c. Distribute fertilizer evenly over turf or groundcover areas to avoid patchy coloration.
- H. Replacement of Plants: Replace dead, dying, and missing plants with plants of a size, condition, and variety acceptable to Architect or Owner at Contractor's expense.
- 3.03 GROUND COVER CARE
- A. Weed Control: Control weeds preferably with mechanical methods, and also with preemergent herbicides and selective systemic herbicides. Hoe weeds as little as possible since this may result in plant damage. Foot traffic in planted areas shall be minimized, and soil compaction shall be loosened immediately.

- B. Watering: Water enough so that moisture penetrates throughout root zone and only as frequently as necessary to maintain healthy growth.
 - 1. Do not maintain soil in a constantly wet condition.
 - 2. The contractor shall familiarize himself with the particular water requirements for the planting and shall be responsible for setting and maintaining the automatic controller to optimum minimum levels.
 - 3. Damage to the planting caused by over-watering or under-watering shall be the responsibility of the Contractor to replace.
- C. Trash: Remove trash weekly. Remove debris, clippings or branches produced by maintenance activities within 8 hours.
- D. Edging and Trimming: Edge ground cover to keep in bounds and trim top growth as necessary to achieve an overall even appearance.
- E. Replacement: Replace dead and missing plants at Contractor's expense.

3.04 LAWN AND TURF CARE

- A. Mowing and Edging:
 - 1. Mowing of turf will commence when the grass has reached a recommended height for the specified species. Mowing will be at least twice a week after the first cut. Turf must be well-established and free of bare spots and weeds to the satisfaction of the Architect prior to final acceptance.
 - 2. Edges shall be trimmed at least weekly or as needed for a neat appearance.
 - 3. Grass clippings, if visible in piles regardless of size shall be removed from the premises.
- B. Watering: Lawns shall be watered at such frequency as weather conditions require to replenish soil moisture below root zone and maintain healthy growth.
- C. Fertilizing:
 - 1. Fertilize all on-grade lawn areas as follows or as recommended by soils report:
 - a. At the end of the first 30 calendar days and at 30 to 90 calendar day intervals thereafter - 5 lbs. per 1,000 square feet of maintenance fertilizer.
 - b. After application, irrigate thoroughly.
- D. Weed Control: Remove broad leaf weeds manually or control with selective herbicides. Turf areas shall be kept weed-free.
- E. Renovating:
 - 1. If required, remove thatch by verticutting, preferably in the fall but otherwise in the spring. At this time, fertilize with maintenance fertilizer and over-seed if needed.
 - 2. Aerify compacted areas to improve water penetration whenever needed.

3.05 IRRIGATION SYSTEM

- A. System Inspection: Contractor shall continuously check all systems for proper operation. Lateral lines shall be flushed out after removing the last sprinkler head or two at each of the lateral. All heads are to be continuously adjusted as necessary for proper coverage and to eliminate over-spray on buildings or paving. Contractors' regular maintenance personnel shall test, observe, and adjust each sprinkler system no less than once per month.
- B. Controllers: Set and program automatic controllers for seasonal water requirements and minimum optimum water use. Give Owner's representative a key to controllers and instructions on how to turn off system in case of emergency.
- C. Repairs: Repair all damage to irrigation system at Contractor's expense. Repairs shall be made within one watering period.

END OF SECTION

SECTION 32 01 90.33

TREE AND SHRUB PRESERVATION

PART 1 GENERAL

1.01 SUMMARY:

- A. Provide all labor, materials, equipment, services, and miscellaneous and incidental work to provide all tree protection as indicated on the Drawings and as specified including:
 - 1. Protection and welfare of all existing trees that are to remain, including trimming, cabling, and repair of such trees as necessary.
 - 2. Contractor shall submit tree maintenance plans including temporary irrigation system for Owner's Representative's approval.
 - 3. Completely coordinate all Work.

1.02 DEFINITIONS:

- A. "Injury" is defined, without limitation, as any bruising, scarring, tearing, or breaking of roots, branches or trunk.
- B. "Drip line" is defined as the outermost limits of the tree canopy.
- C. ISA: International Society of Arboriculture.
- D. Certified Arborist: an ISA-certified arborist.

1.03 QUALITY ASSURANCE:

- A. General Responsibility: The Contractor shall be directly responsible for protection and welfare of existing trees within the Contract Limits, which are noted to remain. This responsibility shall continue throughout the full construction period until the entire Project is completed and accepted by Owner and through completion of the guarantee period.
- B. Qualifications of Workmen: only a certified arborist or certified tree worker shall perform Trimming. Provide at least one person approved by Owner who shall be present at all times during tree protection and trimming operations, who shall be thoroughly familiar with the type of work involved, and who shall direct all protection and trimming work.
 - 1. All tree trimming on this project shall be under the direction of Owner's Representative.
 - 2. Pruning of mature trees shall be considered as part of this project at the discretion of the Landscape Architect and/or Owner's Representative.
- C. Reference Standards: Published specifications, standards, tests, or recommended methods of trade, industry or governmental organization apply to work of the Section.
 - 1. International Society of Arboriculture (ISA) "Guide for Establishing Values of Tree and Other Plants," prepared by the Council of Tree and Landscape Appraisers (CTLA).
 - 2. "Cabling, Bracing and Guying Standards for Shade Trees," as published by the National Arborist Association (NAA), 174 RT 101, Bedford, New Hampshire, 03102.
 - 3. International Society of Arboriculture (ISA) - Tree Pruning Guidelines.

1.04 SUBMITTALS:

- A. Refer to Division 1 for procedure.
- B. Pruning.
- C. Moving Equipment.
- D. Guying materials.
- E. Fencing materials.
- F. Tree Maintenance Plan: Contractor shall submit tree maintenance plans, including design of temporary irrigation system (if required), for approval by Owner's Representative.

1.05 JOB CONDITIONS:

- A. Pre-Construction Meeting: prior to performing any work of the Contract, Contractor shall call for a site meeting with the Owner's Representatives. This meeting shall occur prior to construction of any nature on site. The purpose of the meeting shall be to establish the conditions of all existing trees to be preserved or relocated, tree protection requirements, trimming procedures, and responsibilities, upon receipt of the site by the Contractor. Failure to call for said meeting implies acceptance by the Contractor of trees to be preserved in their existing condition.
- B. Sequencing Schedule: Coordinate and cooperated with other trades to enable work to proceed as rapidly and efficiently as possible.

1.06 GUARANTEE:

- A. Contractor shall guarantee that all plants covered by the provisions of this Section will be in a healthy and flourishing condition of active growth 1 year from the date of Substantial Completion.
- B. During the warranty period the Contractor shall be liable for damages to all trees covered by the provisions of this Section and shall pay compensation to Owner.
 - 1. Contractor shall reimburse Owner for loss of trees due to damage or lack of care (See Section 1.13 - Repair Compensation).
 - 2. For trees injured, but not a complete loss to Owner, the Owner's Representative shall determine the amount of penalty.
- C. Contractor will not be held responsible for failures due to neglect by Owner, vandalism, etc., during the warranty period. Report such conditions within 24 hours to Owner's Representative.

PART 2 PRODUCTS

2.01 TREE PROTECTION FENCING:

- A. Tree Protection Fence: Eight (8') foot high chain-link fence, sturdy and capable of acting as a barrier against objects, vehicles, etc., on site during construction process. It shall be constructed and designed to allow for relocations as required and shall have gate access to inside for care of tree. It shall be continuously maintained and repaired as necessary. Metal shall be galvanized with posts set in 12" diameter x 24" depth footings with top rails.

1. Install tree protection fencing around trees to be preserved at their dripline or at a minimum of 15' from the tree's trunk. Stands of trees may be fenced as a group. Fencing shall remain until all construction work has been completed, and it shall then be removed as directed by the Owner's Representative.
2. During construction, relocation of the fence may be required to facilitate construction. The Contractor shall do so as directed by the Owner's Representative at no additional expense to the Owner and reset if necessary.

PART 3 EXECUTION

3.01 PROTECTION OF TREES:

- A. Water: Provide ample water supply of potable quality and sufficient quantity for all operations required under this section.
- B. The existing trees to be preserved presently are in excellent condition. Trees shall not be allowed to deteriorate and shall be maintained in a healthy and vigorous condition during the course of construction and maintenance period.
- C. During the course of construction, the Contractor shall take all necessary precautions, as outlined herein, to protect the existing trees to be preserved from injury or death. Protection shall be given to the roots, trunk, and foliage of all existing trees to remain.
- D. Trees subject to the provisions of this Section which have been injured, shall be repaired immediately by an approved, certified arborist. Repair may include removal of rough edges and sprung bark and severely injured branches as directed by the Owner's Representative.
- E. Tree protection fencing shall be installed for the protection of existing trees to be preserved. No construction, demolition, or work of any nature will be allowed within the fenced area without prior written approval by the Owner's Representative.
 1. Approval by the Owner's Representative for work within the fenced area shall not release the Contractor from any of the provisions specified herein for the protection of existing trees to be preserved.
 2. During construction of approved work within the fenced area, no main lateral roots, taproots, or roots larger than two (2") inches in diameter shall be cut without prior written approval by the Owner's Representative.
 3. Cut roots with sharp pruning requirements per ISA guidelines and standards.
 4. All root pruning is to be observed by a Certified Arborist.
- F. During construction the existing site surface drainage patterns shall not be altered within the area of drip line or in compliance with the development plans.
- G. Contractor shall not alter the existing water table within area of drip line during rough grading (as directed by Owner's Representative.)
- H. Take necessary measures to maintain healthy living conditions for existing trees to be preserved. Such measures shall include but not be limited to periodic washing of leaves for the removal of dust, etc.
- I. Do not permit the following within the drip line of any existing tree to be preserved:
 1. Storage or parking of automobiles or other vehicles.

2. Stockpiling of building materials or refuse of excavated materials.
3. Skinning or bruising of bark.
4. Use of trees as support posts, power poles, or signposts; anchorage for ropes, guy wires, or power lines; or other similar functions.
5. Dumping of poisonous materials on or around trees and roots. Such material includes but is not limited to paint, petroleum products, dirty water, concrete slurry, or other deleterious materials.
6. Cutting of tree roots by utility trenching, foundation digging, placement of curbs and trenches, and other miscellaneous excavation without prior written approval by Owner's Representative.
7. Damage to trunks, limbs, or foliage caused by maneuvering vehicles or stacking material or equipment too close to tree.
8. Compaction of the root area by movement of trucks or grading machines; storage equipment, gravel, earth fill, or construction supplies, etc.
9. Excessive water or heat from equipment, utility line construction, or burning of trash under or near shrubs or trees.
10. Damage to root system from flooding, erosion, and excessive wetting and drying resulting from dewatering and other operations.

J. Excavation Around Trees:

1. Excavation or fill within drip lines of trees shall be done only where necessary and with the direction of the Owner's Representative.
2. Where trenching for utilities is required within drip lines, it shall be under the supervision and direction of the Owner's Representative. Trenching within a tree's dripline area requires the use of hand tools. Hand clear and excavate to minimize damage to root systems. Use narrow-tine spading forks and comb soil to expose roots.
3. Where excavation for new construction is required within drip line of trees, hand excavation may be required to minimize damage to root system. Any pruning of damaged roots or roots requiring removal shall be observed by a Certified Arborist. Roots larger than two (2) inches in diameter require written approval by the Owner's Representative prior to root pruning.
4. Exposed roots and soil areas shall not be allowed to dry out before permanent backfill is placed. Temporary earth cover or organic mulch shall be provided, or roots shall be packed with wet peat moss or four layers of wet, untreated burlap and temporarily supported and protected from damage until permanently covered with backfill. The cover over the roots shall be wetted to the point of runoff daily. When complete, install broken concrete retaining walls as shown on Plan Details wherever the grade around a tree to be saved is higher or lower by 6" from the existing grade. See Planting Plan and Details.
5. Pruning may be required to balance loss to root system caused by damage or cutting of root system. Thinning shall not exceed 30 percent of existing foliage and shall be directed by the Owner's Representative.

3.02 TREE PRUNING

- A. Pruning: Trees which require pruning shall be inspected by the Owner's Representative and the Contractor before starting work this work. All Pruning shall be in accordance with the standards of the ISA or as directed by the Owner's Representative. A sample tree shall serve as a guide in the pruning of the remaining trees.

3.03 TREE REMOVAL

- A. Trees designated for removal shall be removed to a point at least 1' (one foot) or more below subgrade. Refer to Section 02 41 00 (Demolition). Trees shall not be felled but cut down in sections and lowered to the ground to minimize damage to other trees and planting and protect against injury to anyone in the vicinity.
- B. The Owner's Representative and the Contractor's Arborist will identify limbs and roots, which are to be trimmed.
- C. The Owner's Representative shall direct the removal of branches from trees and large shrubs that are to remain if required clearing for new construction.
- D. Dead and damaged trees that are determined by the Owner's Representative and arborist to be incapable of restoration to normal growth pattern shall be removed.
- E. Cut evenly, using proper tools and skilled workmen, to achieve neat severance with the least possible damage to the tree.
- F. In the case of root cuts, apply wet burlap or other protection, approved as noted herein, to prevent drying out, and maintain them in a wet condition as long as necessary for temporary protection.

3.04 IRRIGATION SYSTEM

- A. Protect existing irrigation system from damage. Wherever possible leave water source for watering trees and keep ground around all trees to remain in the area sufficiently moist until the end of project.

3.05 REPAIR COMPENSATION

- A. Damage to existing tree crowns or roots over two (2) inches in diameter shall be immediately reported to Owner's Representative in writing, and, at the direction of the Owner's Representative, repaired immediately at the Contractor's expense by an approved, certified arborist.
- B. The Owner's Representative shall direct repair of trees damaged by construction operations. Repairs shall be made within 24 hours after damage occurs to prevent progressive deterioration of damaged trees.
- C. Any tree to remain which is damaged or destroyed owing to the Contractor's negligence or failure to provide adequate protection shall be compensated for in accordance with "The Guide for Establishing Values of Trees and Other Plants as produced by the International Society of Arboriculture.
- D. Maintenance including watering, fertilizing, pruning, pest control, irrigation, and other care to bring the replacement tree to the same general condition of original item shall be the responsibility of the Contractor.
- E. Damaged tree limbs or trees which have died because of injury during construction shall remain the property of Owner and shall remain or be removed by the Contractor as directed by Owner's Representative.

3.06 MAINTENANCE

- A. Contractor shall be responsible to perform periodic inspections of existing trees to be preserved and submit written proposals to the Owner's Representative for additional maintenance work as may be required to ensure the health and general well-being of the trees. Contractor shall retain, at the direction of the Owner's Representative additional specialists as may be required to perform this work.

- B. Irrigation: During construction the existing trees to be preserved shall, at the directions of the Owner's Representative, be irrigated to a minimum of 3' depth. Quantities and lengths of time are variable and shall depend upon climactic conditions or per the direction of the Owner's Representative.

END OF SECTION

SECTION 32 12 16

ASPHALT PAVING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Paving for playground, parking areas, areas between buildings, synthetic track surfacing adjacent to planting and turf areas as indicated.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 31 22 00 - Grading.

1.02 SUBMITTALS

A. Shop Drawings: Submit site plan indicating extent of paving and accessories.

B. Product Data: Manufacturer's technical data for materials and products.

1.03 QUALITY ASSURANCE

A. Manufacturer Qualifications: Manufacturer shall be registered with and approved by authorities having jurisdiction or the DOT of the state in which Project is located.

B. Standard Specifications: Comply with the Standard Specifications for Public Works Construction (SSPWC) and the California Department of Transportation (Caltrans), latest editions and supplements for asphalt paving work. These Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and payment sections do not apply to this document.

C. Asphalt-Paving Publication: Comply with AI MS-22, "Construction of Hot Mix Asphalt Pavements," unless more stringent requirements are indicated.

1.04 PROJECT CONDITIONS

A. Information on Drawings or in soils report does not constitute a guarantee of accuracy or uniformity of soil conditions over the Project site.

B. A copy of the soils report is available for examination in the office of the Architect during regular office hours of the Architect.

PART 2 PRODUCTS

2.01 PAVING AGGREGATE

- A. Aggregates: Class 2 Aggregate Base in conformance with CALTRANS Section 26-1.02, MATERIALS; or Crushed Aggregate Base or Crushed Miscellaneous Base in conformance with SSPWC Section 200-2 UNTREATED BASE MATERIALS.
- B. Aggregates for Asphaltic Concrete Paving: Conform to CALTRANS Section 39-2.0B (4) Aggregates; or SSPWC Section 203-6.2.2 Rock Products for Asphalt Concrete Mixes. Plus 50/60 penetration liquid asphalt at 5 percent to 6-1/2 percent of combined dry aggregates.

2.02 BITUMINOUS MATERIALS

- A. Tack Coat: PG 64-10 conforming to Section 92 of the Caltrans Standard Specifications, unless noted otherwise.
- B. Provide materials of the class, grade, or type indicated on the Drawings, conforming to relevant provisions of Section 203 - Bituminous Materials of the Standard Specifications for Public Works Construction.
- C. Mixes: Hot-Mix Asphalt: Dense, hot-laid, hot-mix asphalt plant mix III-C3 PG 64-10 designed in conformance with SSPWC Section 203-6.5, unless noted otherwise.

2.03 AUXILIARY MATERIALS

- A. Herbicide: Commercial chemical for weed control, registered by the EPA. Provide in granular, liquid, or wettable powder form.
- B. Wheel Stops: Precast, air-entrained concrete
 - 1. Dowels: Galvanized steel, one-half-inch diameter, 18-inch minimum length.

2.04 HEADERS

- A. Concrete: Per specification Section 32 1313 - Site Concrete Work.

PART 3 EXECUTION

3.01 HEADERS

- A. Install headers along edge of bituminous surfacing abutting turf, earth, or planting area, unless indicated otherwise.
- B. Install headers so the bottom surface has continuous bearing on solid grade. Where excavation for headers is undercut, thoroughly tamp soil under the header. Compact backfill on both sides of header to the density of adjacent undisturbed earth.
- C. Remove existing headers where new surfacing is installed adjacent to existing surfacing.
- D. Install temporary headers at transverse joints of paving where continuous paving operations are not maintained.
- E. Provide additional stakes and anchorage as required to fasten headers in place.

3.02 COLD MILLING

- A. Clean existing pavement surface of loose and deleterious material immediately before cold milling. Remove existing asphalt pavement by cold milling to grades and cross sections indicated.
 - 1. Mill to a depth of two inches.

3.03 PATCHING

- A. Hot-Mix Asphalt Pavement: Saw cut perimeter of patch and excavate existing pavement section to sound base. Excavate rectangular or trapezoidal patches, extending 12 inches into adjacent sound pavement, unless otherwise indicated. Cut excavation faces vertically. Remove excavated material. Recompact existing unbound-aggregate base course to form new subgrade.
- B. Tack Coat: Apply uniformly to vertical surfaces abutting or projecting into new, hot-mix asphalt paving at a rate of 0.05 to 0.15 gallons/square yard.
- C. Patching: Fill excavated pavements with hot-mix asphalt base mix and, while still hot, compact flush with adjacent surface.

3.04 CONSTRUCTION OF ASPHALT CONCRETE PAVEMENT

- A. Proof-roll subbase using heavy, pneumatic-tired rollers to locate areas that are unstable or that require further compaction.
- B. Immediately before placing asphalt materials, remove loose and deleterious material from substrate surfaces. Ensure that prepared subgrade is ready to receive paving.
 - 1. Sweep loose granular particles from surface of unbound-aggregate base course. Do not dislodge or disturb aggregate embedded in compacted surface of base course.
- C. Herbicide Treatment: Apply herbicide according to manufacturer's recommended rates and written application instructions. Apply to dry, prepared subgrade or surface of compacted-aggregate base before applying paving materials.
- D. Thickness of Surfacing: Unless otherwise indicated on Drawings or specified, install bituminous surfacing to a compacted thickness of 2 inches.
- E. Provide surfacing material over base course.
- F. Surfaces of walls, concrete, masonry, or existing bituminous surfacing indicated to be in direct contact with installed bituminous surfacing shall be cleaned, dried and uniformly coated with an asphaltic emulsion film.
- G. Thicken edges of bituminous surfacing that do not abut walls, concrete, or masonry, and edges joining existing bituminous surfaces. Remove headers at existing bituminous surfacing where new bituminous surfacing is to be installed. Thicken edges an additional 2 inches and taper to the indicated or specified thickness 6 inches back from such edges.
- H. At stairways, adjust thickness of paving such that the first tread is equal in height to all other treads.
- I. Provide adequate protection for concrete, planting areas, and other finish Work adjacent to areas indicated to receive bituminous surfacing.
 - 1. Placing:

2. Machine place hot-mix asphalt on prepared surface, spread uniformly, and strike off. Place asphalt mix by hand to areas inaccessible to equipment in a manner that prevents segregation of mix. Place each course to required grade, cross section, and thickness when compacted.
 3. Do not install bituminous surfacing when atmospheric temperature is below 40 degrees F; or when fog or other unsuitable weather conditions are present. Temperature of mixture at time of installation shall not be lower than 260 degrees F in warm weather or higher than 320 degrees F in cold weather.
 4. Where 2-inch or 3-inch thick surfacing is indicated or specified, install surfacing in one course. Where surfacing is indicated or specified 4 inches or more in thickness, except for thickened edges, install bituminous surfacing in courses of approximately equal thickness, each course not exceeding 2 ½ inches in thickness.
 5. Regulate paver machine speed to obtain smooth, continuous surface free of pulls and tears in asphalt-paving mat.
 6. Place paving in consecutive strips not less than 10 feet wide unless infill edge strips of a lesser width are required.
 7. Promptly correct surface irregularities in paving course behind paver. Use suitable hand tools to remove excess material forming high spots. Fill depressions with hot-mix asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.
- J. Stakes or Screeds: Provide grade or screed stakes spaced not more than 15 feet apart in flow lines with grades of less than one percent. Continuous screeds may be provided instead of stakes.
- K. Spreading: Install bituminous surfacing in a manner to cause least possible handling of mixture. In open areas and wherever practicable, install by mechanical means with a self-propelled mechanical spreader. In confined or restricted areas, install mixture with hot shovels and rakes, and smooth with lutes.
- L. Joints: Provide vertical joints between successive runs. Install joints true to line, grade, and cross section. Lapped joints are not permitted.
- M. Rolling:
1. Finish roll with a self-propelled tandem roller weighing at least 8 tons. Break down roll with a self-propelled roller weighing between 1 ½ tons and 8 tons.
 2. Roll in a manner that preserves flow lines and the established finished grades. Break down roll in areas adjacent to flow lines parallel to flow lines. Break down roll after bituminous surfacing is installed without shoving or cracking of mixture under roller. Continue finish rolling until surfacing is unyielding, true to grade, and meets requirements for specified smoothness. Areas inaccessible to finish roller may be finish rolled with breakdown roller or tamped with hot tamping irons and smoothed with hot smoothing irons or hand roller.
 3. Where bituminous surfacing abuts concrete, masonry, walks or paving, tamp joint smooth, if necessary, as described above to obtain a uniformly even joint, true to line and grade. Tamp and smooth to properly compact.
 4. Compacted bituminous surfacing shall be provided with a bulk specific gravity of at least 2.31 when tested in accordance with ASTM D1188.
- N. Protection:

1. After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened.
2. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.05 TOLERANCE

- A. Smoothness: Surface of bituminous surfacing after rolling, shall be even, smooth and uniform in texture with no voids or rock pockets, free of roller marks or other irregularities, and not varying by more than 0.03 foot, except at local depressions or raised areas as indicated, when a 10-foot straightedge is placed on surface.
- B. Grade: Finished grade shall not vary more than 0.02 foot above or below required grade. Variations within prescribed tolerance shall be compensating so that average grade and cross-section are provided.
- C. Premium paving tolerances and requirements for synthetic track:
 1. General: Test in-place asphalt concrete courses for compliance with requirements or thickness and surface smoothness. Repair or remove and replace unacceptable paving as directed by Owner's representative.
 2. Thickness: Tolerances for thickness shall be ¼ inch, plus or minus.
 3. Planarity: The asphalt substrate shall not vary from the planned cross slope by more than plus or minus 0.1 percent. The finished asphalt shall not vary, plus or minus, under a 10 feet straight edge greater than 1/8 inch. Flood test the surface with the use of a water truck. If, after 30 minutes on a 70-degree F day, "bird baths" are evident at a depth more than 1/8 inch repair using the best method of correction.
 4. Corrective Measures: Determine if the planarity, cross slopes, and general specifications have been met. If all of the conditions have been met notify the Owner in writing of the acceptance of the asphalt paving.

3.06 TESTING

- A. After first coat of surface seal has been installed and after a 24-hour period, the flood test shall be completed of the bituminous surfacing in presence of the Project Inspector. Repair areas of standing water or puddles and flood test locally; install surface seal and retest as necessary.

3.07 SURFACE SEALING

- A. After bituminous surfacing has passed flood test, clear and allow to dry and provide one more coat of surface seal.
- B. Where indicated, provide multiple coats of surface seal to existing bituminous surfacing.
- C. Where new bituminous surfacing joins existing bituminous surfacing, overlap surface seal a minimum of 12 inches onto existing bituminous surfacing.

3.08 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.09 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 32 12 36

EMULSIFIED SLURRY SEAL

PART 1 GENERAL

1.01 SUMMARY

- A. The work shall consist of mixing asphaltic emulsion, aggregate, set-control additives and water, and spreading the mixture on a surfacing or pavement.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated. Include technical data and tested physical and performance properties.
- B. Asphaltic Emulsion: Certification, by authorities having jurisdiction, of approval of each job mix proposed for the Work.
- C. Material certificates.
- D. Log of slurry seal application, including dates, times, temperature readings and other pertinent information.

1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Manufacturer shall be registered with and approved by authorities having jurisdiction or the DOT of the state in which Project is located.
- B. Standard Specifications: Comply with latest editions and supplements for Caltrans Standard Specifications Sections 37 and 94. These Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and payment sections do not apply to this document.

1.04 PROJECT CONDITIONS

- A. Environmental Limitations: The slurry seal shall not be applied if either the pavement or air temperature is below 50 degrees Fahrenheit. and falling, but may be applied when both pavement and air temperatures are above 45 degrees Fahrenheit and rising. No slurry seal shall be applied when there is a possibility of freezing temperatures at the project location within 24 hours after application.
- B. Pavement-Marking Paint: Proceed with pavement marking only on clean, dry surfaces and at a minimum ambient or surface temperature of 40 degrees Fahrenheit for oil- based materials, 50 degrees Fahrenheit for water-based materials, and not exceeding 95 degrees Fahrenheit.

PART 2 PRODUCTS

2.01 ASPHALTIC EMULSION

- A. Asphaltic emulsion shall be a quick-setting type, grade QS1h anionic, or grade CQS1h cationic, conforming to the provisions in Caltrans Standard Specifications Section 94, Table 4. The grades of asphaltic emulsion shall be at the option of the Contractor.

2.02 AGGREGATE

- A. Aggregate shall conform to the provisions in Caltrans Standard Specification Section 37- 2.02C, Type II

2.03 WATER

- A. Water shall be such quality that the asphalt will not separate from the emulsion before the slurry seal is in place in the work. If necessary for workability, a set-control agent that will not adversely affect the slurry seal may be used.

2.04 MIX DESIGN

- A. Compatibility of the emulsified asphalt, aggregate, water and additives shall be evaluated in the mix design. The slurry seal mixture shall conform to the requirements specified when tested in accordance with the Caltrans Standard Specifications Section 37-2.03.

2.05 PAVEMENT MARKING PAINT

- A. Pavement-Marking Paint: Latex, waterborne emulsion, lead and chromate free, ready mixed, complying with Caltrans Standard Specifications - Section 84 (Federal Specification No. TT-P-1952 for Blue, Red and Green paint; and State of California Standard Specification No. PTWB-01 for White, Yellow and Black paint) with drying time of less than 45 minutes.

- 1. Color: White

PART 3 EXECUTION

3.01 SURFACE PREPARATION

- A. Prior to applying the slurry seal, loose material, oil spots, vegetation, and other objectionable material shall be removed. A standard cleaning method such as sweeping, flushing, or other means will be acceptable. If water is used, cracks shall be allowed to dry thoroughly before slurry surfacing. Manholes, valve boxes, catch basins, and other utility boxes shall be protected from slurry seal by a suitable method.
- B. Treat cracks wider than 0.25 inches in the pavement surface with an approved crack sealer prior to application of slurry seal.

3.02 PLACING

- A. The slurring mixture shall be uniformly spread on the existing surfacing within the rate specified without spotting, re-handling or otherwise shifting of the mixture.
- B. Slurry seal shall not be placed when the atmospheric temperature is below 50 degrees Fahrenheit or during unsuitable weather.
- C. Slurry seal shall be spread at a rate specified in Caltrans Standard Specifications Section 37-2.06.
- D. The mixture shall be uniform and homogeneous after spreading on the existing surfacing and shall not show separation of the emulsion and aggregate after setting.
- E. Lumping, balling, or unmixed aggregate will not be acceptable.

- F. Adequate means shall be supplied to protect slurry seal from damage by traffic until such time that the mixture has cured sufficiently so that the slurry seal will not adhere to and be picked up by the tires of vehicles.
- G. No excess buildup, uncovered areas, or unsightly appearance shall be permitted on longitudinal or traverse joints. The contractor shall supply suitable equipment to produce a minimum number of longitudinal joints throughout the project. When possible, a longitudinal joint shall not be placed in a wheel path. Less than full box width passes will be used only as required. If less than full box width passes are used, they shall not be the last pass of any paved area. A maximum of six inches shall be allowed for overlap of longitudinal joints.
- H. Area which cannot be accessed by the mixing machine shall be surfaced using hand squeegees to allow complete and uniform coverage. If necessary, the area to be handworked shall be lightly dampened prior to mix placement. Handwork shall exhibit the same finish as that applied by the spreader and shall be completed prior to final surfacing.
- I. Care shall be taken to apply straight lines along curbs and gutters. No run-off on these areas will be permitted. Roofing felt or heavy plastic may be used to begin or end a pull cleanly.
- J. Rolling is not necessary for slurry seal on roadways. Parking areas shall be rolled by a self-propelled, 10-ton (maximum) pneumatic tire roller equipped with a water spray system. All tires shall be inflated per manufacturer's specifications. Rolling shall not start until the slurry has cured sufficiently to avoid damage by the roller. Areas which require rolling shall receive a minimum of two full coverage passes.

3.03 PAVEMENT MARKING

- A. Do not apply pavement-marking paint until layout, colors, and placement have been verified with Architect.
- B. Allow paving to age for 30 days before starting pavement marking.
- C. Sweep and clean surface to eliminate loose material and dust.
- D. Apply paint with mechanical equipment to produce pavement markings, of dimensions indicated, with uniform, straight edges. Apply at manufacturer's recommended rates to allow a minimum wet film thickness of 15 mils.

3.04 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and to prepare test reports.
- B. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- C. Remove and replace or install additional slurry seal mixture where test results or measurements indicate that it does not comply with specified requirements.

3.05 DISPOSAL

- A. Except for material indicated to be recycled, remove excavated materials from Project site and legally dispose of them in an Environmental Protection Agency (EPA) approved landfill.

END OF SECTION

SECTION 32 13 13
SITE CONCRETE WORK

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Portland cement concrete pavement, cement walks, curbs, gutters, trash pick-up area, ramps, mowing strips, fence post footings, sliding gate concrete tracks, catch basins, pipe bedding and encasements, thrust blocks, transition structures, flagpoles and light standard bases and footings, athletic equipment footings and equipment pads.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 01 35 93 - Off-site Improvement Procedures.
3. Section 01 35 96 - Off-site Improvement Procedures (B-Permit).
4. Section 03 20 00 - Concrete Reinforcement.
5. Division 23 - HVAC.
6. Division 26 - Electrical.
7. Section 31 22 00 - Grading.
8. Section 31 23 16 - Excavation and Fill for Pavement.
9. Section 32 12 16 - Asphalt Paving
10. Section 33 11 00 - Site Water Distribution Utilities.
11. Section 33 30 00 - Site Sanitary Sewer Utilities.
12. Section 33 40 00 - Storm Drainage Utilities.

1.02 SUBMITTALS

- A. Shop Drawings: Submit plans, elevations and details of concrete site Work.
- B. Product Data: Submit mix designs and manufacturer's technical data for materials and products. Submit 3-inch by 3-inch concrete Sample of each specified color.
- C. Material Sample: Submit one concrete bumper to the Project Inspector for destructive testing.

1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Manufacturer of ready-mixed concrete products who complies with ASTM C 94/C 94M requirements for production facilities and equipment.
- B. ACI Publications: Comply with ACI 301, "Specification for Structural Concrete," unless modified by requirements in the Contract Documents.

- C. All work to be performed and materials to be used shall be in accordance with the Standard Specifications for Public Works Construction, latest edition and supplements.
- D. The Contractor shall have one copy of the Standard Specifications at the job site.
- E. The Standard Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and pavement sections do not apply to this document.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Concrete, Mortar and Related Materials: Comply with applicable provisions of Standard Specifications for Public Works Construction, Section 201 - Concrete, Mortar and Related Materials:
 - 1. Concrete: 28-day compressive strength 2,500 psi, and a maximum of 3,250 psi, unless specified otherwise.
 - 2. Portland Cement: ASTM C 150, Type II, unless noted otherwise.
 - 3. Pozzolan: ASTM C618, Class F or N Fly Ash, 100 pounds maximum per cubic yard, containing one percent or less carbon. Fly ash shall not be used in excess of 15 percent by weight of total cement quantity.
 - 4. Expansion Joint Filler: Preformed expansion joint filler, bituminous type, complying with ASTM D994.
 - 5. Cementitious Material: Use the following cementitious materials, of the same type, brand, and source throughout the Project
 - 6. Combined Aggregates: Gradation "C" conforming to SSPWC Section 201-1.3.2, unless noted otherwise.
 - 7. Water: ASTM C 94/C 94M.
- B. CURING MATERIALS
 - 1. Liquid Curing Compound: ASTM C309, fugitive dye dissipating type, complying with Rule II 13 of the South Coast Air Quality Management District and Federal Air Quality Regulation 40 CFR 52.254.
 - 2. Moisture-Retaining Cover (Curing Sheet): ASTM C 171, non-staining polyethylene film or white burlap-polyethylene sheet.
 - 3. Water: Potable.
 - 4. Evaporation Retarder: Waterborne, monomolecular film forming; manufactured for application to fresh concrete.
- C. STEEL REINFORCEMENT
 - 1. Reinforcing Mesh: ASTM A185, 4 by 4/W1.4 by W1.4 welded wire mesh.
 - 2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60; deformed.
 - 3. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice."

- D. Form Materials:
 - 1. Side forms: Douglas fir, Construction Grade or Better or metal forms.
 - 2. Stakes: Douglas fir, Construction Grade or Better or metal stakes.
- E. Concrete Parking Bumpers:
 - 1. Precast concrete, smooth and free of pits and rock pockets, providing a minimum 28-day compressive strength of 3,500 psi. Size at least 7 ½-inch wide, 5 ½-inch high and 6-foot long. Reinforce with two #5 reinforcing bars. Provide 2 ¾-inch diameter pre-drilled holes for anchor installation.
 - 2. Bumper Anchors: Provide ½ inch diameter by 18-inch long galvanized steel pipe.
 - 3. Bumper Adhesive: Provide adhesive recommended by bumper manufacturer/installer for fastening bumpers to concrete pavement.
- F. CONCRETE MIXTURES:
 - 1. Maximum Water-Cementitious Materials Ratio at Point of Placement: 0.60, unless noted otherwise.
 - 2. Slump Limit: Four inches, plus or minus one inch, unless noted otherwise.
 - 3. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Furnish batch certificates to Architect for each batch discharged and used in the Work.

PART 3 EXECUTION

3.01 CONSTRUCTION OF FORMS FOR CAST-IN-PLACE STRUCTURES

- A. Proof-roll prepared subbase surface below concrete pavements with heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding.
- B. EDGE FORMS AND SCREED CONSTRUCTION
 - 1. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for pavement to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.
 - 2. Clean forms after each use and coat with form-release agent to ensure separation from concrete without damage.
- C. STEEL REINFORCEMENT
 - 1. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
- D. Concrete Pavement: Install Portland cement concrete pavement in compliance with the Standard Specifications for Public Works Construction, Section 302- Roadway Surfacing.
- E. JOINTS
 - 1. General: Form construction, isolation, and control joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated.

2. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half hour unless pavement terminates at isolation joints.
 3. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where indicated.
 4. Control Joints: Form weakened-plane control joints, sectioning concrete into areas as indicated. Within 24 hours of pour, construct control joints for a depth equal to a minimum of one inch, or at least one-fourth of the concrete thickness, whichever is greater. Match joints of existing concrete pavement wherever applicable.
 5. Edging: Tool edges of pavement, gutters, curbs, and joints in concrete after initial floating with an edging tool to a one-fourth-inch radius. Repeat tooling of edges after applying surface finishes. Eliminate tool marks on concrete surfaces.
- F. Miscellaneous Exposed Concrete: Install concrete curbs, walks, gutters, cross gutters, access ramps, driveways, catch basins, yard boxes, vaults and similar structures, in compliance with the Standard Specifications for Public Works Construction, Section 303- Concrete and Masonry Construction.
- G. Exposed Concrete Bases: Install bases, such as for post, flagpole, light standards and similar bases, in compliance with the Standard Specifications for Public Works Construction, Section 303 - Concrete and Masonry Construction.
- H. Post, flagpole, light standard footings below grade, underground conduit bedding, encasements, thrust blocks and similar structures may be placed directly in excavations conforming to the required sizes.
- I. Reinforcement installation and concrete placement, surface finishes, curing and removal of forms shall be performed in compliance with applicable provisions of Standard Specifications for Public Works Construction, Section 303 - Concrete and Masonry Construction. Provide heavy broom finish at slopes exceeding six percent and medium broom finish at slopes up to six percent.

3.02 INSTALLATION OF PARKING BUMPERS

- A. Install bumpers as indicated on the Drawings. On bituminous paving, install anchors through pavement and into the ground a minimum of 12 inches. On concrete pavement, install bumpers in a continuous bed of adhesive.

3.03 PAVEMENT TOLERANCES

- A. Comply with tolerances as follows
- B. Elevation: One-fourth inch.
- C. Thickness: Plus three-eighths inch minus one-fourth inch.
- D. Surface: Gap below 10-foot long, unleveled straightedge not to exceed one-fourth inch.
- E. Joint Spacing: Three inches.
- F. Contraction Joint Depth: Plus one-fourth inch no minus.
- G. Joint Width: Plus one-eighth inch, no minus.

3.04 CLEAN UP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.05 PROTECTION

- A. Remove and replace concrete pavement that is broken, damaged, or defective or that does not comply with requirements in this Section.
- B. Protect concrete from damage. Exclude traffic from pavement for at least 14 days after placement.
- C. Maintain concrete pavement free of stains, discoloration, dirt, and other foreign material. Sweep concrete pavement not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION

This page intentionally left blank

SECTION 32 13 73

CONCRETE PAVEMENT JOINT SEALANTS

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes the following:
 - 1. Expansion and isolation joints within cement concrete pavement.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Compatibility and Adhesion Test Reports: From sealant manufacturer.

1.03 QUALITY ASSURANCE

- A. Preconstruction Compatibility and Adhesion Testing: Submit samples of materials that will contact or affect joint sealants to joint-sealant manufacturers for testing according to manufacturer's standard test method to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products listed in other Part 2 articles.

2.02 MATERIALS, GENERAL

- A. Compatibility: Provide joint sealants, backing materials, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer based on testing and field experience.
 - 1. Primers: Product recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.
- B. Colors of Exposed Joint Sealants: As selected by Architect from manufacturer's full range.

2.03 COLD-APPLIED JOINT SEALANTS

- A. Type NS Silicone Sealant for Concrete: Single-component, low-modulus, neutral-curing, nonsag silicone sealant complying with ASTM D 5893 for Type NS.
 - 1. Products:
 - a. Crafcoc Inc.; RoadSaver Silicone.

- b. Dow Corning Corporation; 888.
 - c. Or any equivalent product.
- B. Type SL Silicone Sealant for Concrete: Single-component, low-modulus, neutral-curing, self-leveling silicone sealant complying with ASTM D 5893 for Type SL.
 - 1. Products:
 - a. Crafcoc Inc.; RoadSaver Silicone SL.
 - b. Dow Corning Corporation; 890-SL.
 - c. Or any equivalent product.

2.04 HOT-APPLIED JOINT SEALANTS

- A. Elastomeric Sealant for Concrete: Single-component formulation complying with ASTM D 3406.
 - 1. Products:
 - a. Crafcoc Inc.; Superseal 444/777.
 - b. Meadows, W. R., Inc.; Poly-Jet 3406.
 - c. Or any equivalent product.

2.05 JOINT-SEALANT BACKER MATERIALS

- A. General: Provide joint-sealant backer materials that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by joint-sealant manufacturer based on field experience and laboratory testing.
- B. Round Backer Rods for Cold-Applied Sealants: ASTM D 5249, Type 3, of diameter and density required to control sealant depth and prevent bottom-side adhesion of sealant.
- C. Backer Strips for Cold-Applied Sealants: ASTM D 5249; Type 2; of thickness and width required to control sealant depth, prevent bottom-side adhesion of sealant, and fill remainder of joint opening under sealant.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Concrete curing requirement: The concrete must be allowed to cure and dry a minimum of seven days in good drying weather before installing sealant. An additional day of good drying weather must be allowed for each day of poor, inclement weather.
- B. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions.
- C. Joint Priming: Prime joint substrates where indicated or where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience.
- D. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

- E. Install backer materials to support sealants during application and at position required to produce optimum sealant movement capability. Do not leave gaps between ends of backer materials. Do not stretch, twist, puncture, or tear backer materials. Remove absorbent backer materials that have become wet before sealant application and replace them with dry materials.
- F. Install sealants at the same time backings are installed to completely fill recesses provided for each joint configuration and to produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.
- G. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
- H. Clean off excess sealants or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved by manufacturers of joint sealants and of products in which joints occur.

SECTION 32 17 13
PARKING BUMPERS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Precast concrete wheel stops.
 2. Resilient wheel stops.

1.02 ACTION SUBMITTALS

- A. Product Data:
1. Precast concrete wheel stops.
 2. Resilient wheel stops.
 3. Resilient-shell, concrete-filled wheel stops
- B. Samples for Verification: For wheel stops, **[6 inches long]** <Insert dimension>, showing color and cross section; with mounting hardware.

PART 2 PRODUCTS

2.01 PARKING BUMPERS

- A. Precast Concrete Wheel Stops: Precast, steel-reinforced, air-entrained concrete; 4000-psi minimum compressive strength; **[manufacturer's standard height and width]** **[4-1/2 inches high by 9 inches wide]** <Insert dimensions> by **[72 inches]** <Insert dimension> long. Provide chamfered corners[, **transverse drainage slots on underside,**] and a minimum of **[two]** **[three]** factory-formed or -drilled vertical holes through wheel stop for anchoring to substrate.
1. Source Limitations: Obtain wheel stops from single source from single manufacturer.
 2. Surface Appearance: Smooth, free of pockets, sand streaks, honeycombs, and other obvious defects. Corners shall be uniform, straight, and sharp.
 3. Surface Sealer: [Manufacturer's standard salt-resistant, clear sealer] <Insert requirement>, applied at precasting location.
 4. Mounting Hardware: Galvanized-steel [spike or dowel, **1/2-inch** diameter, **14-inch** minimum length] [lag screw, shield, and washers; **1/2-inch** diameter, **8-inch** minimum length] [hardware as standard with wheel-stop manufacturer].

- B. Resilient Wheel Stops: Solid, integrally colored [rubber] [or] [plastic]; UV stabilized; [manufacturer's standard height and width] [4 inches high by 6 inches wide] <Insert dimensions> by [72 inches] <Insert dimension> long. Provide chamfered corners and a minimum of [two] [three] [four] factory-formed or -drilled vertical holes through wheel stop for anchoring to substrate.
1. Source Limitations: Obtain wheel stops from single source from single manufacturer.
 2. Color: [Black] [Yellow] [Gray] [Green] [Blue] <Insert color>.
 3. Mounting Hardware: Galvanized-steel [spike or dowel, **1/2-inch** minimum diameter, **14-inch** minimum length] [lag screw, shield, and washers; **1/2-inch** diameter, **8-inch** minimum length] [hardware as standard with wheel-stop manufacturer].
 4. Adhesive: Polyurethane or epoxy, as recommended in writing by wheel-stop manufacturer for adhesion to substrate.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that pavement is in suitable condition to begin installation in accordance with manufacturer's written instructions.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install wheel stops in accordance with manufacturer's written instructions unless otherwise indicated.
- B. Install wheel stops in bed of adhesive before anchoring to substrate.
- C. Securely anchor wheel stops to substrate with hardware in each preformed vertical hole in wheel stop as recommended in writing by manufacturer. Recess head of hardware beneath top of wheel stop.

END OF SECTION

SECTION 32 17 23
PAVEMENT MARKINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Parking stripes, markings and accessibility symbols.
 - 2. Exterior athletic court markings.
 - 3. Playground markings.
 - 4. Fire lane "No Parking."
 - 5. Curb marking and red curbs.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.

1.02 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings, indicating location, extent, color and texture of markings.
- B. Material Samples: Submit color Samples.

1.03 PROJECT CONDITIONS

- A. Do not install markings when adverse weather conditions are forecasted.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Paint: Water emulsion-based traffic paint must be approved by OEHS.
 - 1. Dunn Edwards: Vin-L-Stripe.
 - 2. Pervo Paint Company: Acrylic Traffic Paint.
 - 3. Sherwin Williams: Setfast Acrylic Traffic Paint.
 - 4. Vista Paint Corporation: Traffic Paint.
 - 5. Equal.

PART 3 EXECUTION

3.01 PAVEMENT MARKINGS

- A. Application of Paint:

1. Prior to application of paint, allow the pavement to properly cure. Clean and prepare in accordance with paint manufacturer's written recommendations.
2. Provide mechanical equipment to apply paint in a uniform, straight or curved pattern, without gaps, holidays, runs, or other defects.
3. Do not permit traffic until paint has completely cured.
4. Apply two coats in thickness recommended by manufacturer.
5. Playground Markings: Submit Samples to Architect for review. Limited color palettes may be submitted.

B. Marking Width and Color: Unless indicated otherwise, marking width and color are as follows:

Location	Width	Color
Parking stall lines	4 inches	White
Traffic Markings		
Striping:	4 inches	Yellow
General	4 inches	Yellow
Accessible Parking	4 inches	Blue
International Symbol of Accessibility (ITA)	2 inches	White on blue background
Athletic Court Lines:	2 inches	*White
Letters and numbers:		As indicated

*Where two sets of lines overlap, one set shall be white and the other set shall be yellow.

3.02 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 32 17 26

TACTILE WARNING SURFACING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Plastic tactile and detectable warning tiles for pedestrian walking surfaces.

1.02 RELATED REQUIREMENTS

- A. Section 32 13 13 - Concrete Paving: Concrete sidewalks.
- B. Section 32 17 23.13 - Painted Pavement Markings.

1.03 REFERENCE STANDARDS

- A. 49 CFR 37 - Transportation Services for Individuals with Disabilities (ADA) current edition.
- B. ADA Standards - Americans with Disabilities Act (ADA) Standards for Accessible Design 2010.
- C. ATBCB PROWAG - Proposed Accessibility Guidelines for Pedestrian Facilities in the Public Right-of-Way 2011.
- D. California Code of Regulations, Title 24, Part 1 - California Administrative Code, Chapter 5, Articles 2, 3, and 4, Most current edition.
- E. California Code of Regulations, Title 24, Part 2 - California Building Code, Chapter 11B, Most current edition.
- F. California Code of Regulations, Title 24, Part 12 - California Referenced Standards Code, Chapter 12-11B, Most current edition.

1.04 SUBMITTALS

- A. See General Condition Requirements for submittal procedures.
- B. Product Data: Submit manufacturer's product data, standard details, details specific to this project; written installation and maintenance instructions.
- C. Samples: For each product specified provide three (3) samples, 8 inches square, minimum; show actual product, color, and patterns.
- D. Shop Drawings: Submit plan and detail drawings. Indicate:
 - 1. Locations on project site. Demonstrate compliance with referenced accessibility standards.
 - 2. Sizes and layout.
 - 3. Pattern spacing and orientation.
 - 4. Attachment and fastener details, if applicable

- E. Warranty: Submit manufacturer warranty; complete forms in Owner's name and register with manufacturer.

1.05 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with not less than five years documented experience.
- B. Installer Qualifications: Company certified in writing by product manufacturer as having successfully completed work substantially similar to the work of this section.
- C. Americans with Disabilities Act (ADA): Provide tactile warning surfaces which comply with the detectable warnings on walking surfaces section of the Americans with Disabilities Act (Title 49 CFR TRANSPORTATION, Part 37.9 STANDARDS FOR ACCESSIBLE TRANSPORTATION FACILITIES, Appendix A, Section 4.29.2 DETECTABLE WARNINGS ON WALKING SURFACES. In addition, products must comply with CALIFORNIA TITLE 24, PART 2, Chapter 11B, Section 11B-705 requirements regarding patterns, color, and sound on cane contact. In the case of discrepancies, whichever requirement is stricter shall govern.
- D. Polyurethane tactile mat incorporating truncated domes shall conform to the following:
 - 1. Water Absorption of mat when tested by ASTM-D 570 not to exceed 0.36%.
 - 2. Slip Resistance of mat when tested by ASTM-C 1028 the combined wet/dry static coefficient of friction not to be less than 0.90.
 - 3. Tensile Strength of mat when tested by ASTM-D 412 not to be less than 1,100 psi.
 - 4. Tear Strength of Tile when tested by ASTM-D – 624-91 not to be less than 200 psi.
 - 5. Chemical Resistance of mat when tested by ASTM-D-1038: No change.
 - 6. Stain Resistance of mat when tested by ASTM-2299: No change.
 - 7. Smoke Density of mat when tested to ASTM E 662: 245 (@ 4 minutes).
 - 8. Flammability of mat when tested to ASTM E 648: 1.12 watts/ cm. sq.
 - 9. QUV Exposure results when mat tested with "B" Bulbs for 200 hrs.: No change.
 - 10. Freeze-Thaw Cycling when tested to ASTM 1026-84: Unaffected.
 - 11. Hardness of mat when tested to ASTM-D-2240: 90 (Shore A).
 - 12. Specific Gravity of mat when tested to ASTM-D-792: 1.22.
 - 13. Weight loss of mat when tested to ASTM D-1044 (Taber Abrasion H-22 Wheel, 1000gms/1000 cycles) 150 mgs.
- E. Special warnings for disabled persons shall comply with CBC Sections 11B-247.1 and 11B-247.2.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver to project site in manufacturer's protective wrapping and in manufacturer's unopened packaging.
- B. Store covered and elevated above grade and in manufacturer's unopened packaging until ready for installation. Maintain at ambient temperature between 40 and 90 degrees F.

- C. Mat and adhesive materials shall be suitably packaged or crated to prevent damage in shipment or handling. Finished surfaces shall be protected by sturdy wrappings, and shall be identified by model designation or number. Mats shall be kept dry and away from sources of heat. Store on flat level surface.
- D. Mat and adhesives shall be delivered to location at building site for storage prior to installation.

1.07 WARRANTY

- A. See General Condition for additional warranty requirements.
- B. Plastic Tiles: Provide manufacturer's standard five year warranty against manufacturing defects, breakage or deformation.

END OF SECTION

This page intentionally left blank

SECTION 32 18 13
SYNTHETIC TURF SURFACING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections apply to this Section.

1.02 SUMMARY

- A. The work under this section shall consist of furnishing all labor, materials, and equipment necessary to install, in place, all synthetic turf and other materials as indicated on the plans and as specified herein. The installation of all new materials shall be performed in strict accordance with these specifications, the turf provider's instructions and in accordance with all details and shop drawings.

1.03 SUBMITTALS

- A. Substitutions: Products other than RootZone 3D3 BLEND 60 are acceptable if in compliance with all requirements of these specifications. Submit alternate products with the bid proposal and provide the following:
 - 1. Provide all specifications, product data, certification and required information for proposed alternate. It is the responsibility of the bidder to prove that the product substitution is equal to or greater than the product specified.
 - 2. Provide a sample copy of insured warranty and insurance policy information.
 - 3. Provide a sample (8.5" x 11") of the product substitution.
- B. Product Data: For each type of product indicated.
 - 1. Submit catalog cuts, material safety data sheets (MSDS), brochures, specifications, preparation and installation instructions and recommendations.
 - 2. All supplied and installed materials and products will meet or exceed the minimum specifications designated in this section. Sufficient data must be submitted to indicate compliance with the Contract Documents.
 - 3. Submit instructions for installation.
- C. Test Results: The following test results, certified by a licensed independent testing laboratory, shall be submitted as outlined below:
 - 1. With the bid – Mandatory and minimum specifications as shown in Part 2. Bids not meeting the minimum specifications will be rejected.
 - 2. Upon completion of the installation of the infill (including anti-static applications)— Installer Supervisor must measure and record infill depth using a depth tester for Turf and Tracks with analog or digital readout. At ten separate field locations, three data points should be recorded by measuring the infill depth in a triangular pattern approximately 12" – 18" apart. At each of the ten testing locations, the three data points should be averaged. Any location that does not measure 1.46" in depth or more must be corrected.

3. At completion of project – Dynamic Cushioning Test according to ASTM F-355-95, Procedure A and Standard F-1936-98 only if the finished product is to be used for American Football.
- D. Shop Drawings: Show fabrication and installation details for synthetic turf including, but not limited to:
1. Proposed locations of all seams in fabric surfacing. Show installation methods and construction.
 2. Field lining and marking - Submit a complete scale and dimensional drawing of inlaid or tufted-in field lines and marking boundaries. Include graphics for end zones and center logo artwork for approval as well.
 3. All submittals shall be provided within 14 days after Notice to Proceed
- E. The Turf Manufacturer shall provide the following samples of the artificial turf selected for this project:
1. An 8.5" x 11" minimum sample of the exact synthetic turf and infill system that is specified for this project.
 2. Infill mix in accordance with product specifications
- F. Turf Manufacturer Certificates: Certified list of fifty (50) existing installations of a synthetic turf and infill system within the last three years, including Owner Representative and telephone number, attesting compliance with quality assurance information. All must be located within the continental United States.
- G. With the bid - Proof that the Turf Manufacturer is a member, in good standing, of the Synthetic Turf Council
- H. With the bid – Sample Warranty: Provide a sample pre-paid third party insured warranty with the bid. Policy must be in force at the time of the bid.
1. The Contractor shall provide a warranty to the Owner that covers defects in materials and installation workmanship of the turf for a period of ten (10) years from the date of substantial completion. The turf provider must verify that their representative has inspected the installation and that the work conforms to the turf provider's requirements and any written directives. The warranty shall include general wear and damage caused by UV degradation. Other items that must be addressed include the following:
 - a. Acceptable uses for the field
 - b. Fading
 - c. Color match within specifications.
 - d. Excessive fiber wear
 - e. Wrinkling and panel movement
 - f. Shock absorbency (Gmax)
 - g. Seam integrity
 - h. Drainage (through the turf only)
 2. Exclusions shall include the following:
 - a. Vandalism
 - b. Acts of God

3. The warranty shall be fully third-party insured for the first 8-Years and be non-prorated. Warranties that include language which pro-rates benefits shall cause the provider's bid to be rejected. Prior to final payment for the synthetic turf, the Contractor shall submit to the Owner, this policy guaranteeing the warranty to the Owner. Insurance must reflect the following values:
 - a. \$5,000,000 per each insured warranty
 - b. \$5,000,000 annual aggregate for all warranties issued during each 12-month period of the 8-Year third-party insured warranty.
 - c. Policies that are backed by a Letter of Credit are not acceptable.
 - d. Policy must be issued by an A- rated or greater A.M. Best Rating
 - e. Policies that include self-insurance or self-retention clauses shall not be considered. Policy cannot include any form of deductible amount. Policy must be in force at the time of the bid.
- I. With the bid – Turf Manufacturer must attest that their submitted products infringe on no known patents.
- J. Maintenance and Operations Data: At the completion and acceptance of the project submit 3 complete sets, in manual form, of all the turf provider's recommended procedures and materials for, but not limited to general maintenance, line/marketing installation, small repair procedures, cleaning, etc.
- K. Project Record Documents: Record actual locations of seams, drains, and other pertinent information in accordance with the General Requirements

1.04 QUALITY ASSURANCE

- A. Turf Manufacturer Qualifications
 1. Shall be experienced in the installation of synthetic infill grass (including in-house factory extruded nylon RootZone® fiber) for a minimum of five (5) years.
 2. Shall have a minimum of 500 full sized tall fiber infilled type field installations. Field size to be a minimum of 65,000 square feet to qualify. This list is to be provided with the bid.
 3. Shall provide third party certification confirming compliance with referenced standards.
 4. Turf Manufacture must formulate and produce its own fiber master batch.
- B. Installer Qualifications:
 1. The installation team shall be an established, insured installation firm experienced as a premium turf installer with suitable equipment and supervisory personnel, with a minimum of five years' experience with 15-foot-wide tufted materials.
 2. The installation team shall be trained and certified, in writing, by the turf manufacturer, as competent in the installation of the specified material, including seaming and proper installation of the infill mixture.
 3. The site superintendent shall have at least 10 installations that are similar to this type of tall fiber synthetic turf system.
- C. All components and their installation method shall be designed and manufactured for use on outdoor athletic fields. The materials as hereinafter specified, should be able to withstand full climatic exposure, be resistant to insect infestation, rot, fungus and mildew; to ultra-violet light

and heat degradation, and shall have the basic characteristic of flowthrough drainage allowing free movement of surface run-off through the turf and directly into prepared granular base and into the field drainage system.

- D. The synthetic turf and components shall be of national reputation. The turf fabric shall be installed by factory-authorized and certified technicians.

1.05 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit synthetic turf work to be performed according to Contractor or Turf Provider's written instructions and warranty requirements.
- B. Field Measurements: Indicate measurements on Shop Drawings.

1.06 WARRANTY

- A. Special warranty for American Football: Turf must maintain an ASTM F 355 Gmax of less than 165 for the life of the warranty. This is for the entire warranty period of ten (10) years.

1.07 MAINTENANCE SERVICE

- A. Turf Installation Contractor shall train maintenance staff and/or contracted maintenance staff in the use of the recommended maintenance equipment and provide maintenance guidelines to the facility maintenance staff.
- B. Annual Manufacturer Certified Maintenance plan for life of warranty (10 years) must be provided. Must include, but not limited to, a minimum of 1 visit per year with the following services performed:
 - 1. Full Field Inspection
 - 2. Entire Field Grooming
 - 3. Magnetic Metal Collecting
 - 4. Professional Cleaning
 - 5. Disinfectant application
 - 6. Owner Maintenance procedure review

PART 2 PRODUCTS

2.01 ACCEPTABLE TURF MANUFACTURERS

- A. Pre-Approved turf manufacturer:
 - 1. AstroTurf Corporation – AstroTurf® Rootzone 3D3 BLEND 60
2680 Abutment Road, SE
Dalton, GA 30721
P: 706.277.8873
 - 2. Alternate provider is acceptable and must meet and/or be equivalent to all listed requirements, qualifications, and specifications.

2.02 TURF MATERIALS

- A. Synthetic Turf System: A complete synthetic turf system consisting of a combination of 10,800 denier monofilament fibers made from a singularly extruded combination of stabilized polyethylene and nylon polymers with proper compatibilizers and 10,000 denier parallel slit film fibers along with an in-house factory extruded monofilament nylon RootZone®. Pile height shall be nominal 2.0". Fibers shall be tufted to a primary backing and a mechanically applied adhesive secondary backing.
1. The tufted fiber's face weight shall not weigh less than 60 ounces per square yard. The tufted rows of fiber are to be spaced no more than 3/8" apart. ASTM tests proving the fiber meets these qualifications must be provided with the bid. Turf systems that do not meet this specification will be disqualified.
 2. The carpet's primary backing shall have a minimum weight of 6.7 oz per square yard. The carpet shall then be coated with a secondary backing of polyurethane synthetic coating material with a minimum application rate of 20 ounces per square yard and then perforated for adequate drainage. Carpets that are not perforated for adequate drainage shall not be acceptable.
 3. The carpet shall be delivered in 15' wide rolls. The rolls shall be of sufficient length to go from sideline to sideline. Head seams, other than at sidelines, will not be acceptable.
- B. The infilled pile surface shall provide good traction in all types of weather with the use of conventional sneaker type shoes, composition molded sole athletic shoes, and screw- in style football cleats.
- C. The pile surface shall be suitable for both temporary and permanent line markings using acrylic paint, as per the turf provider's recommendations.
- D. All adhesives used in bonding the seams shall be resistant to moisture, freeze/thaw, bacteria and fungus attacks, and resistant to ultraviolet radiation. The adhesive shall be made especially for the adhesion of synthetic turf seams and inlaid field markings and graphics.
- E. The seam specific adhesive system shall have been utilized on at least 25 full installations. Provide this information with the bid. It shall consist of a factory-made adhesive bed applied to a non-woven fabric seaming tape. The adhesive bed shall be a metered amount suitable for the application. It shall be heat and pressure activated. A special heat application machine and pressure application using weighted rollers is mandatory.
- F. Supply field groomer and sweeper or single maintenance apparatus that performs both basic maintenance functions.
- G. Perimeter edge details required for the system shall be as detailed and recommended by the turf provider, and as approved by the turf provider.

2.03 TURF FABRIC SURFACE

- A. The pile surface shall resemble freshly mown natural grass in appearance, texture and color.
- B. The pile surface shall be nominally uniform in length.
- C. The pile fiber angle shall be 90 degrees \pm 15 degrees, measured from the horizontal after installation of the infill material.
- D. The entire system shall be resistant to weather, insects, rot, mildew, and fungus growth and will be non-allergic and non-toxic.
- E. The synthetic turf system shall have a nominal fiber length of 2.0".

- F. Each roll shall be minimum 15' wide.
- G. The entire system shall be constructed for porous standards as specified. Synthetic turf system shall be perforated at 4 – 6" on center. Systems that are not perforated for maximum drainage shall not be acceptable.
- H. All markings shall be tufted in-place, inlaid or glued. It is recommended that the maximum amount of markings be factory-prefabricated into the turf system prior to shipment to site. At a minimum all football markings (except for hash marks) must be factory prefabricated.

2.04 PRODUCT SPECIFICATIONS - TURF

- A. Face yarns shall be a combination of:
 1. A proven athletic quality, outdoor stabilized blend of non-texturized monofilament yarn with a minimum of 330-micron thickness used with parallel slit film polyethylene fibers and;
 2. An in-house factory extruded texturized monofilament nylon RootZone designed specifically for outdoor use, to best resist the effects of ultraviolet degradation, heat, foot traffic, water, and airborne pollutants.
- B. The fabric shall possess the following minimum physical characteristics. ASTM testing shall be provided with the bid and any products not meeting the minimum physical characteristics will be rejected:

Average Pile Yarn Face Weight	ASTM D 5848	60 oz/square yard
Average Total Weight	ASTM D 5848	86.7 oz/square yard
Secondary Backing Weight	ASTM D 5848	20 oz/square yard
Primary Backing	ASTM D 5848	6.7 oz/square yard
Average Tuft Length	ASTM D 5823	2.00"
Tufting Gauge	ASTM D 5793	3/8" maximum
Tuft Bind	ASTM D 1335	> 8 lbs
Yarn Denier (monofilament fiber)	ASTM D 1577	10,800 / 6
Yarn Denier (slit film fiber)	ASTM D 1577	10,000/1
Yarn Denier (secondary fiber)	ASTM D 1577	6,000/8
Fiber Thickness (primary/secondary)	ASTM D 3218	330 / 100 microns
Surface Flammability	ASTM D 2859	8 of 8 PASS
Permeability	ASTM F 1551	>30
Melt Point	ASTM D 789	248 degrees F
Gmax System (American Football)	ASTM F 355	<125 at installation, <165 over life of warranty.

2.05 INFILL MATERIAL

- A. Infill composition shall consist of a ballast layer of silica sand topped by EPDM rubber and Zeolite infill in a ratio by weight of EPDM 1 lb/sqft, Zeolite 1 lb/sqft and silica sand 3.5 lbs/sqft.
- B. Silica sand infill:

1. Must be clean, sub-angular silica sand.
 2. Must be a 20-40 sieve size.
- C. Zeolite infill:
1. Must be clean, uniform particle.
 2. Must be mined in Death Valley, CA (KMI)
- D. EPDM Rubber Infill:
1. Must be 100% virgin Material.
 2. Must be a .5mm – 1.5mm sieve size.
 3. Must be provided by the synthetic turf manufacturer.
- E. Immediately after infill layers are installed, infill depth must be measured per testing protocol detailed in Section 1.3 C. 2 above to ensure that infill layer is at least 1.46” deep.

2.06 SHOCK PAD MATERIALS

- A. A shock pad is required for impact attenuation.
- B. Shock Pad must be approved by turf provider for use under the specified turf system.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Prior to installation of the synthetic turf, examine substrates and conditions, with Installer present, for compliance with requirements for visual installation tolerances. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Certification of prior work: The synthetic turf manufacturer and / or certified installation contractor shall perform a visual inspection of the field base onto which the synthetic turf system is to be installed and to examine the finished surface for required compaction, and grade tolerances (through string line testing). After any discrepancies between the required materials, application and tolerance requirements noted have been corrected, the synthetic turf installer should submit a written certification of VISUAL acceptance of the base for installation of the synthetic turf system. Any tests other than VISUAL tests (string line, water hose, etc...) shall be the responsibility of the General Contractor, Architect, Engineer, or Sports Field Consultant.
- C. Installation of all materials shall be performed in full compliance with approved project shop drawings. Only factory trained and certified technicians skilled in the installation of athletic caliber synthetic turf systems, working under the direct supervision of the turf manufacturer's project managers, shall undertake the placement of the turf system. The designated supervisory personnel on the project must be certified, in writing by the turf provider as competent in the installation of these materials, including proper seaming and proper installation of the infill mixture. The turf provider shall certify the installation and warranty compliance.

3.02 PREPARATION

- A. Inspect delivered field surface fabric and components immediately prior to installation. Any damaged or defective items shall be rejected. Installed synthetic turf system shall be inspected for, but not limited to, the following:

1. Uniformity of product and color
 2. Surface wrinkles
 3. Field markings
 4. Field Edge installation
 5. Pile height of each roll shall be measured. Any material(s) that does not meet minimum height and thickness specifications shall be rejected. Pile height shall be measured in its finished positions.
- B. Environmental Conditions: Weather conditions are important for the successful installation of the systems. No work under this section will proceed when:
1. Ambient temperatures are below 45 degrees F.
 2. Material temperatures are below 45 degrees F.
 3. Surfaces are wet or damp
 4. Rain is imminent or falling.
 5. Conditions exist or are imminent, which will be unsuitable to installation requirements of the systems specified herein. Humidity levels will be inside the limits recommended by the adhesive manufacturer to obtain optimal bonding characteristics of the surfaces.

3.03 INSTALLATION OF THE SYNTHETIC TURF

- A. The full width rolls shall be laid out across the field. When all of the rolls of the playing surface have been installed, the sideline areas will be installed at right angles to the playing field turf. All seam widths are to be held to a minimum and shall be traverse to the field direction. Seams shall be flat, tight, and permanent with no separation or fraying. All seams shall remain as required for the duration of the warranty period.
- B. The perimeter of the field shall be firmly secured to the edge anchors for the life of the warranty and in accordance to project details.
- C. Resilient Infill
1. The sand ballast infill material shall be spot inspected and tested for conformance to sieve specifications.
 2. Sand ballast Infill must be placed in such a way as to minimize fiber entrapment.
 3. The rubber infill must be uniformly applied so as to ensure uniform, predictable surface.
 4. After infill layers are installed, infill depth must be measured to ensure that infill depth is at least 1.46" deep.

3.04 FIELD LINING AND MARKINGS

- A. All markings shall be installed in accordance with prior approved project Shop Drawings.
- B. Inlays shall conform to the turf manufacturer's specifications, directions, and recommendations for the best results.
- C. Striping layouts shall be accurately measured by the Contractor before installation of inlaid field markings.
- D. Install inlays only when the surface is completely dry. Adhere all inlays securely into place. Never loose-lay and sew an inlay into place.

3.05 FIELD QUALITY CONTROL—TESTING AGENCY:

- A. Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.
- B. Testing Services: Testing and inspecting of completed applications of synthetic turf system shall take place in suggestive states, in areas of extent and using methods that are industry standard. Do not proceed with application of next stages until test results for previously completed applications show compliance.
- C. Remove and replace items where test results indicate that they do not comply with specified requirements.

3.06 FINAL ACCEPTANCE

- A. Upon final acceptance, the Manufacturer shall submit to the Owner three (3) copies of Maintenance Manuals, which will include all necessary instructions for the proper care and preventative maintenance of the synthetic turf system, including painting and striping.
- B. The Manufacturer shall ensure that the turf can be plowed with Manufacturer approved snow removal equipment as detailed in the provided Maintenance Manuals.
- C. The finished playing surface shall appear as mowed grass with no irregularities and shall afford excellent traction for conventional athletic shoes of all types. The finished surface shall resist abrasion and cutting from normal use.

3.07 CLEANING

- A. The contractor shall provide the labor, supplies, and equipment as necessary for final cleaning of surfaces and installed items. All usable remnants of new material shall become the property of the Owner. The Contractor shall keep the area clean throughout the project and clear of debris. Surfaces, recesses, enclosures, etc., shall be cleaned, as necessary, to leave the work area in a clean, immaculate condition ready for immediate occupancy and use by the Owner.

END OF SECTION

SECTION 32 31 13

CHAIN-LINK FENCES AND GATES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SECTION INCLUDES

- A. Fence framework, fabric, and accessories.
- B. Excavation for post bases; concrete foundation for posts.
- C. Manual gates and related hardware.

1.03 QUALITY ASSURANCE

- A. Perform Work in accordance with CLEFMI – Product Manual.

1.04 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the products specified in this section with minimum three years' experience.

1.05 ACTION SUBMITTALS

- A. Product Data: Within 35 calendar days after the Contractor has received the District's Notice to Proceed, submit:
 - 1. Materials list and cut sheets of items proposed to be provided under this Section.
 - 2. Manufacturer's specifications and other data needed to prove compliance with the specified requirements.
 - 3. Shop drawings in sufficient detail to show fabrication, installation, anchorage, and interface of the work of this Section with the work of adjacent trades; do not use architect's drawings. If heights are not indicated on drawings, fencing shall be 8'- 0" high.
 - 4. The manufacturer's recommended installation procedures which, when accepted by the Architect, will become the basis for accepting or rejecting actual installation procedures for the Work.

PART 2 PRODUCTS

2.01 CHAIN-LINK FENCING AND GATES

- A. General: Where vinyl coated fabric is called for on the drawings, also provide color coated framing, posts, rails, and associated items. Similarly, where galvanized fabric is indicated, associated framing and accessories shall be galvanized.

1. Pipe sizes indicated are commercial pipe sizes.
2. Tube sizes indicated are nominal outside dimensions.

2.02 GALVANIZING

- A. On steel framework and appurtenances, provide galvanized finish with not less than the following weight of zinc per sq. ft. Typical.
 1. Pipe: 1.8 oz, complying with ASTM A120.
 2. Square Tubing: 2 oz, complying with ASTM A123.
 3. Hardware and Accessories: Comply with table II of ASTM A121.
 4. Fabric: 2.0 oz, complying with class II of ASTM A121.

2.03 FABRIC

- A. Provide galvanized 9-gauge wire and 0.148" vinyl coated wire in 2" mesh (or 1" where indicated on drawings), with top and bottom salvages twisted and knuckled. Galvanized finish where indicated on the drawings. Vinyl coated finishes shall be in the color selected by the Architect. Provide fabric in one-piece widths.

2.04 POSTS, RAIL, AND ASSOCIATED ITEMS

- A. End, Corner, Slope, and Pull Posts:
 1. Provide at least the following minimum sizes and weight:

Material and Dimensions	lbs/ft.
a. Pipe, 4" Outside Dimension	10.8
 2. From 8'-1" to 17'-0" high fence, end & corner posts shall be 6" diameter pipes, 19 lbs/ft
 3. From 17'-1" to 20'-6" high fence, end & corner posts shall be 8" diameter pipes, 28.60 lbs/ft.
 4. Finish: Vinyl Coated : Color selected by the Architect Galvanized finish (where indicated on drawings)
- B. Line Posts:
 1. Provide minimum sizes and weights as follows:

Material and Dimensions	lbs per liner ft.
a. Pipe, 4" Outside Dimensions	10.8
 2. From 8'-1" to 17'-0" high fence, end & corner posts shall be 6" diameter pipes, 19 lbs/ft
 3. From 17'-1" to 20'-6" high fence, end & corner posts shall be 8" diameter pipes, 28.60 lbs/ft.
 4. Finish: Vinyl Coated : Color as Selected by the Architect or Galvanized finish (where indicated on drawings)
- C. Gate Posts:
 1. Provide gate posts for supporting single gate leaf, or one leaf on a double gate installation, for nominal gate widths as follows:

Material and Dimensions	lbs per lin ft
-------------------------	----------------

- a. Pipe, 4" Outside Dimension, 10.8 lbs/ft.
 2. Vinyl Coated: Green or Galvanized Finish (where indicated on drawings)
 3. Over 13 feet wide, and up to 18 feet wide: Use 6.625" outside diameter pipe weighing 14.0 lbs per lin ft.
 4. Over 18 Feet Wide: Use 8.625" outside diameter pipe weighing 24.70 lbs per lin ft.
- D. Top Rails:
1. Use 1.9" outside diameter pipe weighing 2.72 lbs per lineal ft. vinyl coated; or
 2. Provide in manufacturer's longest lengths, with expansion type couplings approximately 6" long for each joint.
 3. Provide means for attaching top rail securely to each gate, corner, pull, slope and end post.
- E. Post Brace Assemblies:
1. Provide at end and gate posts, and at both sides of corner, slope, and pull posts, with the horizontal brace located at mid-height of the fabric.
 2. Use 1.9" diameter pipe weighing 2.72 lbs per lineal ft. vinyl coated for horizontal brace.
 3. Use 3/8" diameter rod with turnbuckle for diagonal truss.
- F. Tension Wire: Provide 7-gauge galvanized vinyl coated coiled spring wire at bottom of fabric.
- G. Post Tops:
1. Provide single piece steel, wrought iron, or malleable iron, Vinyl coated designed as weathertight closure cap.
 2. Provide one cap for each post.
 3. Provide caps with openings to permit passage of top rail.
- H. Stretcher Bars:
1. Provide one-piece lengths equal to full height of fabric, with a minimum cross-section of 3/16" x 3/4".
 2. Provide one stretcher bar for each gate and end post, and two for each corner, slope, and pull post, except where fabric is woven integrally into the post.
- I. Stretcher Bar Bend:
1. Provide steel, wrought iron, or malleable iron, spaced not over 15" on centers, to secure stretcher bars to end, corner, pull, slope, and gate posts.
 2. Bands may be used also with special fittings for securing rails to end, corner, pull, slope, and gate posts.
- 2.05 GATES-SWINGING AND ROLLING
- A. General:
1. Fabricate gate perimeter frames of tubular members.
 2. Provide additional horizontal and vertical members to assure proper operation of the gate and for attachment of fabric, hardware, and accessories.
 3. Space so frame members are not more than 8 feet apart.

4. Fabricate Gate Frames from:
 - a. Materials and Dimensions: lbs per lineal ft.
 - b. Pipe 1.90" Outside Diameter: 2.72
 - c. Tubing, 2" Square: 2.60

- B. Fabrication:
 1. Assemble gate frames by welding them with special malleable or pressed steel fittings and rivets for rigid connections.
 2. Use same fabric as used in the fence.
 3. Install fabric with stretcher bars at vertical edges as a minimum.
 4. Attach stretchers to gate frame not more than 15" on centers.
 5. Attach hardware with rivets or by other means which will provide security against removal and breakage.
 6. Provide diagonal cross-bracing consisting of 3/8" diameter adjustable length truss rods on gates where required to provide frame rigidity without sag or twist.

- C. Swinging Gate Hardware:
 1. Provide following for each gate:
 - a. Hinges:
 - 1) Pressed or forged steel, or malleable iron, to suite the gate size; non-lift-off type, offset to permit 180-degree opening.
 - 2) Provide 1-1/2 pair of hinges for each leaf over 6 feet in nominal height.
 - b. Latches:
 - 1) Provide forked type to permit operation from either side of the gate. Plunger-bar type is not acceptable.
 - 2) Provide padlock eye as integral part of latch.
 - c. Keeper: Provide keeper for vehicle gates, which automatically en gauges the gate leaf and holds it in the open position until manually released.
 - d. Double Gates:
 - 1) Provide gate stops for double gates consisting of mushroom or flush plate, with anchors.
 - 2) Set in concrete to en gauge the center drop rod or plunger bar.
 - 3) Provide locking device and padlock eyes an integral part of the latch, requiring one padlock for locking both gate leaves.
 - e. Gates: Gates in path of travel across an exit to a public way or to a safe dispersal area must comply with exit door hardware and shall have Panic hardware and lever handled latches, (CBC Section 1133B.1.1.1.4). Hardware shall not require pinching, grasping or twisting motion to operate and provide solid kick plates 10" minimum high 3" maximum from paving on both sides of the gate. Gates shall also have a 5 lb. maximum opening pressure and door maneuvering clearance.

- D. Rolling Gate Hardware:
 1. Provide the Following for Each Gate:

- a. Latches:
 - 1) Provide forked type or plunger-bar type to permit operation from either side of the gate.
 - 2) Provide padlock eye as integral part of latch.
 - 3) Mounting height 30"-44" A.F.F.
- b. Universal Track Bracket: Provide 10-gauge galvanized steel brackets with 3/8" diameter galvanized J-Bolts and nuts.
- c. Rear Wheels:
 - 1) Provide 5" outside diameter, 4" diameter V-Groove, galvanized steel roller bearing wheel.
 - 2) Anchor rear wheels to gate frame with 5/8" diameter bolts.
- d. Double Wheel Carriage: Provide 1" x 2" x 14 ga galvanizing steel tube axle with 3/8" diameter galvanized J-Bolts and 6" diameter rubber tire with galvanized steel roller bearing hub.
- e. Provide locking device and padlock eyes as an integral part of the latch.

2.06 MISCELLANEOUS MATERIALS AND ACCESSORIES

A. Wire Ties:

- 1. For tying fabric to line posts, use 9-gauge galvanized wire ties spaced 12" on center.
- 2. For tying fabric to rails and braces, use 9-gauge galvanized wire ties spaced 24" on center.
- 3. For tying fabric to tension wire, use 11 gauge galvanized hot rings spaced 24" on center.
- 4. The manufacturer's standard wire ties will be acceptable if of equal strength and durability.

B. Concrete: Comply with provisions of Section 033000 for 2500 psi concrete.

PART 3 EXECUTION

3.01 SURFACE CONDITIONS

- A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until unsatisfactory conditions are corrected.

3.02 INSTALLATION

A. General:

- 1. Install posts at a maximum spacing of 8 feet on center.
- 2. Install corner or slope posts where changes in line or grade exceed a 30-degree deflection.

B. Excavating:

- 1. Drill holes for post footing in firm, undisturbed or compacted soil, strictly adhering to the dimension and spacing shown.

2. Spread soil from excavations uniformly adjacent to the fence line, or on adjacent areas of the site if so directed.
3. When soil from rock is encountered near the surface, drill into rock at least 12" for line posts and at least 18" for end, pull gate, and corner posts. Drill hole at least 1" greater diameter than the largest dimension of the post to be placed.
4. If solid rock is below soil overburden, drill to full depth required, except penetration into rock need not exceed minimum depths as specified above.

C. Setting Posts:

1. Remove loose and foreign materials from sides and bottoms of holes, and moisten soil prior to placing concrete.
2. Center and align posts in hole.
3. Place concrete around posts in a continuous pour, and vibrate or tamp for consolidation.
4. Check each post for vertical and top alignment, and hold in position during placement and finishing operations.
5. Trowel tops of footings, and slope or dome to direct water away from posts.
6. Extend footings for gate posts to the underside of bottom hinge.
7. Set keeps, stops, sleeves, and other accessories into concrete as required.
8. Keep exposed concrete surfaces moist for at least seven days after placement, or cure with membrane curing material or other curing method accepted by the Architect.
9. Grout-in those posts which are set into sleeved holes concrete constructions, or rock excavations, using non-shrink portland cement grout or other grouting material accepted by the Architect.

D. Concrete Strength:

1. Allow concrete to attain at least 7% of its minimum 28-day strength before rails, tension wires, and/or fabric is installed.
2. Do not, in any case, install such items in less than seven days after placement of concrete.
3. Do not stretch and tension fabric and wire, and do not hang gates, until concrete has attained its full design strength.

E. Rails and Bracing:

1. Install fence with a top rail and bottom tension wire.
2. Install top rails continuously through post caps or extension arms, bending to radius for curved runs.
3. Provide expansion couplings as recommended by the fencing manufacturer.
4. Provide bracing to the midpoint of the nearest line post or posts at all ends, corner, slope, pull and gate posts.
5. Install tension wires parallel to the line of fabric by weaving through the fabric and tying each post with not less than 6-gauge galvanized wire, or by securing the wire to the fabric.

F. Installing Fabric:

1. Leave approximately 2" between finish grade and bottom salvage.

2. Excavate high points in the ground to clear the bottom of the fence.
 3. Place and compact fill to within 1" of the bottom of the fabric in depressions if no mow curb.
 4. Pull fabric taut and tie to posts, rails, and tension wires.
 5. Install fabric on outward side facing side of fence, and anchor to framework so that the fabric remains in tension after pulling force is removed.
 6. Install stretcher bars by threading through or clamping to fabric on 4" centers, and secure to posts with bands spaced 15" on centers.
- G. Installing Gates:
1. Install gates plumb, level, and secure for full opening without interference.
 2. Install ground-set items in concrete for anchorage in accordance with the fence manufacturer's recommendations as accepted by the Architect.
 3. Lubricate and adjust the hardware for smooth operation.
- H. Miscellaneous:
1. Use U-shaped tie wires, conforming to diameter of pipe to which attached, clasping pipe and fabric firmly with ends twisted at least two full turns.
 2. Bend ends of wire to minimize hazards to persons and clothing.
 3. Fasteners:
 - a. Install nuts from tension band and hardware bolts on side of fence opposite fabric side.
 - b. Peen the ends of bolts to prevent removal of nuts.
 4. Repair coatings damaged in the shop or field erection, using a hot-applied repair compound applied in accordance with its manufacturer's recommendations as accepted by the Architect.

END OF SECTION

SECTION 32 33 00

SITE FURNISHINGS

PART 1 GENERAL

1.01 DESIGN REQUIREMENTS:

- A. Designer shall consult College Facility Director for final selections.
- B. Designer shall review and adapt most current College Master Plan, Facility Master Plan and College Design Standards to establish basis of design.
- C. All furniture shall meet current ADA requirements.
- D. All furniture shall be secured by anchoring, placed inside a secure enclosure, or embedded into the ground/floor to prevent thief.
- E. All furniture shall have a minimum of 3-years full warranty (including discoloring) and 9 years warranty on material.
- F. All benches shall have metal handlebars or divider in the middle with spacing not to exceed 42" to prevent horizontal occupancy.
- G. Apply anti-graffiti coating if requested by the Owner.
- H. Possible material for tables, chair and benches are:
 - 1. Hard Plastic.
 - 2. Concrete.
 - 3. Metal – aluminum preferred.
- I. No wooden products of any kind.
- J. Sample Products: Wausau Tile concrete & metal tables as well as trash receptacles and benches.
 - 1. Concrete tables
 - a. ADA 3-seater options
 - b. 2-seater tables for above grade installation - non-anchoring
 - 2. Bench
- K. No fiber glass umbrellas shall be used.
- L. Fabric umbrellas shall be avoided unless requested by the Campus Facility Director.
- M. All litter receptables and trash enclosures shall be screened with landscaping whenever possible.

END OF SECTION

This page intentionally left blank

SECTION 32 84 00
PLANTING IRRIGATION

PART 1 GENERAL

1.01 DESCRIPTION:

- A. Division 1 applies to this Section. Provide all labor, materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing all operations in connection with furnishing, delivery, and installation of the Work of this Section, complete as shown on the Drawings and/or specified herein.
- B. Work in This Section: Principal items include:
 - 1. Irrigation mains.
 - 2. Laterals.
 - 3. Sprinkler heads.
 - 4. Control valves.
 - 5. Coupler valves, etc.
 - 6. Automatic controllers.
- C. Related Work Not in This Section: Examine all Sections for Work related to Work of this Section; principal items of which are:
 - 1. Operation and Maintenance of Site Improvements – Section 32 01 30
 - 2. Drip Irrigation – Section 32 84 13
 - 3. Planting – Section 32 90 00
- D. Definition: The word Architect as used herein shall refer to the Landscape Architect or the Owner.

1.02 ASSURANCE AND REQUIREMENTS:

- A. Permits and Fees: Contractor shall obtain and pay for all permits and all inspections as required.
- B. Manufacturer's Directions: The manufacturer's directions and detailed drawings shall be followed in all cases where the manufacturers of articles used in this contract furnish directions covering points not shown in the Drawings and Specifications.
- C. Ordinances and Regulations: All local, municipal, and state laws, and rules and regulations governing or relating to any portion of this Work are hereby incorporated into and made a part of these Specifications, and their provisions shall be carried out by the Contractor. Anything contained in these Specifications shall not be construed to conflict with any of the above rules and regulations or requirements of the same. However, when these Specifications and Drawings call for, or describe materials, workmanship, or construction of a better quality, higher standard, or larger size than is required by the above rules and regulations, the provisions of these Specifications and Drawings shall take precedence.

D. Explanation of Drawings:

1. Due to the scale of the Drawings, it is not possible to indicate all offsets, fittings, sleeves, etc. which may be required. The Contractor shall carefully investigate the structural and finished conditions affecting all of his Work and plan his Work accordingly, furnishing such fittings, etc., as may be required to meet such conditions. Drawings are diagrammatic and indicative of the Work to be installed. The Work shall be installed in such a manner as to avoid conflicts between Irrigation systems, planting, and architectural features.
2. All Work called for on the Drawings by notes or details shall be furnished and installed whether or not specifically mentioned in Specifications.
3. Contractor shall not willfully install the irrigation system as shown on the Drawings when it is obvious in the field that obstructions, grade differences or discrepancies in area dimensions exist that might not have been considered in the engineering. Such obstructions or differences should be brought to the attention of the Owner's authorized representative. In the event this notification is not performed, Contractor shall assume full responsibility for any revision necessary.
4. Work of this Section which is allied with the Work of other trades shall be coordinated as necessary.

E. Underwriters Laboratories: Electrical wiring, controls, motors, and devices shall be UL listed and so labeled.

1.03 DESIGN

- A. New irrigation system shall be designed to accommodate future reclaimed water connections to municipal water sources, campus rainwater harvesting, or greywater reuse systems.

1.04 SUBMITTALS:

- A. Refer to the General Conditions for procedures.

B. Materials List:

1. The Contractor shall furnish the articles, equipment, materials, or processes specified by name in Drawings and Specifications. No substitutions will be allowed without prior written acceptance by the Architect.
2. Complete material list shall be submitted prior to performing any Work. Material list shall include manufacturer, model number, and description of all materials and equipment to be used.
3. Equipment or materials installed or furnished without prior approval of the Architect may be rejected and the Contractor requested to remove such materials from the site at his own expense.
4. Approval of any item, alternate, or substitute indicated only that the product or products apparently meet the requirements of the Drawings and Specifications of the basis of the information or samples submitted.
5. Manufacturer's warranties shall not relieve Contractor of his liability under the guarantee. Such warranties shall only supplement the guarantee.
6. If equipment is as specified, no manufacturer descriptive catalogs are necessary in submittal.

C. Record Drawings:

1. Contractor shall provide and keep up to date and complete "as-built" record set of blue-line prints or CADD files which shall be corrected daily and shown every change from the original Drawings and Specifications and exact "as-built" locations, sizes, and kinds of equipment. Prints for these purposes may be obtained from the Architect at cost. This set of Drawings shall be kept on the site and shall be used only as a record set.
2. These Drawings shall also serve as Work progress sheets and shall be the basis for measurement and payment for Work completed. These Drawings shall be available at all times for site reviews and shall be kept in a location designated by the Architect. Should the record blue-line or CADD file as-built progress sheets not be available for review or not up to date at the time of any site reviews, it will be assumed that no Work has been completed and the Contractor will be assessed the cost of that site visit at the current billing rate of the Architect. No other inspections shall take place prior to payment of that assessment.
3. The Contractor shall make neat and legible notations on the as-built progress sheets daily as Work proceeds, showing the Work as actually installed. For example, should a piece of equipment be installed in a location that does not match the plan, the Contractor must indicate that equipment has been relocated in a graphic manner so as to match the original symbols as indicated in the irrigation legend. The relocated equipment and dimensions will then be transferred to the original as built plan at the proper time.
4. Before the date of the final site review, Contractor shall create a transparency or CADD drawing showing all information from the as-built prints. The dimensions shall be made so as to be easily readable even on the final controller chart (See section C below).
5. The Contractor shall dimension from two permanent points of reference, building corners, sidewalk, or road intersections, etc., the location of the following items:
 - a. Connection to existing water lines.
 - b. Connection to existing electrical power.
 - c. Gate valves.
 - d. Routing of sprinkler pressure lines. (Dimension max. 100' along routing.)
 - e. Sprinkler control valves.
 - f. Routing of control wiring.
 - g. Quick coupling valves.
 - h. Other related equipment as directed by the Architect.
6. On or before the date of the final site review, the Contractor shall deliver the corrected and completed transparencies or CADD drawings to the Architect. Delivery will not relieve the Contractor of the responsibility of furnishing required information that may be omitted from the Drawings.

D. Controller Charts:

1. Record Drawings shall be approved by the Architect before controller charts are prepared.
2. Provide one controller chart for each controller supplied.
3. The chart shall show the area controlled by the automatic controller and shall be the maximum size which the controller door will allow.
4. The chart is to be a reduced drawing of the actual as-built system, of a maximum size that will fit inside controller housing, double sided if required for readability.

5. The chart shall be a blackline print and a different color shall be used to indicate area of coverage for each station, using pastel or transparent colors.
6. When completed and approved, the chart shall be hermetically sealed between two pieces of plastic, each piece being a minimum 20 mils.
7. These charts shall be completed and approved prior to final acceptance of the irrigation system.

E. Operation and Maintenance Manuals:

1. Prepare and deliver to the Architect within 10 calendar days prior to completion of construction, two hard cover binders with three rings containing the following information:
 - a. Index sheets stating Contractor's address and telephone number, list of equipment with name and addresses of local manufacturer's representative.
 - b. Catalog and part sheets on all materials and equipment installed under this Contract.
 - c. Guarantee statement.
 - d. Complete operating and maintenance instruction on all major equipment.
2. In addition to the above-mentioned maintenance manuals, provide the Owner's maintenance personnel with instructions for major equipment, and show evidence in writing to the Architect at the conclusion of the project that this service has been rendered.

F. Equipment to Be Furnished:

1. At time of final acceptance, Irrigation Contractor shall deliver to the Owner:
 - a. Two keys for opening valve boxes.
 - b. Two keys for each automatic controller.
 - c. Hose and Swivel Assemblies: Supply one (1) set of hose and swivel assemblies for every five (5) quick coupling valves installed.
 - d. Two special wrenches suitable for operating each type of shut-off valve installed.
 - e. Operating instructions and parts lists, as printed by each manufacturer of each type of equipment installed. Refer to "Material" section of the specifications and legend on the drawings.
 - f. List of equipment with names and addresses of local manufacturer representatives.
 - g. "As-built" drawings and controller charts.
2. The above-mentioned equipment shall be turned over to the Owner at the conclusion of the project. Before final acceptance can occur, evidence that the Owner has received material must be shown to the Architect.

1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Contractor is cautioned to exercise care in handling, loading, unloading, and storing of PVC pipe and fittings. All PVC pipe shall be transported in a vehicle which allows the length of pipe to lie flat so as not to subject it to undue bending or concentrated external load at any point. Any section of pipe that has been dented or damaged will be.

1.06 GUARANTEE:

- A. The one (1) year guarantee for the sprinkler irrigation system shall be made in accordance with the General Conditions. A copy of the guarantee form shall be included in the operations and maintenance manual.

PART 2 PRODUCTS

2.01 MATERIALS:

- A. Materials for irrigation installation shall be new materials and as specified unless specifically approved in writing by the Owner's representative as equal products. They shall conform to the provisions of the Drawings and Specifications.
1. All materials shall be as noted on irrigation legend and details, unless otherwise noted.
 2. All materials shall be reviewed and approved by Owner's representative.
 3. All materials shall be brass where applicable.
- B. Electrical:
1. High Voltage: All high voltage electrical service required for automatic controller and other equipment noted on Drawing for irrigation system will be provided by others. Irrigation Contractor shall be responsible for final connection.
 2. Low Voltage: Connections between controller and remote control valves shall be made with direct burial AWG-UF, 600 volt wire, insulation thickness 3/64", utilizing low density high molecular weight polyethylene insulation. Splices, where permitted, shall be waterproofed using splices or fusible heat shrinking tubing and housed in a box. Boxes for other irrigation may be utilized for this purpose. Wire sizing shall be a minimum of #14 "UF. 600 volt underground wiring. Common wire is to be white in color, and all others a different color.
- C. Piping:
1. PVC (Solvent Weld):
 - a. Pipe: Manufactured from virgin polyvinyl chloride compound in accordance with ASTM D 1785 or ASTM D 2241, cell classification 12454B, and hydrostatic design stress rating not less than 2,000 P.S.I.
 - b. Fittings (Solvent weld or thread) Standard weight, Schedule 40, side gated, injection molded PVC complying with ASTM D 2466, cell classification 12454B, including threads when required.
 - c. PVC nipples shall be Schedule 80 with machine threads.
 - d. All PVC pipe must be labeled with the following markings:
 - 1) Manufacturer's name.
 - 2) Nominal pipe size.
 - 3) Schedule or class.
 - 4) Pressure rating in A.S.T. (Not required on drip tubing).
 - 5) NSF National Sanitation Foundation) approval (Not required on drip tubing).
 - 6) Date of extrusion.
 - e. Solvent cement and primer for PVC solvent-weld pipe and fittings shall be of type and installation method prescribed by the manufacturer.

2. Galvanized Pipe and Fittings:
 - a. Pipe shall be galvanized steel, American National Standard Institute (ANSI), Schedule 40 galvanized, mild steel screwed pipe.
 - b. Fittings: Screwed beaded malleable iron, or 125 pound cast iron, flanged.
 - 1) Schedule 80 Socked Weld.
 - 2) Schedule 40 PVC.
 - 3) Marlex Schedule 80 Socked Weld Fittings.
 - c. Unions (2" and Smaller): Ground joint pattern.
 - d. Unions (Larger Than 2"): Flanged type, packed with 1/16" thick fiber gaskets.
 3. Copper Pipe and Copper Fittings: Pipe and fittings shall be provided wherever local codes require its use, as for example under building slabs and attached to parking structure roofs.
- D. Protective Enclosures: backflow devices and other above-ground devices shall be equipped with a vandal resistant protective enclosure, min. 1 ¼" diameter steel tube frame, min. #13 expanded metal panels, single swing with gated end, lockable, powder-coated per owner's color preference.
- E. Controller: shall be a smart controller with rain sensor and hard-wired to Campus central control as shown in legend and plans.
1. Calsene-Cs3000 or approved equal.
- F. Controller Enclosure:
1. StrongBox (VIT Products), with QuickPad, Controller Subassembly, and Rain Switch Enclosure options.
 2. Toro Sentinel Enclosure.
- G. Grounding Rod:
1. Paige 182007 with Paige 1820037P Connection.
- H. Control Wire:
1. Common:
 - a. Paige P7001D 12 Awg White.
 2. Hot:
 - a. Paige P7001D 14 Awg Colored.
- I. Waterproof Wire Connector.
1. Spears Ds-500 Dri-Splice.
- J. Remote Controller:
1. Toro TMR-1 Remote Control System or approved equal.
- K. Remote Site Management System:
1. Toro TriComm System or approved equal.
- L. Flow Sensor:

1. Toro TFS Series.
 2. Rain Bird FS Series.
 3. Calsense Flow Sensor (Brass).
- M. Rain Sensor:
1. Toro TRS Wired Rainsensor.
 2. Hunter Rain-Clik Sensor.
- N. Booster Pump:
1. Barrett Irriboost with variable speed drive and stainless-steel enclosure.
- O. Basket Strainer:
1. Yardney SBX-T Series.
- P. Basket Strainer Enclosure:
1. StrongBox (VIT Products) SBBC-XXSS with QuickPad option.
- Q. Fertilizer Injector:
1. Ez-Flo Ez Series.
- R. Master Valve:
1. Toro 220 (Brass).
 2. Toro P-2205 (Plastic).
- S. Pressure Reducing Valve:
1. Zurn Wilkins 500XL.
- T. Electric Control Valves: Each control zone shall have its own manual shut off valve.
1. Hunter IBV (Brass).
 2. Superior 950 (Brass).
 3. Toro 220 (Brass).
 4. Toro P-220S (Plastic).
 5. Rain Bird P-220 (Brass).
- U. Boxes For Remote Control Valves: boxes shall be rectangular concrete boxes with locking covers.
- V. Quick Coupling Valves: Valves shall be as shown in legend and details.
1. Rain Bird 44NP.
 2. Toro 474-44.
- W. Hose and Swivel Assemblies: Supply 1 set of hose and swivel assemblies for every 5 quick coupling valves.
- X. Air Release Valve:

1. Cla-Val #33-A Series.
- Y. Ball Valves:
1. 2" and smaller.
 - a. Nibco T-585-70 Series.
- Z. Gate Valves:
1. 2" and smaller.
 - a. Nibco T-113 Series.
 2. 2-1/2" and larger.
 - a. Nibco F-619 Series.
 - b. Mueller Resilient Wedge.
- AA. Gate Valve Boxes: Boxes shall be rectangular concrete boxes with locking covers, manufactured by Brooks or Carson or equal, and shall be of size and type as called out on the Drawings and in the details.
- BB. Spray Sprinkler Heads: Heads shall be of the adjustable type, sizes, and designations as shown on Drawings, or equal, and shall be sized, selected, and placed in a manner to achieve complete water coverage of areas to be irrigated.
1. Hunter
 - a. I-20 Series.
 - b. I-40 Series.
 - c. 540 Series.
 2. Rain Bird
 - a. 1800 Series.
 - b. 5000 Series.
 - c. Falcon Series (Stainless-Steel Body).
- CC. Rotor Sprinkler Heads:
1. Toro
 - a. TR70P Series.
 - b. T5 Rapid Set Series Rotor.
 - c. 570Z-Prx-Com-E with precision rotating nozzle.
 2. Rain Bird
 - a. 5000 Series.
 - b. Falcon Series (Stainless-Steel Body).
 3. Hunter
 - a. I-20 Series.
 - b. I-40 Series.
- DD. Artificial Turf Cooling System Heads:

1. Toro TS90TP Series, or approved equal.

EE. Tree Root Watering System:

Rain Bird Root Watering System (RWS).

PART 3 EXECUTION

3.01 WORK PROCEDURES:

- A. Contractor shall follow local building codes, customary practices and as follows:
- B. General: The Contractor shall connect to existing water supply as shown on the Drawings and as necessary to carry out the intent of the Drawings and Specifications. Check location of lines, valves, other underground utilities, etc., and receive approval of Owner's representative before any installation. The Contractor shall check and verify existing water pressure and available gallonage before starting Work and shall inform the Architect if not adequate as designed.
- C. Trenches, Subgrades, and Backfill: Excavate trenches, prepare subgrades and backfill true to line and grade with sufficient room for pipe fittings, testing, and inspection operations. Cut bottom of trench so that pipe barrel rests uniformly on trench bottom. Do not backfill until pipe system has been subjected to a hydrostatic test as specified.
- D. Depth: Depth of coverage for irrigation piping shall be as follows:
 1. Main lines - 18 inches minimum depth.
 2. Lateral lines - 12 inches minimum depth.
 3. Where subslab conflicts, install as deep as possible.
 4. 24 inch depth for all lines under driveways.
- E. Backfill: Backfill trenches after acceptance of Work with suitable approved material, tamping soil around pipe, and thoroughly water settling all trench fills. Trenches under walks and roads shall be backfilled in accordance with General and Special Conditions of the Specifications. Wherever subsidence of trenches occurs, the Contractor shall be responsible for restoring all to final grade.
- F. Control Valves: Locate control valves near walks or to accessible areas; control valves shall never be more than 12" from walks or nearest access as indicated on Drawings and in a manner to make them accessible to manual operations without interference of water spray from heads.
- G. Quick Coupling Valves: Install all quick coupling valves as indicated on Drawings and to conform to the full intent and meaning of the Drawings and the Specifications.
- H. Pipe: All pipe shall be laid true and accurate to grade with full length of pipe section lying solidly on a firm base. If grade or joint of pipe is disturbed after laying, it shall be taken up and relaid.
 1. Clean interior of pipe thoroughly and remove all dirt or foreign matter before lowering pipe into trench and keep clean during operations by plugs or other approved method. The ends of all threaded pipe shall be reamed out full size and with a long taper reamer so as to be partially bell-mouthed and perfectly smooth. All offsets shall be made with fittings. All water lines shall be thoroughly flushed out before the heads are installed.

2. Threads on pipe shall be cut with sharp clean dies to conform to American Standards Association Specifications and so that not more than 2 threads are left exposed on the pipe.
 3. Joints in all screwed metallic and metallic to plastic piping shall be made by applying specified pipe joint compound tape to the threaded end with one-half inch lapping before screwing joints together.
 4. Do not lay pipe in water or mud. Keep ends of pipe securely closed when work is not in operation to prevent water or other matter from entering the lines.
 5. Long runs of PVC pipe shall be slightly snaked in the trench to allow for contraction.
 6. Replace without cost to the Owner any pipe that is found to be defective.
 7. Provide unions and fittings as necessary to make all connections to existing lines and to complete Work as intended on the Drawings.
 8. Install dielectric couplings and flanges as required at the junction of pipes or fittings made of dissimilar metal.
 9. Risers to sprinkler heads shall be Schedule 80 PVC, or as shown in the details, and offset from laterals as indicated on the Drawings.
 10. All sprinkler heads next to walks, paths, parking areas, and any areas where people normally walk shall be the pop-up type. No fixed sprinkler risers shall be installed next to such walks, paths, or parking areas.
 11. Solvent weld joints will be made as follows:
 - a. Good square cuts, clean and free of debris and shavings and moisture.
 - b. Main Line Only: Apply p-70 Weldon or equal. Finish make up of joint using Weldon 711 or equal. Hot glue will not be permitted.
- I. Tests: Test all sprinkler mains after pipe is laid and joint completed by submitting to a pressure test of static pressure in the presence of the Owner's representative. Do not backfill any trench until the Owner's representative has approved the test. Repair any leaks until lines meet test requirements and the Owner's representative's approval. All laterals shall be tested under main pressure for leaks; any leaks shall be repaired. All tests except for the laterals shall be for the duration of 4 hours with a maximum drop of 4 psi allowed.
- J. Flushing of System:
1. After all new sprinkler pipe lines and risers are in place and connected, all necessary diversion Work has been completed, and prior to installation of sprinkler heads, the control valves shall be opened and full head of water used to flush out the system.
 2. Sprinkler heads shall be installed only after flushing of the system has been accomplished to the complete satisfaction of the Architect.
- K. Sprinkler Heads: Install sprinkler heads as directed. Where they adjoin the edges of walks, set turf pop-up heads in 2" from edge and shrub and rotor heads 6" in from edge. Special conditions for installing heads shall be as shown on the Drawings.
1. Space the sprinkler heads as shown on Drawings or as directed and as necessary to gain full water coverage of the sprinkler areas. Adjust heads as necessary, changing sizes and nozzles until Work is approved.
 2. Add sprinkler heads as needed or as directed for full water coverage of all areas without extra cost to the Owner.
 3. Make final adjustments of all sprinkler heads after soil has settled.

- L. Finish Grade: Bring all areas excavated for the installation to a neat and true finish grade to match adjoining areas.
- M. Completion: Leave entire installation in complete working order, free from any and all defects in material, workmanship, or finish, regardless of any discrepancies and/or omissions in Drawings and Specifications.

3.02 TEMPORARY REPAIRS:

- A. Owner reserves the right to make temporary repairs as necessary to keep the sprinkler system equipment in operating condition. The exercise of this right by the Owner shall not relieve the Contractor of his responsibility under the terms of the guarantee as specified herein.

3.03 MAINTENANCE:

- A. The entire sprinkler irrigation system shall be under fully automatic operation for a period of seven days prior to any planting.

3.04 CLEANUP:

- A. Clean-up shall be performed as each portion of Work progresses. Refuse and excess dirt shall be removed from the site, all walks and paving shall be broomed or washed down, and any damage sustained to the Work of others shall be repaired and Work returned to its original condition.

3.05 PROJECT RECORD (AS-BUILT) DRAWINGS

- A. Document field changes from original design and construction documents. Maintain on-site and separate from original construction documents, one complete set of documents labeled "Project Field Documents". Keep documents current. Do not permanently cover work until accurate "as-built" information is recorded.
- B. Record pipe network alterations daily. Record work that is installed differently than shown on construction documents. Record accurate reference dimensions, measured from at least two permanent reference points of each control zone kit assembly, each zone boundary, each air relief valve assembly, each flush point assembly, and other irrigation components enclosed within valve box.
- C. Obtain from General Contractor CADD files prior to construction completion. Duplicate information contained on "Project Field Documents" maintained on-site using technical drafting pen or AutoCAD. Label each sheet "Record Drawing".
- D. Provide "Record Drawings" to Owner's Representative. Completion of Record Drawings is required prior to final construction review at completion of irrigation system installation.

END OF SECTION

This page intentionally left blank

SECTION 32 84 13

DRIP IRRIGATION

PART 1 GENERAL

1.01 SCOPE

- A. This section specification information is for low volume dripline irrigation products including Control Zone Kits, Dripline, compatible fittings, and Low Volume Emission Devices.
- B. Provide labor, materials, supplies, equipment, tools, and transportation, and perform all operations in connection with and reasonably incidental to the complete installation of the drip irrigation system, and guarantee/warranty as shown on the drawings, the installation details, and as specified herein.

1.02 RELATED WORK

- A. Division 00 – Procurement and Contracting Requirements
- B. Division 01 – General Requirements
- C. Division 22 – Plumbing
- D. Division 26 – Electrical
- E. Division 31 – Earthwork
- F. Division 32 – Exterior Improvements
- G. Division 33 - Utilities

1.03 SUBMITTALS

- A. Materials List: Include dripline and low-volume irrigation components, control zone components, shop drawings and other components shown on drawings and installation details or described herein. Quantities of materials need not be included.
- B. Manufacturers' Data: Submit manufacturers' catalog cuts, specifications, and operating instructions for equipment shown on materials list.
- C. Shop Drawings: Submit shop drawings called for in installation details. Show products required for proper installation, their relative locations, and critical dimensions. Note modifications to installation details as part of shop drawing documentation.

1.04 FLUSHING AND TESTING

- A. Schedule testing with Owner's Representative a minimum of three (3) days in advance of testing.
- B. Provide clean, clear water, pumps, labor, fittings, and equipment necessary to conduct line flushing and testing procedures.

- C. Recommended Dripline and Emitter Lateral Flushing Procedures.
 - 1. Flush the system every two weeks for the first six (6) weeks and check the water that is flushed out for cleanliness. Establish a regular system flushing schedule for the future based on results from the initial six-week flushing schedule.
 - 2. Flush the system completely after any repairs are made and monitor system operation closely under regular system flushing schedule.
 - 3. Check the pressure at the supply and flush headers on a regular basis and compare with the pressure readings taken after installation.
- D. Recommended Dripline and Emitter Lateral Leakage Testing Procedures.
 - 1. Subject installed dripline tubing and emitter lateral piping to water pressure equal to specified operating pressure for ten (10) minutes. Test with control zone components and dripline flush valve components installed.
 - 2. Partially backfill buried pipe and tubing to prevent movement under pressure. Expose couplings, fittings, and valve components.
 - 3. Visually inspect valve assemblies and fittings for leakage and replace defective pipe, fitting, joint, valve, or appurtenance. Repeat test until test segment is free from leaks. Cement or caulking to seal leaks is prohibited.
- E. Recommended Dripline and Emitter Lateral Operational Testing Procedures.
 - 1. Activate each dripline and emitter lateral control zone valve in sequence from controller. Provide either one additional person with radio or use handheld remote to activate remote control valves from controller. Manually activating remote control valve using manual bleed mechanism at remote control valve is not an acceptable method of activation. Owner's Representative will visually observe operation, water application patterns, and leakage.
 - 2. Replace or adjust defective valve, fitting, dripline segment, emitter lateral segment, or appurtenance to correct operational and coverage uniformity deficiencies.
 - 3. Repeat test(s) until each dripline or emitter lateral test segment passes testing procedures. Repeat tests, replace components, and correct deficiencies at no additional cost to Owner and/or Owner's Representative.

1.05 GUARANTEE/WARRANTY AND REPLACEMENT

- A. The purpose of guarantee/warranty is to ensure that Owner receives irrigation materials of prime quality, installed and maintained in thorough and careful manner.
- B. Contractor is responsible for providing guarantee/warranty of irrigation materials, equipment, and workmanship against defects for period of one (1) year from formal written acceptance by Owner's Representative. Fill and repair depressions. Restore landscape, utilities, structures, and site features damaged by settlement of irrigation trenches or excavations. Repair damage to premises caused by defective items. Make repairs within seven (7) days of notification from Owner's Representative.
- C. Replace damaged items with new and identical materials, using methods specified in contract documents or applicable codes. Make replacements at no additional cost to contract price.
- D. Guarantee/warranty applies to originally installed materials and equipment, and replacements made during guarantee/warranty period.

PART 2 MATERIALS

2.01 ACCEPTABLE MANUFACTURERS

- A. For purposes of specification, Rain Bird is shown as the specified manufacturer. Substitutions are allowed on an equivalent basis.

2.02 LATERAL PIPE AND FITTINGS

- A. Use rigid, unplasticized polyvinyl chloride (PVC) 1120, 1220 National Sanitation Foundation (NSF) approved pipe, extruded from material meeting requirements of Cell Classification 12454-A or 12454-B, ASTM Standard D1784, with integral belled end suitable for solvent welding.
- B. Use Schedule 40 conforming to dimensions and tolerances established by ASTM Standard D1785; UV radiation resistant.
- C. Use Schedule 40, Type 1, PVC solvent weld fittings conforming to ASTM Standards D2466 and D1784 for PVC pipe. Use primer approved by pipe manufacturer. Solvent cement to conform to ASTM Standard D2564, of type approved by pipe manufacturer.
- D. Use PVC Schedule 80 nipples and PVC Schedule 40 or 80 threaded fittings for threaded pipe connections as specified on the drawings and details.
- E. Threaded joint sealant: Use non-hardening, nontoxic pipe thread sealant formulated for use on threaded connections and approved by pipe fitting or valve manufacturer.

2.03 DRIP IRRIGATION COMPONENTS

A. Control Zone Kits

1. General Information

- a. Control zone kit assemblies for dripline irrigation zones must include control valve, filtration, and pressure regulation components sized to meet the hydraulic demands and flow requirements of the zones that they service.

2. Low Flow Control Zone Kit for dripline zones with flows from 0.2 to 5.0 GPM (0.8 to 18.9 lpm), shall include low flow valve (LFV) and pressure regulating filter (PRF).

a. Low Flow Valve (LFV) component specifications shall include:

- 1) Valve body and bonnet constructed of high impact, weather-resistant plastic, stainless steel and other chemical/UV resistant materials.
- 2) Diaphragm with a double-knife seal, constructed of durable Buna-N rubber with a clog-resistant metering orifice.
- 3) Energy-efficient, low-power encapsulated solenoid with captured plunger and 90 mesh (200 micron) solenoid filter.
- 4) External bleed for manual system flushing during start-up, internal bleed for manual zone activation during maintenance operations.
- 5) Inlet pressure rating: 20 to 120 PSI (1,4 to 8,3 bar)
- 6) Female threaded inlet and outlet connections

- b. Anti-siphon valve configuration shall incorporate atmospheric vacuum breaker with I.A.P.M.O and A.S.S.E. listing approval. Pressure Regulating Filter (PRF) shall combine filtration and pressure regulation in one integrated unit for protection of downstream components of drip irrigation system. PRF component specifications include:
 - 1) Compact “Y” filter body and cap configuration constructed of glass-filled, UV-resistant polypropylene, with 120 PSI (8,3 bar) operating pressure rating.
 - 2) Standard 200 mesh (75 micron) filter screen constructed of durable stainless steel attached to a polypropylene frame. Screen is serviceable for cleaning purposes by unscrewing cap from filter body and removing filter element.
 - 3) Normally-open pressure regulating device with preset outlet pressure of approximately 30 PSI (2,1 bar). Pressure regulating device allows full flow with minimal pressure loss unless inlet pressure is greater than preset level. As inlet pressure increases above preset level, internal spring compresses to reduce downstream pressure.
 - 4) Male threaded 3/4” (19 mm) inlet and outlet connections.
- 3. Medium Flow Control Zone Kit for dripline zones with flows from 3.0 to 15.0 GPM (11.4 to 56.8 lpm).
 - a. Including \ DV or ASVF valve and pressure regulating filter (PRF).
 - b. DV Valve component specifications must include:
 - 1) Valve body and bonnet constructed of high impact, weather-resistant plastic, stainless steel and other chemical/UV resistant materials.
 - 2) Energy-efficient, low-power encapsulated solenoid with captured plunger and 90 mesh (200 micron) solenoid filter.
 - 3) External bleed for manual system flushing during start-up, internal bleed for manual zone activation during maintenance operations.
 - 4) Inlet pressure rating: 20 to 120 PSI (1.4 to 8.3 bar)
 - 5) Female threaded inlet and outlet connections
 - 6) Anti-siphon valve configuration \ includes listed features and incorporates atmospheric vacuum breaker with I.A.P.M.O and A.S.S.E. listing approval.
 - c. Pressure Regulating Filter (PRF) combines filtration and pressure regulation in one integrated unit for protection of downstream components of drip irrigation system. PRF component specifications include:
 - 1) Compact “Y” filter body and cap configuration constructed of glass-filled, UV-resistant polypropylene, with 120 PSI (8,3 bar) operating pressure rating. \
 - 2) Standard 200 mesh (75 micron) filter screen constructed of durable stainless steel attached to a polypropylene frame. Screen is serviceable for cleaning purposes by unscrewing cap from filter body and removing filter element.
 - 3) Normally-open pressure regulating device with preset outlet pressure of approximately 40 PSI (2,8 bar). Pressure regulating device allows full flow with minimal pressure loss unless inlet pressure is greater than preset level. As inlet pressure increases above preset level, internal spring compresses to reduce downstream pressure.

- 4) Male threaded 1" (25 mm) inlet and outlet connections.
4. Medium Flow Commercial Control Zone Kits for dripline zones with flows from 3.0 to 20.0 GPM (11.4 to 75.7 lpm), including PESB valve with PVC ball valve and pressure regulating quick-check basket filter and PGA valve with pressure regulating basket filter.
 - a. PESB valve assembly component specifications must include:
 - 1) 1" (25 mm) PVC full-port ball valve with female threaded inlet and outlet connections
 - 2) PESB valve body and bonnet constructed of durable glass-filled nylon, stainless steel and other chemical/UV resistant materials
 - 3) Diaphragm constructed of a durable Buna-N rubber material reinforced with nylon.
 - 4) One-piece solenoid with captured plunger and 90 mesh (200 micron) solenoid filter.
 - 5) External bleed for manual system flushing during start-up, internal bleed for manual zone activation during maintenance operations.
 - 6) Inlet pressure rating: 20 to 200 PSI (1,4 to 13,8 bar)
 - 7) Female threaded inlet and outlet connections
 - b. PGA valve assembly component specifications must include:
 - 1) PGA valve body and bonnet constructed of durable glass-filled nylon, stainless steel and other chemical/UV resistant materials.
 - 2) Diaphragm constructed of a durable Buna-N rubber material reinforced with nylon.
 - 3) One-piece solenoid with captured plunger and 90 mesh (200 micron) solenoid filter.
 - 4) External bleed for manual system flushing during start-up, internal bleed for manual zone activation during maintenance operations.
 - 5) Inlet pressure rating: 15 to 150 PSI (1,4 to 13,8 bar)
 - 6) Female threaded inlet and outlet connections
 - c. Pressure Regulating Quick Check Basket Filter combines filtration and pressure regulation in one integrated unit for protection of downstream components of drip irrigation system. Pressure regulating basket filter component specifications must include:
 - 1) Basket style body and jar-top cap constructed of heavy-duty glass-filled, UV-resistant polypropylene, with 150 PSI (10,3 bar) operating pressure rating.
 - 2) Indicator incorporated into filter cap that changes color from green to red during operation when the filter element requires cleaning.
 - 3) Standard 200 mesh (75 micron) filter screen constructed of stainless steel attached to propylene frame. Screen is serviceable for cleaning purposes by unscrewing cap from filter body and removing filter element.

- 4) Normally-open in-line pressure regulating device, constructed of durable, UV resistant non-corrosive material able to accommodate an inlet pressure rating of not less than 150 PSI (10,3 bar), with preset outlet pressure of approximately 40 PSI (2,8 bar). Pressure regulating device allows full flow with minimal pressure loss unless inlet pressure is greater than preset level. As inlet pressure increases above preset level, internal spring compresses to reduce downstream pressure.
 - 5) Male threaded 1" (25 mm) inlet and outlet connections.
5. Control Zone Kit for dripline zones with flows from 15.0 to 40.0 GPM (56,8 to 151,4 lpm), including PESB valve and two parallel pressure regulating quick-check basket filters.
- a. PESB valve assembly component specifications must include:
 - 1) PESB valve body and bonnet constructed of durable glass-filled nylon, stainless steel and other chemical/UV resistant materials
 - 2) Diaphragm constructed of a durable rubber material reinforced with nylon
 - 3) One-piece solenoid with captured plunger and 90 mesh (200 micron) solenoid filter
 - 4) External bleed for manual system flushing during start-up, internal bleed for manual zone activation during maintenance operations.
 - 5) Inlet pressure rating: 20 to 200 PSI (1,4 to 13,8 bar)
 - 6) Female threaded inlet and outlet connections
 - b. Pressure Regulating Quick Check Basket Filter combines filtration and pressure regulation in one integrated unit for protection of downstream components of drip irrigation system. Pressure regulating basket filter component specifications must include:
 - 1) Basket style body and jar-top cap constructed of heavy-duty glass-filled, UV-resistant polypropylene, with 150 PSI (10,3 bar) operating pressure rating.
 - 2) Indicator incorporated into filter cap that changes color from green to red during operation when the filter element requires cleaning.
 - 3) Standard 200 mesh (75 micron) filter screen constructed of stainless steel attached to propylene frame. Screen is serviceable for cleaning purposes by unscrewing cap from filter body and removing filter element.
 - 4) Normally-open in-line pressure regulating device, constructed of durable, UV resistant non-corrosive material able to accommodate an inlet pressure rating of not less than 150 PSI (10,3 bar), with preset outlet pressure of approximately 40 PSI (2,8 bar). Pressure regulating device allows full flow with minimal pressure loss unless inlet pressure is greater than preset level. As inlet pressure increases above preset level, internal spring compresses to reduce downstream pressure.
 - 5) Male threaded 1" (25 mm) inlet and outlet connections.

B. Dripline Components

1. General Information
 - a. Provide flexible dual-layered pressure-compensating inline Dripline.
 - b. Provide insert or compression fittings that are compatible with inline emitter tubing as indicated on construction drawings.
2. Rain Bird XFD On-Surface Dripline with pressure-compensating inline emitters.:

- a. Available Rain Bird XFD On-Surface Dripline model numbers for POTABLE water systems; a dual-layered, brown colored dripline tubing with emitter flow rates and spacing as shown:
 - 1) Rain Bird XFD-06-12; 0.6 GPH (2,3 lph) emitters spaced 12" (30,5 cm) on-center.
 - 2) Rain Bird XFD-06-18; 0.6 GPH (2,3 lph) emitters spaced 18" (45,7 cm) on-center.
 - 3) Rain Bird XFD-09-12; 0.9 GPH (3,4 lph) emitters spaced 12" (30,5 cm) on-center.
 - 4) Rain Bird XFD-09-18; 0.9 GPH (3,4 lph) emitters spaced 18" (45,7 cm) on-center.
 - b. Available Rain Bird XFDP On-Surface Dripline model numbers for NON-POTABLE water systems; a dual-layered, purple colored dripline tubing with emitter flow rates and spacing as shown:
 - 1) Rain Bird XFDP-06-12; 0.6 GPH (2,3 lph) emitters spaced 12" (30,5 cm) on-center.
 - 2) Rain Bird XFDP-06-18; 0.6 GPH (2,3 lph) emitters spaced 18" (45,7 cm) on-center.
 - 3) Rain Bird XFDP-09-12; 0.9 GPH (3,4 lph) emitters spaced 12" (30,5 cm) on-center.
 - 4) Rain Bird XFDP-09-18; 0.9 GPH (3,4 lph) emitters spaced 18" (45,7 cm) on-center.
 - c. Required dripline tubing material and performance specifications include:
 - 1) XFD tubing; dual-layered, brown in color, conforming to an outside diameter (O.D.) of 0.634 inches (16 mm) and an inside diameter (I.D.) of 0.536 inches (13,6 mm) and wall thickness of 0.049 inches (1,2 mm)
 - 2) XFDP tubing; dual-layered, purple in color, conforming to an outside diameter (O.D.) of 0.634 inches (16 mm) and an inside diameter (I.D.) of 0.536 inches (13,6 mm) and wall thickness of 0.049 inches (1,2 mm)
 - 3) Factory installed, pressure-compensating, inline emitters welded to the inner circumference of the polyethylene tubing at spacing specified by model number.
 - 4) Inline emitters designed to pressure-compensate by lengthening the emitter's turbulent flow path (Rain Bird patent pending)
 - 5) Consistent flow rate from each installed inline emitter when emitter inlet pressure is supplied between recommended operating range of 8.5 to 60 PSI (0,7 to 4,1 bar)
 - 6) Required filtration for XF Series dripline tubing and emitters is 120 mesh (125 micron)
3. Rain Bird XFCV Dripline with Heavy-Duty Check Valve and pressure-compensating inline emitters.
 - a. Available Rain Bird XFCV Dripline with Heavy Duty-Check Valve model numbers for POTABLE water systems; brown colored dripline tubing with emitter flow rates and spacing as shown:
 - 1) Rain Bird XFCV-06-12; 0.6 GPH (2,3 lph) emitters spaced 12" (30,5 cm) on-center.

- 2) Rain Bird XFCV-06-18; 0.6 GPH (2,3 lph) emitters spaced 18" (45,7 cm) on-center.
 - 3) Rain Bird XFCV-09-12; 0.9 GPH (3,4 lph) emitters spaced 12" (30,5 cm) on-center.
 - 4) Rain Bird XFCV-09-18; 0.9 GPH (3,4 lph) emitters spaced 18" (45,7 cm) on-center.
- b. Required dripline tubing material and performance specifications include:
- 1) XFCV tubing; dual-layered, brown in color, conforming to an outside diameter (O.D.) of 0.634 inches (16 mm) and an inside diameter (I.D.) of 0.536 inches (13,6 mm) and wall thickness of 0.049 inches (1,2 mm)
 - 2) Inline emitter that includes a 3.5psi check-valve to facilitate 8ft of holdback.
 - 3) Factory installed, pressure-compensating, inline emitters welded to the inner circumference of the polyethylene tubing at spacing specified by model number.
 - 4) Inline emitters designed to pressure-compensate by lengthening the emitter's turbulent flow path (Rain Bird patent pending)
 - 5) Consistent flow rate from each installed inline emitter when emitter inlet pressure is supplied between recommended operating range of 8.5 to 60 PSI (0,7 to 4,1 bar)
 - 6) Required filtration for XF Series dripline tubing and emitters is 120 mesh (125 micron)
4. Rain Bird XFS Sub-Surface Copper-Colored Dripline with Copper Shield™ Technology and pressure-compensating inline emitters.
- a. Available Rain Bird XFS Sub-Surface Copper-Colored Dripline model numbers for POTABLE water systems; dual layered, copper colored dripline tubing with emitter flow rates and spacing as shown:
- 1) Rain Bird XFS-06-12; 0.6 GPH (2,3 lph) emitters spaced 12" (30,5 cm) on-center.
 - 2) Rain Bird XFS-06-18; 0.6 GPH (2,3 lph) emitters spaced 18" (45,7 cm) on-center.
 - 3) Rain Bird XFS-09-12; 0.9 GPH (3,4 lph) emitters spaced 12" (30,5 cm) on-center.
 - 4) Rain Bird XFS-09-18; 0.9 GPH (3,4 lph) emitters spaced 18" (45,7 cm) on-center.
- b. Available Rain Bird XFSP Sub-Surface Copper-Colored Dripline model numbers for NON-POTABLE water systems; dual layered purple colored dripline tubing with emitter flow rates and spacing as shown:
- 1) Rain Bird XFSP-06-12; 0.6 GPH (2,3 lph) emitters spaced 12" (30,5 cm) on-center.
 - 2) Rain Bird XFSP-06-18; 0.6 GPH (2,3 lph) emitters spaced 18" (45,7 cm) on-center.
 - 3) Rain Bird XFSP-09-12; 0.9 GPH (3,4 lph) emitters spaced 12" (30,5 cm) on-center.
 - 4) Rain Bird XFSP-09-18; 0.9 GPH (3,4 lph) emitters spaced 18" (45,7 cm) on-center.

- c. Dripline tubing material and performance specifications:
 - 1) XFS Copper-colored, dual layered tubing conforming to an outside diameter (O.D.) of 0.634 inches (16 mm) and an inside diameter (I.D.) of 0.536 inches (13,6 mm) and wall thickness of 0.049 inches (1,2 mm)
 - 2) XFSP tubing; dual layered, purple in color, conforming to an outside diameter (O.D.) of 0.634 inches (16 mm) and an inside diameter (I.D.) of 0.536 inches (13,6 mm) and wall thickness of 0.049 inches (1,2 mm)
 - 3) Factory installed, pressure-compensating, inline emitters welded to the inner circumference of the polyethylene tubing at spacing specified by model number
 - 4) Consistent flow rate from each installed inline emitter when emitter inlet pressure is supplied between recommended operating range of 8.5 to 60 PSI (0,7 to 4,1 bar)
 - 5) Required filtration for XF Series dripline tubing and emitters is 120 mesh (125 micron)
- 5. Rain Bird XF Series Blank Dripline Tubing
 - a. Available model numbers for POTABLE water systems:
 - 1) Rain Bird XFD blank tubing, dual-layered and brown in color.
 - b. Available model numbers for NON-POTABLE water systems:
 - 1) Rain Bird XFDP blank tubing, dual-layered and purple in color.
- 6. Rain Bird Easy Fit Dripline Tubing Compression Fittings
 - a. Available model numbers, designed for compatibility with Rain Bird XF Series Dripline Tubing:
 - 1) Tee: MDCFTEE
 - 2) Coupling: MDCFCOUP
 - 3) Elbow: MDCFEL
 - 4) Adapters:
 - (a) 1/2" (13 mm) Male pipe thread adapter: MDCF50MPT
 - (b) 3/4" (19 mm) Male pipe thread adapter: MDCF75MPT
 - (c) 1/2" (13 mm) Female pipe thread adapter: MDCF50FPT
 - (d) 3/4" (19 mm) Female pipe thread adapter: MDCF75FPT
 - (e) 3/4" (19 mm) Female hose thread adapter: MDCF75FHT
 - 5) Flush Cap end closure for POTABLE system: MDCFPCAP
 - 6) Flush Cap end closure for NON-POTABLE system: MDCFPCAP
 - b. Easy Fit compression fitting material and performance specifications include:
 - 1) Easy Fit directional fittings and flush cap fittings constructed from molded UV-resistant ABS material with Buna-N rubber seal for long-term, leak free connections.
 - 2) Easy Fit adapters constructed from UV-resistant ABS materials for use exclusively with Easy Fit Compression Fittings

- 3) Easy Fit Compression Fittings are intended for use with polyethylene tubing from .630" to .669" (16 mm-17 mm) OD to provide a leak-free compression fit.
 - 4) Maximum pressure loss for the Easy Fit adapters estimated to be 0.1 PSI (0,007 bar) per adapter.
 - 5) Operating pressure range for Easy Fit compression fittings and adapters is 0 to 60 PSI (0 to 4,1 bar)
7. Rain Bird XF Series Dripline Tubing Insert Fittings
- a. Available model numbers, designed for compatibility with Rain Bird XF Series Dripline Tubing:
 - 1) Tee: XFF____TEE insert tee (17 x17 x 17 mm)
 - 2) Coupling: XFF-COUP____insert coupling (17 x 17 mm)
 - 3) Elbow: XFF-ELBOW insert elbow (17 x 17 mm)
 - 4) Cross: XFD-CROSS insert cross (17 x 17 x 17 x 17 mm)
 - 5) Insert Adapters:
 - (a) 1/2" (13 mm) Male pipe thread adapter: XFF-MA-050 [17 mm x 1/2" (13 mm) MPT]
 - (b) 3/4" (19 mm) Male pipe thread adapter: XFF-MA-075 [17 mm x 3/4" (19 mm)MPT]
 - (c) 3/4" (19 mm) Female pipe thread adapter: XFD-FA-075 [17 mm x 3/4" (19 mm)FPT]
 - (d) 1/2" (13 mm) Tee male pipe thread adapter: XFF-TMA-050 [17 mm x 1/2" (13 mm)MPT x 17 mm]
 - (e) 3/4" (19mm) Tee female pipe thread adapter: XFD-TFA-075 [17 mm x 3/4" (19 mm)FPT x 17 mm]
 - b. Insert fitting specifications and features include:
 - 1) Constructed from acetyl plastic.
 - 2) Intended for use with polyethylene tubing with ID of 0.536" (13,6 mm) Operating pressure range is 0 to 50 PSI (0 to 3,5 bar)
8. Rain Bird Air Relief Valves.
- a. Available model numbers, designed for compatibility with Rain Bird XF Series Dripline Tubing:
 - 1) ARV050 Air Relief Valve; includes 1/2" (13 mm) air relief valve.
- C. Rain Bird Point Source Irrigation Emission Devices
1. General Information
 - a. Provide low-volume point-source emission devices to efficiently deliver irrigation water at the plant root zone as indicated on construction drawings.
 2. Rain Bird Single-outlet Xeri-Bug™ Emitters
 - a. Available model numbers with self-piercing barb inlet:
 - 1) XB-05PC (Blue); 0.5 GPH (1,89 lph)
 - 2) XB-10PC (Black); 1.0 GPH (3,79 lph)

- 3) XB-20PC (Red); 2.0 GPH (7,57 lph)
 - b. Available model numbers with 10-32 threaded inlet:
 - 1) XB-05PC-1032 (Blue); 0.5 GPH (1,89 lph)
 - 2) XB-10PC-1032 (Black); 1.0 GPH (3,79 lph)
 - 3) XB-20PC-1032 (Red); 2.0 GPH (7,57 lph)
 - c. Available model numbers with 1/2" (13 mm) threaded inlet:
 - 1) XBT-10 (Black); 1.0 GPH (3,79 lph)
 - 2) XBT-20 (Red); 2.0 GPH (7,57 lph)
 - d. Single-outlet Xeri-Bug Emitter specifications and features include:
 - 1) Available with three inlet options:
 - (a) Self-piercing barb inlet; Emitters with self-piercing barb inlet permit one-step insertion into 1/2" (13 mm) or 3/4" (19 mm) drip tubing when installed with manufacturer's tool.
 - (b) 10-32 threaded inlet; Emitters with 10-32 threaded inlet allow threaded connection into PolyFlex Riser, 1032 Thread Adapter, or 1800 Xeri-Bubbler Adapter
 - (c) 1/2" (13 mm) threaded inlet; Emitters with 1/2" (13 mm) threaded inlet allow threaded connection into 1/2" (13 mm) PVC male adapter.
 - 2) External surfaces constructed from UV resistant acetyl materials.
 - 3) Self-flushing to minimize clogging.
 - 4) Color-coded to identify flow rate.
 - (a) Blue emitter indicates a flow rate of 0.5 GPH (1,89 lph)
 - (b) Black emitter indicates a flow rate of 1.0 GPH (3,79 lph)
 - (c) Red emitter indicates a flow rate of 2.0 GPH (7,57 lph)
 - 5) Pressure-compensating over the pressure range of 15 to 50 PSI (1,0 to 3,5 bar) with consistent flow rate of [0.5 GPH (1,89 lph)] or [1.0 GPH (3,79 lph)] or [2.0 GPH (7,57 lph)] over this pressure range
3. Rain Bird Single-outlet Pressure-Compensating Modules
- a. Available model numbers with self-piercing inlet barb:
 - 1) PC-05: light brown, 5 GPH (18,95 lph)
 - 2) PC-07: violet, 7 GPH (26,53 lph)
 - 3) PC-10: green, 10 GPH (37,90 lph)
 - 4) PC-12: dark brown, 12 GPH (45,48 lph)
 - 5) PC-18: white, 18 GPH (68,22 lph)
 - 6) PC-24: orange, 24 GPH (90,96 lph)
 - b. Available model numbers with 10-32 threaded inlet:
 - 1) PC-05 1032: light brown, 5 GPH (18,95 lph)
 - 2) PC-07 1032: violet, 7 GPH (26,53 lph)
 - 3) PC-10 1032: green, 10 GPH (37,90 lph)

- c. Available model numbers with 1/2" FPT inlet:
 - 1) PCT-05: light brown, 5 GPH (18,95 lph)
 - 2) PCT-07: violet, 7 GPH (26,53 lph)
 - 3) PCT-10: green, 10 GPH (37,90 lph)
- d. Pressure-Compensating Module specifications and features include:
 - 1) Available with three inlet options:
 - (a) Self-piercing barb inlet; Emitters with self-piercing barb inlet permit one-step insertion into 1/2" (13 mm) or 3/4" (19 mm) drip tubing when installed with Rain Bird Xeriman tool.
 - (b) 10-32 threaded inlet; Emitters with 10-32 threaded inlet allow threaded connection into PolyFlex Riser, 1032 Thread Adapter, or 1800 Xeri-Bubbler Adapter
 - (c) 1/2" FPT Threaded inlet allow threaded connection to 1/2" PVC riser.
 - 2) External surfaces constructed from UV resistant acetyl materials.
 - 3) Color-coded to identify flow rate;
 - (a) Tan outlet indicates a flow rate of 5 GPH (18,93 lph)
 - (b) Violet outlet indicates a flow rate of 7 GPH (26,50 lph)
 - (c) Green outlet indicates a flow rate of 10 GPH (37,85 lph)
 - (d) Dark brown outlet indicates a flow rate of 12 GPH (45,42 lph)
 - (e) White outlet indicates a flow rate of 18 GPH (68,13 lph)
 - (f) Orange outlet indicates a flow rate of 24 GPH (90,84 lph)
 - 4) Pressure-compensating over the pressure range of 10 to 50 PSI (0.7 to 3,5 bar) with consistent flow rate of [5 GPH (18,93 lph)] or [7 GPH 26,50 lph]] or [10 GPH (37,85 lph)] or [12 GPH (45,42 lph)] or [18 GPH (68,13 lph)] or [24 GPH (90,84 lph)] over this pressure range.
- 4. Rain Bird PC Diffuser Cap specifications and features include:
 - 1) Available with two color options:
 - (a) PC Diffuser (Black); This Diffuser Cap is to be used for Pressure-Compensating Module zones serviced by a potable water source.
 - (b) PC DIFF-PPL (Purple); This Diffuser Cap is to be used for Pressure-Compensating Module zones serviced by a non-potable water source.
 - (1) Constructed from UV-resistant polyethylene material
 - (2) Capable of snapping onto Rain Bird Pressure-Compensating Modules to create a bubbler effect and prevent wash out
- 5. Rain Bird Multi-outlet Xeri-Bug Emission Devices
 - a. Available model numbers with barb inlet:
 - 1) XB-05-6: Blue, 0.5 GPH (1,89 lph/outlet)
 - 2) XB-10-6:Black, 1.0 GPH (3,79 lph/outlet)
 - 3) XB-20-6:Red, 2.0 GPH (7,57 lph/outlet)
 - b. Available model numbers with 1/2" (13 mm) female threaded inlet:

- 1) XBT-05-6: Blue, 0.5 GPH (1,89 lph/outlet)
 - 2) XBT-10-6:Black, 1.0 GPH (3,79 lph/outlet)
 - 3) XBT-20-6:Red, 2.0 GPH (7,57 lph/outlet)
- c. Multi-outlet Xeri-Bug specifications and features include:
- 1) Available with two inlet options:
 - (a) Barb inlet; Emitters with barb inlet permit insertion into 1/2" (13 mm) or 3/4" (19 mm) drip tubing
 - (b) 1/2" (13 mm) threaded inlet; Emitters with 1/2" (13 mm) threaded inlet allow threaded connection into 1/2" (13 mm) PVC male adapter.
 - 2) Six outlet ports, barbed to retain 1/4" (6,4mm) distribution tubing.
 - 3) External surfaces constructed from UV resistant acetyl materials.
 - 4) Self-flushing to minimize clogging.
 - 5) Color-coded to identify flow rate.
 - (a) Blue emitter indicates a flow rate of 0.5 GPH (1,89 lph) per outlet.
 - (b) Black emitter indicates a flow rate of 1.0 GPH (3,79 lph) per outlet.
 - (c) Red emitter indicates a flow rate of 2.0 GPH (7,57 lph) per outlet.
 - 6) Pressure-compensating over the pressure range of 15 to 50 PSI (1,0 to 3,5 bar) with consistent flow rate of [0.5 GPH (1,89 lph)] or [1.0 GPH (3,79 lph)] or [2.0 GPH (7,57 lph)] GPH over this pressure range
6. Rain Bird 6-outlet Manifold Emission Device
- a. Available model number:
 - 1) EMT-6XERI
 - b. 6-outlet Manifold specifications and features include:
 - 1) 1/2" (13 mm) female threaded inlet.
 - 2) Six free-flowing outlet ports, barbed to retain 1/4" (6,4 mm) distribution tubing and sealed by manufacturer with durable plastic caps removable with pliers during installation.
 - 3) Recommended operating pressure range between 15 to 50 PSI (1,0 to 3,5 bar)
7. Rain Bird Multi-Outlet Xeri-Bird™ 8 Emission Device
- a. Available model numbers:
 - 1) XBD-80: Xeri-Bird™ 8 unit (includes seven removable port plugs) with filter.
 - 2) XBD-81: Xeri-Bird™ 8 unit with eight 1 GPH (3,79 lph) Xeri-Bug (XB-10-PC) emitters factory installed and filter.
 - b. Xeri-Bird™ 8 specifications and features include:
 - 1) 1/2" (13 mm) threaded device inlet with union base nut to allow removal of the Xeri-Bird 8 body from .
 - 2) Eight independent ports, each capable of accepting a Rain Bird Xeri-Bug™ emitter or Rain Bird PC Module for independent flows from 0.5 to 24 GPH (1,89 to 90,96 lph), or a self-piercing barb connector (SPB-025) for unrestricted flow.

- 3) Eight barbed outlet ports mounted on bottom of device capable of securely retaining 1/4" (6,4 mm) distribution tubing.
- 4) 200 mesh (75 micron) filter, easily serviceable from top of unit.
- 5) Capable of being used with retrofit pressure regulator (PRS-050-30) when pressure regulation is required at unit.

D. Low Volume Broadcast Irrigation Emission Devices

1. General Information

- a. Provide low-volume broadcast emission devices to efficiently deliver irrigation water in a short-radius wetting pattern.

2. Rain Bird Xeri-Bubbler™

- a. Available model numbers with 1/4" (6,4 mm) barb inlet:

- 1) SXB-180-025; half-circle, 5 streams
- 2) SXB-360-025; full-circle, 8 streams
- 3) UXB-360-025; full-circle, umbrella

- b. Available model numbers with 10-32 thread inlet:

- 1) SXB-180-1032; half-circle, 5 streams
- 2) SXB-360-1032; full-circle, 8 streams
- 3) UXB-360-1032; full-circle, umbrella

- c. Available model numbers with 5" (12,7 cm) spike inlet:

- 1) SXB-180-SPYK; half-circle, 5 streams
- 2) SXB-360-SPYK; full-circle, 8 streams
- 3) UXB-360-SPYK; full-circle, umbrella

- d. Xeri-Bubbler™ specifications and features include:

- 1) Three inlet connection options:
 - (a) 10-32 self-tapping thread
 - (b) 1/4" (6,4 mm) barb
 - (c) 5" (12,7 cm) spike
- 2) Three flow pattern options:
 - (a) Half-circle with 5 streams
 - (b) Full-circle with 8 streams
 - (c) Full-circle umbrella pattern
- 3) Flow and radius adjustment capability by turning outer cap
- 4) SXB series features flow range of 0 to 13 GPH (0 to 49,2 lph)
- 5) UXB series features flow range of 0 to 35 GPH (0 to 132,5 lph)
- 6) Operating pressure range between 15 to 30 PSI (1,0 to 2,1 bar)

3. Rain Bird Xeri-Pop™ Micro-Spray

- a. Available model numbers:

- 1) XP-400X; 4-inch (101,6 mm) pop-up

- 2) XP-600X; 6-inch (152,4 mm) pop-up
- 3) XP-1200X; 12-inch (304,8 mm) pop-up
- b. Xeri-Pop™ Micro-Spray specifications and features include:
 - 1) 1/4" (6,4 mm) barb inlet located in base of unit for connection to 1/4" (6,4 mm) distribution tubing.
 - 2) Three pop-up height options:
 - (a) 4-inch (10,16 cm) pop-up
 - (b) 6-inch (15,24 cm) pop-up
 - (c) 12-inch (30,5 cm) pop-up
 - 3) Compatible with the following Rain Bird nozzles:
 - (a) Multi-port Series nozzles
 - (b) 5-series MPR plastic nozzles
 - (c) 5-series plastic bubbler nozzle (use in conjunction with Rain Bird PCS-series pressure compensating screen)
 - (d) 8-series MPR plastic nozzles
 - 4) External body construction using UV-resistant ABS material.
 - 5) Self-flushing, pressure-activated wiper seal
 - 6) Operating pressure range between 20 to 50 PSI (1,4 to 3,5 bar). Optimum performance achieved with 40 PSI (2,8 bar) pressure regulator.
4. Rain Bird Xeri-Sprays™
 - a. Available model numbers:
 - 1) XS-090; Quarter-circle, spray pattern
 - 2) XS-180; Half-circle, spray pattern
 - 3) XS-360; Full-circle, stream spray pattern
 - 4) 360 ADJMST; Full-circle spray
 - b. Xeri-Spray™ specifications and features include:
 - 1) 10-32 self-tapping threaded inlet
 - 2) Four flow pattern options:
 - (a) Quarter-circle spray pattern
 - (b) Half-circle spray pattern
 - (c) Full-circle spray pattern
 - (d) Full-circle mister
 - 3) Operating pressure range between 10 to 30 PSI (0,75 to 2,1 bar)
 - 4) Adjustable flow and radius with integral ball valve
 - (a) Flow adjustability between 0 to 31 GPH (0 to 117,3 lph)
 - (b) Radius adjustability for full-circle sprays between 0 to 13.4 feet (0 to 4,1 m)
 - (c) Radius adjustability for part-circle sprays between 0 to 10.6 feet (0 to 3,2 m)

E. Rain Bird Drip Irrigation Accessories

1. 1/4" (6,4 mm) Barb Transfer Fittings
 - a. Available model numbers:
 - 1) XBF1CONN: 1/4" (6,4 mm) Barb Connector
 - 2) XBF2EL: 1/4" (6,4 mm) Barb x Barb Elbow
 - 3) XBFTEE: 1/4" (6,4 mm) Barb x Barb Tee
 - b. 1/4" (6,4 mm) Barb Transfer Fittings specifications and features include:
 - 1) Three fitting configurations:
 - (a) Connector
 - (b) Elbow
 - (c) Tee
 - 2) Designed for connections of Rain Bird XQ 1/4" (6,4 mm) distribution tubing with an ID of 0.17" (4,3 mm)
 - 3) Barbed on one end to permit easy insertion into any 1/2" (13 mm) or 3/4" (19 mm) polyethylene tubing using a Rain Bird Xeriman® tool (XM-TOOL)
 - 4) Constructed from UV resistant acetyl.
 - 5) Operating pressure range between 0 to 50 PSI (0 to 3.5 bar)
2. Rain Bird Diffuser Bug Cap
 - a. Available model numbers:
 - 1) DBC-025 (Black); for potable water source
 - 2) DBC-025-PPL (Purple); for non-potable water source
 - b. Diffuser Bug Cap specifications and features include:
 - 1) Barb inlet designed to fit into 1/4" (6,4 mm) distribution tubing with ID of 0.16" (4 mm)
 - 2) Flanged shield designed to diffuse water to minimize soil erosion at emission point.
 - 3) Constructed from polyethylene material.
 - 4) Operating pressure range between be 0 to 50 PSI (0 to 3,5 bar)

PART 3 EXECUTION

3.01 INSPECTIONS AND REVIEWS

- A. Pre-construction Site Inspection
 - 1. Verify construction site conditions and note irregularities affecting work of this section. Report irregularities in writing to Owner's Representative prior to beginning work. Commencement of work implies acceptance of existing site conditions.
- B. Utility Locates ("Call Before You Dig")
 - 1. Arrange and coordinate Utility Locates with local authorities prior to construction.
 - 2. Repair underground utilities that are damaged during construction. Make repairs at no additional cost to contract price.

3.02 DRIPLINE EXCAVATION, TRENCHING, AND BACKFILL

- A. Excavate and install pipes at minimum cover indicated in drawings or specifications. Excavate trenches at appropriate width for connections and fittings.
- B. Minimum cover for dripline components (distance from top of pipe to finish grade):
 - 1. Buried PVC manifold and supply header pipe to dripline grid layouts: 12" (30,5 cm) to top of pipe.
 - 2. Buried dripline lateral pipe downstream PVC manifold and supply header pipe: 4" (10 cm) to top of pipe.
 - 3. On-grade dripline lateral pipe downstream PVC manifold and supply header pipe: Secure to finish grade with approved tubing stakes. Install and test prior to installation of landscape fabric and mulch.
- C. Backfill only after buried lines have been reviewed, tested, and approved.
- D. Excavated material is generally satisfactory for backfill. Use backfill free from rubbish, vegetable matter, frozen materials, and stones larger than 2" (50 mm) in maximum diameter. Remove material not suitable for backfill. Use backfill free of sharp objects next to pipe.
- E. Dress backfilled areas to original grade. Incorporate excess backfill into existing site grades. Dispose of excess backfill off site.
- F. Contact Owner's Representative for trench depth adjustments where utilities conflict with irrigation trenching and pipe work.

3.03 ASSEMBLING PIPE AND FITTINGS

- A. General:
 - 1. Keep pipe free from dirt and debris. Cut pipe ends square, debur and clean as recommended by pipe manufacturer.
 - 2. Keep ends of assembled pipe capped. Remove caps only when necessary to continue assembly.
- B. PVC Pipe and Fittings:
 - 1. Use only strap-type friction wrenches for threaded plastic pipes.

2. PVC Solvent Weld Pipe and Fittings:
 - a. Use appropriate primer and solvent cement. Join pipe in manner recommended by pipe and fitting manufacturers and in accordance with accepted industry practices.
 - b. Cure for thirty (30) minutes before handling and twenty-four (24) hours before pressurizing or installing with vibratory plow.
 - c. Snake pipe from side to side within trench.
3. PVC Threaded Connections:
 - a. Use only factory-formed threads. Field-cut threads are not permitted.
 - b. Apply thread sealant in manner recommended by component, pipe, and sealant manufacturers and in accordance with accepted industry practices.

C. Dripline Tubing and Fittings:

1. Use only Rain Bird XF-Series Insert Fittings or Rain Bird Easy Fit Compression Fittings for Rain Bird XF-Series dripline tubing connections or transitions as recommended by the Manufacturer's representative for the specific site and system conditions.
2. Dripline Insert Fittings:
 - a. Install dripline tubing and fittings in manner recommended by manufacturer and in accordance with accepted industry practices.
3. Dripline Compression Fittings:
 - a. Install dripline tubing and fittings in manner recommended by manufacturer and in accordance with accepted industry practices.

3.04 INSTALLATION OF DRIPLINE IRRIGATION COMPONENTS

A. Control Zone Kit Assembly:

1. Flush mainline pipe before installing Control Zone Kit assembly.
2. Locate where shown on drawings. Connect control wires to remote control valve wires using specified wire connectors and waterproof sealant. Provide connectors and sealant per manufacturer's recommendations.
3. Install a maximum of four (4) Low Flow or Medium Flow Control Zone Kits per standard rectangular valve box. Install a maximum of one (1) Medium Flow Commercial Control Zone Kits per standard rectangular valve box. Install a maximum of one High Flow Commercial Control Zone Kits per jumbo rectangular valve box.
 - a. Locate valve boxes at least 12" (30,5 cm) from, and align with, nearby walls or edges of paved areas.
 - b. Group Control Zone Kit assemblies together where practical. Align grouped valve boxes in uniform patterns. Allow at least 12" (30,5 cm) between valve boxes.
 - c. Brand controller letter and station numbers on valve box lid in 2" (50 mm) high letters.

B. Lateral Piping and Dripline Tubing:

1. Install lateral piping and dripline tubing at locations and in grid patterns as indicated on drawings and installation details, and in strict accordance with manufacturer recommendations.
2. Thoroughly flush PVC lateral piping, supply headers, and dripline tubing immediately upon installation.

- C. Air Relief Valve Kit Assembly: Install at all high points in dripline tubing grid as shown and directed on drawings and installation details.
- D. Flush Point Assembly: Install flush header or at ends of each dripline zone segment as shown and directed on drawings and installation details. Install at least 12-inches from and align with adjacent walls or edges of paved areas.

3.05 PROJECT RECORD (AS-BUILT) DRAWINGS

- A. Document field changes from original design and construction documents. Maintain on-site and separate from original construction documents, one complete set of documents labeled "Project Field Documents". Keep documents current. Do not permanently cover work until accurate "as-built" information is recorded.
- B. Record pipe network alterations daily. Record work that is installed differently than shown on construction documents. Record accurate reference dimensions, measured from at least two permanent reference points of each control zone kit assembly, each dripline zone boundary, each air relief valve assembly, each flush point assembly, and other dripline irrigation components enclosed within valve box.
- C. Obtain from General Contractor CADD files prior to construction completion. Duplicate information contained on "Project Field Documents" maintained on-site using technical drafting pen or AutoCAD. Label each sheet "Record Drawing".
- D. Provide "Record Drawings" to Owner's Representative. Completion of Record Drawings is required prior to final construction review at completion of irrigation system installation.

3.06 WINTERIZATION AND SPRING START-UP

- A. Winterize irrigation system in fall following completion, or partial completion, of irrigation system construction. Start-up irrigation system in spring following completion, or partial completion, of irrigation system construction. Repair any damage caused in improper winterization at no additional cost to Owner. Coordinate winterization and start-up with landscape maintenance personnel.

3.07 MAINTENANCE

- A. Maintain irrigation system for duration of 30 calendar days from formal written acceptance by Owner's Representative. Make periodic examinations and adjustments to irrigation system components in order to achieve the most efficient and uniform application of water.
- B. Following completion of Contractor's maintenance period, Owner will be responsible for maintaining system in working order during remainder of guarantee/warranty period, for performing necessary minor maintenance, for protecting against vandalism, and for preventing damage after landscape maintenance operation.

3.08 CLEANUP

- A. Remove from site machinery, tools, excess materials, and rubbish upon completion of work.

END OF SECTION

This page intentionally left blank

SECTION 32 90 00

PLANTING

PART 1 GENERAL

1.01 DESCRIPTION

A. Division 1 applies to this Section. Provide all labor, materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing all operations in connection with the installation of the Work of this Section, complete as shown on the Drawings and/or specified herein. Work In This Section: Principal items include:

1. Examine all other Sections for Work related to those other Sections and required to be included in this Section.
2. Fine grading in landscaping areas.
3. Landscaping.
4. Rodent and vermin control.
5. Soil Testing and Soil Preparation
6. Plants and Planting
7. Staking
8. Herbicide
9. Watering and maintenance

B. Related Work Not In This Section:

1. Section 32 01 30 – Operation and Maintenance of Site Improvements
2. Section 32 01 90.33 – Tree and Shrub Preservation
3. Section 32 84 00 – Planting Irrigation
4. Section 32 84 13 – Drip Irrigation

1.02 SUBMITTALS

A. Refer to Division 1 for procedures.

B. Materials list: Submit complete material list prior to performing any work. Material list shall include manufacturer, model number, and description of all materials and equipment to be used. The Contractor shall also furnish the articles, equipment, materials, or processes specified by name in Drawings and Specifications. For Tree Submittals, provide photo image, height, canopy, width, and caliper at 4' height. A nursery worker shall stand next to the tree in the image for a sense of scale. For Shrub, Groundcover and Vine Submittals, provide photo image, height, and width of the entire plant. No substitutes will be allowed without prior written acceptance. Equipment or materials installed or furnished without prior approval of the Architect may be rejected and the Contractor required to remove such materials from the site at his own expense. All cut sheets, nursery images of trees and samples of materials shall be submitted 3 weeks prior to installation

C. Manufacturer's Product Specification Cut Sheets/Data:

1. Provide 6 copies for all materials.
 2. Submit manufacturer's standard printed product data for all items, referenced to article number in this specification for which each item is being submitted.
 3. Submit manufacturer's printed installation instruction and methods.
 4. Material Safety Data Sheets (MSDS): For all products used.
- D. Required Manufacturer's Product Specification Cut Sheets /Physical Samples: Delivery may begin upon approval of Cut Sheets/Samples or as directed by Owner's Representative. Submit Samples in the form of Cut Sheets and Physical samples as required by the Landscape Architect or Owner's Representative and store on the site until furnishing of material is complete. Samples and Cut Sheets required are listed below:
1. Irrigation Equipment (see Section 32 84 00 and 32 84 13)
 2. Submit 'bagged' samples of each of the following, (2) samples of each, accompanied by (6) copies of the manufacturer's specification cut sheets:
 - a. Physical Samples of Bark Mulch
 - b. Decomposed Granite/Stabilizer
 - c. Decorative Rock/Pea Gravel
 - d. Planting Mix, and Soil Amendments. NOTE: Approved samples of each to remain on site until furnishing of materials is complete. Delivery may begin upon approval of all submittals or as directed by Owner's Representative.
 3. Cut Sheets for Tree Root Control Barriers and Aluminum Edging
 4. Cut Sheets for Tree Stakes/Weed Whip Guards
 5. There shall be at least one (1) photograph of each species of tree, shrub, vine and ground cover to be planted. All photographs shall be taken with a person/or a scale in each photo next to the plant. Include with the photographs of all trees a notation of caliper, canopy width and height of each species of tree. If there are multiple boxes or gallon sizes of the same plant, include separate information for each container sized tree.
 6. Fertilizer Analysis: also provide labels of each fertilizer used and the quantities used in each application.
 7. Soil Amendment Analysis
 8. Analysis of Imported Topsoils and Sand
 9. Cut Sheets of Herbicides, Pesticides and Fungicides: Furnish manufacturer's certification by the USDA, description of ingredients, and recommendations for usage and application rates for each material to be used and dates of application 10.Cut Sheets shall be provided for all other products noted in Part 2, 2.01 Soil Additives, Fertilizers, and Herbicides and 2.02 Staking Material.
- E. Certificates: The Contractor shall submit, at time of delivery, to the Inspector of Record (IOR), delivery receipts or tickets of all amendments and soil additives, reflection actual quantities and types of materials delivered to the project site. Delivery receipts or tickets shall include the name of the project and the date of the actual delivery. Four (4) copies of all receipts / tickets shall be forwarded to the Architect, by the Contractor. Approval of types and quantities by the IOR and Architect are required prior to working in or spreading any amendments or soil additives.

- F. Prior to being placed on maintenance, refer to Section 3.06 "Inspection, Start of Maintenance" - the Contractor shall submit a schedule of all activities planned during the maintenance period. This shall be accepted by the Grounds Supervisor prior to the start of the maintenance period. All schedule changes shall be documented and accepted by the Grounds Supervisor.
- G. Prior to the date of the final walk-through, the Contractor shall acquire from the Grounds Supervisor approved reproducible prints and shall produce the final record from the job record set of all changes made to all plans during construction, label said prints, "As-Builts" and deliver to the Grounds Supervisor and as required by any Local Agency. Prior to the date of final inspection, the Contractor shall deliver to the Grounds Supervisor the "Landscape and Irrigation Guarantee" as required. Said Guarantee shall be on the Contractor's letterhead and dated the scheduled final acceptance date.
- H. All turnover items noted in other specification sections shall be delivered prior to the final walk-through.
- I. Supply a monthly record of all herbicides, insecticides, fertilizers, and disease control chemicals with rates and amounts used noted.

1.03 PROTECTION OF WORK

- A. The Contractor shall be responsible for protection of all adjacent finished surfaces and materials, both interior and exterior, while performing all landscape and irrigation operations, including maintenance. These finishes and materials shall be cleaned and returned to as-new condition when work is completed.

1.04 GUARANTEES AND REPLACEMENTS

- A. Refer to Division 1 for more information.
- B. Shrubs: Guarantee shrubs from the time of installation to the end date of the 90-day Maintenance Period.
- C. Trees: Guarantee all trees to live in a healthy condition for (1) one year from the end date of the Maintenance Period. Dead or unhealthy trees shall be replaced within 10 days after notification of Contractor by the Owner's Representative or the Architect.
- D. Dead and Non-Vigorous Plants: As soon as the weather permits, replace all dead plants and all plants not in a vigorous condition as noted at the end of the Maintenance Period.
- E. Replacements: Plants used for replacement shall be the same kind and size as specified on the Planting Plan. They shall be furnished, planted, and fertilized as specified at no additional cost to the Owner. Replacement plants shall be maintained for a period equal to the original maintenance period. They shall be in excellent condition following the replacement and maintenance.
- F. Provide Certificate of Compliance from authority having jurisdiction indicating approval of plants, fertilizer, and herbicide mixture. Plant Materials: Described by ASTM Z60.1; free of disease or hazardous insects.

PART 2 PRODUCTS.

2.01 ADDITIVES, FERTILIZERS, LANDSCAPE MATERIALS, AND HERBICIDES

- A. Mulch : "Walk On-Chips" as supplied by EarthWorks Soil Amendments Inc., (951)782-0260, or equal approved by the Owner's Representative. The mulch shall consist of fibrous, woody bark mixture of varied particle size.
- B. Prepared Planting Mix for Backfill in all Planting Pits Except Raised Planters: Materials and amounts specified here are anticipated. This amendment is for bidding purposes and shall be superseded by recommendation of soil test/analysis report. Mix shall be the following materials thoroughly mixed:
 - 1. By volume: 30% GroMulch and 70% excavated soil
 - 2. Plus 2 lb. 12_12_12 commercial fertilizer per cubic yard of mix.
 - 3. Plus: 3 lb. Agricultural grade gypsum per cubic yard of mix
 - 4. Plus: 2 lb. Iron sulfate per cubic yard of mix
- C. Ammonium Sulfate: Shall be standard brand (NH₄)₂SO₄.
- D. Urea Formaldehyde: 35_0_0 shall be standard brand, as approved by the Architect.
- E. Iron Sulfate: Shall be standard brand 20% Fe.
- F. Vitamin B1 Root Hormone: Hormone shall be Superthrive, Hormex, or equal approved by the Architect.
- G. Nitrolized Fir bark Fines: Fines shall be "Forest Humus" as sold by Kellogg Company, or equal approved by the Architect.
- H. Commercial Fertilizer: Fertilizer shall be 12_12_12, standard commercial brand as approved by the Architect. Nitrogen for this mix shall be derived from 2% ammoniac, 5% urea, and 14% urea formaldehyde.
- I. Gro Mulch: Mulch shall be manufactured by the Kellogg Co.
- J. Herbicide: Herbicide shall be Roundup or equal approved by the Architect.
- K. Fertilizer Tablets: Agriform per manufacturer's recommendations.
- L. Agricultural Gypsum: Gypsum shall be agricultural calcium sulfate CaSO₄ approved by Landscape Architect. This shall only be used in clay or adobe soils.
- M. Mycorrhizal Fungal Inoculant: Plant and Tree Saver Transplant manufactured by Plant Health CareInc. or equal.
- N. Soil Sulfur: Agricultural grade sulfur containing a minimum of 99% sulfur (expressed as elemental).

2.02 STAKING MATERIAL:

- A. Stakes: Stakes for larger plant material shall be 2" diameter x 10'-0" long lodge pole stakes, actual dimension.

- B. Ties: Ties shall be V.I.T. Cinch Ties, Model #CT32 For 24" box trees.
- C. Tree Trunk Guards: Guards shall be Arbor Guard by Deep Root, (714) 898-0563, or equal approved by the Architect and shall be installed on the trunks of all trees in lawn areas.
- D. Root Control Barrier: All 48" box, 36" box, 24" box and 15-gallon trees planted within 6' of any hardscape areas (sidewalks, walls, concrete drainage swales, curbs, driveways, swales, or any other structure) shall include root barriers, root barriers shall extend 5' on either side of the trunk for a total length of 10'. Root barriers are as follows:
 - 1. 36" box trees, 24" box trees, and 15-gallon trees - Model # UB 18-2 available from DeepRoot, (800) 766-8835
 - 2. 48" box trees - Model # UB 24-2 available from DeepRoot, (800) 766-8835

2.03 STEEL EDGING

- 1. Steel edging shall be 1/4" x 5", black color, with 15" steel stake.
 - a. Manufacturer: Sure-Loc. (800) 787-3562.
 - b. Or approved equal.

2.04 JUTE MESH

- A. Shall be Anti-Wash / Geo Jute by Pacific Soil Stabilization, (805) 925-7737

2.05 PLANT MATERIALS

- A. Quality and Size:
 - 1. The quality and size of all plants shall be No. 1 grade. They shall be fresh, vigorous, of normal growth, free of disease, insects, insect eggs and larvae, with strong root systems.
 - 2. Sizes of plants shall be as stated on the planting plan. No root bound or undersized materials shall be allowed.
 - 3. Protect and maintain plant material in a healthy and vigorous condition until planted.
 - 4. Do not install plant material when ambient temperatures may drop below 35 degrees F or rise above 90 degrees F.
 - 5. Do not place plants in containers or asphalt paving when outdoor temperature exceeds 100 degrees F. for a period exceeding 16 hours.
 - 6. Trees 36" box size or larger shall be tagged at the nursery within 250 miles of the project site.
- B. Pruning: Pruning shall not be done prior to delivery except by special approval of the Architect.
 - 1. Tree Trimmer Qualifications: Company specializing in pruning trees with proof of ISA Arborist Certification and ISA Tree Worker Certification.
 - 2. Tree Pruning: ISA - Pruning Standards for Shade Trees.
- C. Inspection: Inspection of plant materials required by City, State, or Federal authorities shall be the responsibility of the Contractor, and he shall obtain permits or certificates prior to delivery of plants to site.
- D. Plant Marking: Each plant shall be clearly marked with a waterproof tag as to its botanical name as required by California State Agricultural Laws.

- E. Plant reviews: Landscape Architect shall at any time during the tagging, delivery or planting process reject any unhealthy, damaged or dead tree.
- F. Deliver, store, protect and handle products to site under provisions of Section 01600 - Materials and Equipment.

2.06 IMPORTED TOPSOIL

- A. Import Top Soil: Import top soil shall be classified as sandy loam, and must conform to the following:
 - 1. Particle size

	<u>Class Particle Size Range</u>	<u>Maximum %</u>	<u>Minimum %</u>
a.	Silt plus Clay (<0.05mm)	50	15
b.	Coarse Sand (0.5 - 2.0mm)	15	0
c.	Gravel (2.0-13mm)	15	0
d.	Rock (1/2"-1")	5% by volume with none > 1"	
 - 2. Chemistry
 - a. Salinity: Saturation Extract Conductivity (ECe) - less than 3.0 sD/m @ 25° C
 - b. Sodium: Sodium Absorption Ratio (SAR) - less than 6.0
 - c. Boron: Saturation Extract Concentration - Less than 1.0 ppm
 - d. Reaction: pH of Saturated Paste - 5.5-7.8 without high lime content
 - 3. Soil shall contain enough available nitrogen, phosphorus, potassium, calcium and magnesium to support normal plant growth. In the event of nutrient inadequacies, provisions shall be made to add required material prior to planting.
- B. To ensure conformance, samples of the import soil shall be submitted to an approved laboratory for analysis prior to and following backfilling.
- C. Obtain imported topsoil from approved local sources.
- D. Class A topsoil: good class A topsoil should be used as in the following definition. The soil must have a good structure. If necessary, the soil can be conditioned to help improve the physical soil properties.
 - 1. Topsoil shall be free of roots. Clods and stones larger than 1-inch in the greatest dimension, pockets of coarse sand, noxious weeds such as nut grass roots and nodules, sticks, brush and other litter. It shall not be infested with nematodes or other undesirable insects or plant disease organisms.
 - 2. Topsoil shall be friable and have sufficient structure in order to give good tilth and aeration to the soil. Total pore space content on a volume/volume basis shall be at least 15 percent when moisture is present at field capacity. Soil shall have a field capacity of at least 15 percent by weight.
 - 3. Gradation limits - Soil shall be a sandy loam, loam, or clay loam. The definition of soil texture shall be per the USDA classification scheme.

- E. Quality controls: All topsoils to be imported for the planting areas shall receive an "Agricultural Suitability Analysis" of soils before being placed in the planting areas. Soil shall be tested from the source site. There shall be 1 (one) test from each source site. After delivery to site the soil shall again receive 1 (one) soil test before final placement. These tests are to be collected at the site, by a local soil testing laboratory:
1. Sources:
 - a. Soil and Plant Laboratory, (714) 282-8777
 - b. Wallace Laboratories, (310) 615-0116
 - c. Or approved equal.
- F. Tests shall be submitted to the Architect for approval before placing soils. Tests shall include the following:
1. Must include pH measurement in the Saturation Extract, Electro conductivity of the saturation extract and Sodium Adsorption Ratio of the saturation extract. The approved procedures are the following:
 - a. PH: Method 21
 - b. Saturation Extract: Method 2
 - c. Sodium Adsorption Ratio: Method 20b
 - d. Methods of the United States Salinity Laboratory as published in the Agricultural Handbook Number 60 entitled "Diagnosis and Improvement of Saline and Alkali Soils".
 2. The following nutrients and elements must be determined with an approved extraction method. Interpretation data must be given citing concentrations, which are considered to be low, medium and high: boron, calcium, copper, iron, magnesium, manganese, molybdenum, phosphorus, potassium, sodium, sulfur, and zinc. The approved methods are those cited by the Council on Soil Testing and Plant Analysis and those methods currently used by soil scientists and agronomists and published in Communications in Soil Science and Plant Analysis, Soil Science and Soil Science Society of America Journal. Approved methods are Mehlich Number 3, Bray P1, Bray P2, Olsen P, DTPA, ammonium acetate, ammonium bicarbonate-DTPA, and hot water extract for boron.
 3. The saturated extract must be analyzed for calcium, magnesium, sodium, boron, chloride, nitrate, and sulfate.
 4. The following trace metals must be measured by the DTPA extract: Aluminum, arsenic, cadmium, chromium, cobalt, lead, lithium, nickel, selenium, silver, strontium, tin and vanadium.
 5. The presence of calcium carbonate and/or magnesium carbonate must be determined by commonly used methods.
 6. Soil Texture and Organic Matter content may be estimated or determined by commonly used methods.
 7. Interpretation of nutritional deficiencies or excesses and potential toxicities must be given.
 8. If required, determine the following by methods approved by the American Society of Agronomy as published in the Methods of Soil Analysis, methods of the United States Salinity Laboratory as published in the Agricultural Handbook Number 60 entitled "Diagnosis and Improvement of Saline and Alkali Soils," and bulk density of clods by the method published in Soil Science, vol 155, 325-330 (1993):
 - a. Exchangeable Ammonium cation

- b. Base Saturation
 - c. Cation Exchange Capacity
 - d. Carbonates Determination
 - e. Soil Bulk Density (Compaction)
 - f. Sand, Silt and Clay determination.
 - g. Water Infiltration Rate
 - h. Elemental determinations to be made according to methods approved by the EPA or by the American Society of Agronomy.
- G. Possible sources of class A topsoil:
1. Excavations or grading of native topsoil from undeveloped areas.
 2. Excavations or grading of topsoil from previously landscaped or formed areas.
 3. Excavations or grading of topsoil from previously non-landscaped or non-farmed areas if the soil is thoroughly evaluated for potential toxic materials.
 4. Soil supply companies supplying natural topsoil without excessive amending.
 5. Manufacturing of topsoil with less desirable soil as long as the soil has matured and developed the characteristics of class topsoil.
- H. Contractor Responsibilities.
1. Provide inspections, tests and similar quality control services as specified below. The Contractor will pay cost for these services.
 2. Employ and pay an independent agency to perform specified quality control services.
 3. Owner will engage and pay for services of an independent agency to perform inspections and tests, which are not required by the specification.
 4. Retest where results of required inspections, tests or similar services prove unsatisfactory workmanship and materials and do not indicate compliance with specifications regardless of whether the tests and services where not the responsibility of the Contractor will be paid by the Contractor.
- I. Owner Responsibility: Owner will provide and pay for inspections, tests and similar quality control services not specified.
- J. Duties of Testing Agency.
1. Retest where results of required inspections, tests or similar services prove unsatisfactory workmanship and materials and do not indicate compliance with specifications regardless of whether the tests and services where not the responsibility of the Contractor will be paid by the Contractor.
 2. An independent testing agency engaged to perform inspections, sampling and testing of materials shall cooperate with Architect and Contractor in performance of its duties and shall provide qualified personnel to perform required inspections and tests.
 3. The Agency shall notify Architect, owner and Contractor promptly of irregularities or deficiencies observed in the work or materials during performance of its services.
 4. Agency is not authorized to release, revoke, alter or enlarge requirements of specifications or approves or accepts any portion of work or materials.
 5. Agency shall not perform any duties of Contractor.

K. Submittals

1. Independent testing agency shall submit written report of each inspection, test or similar service to Architect and owner unless Contractor is responsible for service. If Contractor is responsible for service, submit written report of each inspection, test or similar service through Contractor.
2. Each source of topsoil shall be tested with representative submittal samples and at various depths. Soil shall be tested from the source site. There shall be a 1 (one) test from each source site. After delivery to site the soil shall again receive 1 (one) soil test before final placement. The owner reserves the right to test delivered materials at owner's expense. If any delivered material fails to meet the specifications, the material will be promptly removed from the site at the Contractor's expense. The Contractor shall pay for the testing of any materials not meeting specifications.

2.07 DECOMPOSED GRANITE MATERIALS

A. Decomposed Granite: Screen evenly and grade from 3/32" max to 0".

1. Sources:
 - a. Gail Materials, (951) 667-6106.
 - b. Southwest Boulder and Stone, (714) 882-1010.
 - c. Or approved equal.

B. Stabilized Binder

1. Patented, non-toxic, organic binder that is a colorless and odorless concentrated powder that binds decomposed granite.

2.08 EXCESS DECOMPOSED GRANITE MATERIALS

- A. Provide owner's authorized rep. with the following excess materials for use in future decomposed granite repair: One (1) 40 to 50 lb. Bags of the aggregate paving blended with proper amount of Stabilizer.

PART 3 EXECUTION

3.01 FINE GRADING

- A. Where any portion of irrigation system is installed after grading and fertilizing has been performed, refill and re-fertilize upper portion of backfill as specified herein.
- B. Fine Grading: Upon completion of rough grading, perform required fine grading of planted areas.
 1. Before and during preliminary fine grading, dig out and remove all weeds and grasses. Dispose of off-site at Contractor's expense.
 2. Remove all rocks larger than one half (1/2) inch in the upper 8" of soils.
 3. Do not work the soil when moisture content is such that excessive compaction will occur, nor when soil is so dry that clods will not break readily.
 4. Apply water, if necessary, to provide ideal density for cross-tilling and for planting.
 5. Grade to anticipate or match the certified finished grades and swales.
 - a. Remove or redistribute excess soil before the application of fertilizer and mulch.

- b. Where soil is to be replaced by plants and/or mulch, make allowance to prevent efficiency in the depth of mulch when final grading is completed.
 - c. Excess soil generated from the planting holes and not used as backfill or in establishing the final grades shall be removed from the site.
- C. Grades and Elevations: When weed abatement, soil preparation and amending is completed, and the soil has dried to be readily worked, fine grade planting areas to elevations shown on Contract Drawings.
- 1. Where grades are not otherwise indicated, provide uniform levels or slopes between points where elevations are given.
 - 2. Make minor adjustments of grade where so requested by the Owner's Representative.
 - 3. Provide finished grades which are even, uniform and without abrupt change of surface.
 - 4. Slope soil areas away from structures to allow natural runoff of water, regrade swale surfaces as required for a minimum 2% run-off, or as indicated on plan. Grade low spots and swales when soil is at optimum moisture content for working.
 - 5. Provide final finished soil grades in planter areas 2 inches below paving and curbs, or as shown on the Contract Drawings. Add mulch on top of soil.
 - 6. Compact all soil to final grades: minimum 80%, maximum 85%, unless otherwise required by soils report or for structural reasons.

3.02 SOIL TESTING, CONDITIONING, FERTILIZING, AND WEED ABATEMENT

- A. Soil Testing: Soils test on site shall be conducted twice:
- 1. After rough grading is complete
 - 2. Before planting commences, but after irrigation installment and soil amendments have been applied.
- B. Tests are to be collected at the site, and analysis and recommendations are to be made by a soil testing and analysis laboratory:
- 1. Sources:
 - a. Soil and Plant Laboratory, (714) 282-8777
 - b. Wallace Laboratories, (310) 615-0116
 - c. Or approved equal.
- C. The Contractor will pay for cost for these services. Copies of tests shall be submitted to the Architect. Contractor shall allow two weeks for each round of soil testing to take place.
- D. Weed Abatement: Determine that rodents and vermin are not present. If rodents and vermin are present control shall be undertaken by a licensed pest control applicator. Weed abatement shall be two grow-kill cycles. Anticipate at least 8 weeks for weed abatement. Contractor shall coordinate the scheduling of any spraying of herbicide to occur on a Friday afternoon or school holiday and shall notify the District one (1) week prior to applications in order for them to post notice. The irrigation system needs to be fully operational and be functioning prior to and during the weed and kill operation. Keep soils moist for 3 weeks. Spray all areas to receive lawn, shrubs or ground cover with herbicide. Keep soils moist for five weeks. Again spray all areas to receive lawn, shrubs or ground cover with herbicide. Follow the manufacturer's recommendations.
- E. After weed abatement, remove and dispose of all dead weeds, including roots.

- F. For existing turf areas to be removed, remove all turf, weeds and roots plus 1" of soil below.
- G. Soil Amendments for planting areas: Do not spread amendments until approval of delivered materials has been received from the IOR and Architect. Materials and amounts specified here are anticipated. This amendment is for bidding purposes and shall be superseded by recommendation of soil test/analysis report.
- H. Tilling: All planting areas in that are 90% soil compaction or above shall be cross-ripped 12" on center to a maximum depth of 10" below grade and follow with rototillage to reduce soil clods to a maximum diameter of 1 -inch in the top 8 inches. Remove stones and foreign matter over one half (1/2) inch in diameter from upper 8" of soil. Planting areas too small for power equipment shall be hand dug and tilled to a depth of 10" below grade. (All tilling shall be completed prior to adding conditioners and fertilizers, unless occupied by existing trees that remain in place) . Any part of the irrigation system, including heads, damaged during tilling shall be replaced with new equipment.
- I. Planting Areas: The following amendments are anticipated. Exact mix and quantities shall be per the recommendations from soil testing results. All planting areas shall receive the following:
 - 1. Gro-Mulch: 3 cubic yards per 1,000 square feet thoroughly mixed into the top 6" of soil for lawn, and 5 cubic yards per 1,000 square feet mixed into top 10" for shrubs and ground cover.
 - 2. Gypsum: 40 lbs./1,000 square feet thoroughly mixed into the top 6" of soil.
 - 3. Commercial fertilizer: 20 lbs./1,000 square feet thoroughly mixed into the top 6" of soil.
- J. Jute Mesh or Matting: Begin at the top of the slope by anchoring the jute mesh in a 6" by 6" wide trench with a 6" steel staple every 12". Backfill and compact the trench after stapling. Roll the blankets down the slope in the direction of the water flow. The edges of parallel rolls of jute mesh must be stapled with approximately a 2" overlap. When the pieces must be spliced down the slope, place the epics end over end (shingle style) with approximately 6" overlap. Staple through overlapped area approximately 12" apart. Also, put 1 staple per square yard all along the roll. Jute mesh is to be installed on all slopes 2-1/2:1 and greater. Repair and stabilize all jute mesh installation that is disturbed during planting installation.

3.03 PLANTING

- A. General:
 - 1. Verify that soils test has been conducted to confirm that amendments have been properly installed prior to commencing planting. Verify that any heads or any parts of the irrigation system damaged by tilling has been repaired, and complete system is operational.
 - 2. Plant all materials as soon as site is available and weather conditions are suitable.
 - 3. Do not plant when weather conditions are unfavorable to good work.
- B. Tree and Large Shrub Planting:
 - 1. Stake plant locations and get approval before excavating pits, making necessary adjustments as directed. Excavate all one gallon and larger plant pits to dimensions shown below.
 - 2. Excavate pits for all plants as shown on the planting details. Tree pits shall be of such a depth that after planting and settling, the crown of the plant shall be at or slightly above its original line of grade and the ball shall sit on compacted soil. The following are minimum sizes for shrub and tree pits:
 - a. 1-gallon plants: 12" diameter hole, depth per detail.

- b. 5-gallon plants: 24" diameter hole, depth per detail.
 - c. 15-gallon plants: 30" diameter hole, depth per detail.
 - d. Boxed trees shall be twice the width of the root ball or a minimum of one foot all around, whichever is greater.
3. Set in Agriform fertilizer tablets per manufacturer's recommendations.
 4. Compact backfill in bottom of pit and tamp firmly. Set plants in center of pits in vertical position so that the soil level of the crown of the plant is flush with or slightly higher than the finish grade after the soil has settled. Backfill with prepared soil mix as described above.
 5. Do not spread amendments/prepared soil mix until approval of delivered materials has been received from the IOR and Owner's Representative.
 6. Form a shallow basin around the edge of tree ball by depressing the soil slightly below the finish grade. Do not raise basin rims above general finished grade. Keep basin within the edges of the tree ball. Each basin shall be of a depth to hold at least two (2) inches of water.
 7. Apply root hormone to each tree as follows:
 - a. Construct tree basins at rim or outer edge of the tree ball so that the water will stay on the top of the ball.
 - b. Apply root hormone at a rate of 2 ounces to 2 gallons of water. Pour it on the top of the tree ball within the basin rim. Immediately after applying root hormone, fill the tree basin with water and allow it to settle within the soil. Repeat applications of clear water once or twice, depending on the condition of the tree ball or as directed by the Architect or Owner's Representative.
 - c. Tree balls shall be set in their pits before application of root hormone and shall be mulched immediately after its application and its irrigation into the ball.
 - d. Apply a second feeding of root hormone in the same manner and amount as above during the maintenance period or within 30 days after the tree is planted, whichever is longer.
 - e. Each tree with a trunk of 12" diameter or less, in a lawn or where string trimmers are used, shall receive a tree trunk guard, to installed per manufacturer's specifications.

C. Shrub Installation

1. Plant shrubs in areas as designated on the Drawings.
2. Grade shrub and ground cover areas 2" below top of walks and curb. Float to a smooth, uniform grade as shown on Drawings. All areas shall slope to drain.
3. Where no grades are shown, establish a smooth and continuous grade between existing or fixed controls such as walks, curbs, catch basins and elevations at steps or buildings. Roll, scarify, rake and level as necessary to make a true, even surface. All finish grades shall meet the approval of the Architect or Owner's Representative before installation of ground cover. All grades shall slope to drain.
4. Loosen soil to a depth of 12" in shrub area and grade to remove ridges and depressions. Remove any additional stones and foreign matter over one half (1/2) inch in diameter from upper 8" of soil. Float areas to finish grade. Apply soil conditioners as specified above, mixing thoroughly into the soil to the depths indicated.
5. Do not pile soil around the crown of any plant. Smooth soil around plants and leave all areas in a neat and clean condition.

6. Water with a light spray.
 - D. Mulching: Apply 'Walk on Bark' or approved equal to all planting areas to a depth of four inches (3"). (unless decomposed granite is noted to be placed between plant material - see Plan) Mulch shall not be piled upon plant stems and trunks.
 - E. Grading: Grade areas around plants to finish grades and dispose of excess soil off the site.
 - F. Pruning: Prune plants according to standard horticultural practice as needed or as directed by the Architect or Owner's Representative.
 1. Tree Trimmer Qualifications: Company specializing in pruning trees with proof of ISA Arborist Certification and ISA Tree Worker Certification.
 2. Tree Pruning: ISA - Pruning Standards for Shade Trees.
 - G. Staking: Stake all trees as shown on Drawings and details with stakes on the windward side of trees. Tie stakes so as to avoid abrasion of the tree. All nursery stakes and ties shall be removed after planting.
- 3.04 DECOMPOSED GRANITE
- A. Do not install decomposed granite or crushed 3/8" or 1/4" minus aggregate paving during rainy conditions or below 40 degrees Fahrenheit and falling.
 - B. Blending Stabilizer
 1. Blend 12 to 16 lbs (call manufacturer for exact blend) of Stabilizer per 1-ton of decomposed granite or crushed 3/8" or 1/4" minus aggregate screenings. It is critical that Stabilizer be thoroughly and uniformly mixed throughout decomposed granite or crushed 1/4" or 3/8" minus aggregate screenings. Bucket blending is not acceptable. Blending with a rake and or shovel is not acceptable.
 - C. Placement
 1. After pre-blending, place the Stabilized decomposed aggregate or 3/8" or 1/4" crushed aggregate screenings on prepared sub-grade. Level to desired grade and cross section.
 2. Depth of pathways - 3" for heavy foot traffic and light vehicles.
 - D. Watering
 1. Water heavily to achieve full depth moisture penetration of the Stabilized pathway Profile. Water activates Stabilizer. To achieve saturation of Stabilized pathway Profile, 25 to 45 gallons of water per 1-ton must be applied. During water application randomly test for depth using a probing device to the final depth.
 - E. COMPACTION
 1. Upon thorough moisture penetration, compact aggregate screenings to 85% relative compaction by compaction equipment such as; a 2 to 4-ton double drum roller or a 1,000 lb. Single drum roller with vibratory plate tamp. Do not begin compaction for 6 hours after placement and up to 48 hours.
 2. Take care in compacting decomposed granite or crushed 3/8" or 1/4" minus aggregate screenings when adjacent to planting and irrigation systems. Hand tamping with 8" or 10" hand tamp recommended.
 - F. INSPECTION

1. Finished surface of pathway shall be smooth, uniform, and solid. There shall be no evidence of chipping or cracking. Cured and compacted pathway shall be firm throughout profile with no spongy areas. Loose material shall not be present on the surface. Any significant irregularities in the path surface shall be repaired to the uniformity of entire installation.

3.05 INSPECTION, START OF MAINTENANCE

- A. Inspection: An inspection shall be made of all planted areas by the Owner's Representative or by the Architect when the landscape installation is complete. The maintenance period will begin after approval by the Owner's Representative or the Architect. The Contractor shall give at least 7 days' notice in advance of the inspection time. If the Owner wants early completion of any portion of the project, "start maintenance for that portion may begin following inspection and approval by the Owner's Representative or the Architect.
- B. Maintenance Period
 1. The 90-day Maintenance Period begins at the end of the substantial construction completion date for the entire project.
 2. The Maintenance Period shall be 90 calendar days.
 3. Any day when the Contractor fails to adequately maintain plantings, replace unsuitable plants, control weeds, trash or other work as determined necessary by the Grounds Supervisor, will not be credited as one of the plant maintenance days.

3.06 MAINTENANCE OF LANDSCAPE AREAS

- A. Maintenance
 1. Before the start of the 90-day Maintenance Period, the Contractor is responsible for maintaining the installation. This period of maintenance responsibility is not part of the 90 day Maintenance Period that begins when the entire project is installed, inspected, and approved for "Start of Maintenance". If the Contractor fails the final inspection, the 90-Day Maintenance Period will begin when the Owner's Representative and the Architect are satisfied that the project is ready for "Start of Maintenance."
 2. If the Maintenance Period is extended beyond the 90 Day time because of rejection by the Owner's Representative or by the Architect, or for whatever reason, then the entire installation will remain the responsibility of the Contractor unless otherwise determined by the Owner's Representative.
 3. The year's guarantee of the trees begins at the end of the Maintenance Period. Any rejected material shall be replaced, and the 90-Day Maintenance Period shall be started from that time for the replaced material only.
 4. Maintain trees and plants in a vigorous, thriving condition by watering, cultivating, pruning, spraying, and any other necessary operation. Keep all shrubs free of weeds. Remove weed roots and stolons from the soil before planting and as necessary after planting.
 5. No stripping of lower branches ("raising-up") of young trees shall be permitted. Lower branches shall be retained in a "tipped back" or pinched condition with as much foliage as possible to promote caliper trunk growth (tapered trunk). Lower branches can be cut flush with the trunk only after the tree is able to stand erect without staking or other support. Sucker growth shall be removed if deemed appropriate by the Grounds Supervisor. Any pruning shall be conducted by a Certified Arborist.

6. Prune trees to select and develop permanent scaffold branches that are smaller in diameter than the trunk or branch to which they are attached which have vertical spacing of from 18" to 48" and radial orientation so as not to over lay one another; to eliminate diseased or damaged growth; to eliminate narrow V-shaped branch forks that lack strength; to reduce toppling and wind damage by thinning out crowns; to maintain growth within space limitations; to maintain a natural appearance; to balance crown with roots. Any pruning shall be conducted by a Certified Arborist.
7. Evergreen trees shall be thinned out and shaped when necessary to prevent wind and storm damage. The primary pruning of deciduous trees shall be done during the dormant season. Damaged trees or those that constitute health or safety hazards shall be pruned at any time of the year as required to eliminate these conditions. Any pruning shall be conducted by a Certified Arborist.
8. Tree trunks shall be always protected from any damage by maintenance equipment. Do not allow weed whippers to touch tree trunks.
9. The objectives of shrub pruning are the same as for trees. Shrubs shall not be clipped into balled or boxed forms unless such is required by the design and directed by the Grounds Supervisor.
10. All pruning cuts shall be made to lateral branches or buds or flush with the trunk, "Stubbing" will not be permitted.
11. Maintain all planting areas by watering, weeding, replanting, and other necessary operations. Keep planting areas free from weeds by removing roots and stolons and keeping the area in a clean and acceptable condition through the end of the Maintenance Period.
12. The Contractor shall check weekly all systems for proper operation. Lateral lines shall be flushed out after removing the last sprinkler head or two at each end of the lateral. All heads are to be adjusted as necessary for unimpeded coverage.

3.07 FINAL INSPECTION

- A. Owner's representative shall make a final inspection upon completion of the specified Maintenance Period.
- B. Contractor shall request final inspection in writing a minimum of 10 calendar days prior to anticipated date of inspection.
- C. All areas shall be weed-free, rodent/vermin free, with healthy growth and full turf/lawn establishment at the final inspection.

3.08 CLEAN UP

- A. Upon completion of all construction and before final acceptance, the Contractor shall broom clean entire paved area. All tools, surplus materials, equipment, debris, and rubbish shall be removed from the site and the site shall be left in a clean, neat condition such as to meet the approval of the Owner's Representative and/or the Architect. During the Maintenance Period, all hardscape/paving areas and gutters shall be clear of debris, leaves, trash etc.

SECTION 32 91 13
SOIL PREPARATION

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. In-Place Amendment of Planting Area Soil Surfaces.
2. Plant Pit Backfill Mix.
3. Stabilized Lawn Planting Mix.

B. Related Sections:

1. Section 32 01 30 – Operation and Maintenance of Site Improvements
2. Section 32 84 00 – Planting Irrigation
3. Section 32 84 13 – Drip Irrigation
4. Section 32 90 00 – Planting

1.02 REFERENCES

A. ASTM — ASTM International: D 1557 — Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.

B. USDA — United States Department of Agriculture:

1. Soil Texture Triangle Classification.
2. Handbook No. 60.

1.03 DEFINITIONS

A. Acceptance, Acceptable, or Accepted: Acceptance by the Landscape Architect in writing.

B. Excessive Compaction: Planting area soil compaction greater than 75 percent of maximum dry density as determined by ASTM D 1557.

C. Landscape Architect: Landscape Architect employed by the Owner to provide professional landscape architectural services for the Project.

D. Drip Line: Line straight down from outermost limit of tree canopy branching.

1.04 SYSTEM DESCRIPTION

A. Backfill Mixes and Amended Planting Area Surface Soil: Uncompacted on-site soil with amendments incorporated uniformly to provide a well-draining, fertile medium for vigorous plant root growth.

- B. Soil Mixes: Uncompacted, imported topsoil with amendment incorporated uniformly to provide a well-draining, fertile medium for vigorous plant root growth.
- C. Structural Planting Soil Mix:
 - 1. Fast draining.
 - 2. Compacted to provide solid aggregate-to-aggregate contact to provide structural support for paving slabs and foundations of structures and sculptures.
 - 3. Uniform blend of aggregate and organic amendment that provides a fertile growing medium in the voids between the aggregate that retains moisture and nutrients for vigorous long-term plant root growth.
 - 4. Growing medium is not excessively compacted so that plant root growth is inhibited.

1.05 SUBMITTALS

- A. General Requirements: Refer to Division 1.
- B. Product Data:
 - 1. Chemical Amendments.
 - 2. Organic Soil Conditioner.
 - 3. Fertilizers.
 - 4. Polymeric Soil Conditioner.
 - 5. Organic Amendment.
 - 6. Coco Peat.
- C. Test Reports:
 - 1. Laboratory soil test reports indicating specified characteristics of soil, with test date no more than 2 weeks old.
 - 2. Laboratory soil test reports.
 - 3. Laboratory test report of organic amendment indicating specified characteristics of organic amendment, with test date no more than 2 weeks old.
 - 4. Sieve analysis of sand for sodded lawn planting mix with test date no more than 2 weeks old.
 - 5. Sieve analysis of sand for palm tree plant pit backfill mix.
- D. Purchase Documentation:
 - 1. Fertilizer Purchase and Delivery Invoices.
 - 2. Chemical Amendment Purchase and Delivery Invoices.

1.06 QUALITY ASSURANCE

- A. Requirements of Regulatory Agencies:
 - 1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.
 - 2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.

B. Agronomic Testing Agency:

1. Send samples to Wallace Laboratories, 365 Coral Circle, El Segundo, CA 90245, and employ the laboratory to test the soil mixes and import soils.

C. Settlement Mock-Up:

1. Mock-up areas of backfill mix at specified depths and apply irrigation to induce settlement, to help determine the amount of settlement which will be caused by irrigation and rain.
2. Use settlement observed in mock-up to help determine allowances to make for settlement as required by this Section and other Sections.

1.07 SITE CONDITIONS

A. Environmental Requirements:

1. Do not work soil when moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in the air or that clods will not break readily.
2. Apply water, if necessary, to bring soil to an optimum moisture content for tilling.
3. Do not work soil when muddy or frozen.
4. Do not apply chemicals if wind conditions will cause hazardous drift to people or property.

B. Existing Conditions:

1. Prior to Work commencement review and clearly mark in field horizontal and vertical locations of existing public underground utilities and structures with respective utility companies.
2. Prior to Work commencement review and clearly mark in field horizontal and vertical locations of existing private underground utilities and structures with the Owner's Designated Representative.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

A. Fertilizers:

1. Roots, Inc., Independence, Mo.; (800) 342-6173; www.rootsinc.com.
2. Vermi Technology Unlimited, Orange Lake, Fla; (352) 591-1111; www.vermitechnology.com.
3. Kelly's Green Team, Newark, Mo.; (660) 627-5500; www.kellysgreenteam.com.

B. Organic Amendments:

1. Earthworks Soil Amendments Inc.; (951) 782-0260; <http://www.ewsa.com>.
2. Aguinaga Green, Inc.; (949) 786-9558; <http://www.aguinagagreen.com>.

2.02 MATERIALS

A. Import Top Soil: Import top soil shall be classified as sandy loam, and must conform to the following:

1. Particle size

Class	Particle (Size Range)	Maximum %	Minimum %
a.	Coarse sand (0.5 - 2.0mm)	15	0
b.	Silt plus clay (<0.05mm)	50	15

Other classes:

c.	Gravel (2-13mm)	15	0
d.	Rock (1/2 – 1 inch)	5 percent by volume with none > 1 inch	

2. Chemistry

- Salinity: Saturation Extract Conductivity (ECe) - less than 3.0 sD/m @ 25° C
- Sodium: Sodium Absorption Ratio (SAR) - less than 6.0
- Boron: Saturation Extract Concentration - Less than 1.0 ppm
- Reaction: pH of Saturated Paste - 5.5-7.8 without high lime content

- Soil shall contain enough available nitrogen, phosphorus, potassium, calcium and magnesium to support normal plant growth. In the event of nutrient inadequacies, provisions shall be made to add required material prior to planting.
- To ensure conformance, samples of the import soil shall be submitted to an approved laboratory for analysis prior to and following backfilling.
- Obtain imported topsoil from approved local sources.

B. Organic Amendment:

- Fully composted aerobic humus compost without presence of decomposition products. The organic matter content shall be at least 50% on a dry weight basis. Humus material shall have an acid-soluble ash content of no less than 6% percent and no more than 20 percent.
- The pH of the material shall be between 6 and 7.5.
- The salt content shall be less than 10 millimho/cm at 25 degrees C on a saturated paste extract.
- Boron content of the saturated extract shall be less than 1.0 part per million.
- Silicon content (acid-insoluble ash) shall be less than 50 percent.
- Calcium carbonate shall not be present if the amendment is to be applied on alkaline soils.
- Types of acceptable products are composts, manures, mushroom composts, straw, alfalfa, peat mosses, etc., low in salts, low in heavy metals, free from weed seeds, free of pathogens and other deleterious materials.
- Composted wood products are conditionally acceptable (stable humus must be present). Wood-based products are not acceptable which are based on redwood or cedar.
- Sludge-based materials are not acceptable.
- Carbon-nitrogen ratio shall be less than 25:1.

11. The compost shall be aerobic without malodorous presence of decomposition products.
12. The maximum particle size shall be 0.5-inch and 80 percent or more shall pass a No. 4 screen for mixing with soil. The maximum particle size for applying via hydroseeding machine shall be 0.25-inch.
13. Maximum total permissible pollutant concentrations in organic amendment in parts per million on a dry-weight basis:
 - a. Arsenic: 20
 - b. Cadmium: 15
 - c. Chromium: 300
 - d. Cobalt: 50
 - e. Copper: 100
 - f. Lead: 200
 - g. Mercury: 10
 - h. Molybdenum: 20
 - i. Nickel: 100
 - j. Selenium: 50
 - k. Silver: 10
 - l. Vanadium: 50
 - m. Zinc: 200
14. Higher amounts of salinity or boron may be present if the soils are to be pre-leached to reduce the excess or if the plant species will tolerate the salinity and/or boron.
15. From 45- to 65-percent moisture measured via wet-weight basis.
16. Free of stones and debris.
17. Tests 5 to 8 on Solvita Test.

C. Fertilizers:

1. Roots "M-Roots" with mycorrhiza 3-3-3.
2. Kelley's Green Team Gypsum Fairway Pellets, 76-percent calcium sulphate dehydrate, 17-percent calcium; 14-percent sulfur, derived from mined gypsum, less than 1-percent moisture content.
3. Vermi Technology pure black worm castings produced without waste products; free of larva, sticks, stones, and debris; 48 percent by weight minimum organic content per ASTM D2974; complying with the following:

Item	Criteria
a. Total Ash	48 percent to 52 percent
b. pH:	5.0 to 7.5
c. % Moisture (wet wt. basis:	30 percent to 50 percent
d. Solvita Rating:	> 8

D. Potential Chemical Amendments Required by Accepted Amendment Program and Backfill Mix:

1. Ground Limestone: Agricultural limestone containing not less than 85 percent of total carbonate, ground to such fineness that 50 percent will pass No. 1 sieve and 90 percent will pass No. 20 sieve.
 2. Dolomite Lime: Agricultural grade mineral soil conditioner containing 35 percent minimum magnesium carbonate and 49 percent minimum calcium carbonate, 100 percent passing No. 65 sieve.
 3. Gypsum: Agricultural grade product containing 80 percent minimum calcium sulfate.
 4. Iron Sulfate (Ferric or Ferrous): Supplied by a commercial fertilizer supplier, containing 20 to 30 percent iron and 35 percent to 40 percent sulfur.
 5. Sulfate of Potash: Agricultural grade containing 50 to 53 percent of water-soluble potash.
 6. Single Superphosphate: Commercial product containing 20 to 25 percent available phosphoric acid.
 7. Ammonium Sulfate: Commercial product containing approximately 21 percent ammonia.
 8. Ammonium Nitrate: Commercial product containing approximately 34 percent ammonia.
 9. Calcium Nitrate: Agricultural grade containing 15-1/2 percent nitrogen.
 10. Urea Formaldehyde: Granular commercial product containing 38 percent nitrogen.
 11. IBDU (Iso Butyldiene Diurea): Commercial product containing 31 percent nitrogen.
 12. Soil Sulfur: Agricultural grade sulfur containing a minimum of 96 percent sulfur.
 13. Silicic Acid Calcium: Commercial grade.
- E. Polymeric Soil Conditioner: Twenty to 25 percent anionic polyacrylamide, water-soluble, linear, 7,500,000-dalton, soil aggregating polymer containing a minimum of 20,000 soil binding sites proven to be efficacious.
- F. Sand for Stabilized Lawn Mix: TLC USGA Greens Sand (909) 594-2696.
- G. Soil Reinforcement Fiber for Stabilized, Civic Green Lawn Mix: Stalok Fiber G-400 as available from Stabilizer Solutions, Phoenix, AZ; (800) 336-2488; www.stabilizersolutions.com.
- H. Sand for Structural Soil Mix: TLC USGA Greens Sand (909) 594-2696.

2.03 MIXES

- A. Preliminary Plant Pit Backfill and Shrub Import Profile Mix to Establish Bid (actual quantities contingent on amendment program determined by the soil test report):
1. Content:
 - a. 8 cubic feet of organic amendment per cubic yard of dry import topsoil.
 - b. 1-pound dry polymeric soil conditioner per cubic yard of dry soil.
 - c. 1/2-pound Triple Superphosphate 0-45-0 per cubic yard of dry soil.
 - d. 1-pound of Nitroform 38-0-0 per cubic yard dry soil.
 - e. 1-pound of Potassium Sulfate 0-0-50 per cubic yard dry soil.
 - f. 2-pound of Gypsum per cubic yard dry soil.
 2. Mixing:

- a. Blend materials uniformly with 50 percent dry existing soil excavated from plant pits and 50 percent dry imported topsoil in bulk by turning over materials with an end loader.
 - b. Blend materials in a clean area which will not contaminate the mix.
 - c. Do not mix in planting areas.
- B. Final Plant Pit Backfill Mix for Installation: Backfill mixes determined by the soil test report.
- C. Preliminary In-Place Amendment of Planting Area Surfaces to Establish Bid (actual quantities contingent on amendment program determined by the soil test report):
1. Rip existing soil to a depth of 9 inches and homogeneously incorporate the following amendments to a 6 inches depth (rates are per 1,000 square feet):
 - a. Ammonium Sulfate (21-0-0) – 5 lbs.
 - b. Potassium Sulfate (0-0-50) - 5 lbs.
 - c. Triple Superphosphate (0-45-0) – 5 lbs.
 - d. Agricultural gypsum – 15 lbs.
 - e. High quality soil amendment – 3 cubic yards.
- D. Final In-Place Amendment of Planting Area Surfaces: Determined by the soil test report.
- E. Sodded Lawn Planting Mix:
1. Sand with peat moss.
 2. Ten pounds of nylon fibers per ton of sand.
- F. Structural Soil Mix:
1. Mix to Establish Bid: 3 parts USGA Greens Sand, 1 part composted organic amendment with peat moss.
 2. Final Mix for Construction: Job Mix Formula determined by the Testing Laboratory
- 2.04 SOURCE QUALITY CONTROL
- A. Organic Amendment: Employ independent soil testing laboratory to test organic amendment for specified properties and submit test results.

PART 3 EXECUTION

3.01 EXAMINATION

- A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
- B. Subgrade:
1. Verify that the subgrade is at the correct elevation and slope.
 2. Inspect soil surface for sticks, oils, chemicals, plaster, concrete, and other deleterious materials.

3. Remove deleterious materials.
- C. Underground Utilities and Structures: Verify that the locations of utilities, structures and other underground items have been clearly marked.
- D. Notification of Unsuitable Conditions: Before proceeding with Work, notify the Owner's Designated Representative in writing of unsuitable conditions and conflicts.
- E. Soil Tests to Determine Final Plant Pit Backfill Mix, Planting Area Soil Surface Amendment Programs, and Maintenance Period Fertilization Programs:
1. Take fifteen 1-pound composite representative soil samples from locations determined by the Landscape Architect in the field.
 2. Send samples to Wallace Laboratories, 365 Coral Circle, El Segundo, CA 90245, and employ the laboratory to test the soil samples for the following:
 - a. pH measurement in the saturation extract per USDA Handbook No. 60, Method 21.
 - b. Electrical conductivity of the saturation extract per USDA Handbook No. 60, Method 2.
 - c. Sodium absorption ratio of the saturation extract per USDA Handbook No. 60, Method 20b.
 - d. Determination of boron, calcium, copper, iron, magnesium, manganese, molybdenum, phosphorous, potassium, sodium, sulfur, and zinc, via the following test methods: Mehlich Number 3, Bray P1, Bray P2, Olsen P, DTPA, ammonium acetate, ammonium bicarbonate DTPA, and hot water extract from boron.
 - e. Analysis of saturation extract for calcium, magnesium, sodium, boron, chloride, phosphorous, nitrate, and sulfate.
 - f. Measurement of following trace metals by the DTPA extract: aluminum, arsenic, cadmium, chromium, cobalt, lead, lithium, nickel, selenium, silver, strontium, tin, and vanadium.
 - g. Presence of calcium carbonate and magnesium carbonate.
 - h. Estimate of soil texture per commonly used methods.
 - i. Estimate of organic matter content per commonly used methods.
 - j. Exchangeable Ammonium Cation.
 - k. Base Saturation.
 - l. Cation Exchange Capacity.
 - m. Carbonates Determination.
 - n. Soil Bulk Density.
 - o. Water Infiltration Rate per USDA Handbook No. 60, Method 34b.
 3. At least 30 days prior to commencement of soil preparation Work, submit to the Landscape Architect the laboratory's written soil test report including the laboratory's soil test data; the laboratory's interpretation of nutritional deficiencies, excesses, and potential toxicities; the laboratory's amendment recommendations; and the laboratory's maintenance recommendations.
- F. Soil Tests for Parasitic Nematodes:

1. Test soils which have been used for agricultural purposes within the prior 12 months for parasitic nematodes.
2. Soil will be acceptable if the parasitic nematode population is less than 200 per 50 cubic centimeters of soil.
3. Do not artificially dry soil prior to testing.
4. Submit written test report to the Architect/Engineer and Horticultural Consultant.

G. Soil Tests for Herbicide Contamination:

1. Perform a radish/rye grass growth trial on soils suspected of herbicide contamination.
2. Submit written test report to the Architect/Engineer and Horticultural Consultant.

3.02 WEED ERADICATION PROGRAM OF EXISTING VEGETATION AT PLANTING AREAS

- A. Six weeks prior to planting and before tilling or amending planting areas, spray existing vegetation with 3 percent Glyphosate solution and repeat treatment 3 weeks later to kill re-emerging vegetation.

3.03 PREPARATION OF SUBGRADE TO RECEIVE IMPORTED SOIL MIXES

A. Protection:

1. Use every possible precaution to prevent damage to existing conditions such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the Work.
2. Use every possible precaution to prevent excessive compaction of planting area soil within or adjacent to the areas of Work.
3. Provide barricades, fences, or other barriers to protect existing conditions to remain from damage and excessive compaction during construction.
4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
5. Submit written notification of conditions damaged during construction to the Owner's Designated Representative immediately.

B. Ripping Subgrade Soil:

1. Prior to placing topsoil, rip areas to receive topsoil on the same day topsoil is placed.
2. Rip subgrade twice to a depth of 6 inches unless indicated otherwise.
3. Space ripping tines at 24 inches on center.
4. Make second ripping pass in a direction 90 degrees to the direction of the first ripping pass.
5. Do not rip closer than 2 feet horizontally and vertically to installed and existing utility lines and structures.

C. Location and Depths: As indicated on the Drawings.

D. Mix Placement:

1. Place soil mixes same day that subgrade soil ripping occurs and prior to vehicle or equipment traffic running over the ripped surface.

2. Place soil mixes with equipment of appropriate size for area and in a manner that avoids excessive compaction of the topsoil.
 3. Avoid repeatedly driving equipment on the same tracks so that topsoil does not become excessively compacted.
- E. Allowances: Place topsoil to elevations that allow for settlement, addition of soil amendment, and finish grading tolerances.
- F. Finished Grade: See Section 32 91 19.
- G. Surface Drainage: Keep soil surface sloped so that surface drains.
- H. Compaction and Contamination:
1. In handling materials and operating tools and equipment, protect the topsoil from excessive compaction by laying down planks, plywood, or other accepted protective devices.
 2. Do not store or stockpile materials on the topsoil.
 3. Do not allow vehicles to park or drive on topsoil, except equipment which is preparing and finish grading the soil.
 4. If ruts are formed, blade rutted topsoil smooth.
 5. Loosen excessively compacted soil to the full depth of the excessive compaction, rototill, and grade surface smooth.
- I. Excessively Compacted Topsoil:
1. Mechanically loosen excessively compacted topsoil to its full depth via a method acceptable to the Landscape Architect and re-grade surface smooth.
 2. Keep topsoil from being excessively compacted until date of Final Completion.
- J. Erosion Repair:
1. Repair erosion that occurs between topsoil installation and plant or seed installation.
 2. Fill eroded areas with topsoil and finish grade.
- 3.04 PREPARATION OF SOIL SURFACE OF PLANTING AREAS
- A. Protection of Existing Conditions:
1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
 2. Use every possible precaution to prevent excessive compaction of planting area soil within or adjacent to the areas of Work.
 3. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction.
 4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 5. Submit written notification of damaged plants and structures to the Owner's Designated Representative immediately.
- B. Surface Preparation:

1. Inspect soil surface for sticks, oils, chemicals, plaster, concrete, and other deleterious materials.
2. Do Work required to remove and dispose of the deleterious materials.

C. Excessively Compacted Areas:

1. Where tilled planting soil or imported planting soils have become compacted more than 75-percent maximum dry density per ASTM D 1557 rip soil to 4 inches below the depth of the excessive compaction.
2. Space ripping tines at 18 inches on center.

3.05 AMENDMENT OF SOIL SURFACE OF PLANTING AREAS

- A. Preliminary Amendment Program to Establish Bid for existing soil Areas in Planting Areas Not to Receive Topsoil: 3 cubic yards of organic amendment per 1,000 square feet, 9 pounds of Nitroform 38-0-0 per thousand square feet, and 2.5 pounds of Triple Superphosphate 0-45-0 per thousand square feet, 10 pounds of Potassium Sulfate 0-0-50 per 1,000 square feet, 20 pounds of polymeric soil conditioner per 1,000 square feet, 30 pounds of Gypsum per 1,000 square feet.
- B. Preliminary Amendment Program to Establish Bid for Areas with Imported Topsoil: 6 cubic yards of organic amendment per 1,000 square feet, 20 pounds of polymeric soil conditioner per 1,000 square feet, 20 pounds of Nitroform 38-0-0 per 1,000 square feet, 10 pounds of Potassium Sulfate 0-0-50 per 1,000 square feet, and 5 pounds of Triple Superphosphate 0-45-0 per 1,000 square feet, 30 pounds of Gypsum per 1,000 square feet.
- C. Final Amendment Programs for Installation: Determined by soil test report results.
- D. Amendment Incorporation:
 1. Spread dry amendments evenly over surface of dry soil with a drop spreader.
 2. Organic amendment and soil must be dry.
 3. Incorporate amendments uniformly within top 6 to 8 inches of soil within a few hours after amendment application, except at areas within drip lines of existing trees to remain.
 4. At areas within drip lines of existing trees to remain, incorporate amendments uniformly to 1 to 2-inch depth within a few hours after application.
 5. Mechanically incorporate the amendments into the soil via a method that will not excessively compact the soil below incorporated amendments.
 6. To activate polymeric conditioner, irrigate soil very slowly so that soil surface will not form a crust and until water penetrates 6-inch depth.
 7. Allow soil to dry until stringiness disappears.
 8. Prior to planting, re-till soil to a 6-inch depth at areas outside of drip lines of existing trees to remain and re-till soil to a 1 to 2-inch depth at areas within drip lines of existing trees to remain.

3.06 STRUCTURAL PLANTING SOIL MIX

A. Placement:

1. Place mix carefully avoiding damage or displacement of other materials such as walls, paving, waterproof membrane, protection board, drain rock, geotextile fabric, and irrigation piping.

2. Do not mix subgrade soils or construction materials with soil mix.
3. Remove soil mix contaminated with subgrade soil, construction materials, or debris.
4. Place soil mix to depths, elevations, and profiles indicated on the Drawings.

B. Compaction:

1. Place soil mix in 6-inch lifts.
2. Compact each lift to 90 percent of maximum density achievable.

C. Settlement Repair: Fill settled low areas with soil mix and repeat compaction and filling process until settlement ceases.

D. Fertilizer Application after Soil Mix Placement:

1. Apply gypsum pellets at rate of 20 pounds per 1,000 square feet.
2. Apply 3-3-3 at rate of 20 pounds per 1,000 square feet.
3. Uniformly spread half of each fertilizer in one direction and spread other half of each fertilizer in direction 90 degrees to direction that first half was spread.
4. Sprinkle surface of soil mix with 2 inches of water after application of fertilizers.

3.07 FIELD QUALITY CONTROL

A. Soil Amendment Verification:

1. Employ the same soil testing laboratory used to test the soil as indicated in Article 3.1 E of this Section, to take up to 10 random composite samples of amended soil surface areas and soil mixes for laboratory testing to verify amendment composition.
2. Perform corrective work as recommended by the laboratory soil test reports.
3. When a laboratory soil test indicates that the soil or soil mixes meet the requirements of the Specifications the Contractor will receive written notification of acceptance from the Landscape Architect.
4. Installation of ground cover plants and seed may commence upon Contractor's receipt of the written notification of acceptance.

END OF SECTION

SECTION 32 92 19

SEEDING

PART 1 GENERAL

1.01 WORK INCLUDED:

- A. Furnish all labor, material, equipment, and services necessary to provide all seeding and hydromulching, complete and in place, as shown and specified.
- B. Work includes:
 - 1. Preparation
 - 2. Option 1: Hydromulching
 - 3. Option 2: Land Imprinting
 - 4. Option 3: Drill Seeding
 - 5. Application of mycorrhizal inoculum
 - 6. Cleanup

1.02 RELATED SECTIONS

- A. Section 32 01 30 – Operation and Maintenance of Site Improvements
- B. Section 32 84 00 – Planting Irrigation.
- C. Section 32 84 13 – Drip Irrigation.
- D. Section 32 90 00 – Planting

1.03 REFERENCES

- A. Latest version of American Society for Testing and Materials (ASTM) standards: ASTM D 422. Standard Test Method for Particle-Size Analysis of Soils.

1.04 SUBMITTALS AND NOTIFICATIONS

- A. Submit documentation to Architect within twenty-five (25) days after award of Contract that all required seed is available. No substitutions may be made without the approval of the Architect. Requests for substitutions due to unavailability must be made in writing.
- B. Materials List and Seed Certification:
 - 1. A complete material list shall be submitted to the Architect prior to performing any work. Material list shall include all hydromulches, binders, seed, etc.
- C. Submit to the Architect a one-pound sample of each type of seed mix specified.
 - 1. The sample shall be drawn from the same lots used for the seeding work.
 - 2. A Registered Seed Technologist shall have tested all seed at a Certified Seed Laboratory within 15 months of delivery to the site.

3. Attach seed tags and test copies for each lot of seed.
- D. The Contractor shall notify the Architect in writing a minimum of 7 days prior to starting seeding work. The notice shall state the equipment to be used (including manufacturer's data sheets), the date and time that operations will start, and the name of the person in the field who will oversee the work.
- E. If work is interrupted for reasons other than inclement weather, the Contractor shall notify the Architect a minimum of 24 hours prior to the resumption of work.

1.05 SOIL TEST:

- A. The contractor shall have imported soil and the soil of the site tested for fertility, agricultural suitability, and appraisal by Soil and Plant Laboratory Inc. (714) 282-8777, or Wallace Labs (310) 615-0116.
 1. The contractor will inform the laboratory, prior to test analysis, of the seed mix to be planted, and that mycorrhizal inoculum will be used.
 2. Soil shall be tested from a minimum of four (4) locations per acre of planted area. Contractors shall record locations where samples were taken.
 3. A copy of the soil test results shall be submitted to the Owner and Architect before work begins.
 4. Contractor shall pay cost of soil test.

1.06 STANDARDS:

- A. A Registered Seed Technologist shall have tested all seed at a Certified Seed Laboratory within 15 months of delivery to the site.
- B. Provide seed that meets or exceeds specifications of Federal, State, and County laws requiring inspection for plant disease or insect control.
- C. Provide seed that is true to botanical name. In all cases, botanical names shall take precedence over common names.
- D. Workmanship: Perform work in accordance with the best standards of practice for landscape work and under the continual supervision of a competent foreman capable of interpreting the drawings and specifications.

1.07 VERIFICATION OF DIMENSIONS AND QUANTITIES:

- A. All scaled dimensions are approximate. Before proceeding with any work, carefully check and verify all dimensions and quantities and immediately inform the Architect of any discrepancy between the drawings and/or specifications and actual conditions. No work shall be done in any area where there is any such discrepancy until the Architect has given approval for the work.

1.08 OBSERVATION SCHEDULE

- A. Contractor shall be responsible for notifying the Architect in advance for the following observations according to the time indicated:
 1. Pre-construction conference - 7 days
 2. Seeding area layout review - 72 hours
 3. Seeding operations - 48 hours

4. Completed seeding - 7 days.

- B. Contractor shall be responsible for scheduling site Observation visits with Architect as work progresses. Failure to schedule required Observations shall not relieve Contractor of responsibility for obtaining approvals. Work that must be redone to satisfy these requirements shall be done by the Contractor at no cost to Owner.
- C. Observations may be waived or combined at the discretion of the Architect.
- D. When someone other than the Architect conducts Observations, the Contractor shall show evidence in writing of when and by whom these observations were made.
- E. No site visits shall commence without adequate preparation, or all items noted in previous Observation Reports either completed or remedied unless the Architect has waived such compliance. Failure to adequately prepare or accomplish previous punch list items shall make the Contractor responsible for reimbursing the Architect for the site visit at his current billing rates per hour plus transportation costs. No further inspections will be scheduled until this charge has been paid and received.

1.09 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver all seed to the jobsite in unopened containers with legible identification labels. Each seed package shall have a complete seed test analysis attached, stating seed lot number, botanical species, dealer's guarantee of percentage of Purity, Inert, Crop, and Weed, as well as Germination, test date, and certificate or stamp of release by a County Agriculture Commissioner.
- B. Store seed material in shade and protect from weather or injury. Maintain in a dry condition, and at a consistent temperature. Architects may at any time reject seed not maintained in this condition.
- C. Deliver non-seed products to site in original unopened containers bearing manufacturer's guaranteed chemical analysis, name, trademark, and conformance to state law. Protect material from damage or breakage. Immediately remove empty containers from the site.

1.10 SAMPLES AND TESTS:

- A. Architects reserve the right to take and analyze samples of materials for conformity to specifications at any time.
- B. Contractor shall furnish samples upon request by Architect.
- C. Rejected materials shall be immediately removed from the site at the Contractor's expense.
- D. Contractor shall pay the cost of testing of materials that do not meet specifications.

1.11 WARRANTY AND REPLACEMENT

- A. The contractor shall reseed any poorly or inadequately germinated areas until each area has germinated a full and healthy stand of the specified plant species.

PART 2 PRODUCTS

1.12 SEED

- A. Fresh, clean, new crop seed.
 - 1. For slurry applications: mechanically mix to specified proportions.
 - 2. For drill applications: mix for appropriate seed boxes.
 - 3. For imprinting applications: mix according to these specifications.

1.13 SOIL AMENDMENTS

- A. Soil amendments shall be as required by the Soils Test.
- B. The contractor shall provide all amendments recommended by the Soils Report at no additional cost to Owner.

1.14 MYCORRHIZAL INOCULUM

- A. Mycorrhizal inoculum shall consist of spores, mycelium, and mycorrhizal root fragments in a solid carrier suitable for handling by hydro-seeding or dry seeding equipment. The carrier shall be the material in which the inoculum was originally produced, and may include organic materials, vermiculite, perlite, calcined clay, or other approved materials consistent with mechanical application and with good plant growth.
- B. Mycorrhizal fungal species shall be suitable for the ph of the soil at the planting site and for the use of the seeds being sown. If the inoculum consists of a mixture of species, no more than 20% of the claimed propagule count shall consist of fungal species known to be unsuitable for the ph of the soil at the planting site.
- C. Mycorrhizal inoculum is a live material. It shall be stored, transported, and applied at temperatures of less than 32° F or greater than 90° F.
- D. Inoculum shall have a guarantee of at least 220 live propagules per kilogram (100 live propagules per pound). Inoculum shall be applied at the rate of 67 kilograms per hectare (60 lb. per acre).

1.15 HYDROMULCHING FERTILIZERS:

- A. Soil additives and fertilizers will be as recommended by the required Soils Test.

1.16 FIBER MULCH:

- A. Fiber mulch shall be derived from recycled newsprint paper and dyed green, such as 'Enviro Fiber S-100 Hydroseeding Mulch' (no known equal). Newsprint is proven superior in water-holding capacity, seed protection and stability.
- B. Application rate: 2000 pounds per acre.
- C. Wood fiber mulch is not acceptable.

1.17 SOIL STABILIZER BINDER ADDITIVE:

- A. Shall be an organic hydromulching tackifier additive composed of finely ground muciloid outer layer of a seed.

PART 3 EXECUTION

1.18 INSPECTION AND ORGANIZATION

- A. Site acceptance:
 - 1. The Contractor shall be responsible for verifying grades and site conditions before beginning work.
 - 2. No change in Contract price will be allowed for actual or claimed discrepancy between existing grade and those shown on the plan after Contractor has accepted existing grades and moved on the site.
 - 3. The Contractor shall be responsible for any damage seedlings after installation prior to acceptance by Owner.
- B. Scheduling: Perform seeding only when weather and soil conditions are suitable, as approved by Architect.
 - 1. Finish grading shall be complete prior to seeding.
 - 2. The irrigation system shall be operational and approved prior to seeding.
 - 3. In areas where applicable, install trees and shrubs prior to seeding.

1.19 AREA PREPARATION

- A. Topsoil shall not be stripped and shall remain in place.
- B. Complete clearing and grubbing to the Architect's satisfaction. At time of seeding, the surface of all areas to be seeded shall be free of large stones, sticks, stumps, or other deleterious matter one inch in diameter or larger, and shall be free from all wire, plaster, construction debris of any kind, or similar objects that would be a hindrance to seeding or maintenance.
- C. Stage the clearing work in areas small enough to insure that seed application will take place before any significant soil erosion will occur. The Contractor shall be responsible for preventing and repairing any soil erosion that occurs during the area preparation.
- D. Clearing and weed control (level areas) - Approximately 3 weeks are needed to complete proper weed abatement. December through February are preferred months for this operation. Schedule may be extended or adjusted depending on weather conditions: colder temperatures and rainfall can add several weeks to the effectiveness of the work.
 - 1. Apply irrigation to encourage weed growth prior to clearing, and to maintain moisture in the soil.
 - 2. Clear weed growth to expose bare soil.
 - 3. Lightly disk to a depth of three inches, followed by a heavy roller.
 - 4. Perform one "grow and kill" cycle after first disking and prior to seeding:
 - a. Watering and fertilizing to encourage weed germination.
 - b. Follow with a second light harrowing or disking to kill the weeds.
 - 5. A heavy roller should be used behind the disc. The second disking ("grow and kill") may also be the final seedbed preparation if seeding immediately follows.
 - 6. Prepare the seed bed immediately prior to seeding on slopes five to one (5:1) or flatter by lightly tilling, harrowing, or disking the soil to a depth of 3".

- E. Clearing and weed control (slopes) - Approximately 6-8 weeks are needed to complete proper weed abatement. December through February are preferred months for this operation. Schedule may be extended or adjusted depending on weather conditions: colder temperatures and rainfall can add several weeks to the effectiveness of the work.
1. The guidelines outlined below are for two full herbicide applications and thorough clearing of the slopes of treated vegetation prior to applying new hydroseed material.
 2. The goal is to hydroseed in the first part of March to benefit from the spring growing season.
 3. Regular inspections and diligence are necessary during all stages of weed abatement.
 - a. Apply contact herbicide to all slope areas after seasonal rains and overhead irrigation has helped germinate weed seeds and 3" to 4" of vegetative growth has occurred. Apply contact herbicide thoroughly to all plants per Manufacturer's guidelines.
 - b. After several days, provide more irrigation on slopes to help encourage plant growth.
 - c. Inspect weed kill progress for 1-2 weeks. Begin removal of dead vegetation where weed kill is successful and rake to remove excess foliage.
 - d. Continue regular irrigation of slopes to encourage additional seed germination for two more weeks.
 - e. Repeat application of herbicide to kill any new seedlings.
 - f. If the weather is cool and overcast, weed growth should be allowed to continue for 3-4 weeks to achieve optimum germination.
- F. Apply soil amendments specified in the Soils Report at the time of the final seedbed preparation at the rates specified.
- G. Prior to seeding, make light applications of irrigation to achieve the optimum germination moisture level in the soil.
- H. Contractor shall be responsible for shaping all seeding areas as indicated on plans or as directed by Architect. Layout and preparation are to be approved by Architect before seed application begins.
- 1.20 APPLICATION OF MYCORRHIZAL INOCULUM BY DRY BROADCASTING
- A. Mycorrhizal inoculum may be incorporated into the hydroseed mix or imprinting operation. If incorporation with the seeding operation is not possible, use the dry broadcast method outlined here.
 - B. Mycorrhizal inoculum shall be broadcast on the soil surface by means of a mechanical device that does not grind or unduly compress the carrier granules or fungal spores.
 - C. The inoculum shall be incorporated into the soil within three hours of broadcasting. Incorporation shall be accomplished by disking, tilling, harrowing, track walking, or ripping the soil, and shall result in incorporation of 80% of the inoculum granules to a depth of 2 to 10 cm (1 to 4 inches).
 - D. Inoculum shall be placed prior to application of seeds.
- 1.21 OPTION 1 - HYDROSEED APPLICATION:

- A. Application of mycorrhizal inoculum by hydro-seed equipment
1. Mycorrhizal inoculum shall be applied in the same application as the seeds. In no case shall Mycorrhizal inoculum be applied after the seeds. Inoculum must be applied within one hour of addition to the mixing tank.
 2. The following mixture in the proportions indicated shall be applied with hydroseeding equipment within 60 minutes after the seed has been added to the mixture:
 3. If temperatures will exceed 90° F, remaining erosion control applications must be applied within three hours of the application of the inoculum.
- B. Hydroseed shall be applied in a two step process with an approximate 24 hour drying time between steps. The first step is hydraulic application of the seed and soil amendment slurry directly to the soil surface. The second step is hydraulic application of the germination layer over the top of the seed. The germination layer consists of fiber mulch and tackifier slurry.
1. Prepare and apply slurries in the proportions and quantities stated on the contract drawings.
 2. Slurry preparation shall take place at the work site and shall begin by adding water to the tank when the engine is at half throttle.
 3. Equipment:
 - a. Hydraulic equipment used for the application of the fertilizer, seed and slurry of prepared wood pulp shall have a built-in agitation system and operating capacity sufficient to agitate, suspend and homogeneously mix a slurry containing not less than 40 lbs. of fiber mulch plus a combined total of 7 lbs. additive solids for each 100 gallons of water.
 - b. The slurry distribution lines shall be large enough to prevent clogging and shall be equipped with a set of hydraulic spray nozzles that will provide a continuous non-fluctuating discharge.
 4. Application: The operator shall spray with a uniform visible coat, using the color of the applied slurry as a guide. Apply the slurry in the correct amount to distribute the specified quantities over the specified areas.
 5. Time Limit: all slurry mixture which has not been applied within two hours after mixing will be rejected and removed from the project and disposed of at the Contractor's expense.
 6. Protection: The Contractor shall exercise special care to prevent any of the slurry from being sprayed outside the designated areas. Any slurry spilled into restricted areas shall be cleaned up at the Contractor's expense to the satisfaction of the Architect.
 7. Immediately following application of hydromulch, the Contractor shall wash excess material from trees, shrubs, fences, valve boxes, equipment markers, or architectural features. Care shall be exercised to avoid washing or eroding mulch materials from the area.

1.22 OPTION 2 - DRILL SEEDING APPLICATION:

- A. Apply soil amendments specified by the Soils Report at the time of the final seedbed preparation at the rate specified.
1. Prior to seeding, make light applications of irrigation in order to achieve the optimum germination moisture level in the soil.
 2. Apply seed mixes specified on the contract drawings by mechanical seed drill designed for drilling native grass seed mixes. The drill shall have separate boxes for large, medium, and small seeds. Mix vermiculite with the seed mixes as necessary to achieve

optimum balancing of seed rates. Test and calibrate the drill rig over a concrete surface to ensure the proper rates are being delivered. A minimum of 150 live seeds per square meter shall be planted.

3. The drill shall open the seedbed, deliver the seed to the proper depth, and close the soil over the seed.
4. A heavy roller shall follow the drill and compress the seed in the seedbed to ensure the seed is in firm contact with moist soil. Native grass seed requires more compression than most agricultural crops.

B. The operator shall fill out daily worksheets. One copy shall be delivered to the Architect. The following shall be recorded:

1. Seed - type, amount
2. Area covered in acres
3. Equipment used - license number if applicable.
4. The drill operator's and the Architect's signatures on the worksheet.

1.23 OPTION 3 - SEED APPLICATION (LAND IMPRINTING)

A. Equipment:

1. Characteristics of imprinting teeth:
 - a. The height of the imprinting teeth shall be at least four inches.
 - b. Imprinting teeth shall be V-shaped in transverse section and may be rectangular or triangular in longitudinal section.
 - c. Any imprinter used on a slope greater than 4:1 shall have teeth ten inches or less in length, with a gap of two inches or more between the end of one segment and the beginning of the next. If the imprinting teeth are longer than ten inches, the machine shall be always operated with the long dimension in a horizontal orientation to the slope.
 - d. The crest-to-crest spacing between teeth shall be less than two feet. One foot is often optimum for land restoration.
 - e. The apical angle of the triangular cross section of the imprinting teeth shall be ninety degrees or less, with acute teeth preferred for the steepest slopes.
 - f. Any imprinter used on a slope greater than 2:1 shall have a "saw tooth" pattern, in which the apex of the tooth is offset, giving a long and a short side to each tooth. The angle between front and rear faces of the imprinting teeth shall be 60 degrees or less. The imprinter shall be operated so that the long face of the impressions lays upslope of the short face.
2. Weight per unit area on teeth
 - a. The static pressure on the soil surface is measured by dividing the total weight of the imprinter, including any ballast, by the total area of tooth contact when the teeth have penetrated halfway into the soil.
 - b. The static pressure on the soil surface shall be at least 12 pounds per square inch and less than 48 pounds per square inch. The lower weights are for softer soils and the higher weights for harder or drier soils.
 - c. No more pressure shall be used than that required to obtain a full-tooth imprint.
3. Maximum length of roller

- a. No individual roller shall be more than eight feet in length, except in the case of level, rock-free land that will not cause a long roller to leave unimprinted areas.
 - b. More than one roller may be attached to a single imprinting device as long as each roller swivels independently over surface obstructions. In this case, the combined rollers may be any practical width.
4. Effects and type of tractor
 - a. The tracks or wheels of the moving tractor shall produce less pressure on the soil than the properly weighted imprinter.
 - b. If the slope is too steep to safely operate a tractor-drawn imprinter, the imprinter may be pulled up and down by means of a winch.
- B. Condition of Soil:
1. The soil may be imprinted when dry if it is soft enough to allow penetration of the imprinting teeth to their full depth, and firm enough to permit the formation of smooth-walled, firm impressions. If the dry soil does not allow formation of quality impressions, it shall not be imprinted until rainfall or irrigation leaves it in a suitable condition.
 2. Soil that is too hard to accept a pattern that conforms to performance specifications with a properly weighted imprinter shall be ripped before imprinting. Adjustment of the imprinter ballast is preferred over ripping where feasible.
 3. Clay soil shall not be imprinted while it is so wet that substantial quantities of it stick to the roller.
- C. Form of impressions
1. Impressions shall be of V-shaped cross section and ten inches or less in length if used on a slope exceeding 4:1.
 2. A pyramidal shape is acceptable if the apical angles between all faces are ninety degrees or less.
 3. The imprinting pattern shall provide a raised soil ridge that prevents continuous movement of drainage water between impressions.
 4. At least 70% of the soil surface shall bear impressions, apart from any peripheral turn-around area and areas rendered untreatable by rocks or other natural features.
 5. At least 70% of the impressions shall reach 90% of the full tooth depth.
 6. At least 70% of the impressions shall have smooth and firm soil over at least 70% of their surface area.
- D. Operating procedures
1. The optimum operating speed is three to four miles per hour.
 2. The imprinter shall be pulled at a speed low enough to ensure that the full weight of the roller always bears upon the soil.
 3. If the impressions are longer than ten inches, the long dimension of each imprint shall lie parallel to the contour of the slope.
 4. If imprint length is ten inches or less, the imprinter may be used in any orientation to the slope.
- E. Proximity to edges of seeded area
1. The imprinting pattern shall extend fully to the boundaries of the project area.

2. The area at the project boundary may serve as a turn-around area and normally will be imprinted by a final pass along the project perimeter. If conditions do not permit imprinting the perimeter, a turn-around area within the project need not be fully imprinted.
3. Any un-imprinted turn-around area on the project boundary shall be no wider than the smallest turning radius allowed by the equipment.

F. Timing

1. The date of imprinting shall fall shortly before or within the early portion of the annual rainy season, November - December.
2. Where the annual rainfall has a bimodal distribution, imprinting shall be carried out during the winter rainy season.

G. Seed distribution

1. Seed dispensed by the imprinting device shall be in firm contact with the soil.
2. A minimum of 150 live seeds per square meter shall be planted.
3. The seed bin shall contain no residual seed from previous uses.
4. Wheat bran or approved substitute shall be mixed with seed to appropriate dilution ratio to prevent seed segregation. The optimum-mixing ratio is usually 1:1 by volume.

H. Mycorrhizal inoculation

1. Mycorrhizal inoculum shall be added to the seed bin of the land imprinting equipment and mixed into the seeds and such other materials as wheat bran. Mycorrhizal inoculum must not be placed in any equipment that has heated up in the sun to a temperature higher than 90° F.
 - a. At no time during storage or application shall inoculum be exposed to temperatures above 90 degrees or below 32 degrees F.
 - b. The inoculum dispensing mechanism shall not be allowed to heat in the sun to temperatures above 90 degrees F.
2. If the land imprinter is equipped with a separate bin for mycorrhizal inoculum, the inoculum shall be dispensed from the separate bin in accordance with the operating procedures for the specified imprinter.
3. The application mechanism shall grind or macerate not more than 5% of the particles or granules in the inoculum.
 - a. Root material shall be removed from the inoculum only if the material will not otherwise pass through the application mechanism.
4. Mycorrhizal inoculum shall be deposited in front of the imprinting roller and beneath the soil surface, with seventy per cent or more of the inoculum deposited between one and six inches beneath the final soil surface.
5. The inoculum injection device shall inflict minimal damage upon the soil. Devices that form narrow slits in the soil are preferred to ripping, disking, or tilling.

1.24 GERMINATION

- A. It shall be the responsibility of the Contractor to operate and manage the irrigation system to achieve proper germination of the seed after application. Refer to Irrigation and Maintenance specifications elsewhere.

1.25 RESEEDING

- A. The Contractor shall reseed bare spots failing to adequately germinate an adequate number of plants within 10 days.
 - 1. The Architect shall be the sole judge of adequacy of coverage.
 - 2. The Contractor shall remain responsible for reseeding until the Architect approves seed application and germination.

1.26 CLEANUP

- A. After all seeding operations have been completed, remove all trash, empty containers and rubbish from the property and dispose of legally. All scars, ruts, or other marks in the ground caused by this work shall be repaired and the ground left in a smooth condition throughout the site. The Contractor shall sweep the site and shall wash down all paved areas within the Contract area, leaving the premises in a clean condition.

DIVISION 33

UTILITIES

This page intentionally left blank

SECTION 33 11 00

WATER UTILITY DISTRIBUTION PIPING

PART 1 GENERAL

1.01 SUMMARY

- A. Requirements: Provide water distribution system, complete, as indicated on the Drawings or inferable therefrom and/or as specified in accordance with the Contract Documents.

1.02 SUBMITTALS

- A. Product Data: Submit copies of manufacturer's specifications and installation instructions for each material. Include certification or other data verifying compliance with required characteristics. Indicate by transmittal form that copy of each has been distributed to the Installer.
- B. Test Reports: Submit certified Test Reports showing compliance of the following items in accordance with Section General Conditions.
 - 1. Laboratory test for bedding and trench stabilization materials.
 - 2. Concrete design mix.
 - 3. Compression tests.
 - 4. Water Test Reports: Submit results of water sample tests by State or local health authorities

1.03 QUALITY ASSURANCE

- A. Regulatory Requirements:
 - 1. Comply with requirements of utility company supplying water. Include tapping of water mains and backflow prevention.
 - 2. All work to be performed and materials to be used shall be in accordance with the Standard Specifications for Public Works Construction, latest edition and supplements.
 - 3. The Contractor shall have one copy of the Standard Specifications at the job site.
 - 4. The Standard Specifications apply only to performance and materials and how they are to be incorporated into the Work. The legal/contractual relationship sections and the measurement and pavement sections do not apply to this document.
- B. Piping materials shall bear label, stamp, or other markings of specified testing agency.
- C. Comply with FM's "Approval Guide" or UL's "Fire Protection Equipment Directory" for fire-service-main products.
- D. NFPA Compliance: Comply with NFPA 24 for materials, installations, tests, flushing, and valve and hydrant supervision for fire-service-main piping for fire suppression.
- E. NSF Compliance:
 - 1. Comply with NSF 14 for plastic potable-water-service piping.

2. Comply with NSF 61 for materials for water-service piping and specialties for domestic water.

1.04 PROJECT CONDITIONS

- A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
 1. Notify Owner's Representative not less than two days in advance of proposed utility interruptions.
 2. Do not proceed with utility interruptions without Owner's Representative written permission.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Prevent damage to materials during loading, transportation, and unloading. Store equipment with moving parts off ground on platforms or skids.

1.06 COORDINATION

- A. Coordinate connection to water main with utility company.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 PIPE AND FITTINGS

- A. PVC, Schedule 40 (NPS 1/8 to NPS 3 1/2): ASTM D 1785. Suitable for potable water distribution and manufactured in compliance with NSF Standards.
 1. Fittings: PVC, Schedule 40 Socket Fittings: ASTM D 2466.
- B. PVC, AWWA Pipe (NPS 4 to NPS 12): AWWA C900, Class 305 DR 14, with bell-and-spigot or double-bell ends.
 1. PVC to PVC Fittings: Push-on-Joint, PVC Fittings, ASTM 3139, with elastomeric gasket bell ends, conforming to ASTM D2122 for bell measurements.
 2. PVC to Metal Fittings, Valves, and Accessories: Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
 - a. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts. Use corrosion resistant, high strength, low alloy steel, bolts and nuts where in contact with corrosive soil ASTM A 325.

2.03 VALVES

A. AWWA, UL/FM Cast-Iron, Gate Valves:

1. Nonrising-Stem, Resilient-Seated Gate Valves: AWWA C509 and UL/F.M. approved, gray- or ductile-iron body and bonnet; with bronze or gray- or ductile-iron gate, resilient seats, bronze stem, and stem nut.
 - a. Minimum Working Pressure: 200 pounds per square inch gauge (psig).
 - b. End Connections: Flanged, push-on rubber gasketed, or mechanical joint, as required.
 - c. Interior Coating: Complying with AWWA C550.
2. Campus Specific Manufacturers
 - a. Harbor: Reliable
 - b. Trade: Reliable, TYCO, or NIBCO

2.04 GATE VALVE ACCESSORIES AND SPECIALTIES

A. Valve Boxes: Comply with AWWA M44 for cast-iron valve boxes. Include top section, adjustable extension of length required for depth of burial of valve, plug with lettering "WATER," bottom section with base of size to fit over valve, and approximately five-inch diameter barrel. Fabricate valve box cover to fit snugly to prevent displacement by traffic.

1. Operating Wrenches: Steel tee-handle with one pointed end, stem of length to operate deepest buried valve, and socket matching valve operating nut.

B. Vertical-Type Indicator Posts: UL 789, FM-approved, cast-iron body with operating wrench, extension rod, and adjustable cast-iron barrel of length required for depth of burial of valve with tamperproof electrical supervisory switch for connection to the fire alarm control panel system.

1. Campus specific Manufacturers:
 - a. Harbor: Clow or Mueller
 - b. Trade: Clow or Mueller

2.05 VALVE APPLICATION

A. General Application: Use mechanical-joint-end valves for NPS 3 and larger underground installation. Use threaded- or flanged-end valves for installation in vaults. Use UL/FM, nonrising-stem gate valves for installation with indicator posts. Use corporation valves and curb valves with ends compatible with piping, for NPS 2 and smaller installation.

1. Where specific valve types are not indicated, the following requirements apply:
 - a. Underground Valves, NPS 3 and Larger: AWWA, cast-iron, nonrising-stem, resilient-seated, gate valves with valve box.
 - b. Underground Valves, NPS 4 and Larger, for Vertical-Type Indicator Posts: UL/FM, Cast-iron, nonrising-stem gate valves with indicator post.

2.06 CORROSION-PROTECTION ENCASUREMENT FOR PIPING

A. All metallic underground piping shall be encased in a Polyethylene tube or wrapped in a Polyethylene sheet. The Polyethylene shall conform to ASTM A674 or AWAA C105, high density, cross laminated, having a thickness of 0.004 inch or LLDPE having a thickness of 0.008 inches.

2.07 WATER METERS

- A. Water meter(s) indicated on drawings shall be installed by the local water purveyor for the area, unless noted otherwise.
- B. For sub-meter specification, refer to Plumbing Design Standard, Section 22 00 00.

2.08 BACKFLOW-PREVENTION DEVICES

- A. General: FM Approved, AWWA, UL Classified, Approved by the Foundation for Cross Connection Control and Hydraulic Research at the University of Southern California.
 - 1. Working Pressure: 175 pounds per square inch (psi) minimum, unless otherwise indicated.
 - 2. Interior Components: Corrosion-resistant materials.
 - 3. Exterior Components: Assembly shall be provided with flanged connections, galvanized cast-iron or epoxy coated construction.
- B. The domestic water system shall be provided with reduced pressure backflow preventers. As a minimum, each building shall be provided with one backflow preventer.
- C. Reduced-Pressure-Detector Assembly Backflow Preventers: Suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet. Include test cocks; pressure-differential relief valve with ASME A112.1.2, air-gap fitting located between two positive-seating check valves; and bypass with displacement-type water meter, valves, and reduced-pressure backflow preventer. Include tamperproof electrical supervisory switch for connection to tie the fire alarm control panel system.
- D. Double-Check-Detector Assembly Backflow Preventers: Suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet. Include test cocks; two positive-seating check valves; and bypass with displacement-type water meter, valves, and double-check backflow preventer. Include tamperproof electrical supervisory switch for connection to tie the fire alarm control panel system.
- E. Campus Specific Manufacturers
 - 1. City: Febco, Watts, or Wilkins
 - 2. East: Watts, Zurn, or Wilkins
 - 3. Harbor: Watts, Febco, Zurn, or Wilkins
 - 4. Mission: Watts or Conbraco
 - 5. Pierce: Wilkins, Febco, watts, or Zurn
 - 6. Southwest: Watts, Zurn, or Wilkins
 - 7. Trade: Wilkins or Febco
 - 8. Valley: Watts, Wilkins, or Febco
 - 9. West: Wilkins, Febco, or Watts

2.09 FIRE HYDRANTS

- A. Before procurement, verify approval has been issued by the Fire Department having jurisdiction.
- B. Wet-Barrel Fire Hydrants: AWWA C503 or UL 312, one NPS 4 and two NPS 2-1/2 outlets, NPS 6 threaded or flanged inlet, and base section with NPS 6 mechanical-joint inlet. Include interior coating according to AWWA C550. Hydrant shall have 150 pounds per square inch gauge (psig) minimum working-pressure design.

1. Outlet Threads: NFPA 1963, with external hose thread used by local fire department. Include cast-iron caps with steel chains.
 2. Operating and Cap Nuts: Pentagon, one-and-one-half inches point to flat.
 3. Direction of Opening: Open hydrant valves by turning operating nut to left or counterclockwise.
- C. Combined length of bury and extension shall be as indicated. Where not indicated, install top of hydrant flange three inches above finished surface.
- D. Exterior Finish: "O.S.H.A. safety yellow" Ameritone 719 or approved equal after receiving a prime coat.
- E. Campus Specific Manufacturers:
1. City: James Jones or Clow Valve
 2. East: James Jones or equivalent
 3. Harbor: Clow Valve, Rich Valve, or James Jones
 4. Mission: James Jones
 5. Pierce: Clow Valve, James Jones, or Rich Valve
 6. Southwest: James Jones or equivalent
 7. Trade: Clow Valve, or Rich valve
 8. Valley: James Jones, Clow Valve, or Rich Valve
 9. West: James Jones or Clow Valve

2.10 FIRE DEPARTMENT CONNECTIONS

- A. Exposed, Freestanding, Fire Department Connections: UL 405, cast-bronze body, with thread inlets according to NFPA 1963 and matching local fire department hose threads, and threaded bottom outlet. Include lugged caps, gaskets, and chains; lugged swivel connection and drop clapper for each hose-connection inlet; 18-inch high brass sleeve; and round escutcheon plate, and all appropriate check valves per NFPA 24.
1. For Escutcheon Plate Marking, refer to plans.
- B. For wall-mounted Fire Department Connections, refer to Section 21 11 19.
- C. Campus Specific Manufacturers:
1. Harbor: Potter-Roemer or Crocker
 2. Trade: Potter-Roemer, Crocker, or Elkhart

PART 3 EXECUTION

3.01 INSPECTION

- A. Examination: Examine substrates, adjoining construction and conditions under which Work is to be installed. Do not proceed with Work until unsatisfactory conditions have been corrected

3.02 PREPARATION

- A. Field Measurements: Verify dimensions before proceeding with Work. Obtain field measurements for work required to be accurately fitted to other construction. Be responsible for accuracy of such measurements and precise fitting and assembly of finished work.

3.03 JOINT CONSTRUCTION

- A. Make pipe joints according to the following:
 1. Ductile-Iron Piping, Gasketed Joints for Water-Service Piping: AWWA C600 and AWWA M41.
 2. Ductile-Iron Piping, Gasketed Joints for Fire-Service-Main Piping: UL 194.
 3. Copper Tubing Soldered Joints: ASTM B 828. Use flushable flux and lead-free solder.
 4. PVC Piping Gasketed Joints: Use joining materials according to AWWA C900. Construct joints with elastomeric seals and lubricant according to ASTM D 2774 or ASTM D 3139 and pipe manufacturer's written instructions.

Dissimilar Materials Piping Joints: Use adapters compatible with both piping materials, with OD, and with system working pressure.

3.04 PIPING INSTALLATION

- A. Project site water lines shall terminate approximately five feet from buildings, unless otherwise indicated on Drawings. Install temporary cap or plug terminals for future connection to building.
- B. Unless otherwise indicated, install all piping, including shutoff valves and strainers, pumps and other equipment at line size with reduction in size being made only at control valve or equipment.
- C. Bury domestic water piping with depth of cover over top at least 36 inches, unless otherwise indicated.
- D. Underground fire protection service piping shall have at least 3 feet of cover, or as recommended by NFPA 24, whichever is greater.
- E. Comply with NFPA 24 for fire-service-main piping materials and installation.
- F. Install PVC, AWWA pipe according to AWWA M23 and ASTM F 645.
- G. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports for all lines NPS 3 or greater.
- H. Make changes in direction of pipes only with fittings or pipe bends and changes in size only with fittings. Do not use miter fittings, face or flush bushings, or street elbows. All fittings shall be of the long radius type, unless otherwise shown on the drawings or specified.
- I. Water Main Connection: Arrange and pay for tap in the water main, water meter, and all associated fees from the water purveyor.

3.05 CLEARANCE OF WATER LINE

- A. Building or Structure: Two feet minimum horizontal separation.
- B. Sewer crossing:
 1. Typical Conditions: Lay water mains over sanitary sewers to provide vertical separation minimum three feet.

2. Unusual Conditions: If above separation cannot be met, for sewers less than three feet below the water pipe, use the following:
 - a. Install water line with all joints located at least four feet from each side of the sewer pipe.
 - b. Sewer pipe encased in six inches concrete around pipe, and extend four feet either side of water main.
- C. Parallel to Sewer Line: Water line shall not be installed in a common trench with the building sanitary sewer unless both of the following requirements are met:
 1. The bottom of the water pipe, at all points, shall be at least 12 inches above the top of the sewer.
 2. The water pipe shall be placed on a solid shelf excavated at one side of the common trench with a minimum clear horizontal distance of at least 12 inches from the sewer.

3.06 ANCHORAGE INSTALLATION

- A. Install anchorages for tees, plugs and caps, bends, crosses, valves, and hydrant branches for all lines NPS 3 or greater. Include anchorages for the following piping systems:
 1. Gasketed-Joint, PVC Water-Service Piping: According to AWWA M23.
 2. Fire-Service-Main Piping: According to NFPA 24.
 3. If soils are corrosive, per the geotechnical report, apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

3.07 VALVE INSTALLATION

- A. Gate Valves: Comply with AWWA C600 and AWWA M44. Install each underground valve with stem pointing up and with valve box. Vertical-Type Indicator Post Gate Valves: Comply with NFPA 24. Install each underground valve and valves in vaults with stem pointing up and with vertical cast-iron indicator post. Include tamperproof electrical supervisory switch for connection to tie the fire alarm control panel system.
 1. Manufacturers: NIBCO, Acorn, Zurn, or equivalent.
- B. Unless otherwise indicated, install all piping, including shutoff valves and strainers, pumps and other equipment at line size with reduction in size being made only at control valve or equipment.

3.08 BACKFLOW-PREVENTER INSTALLATION

- A. Install backflow preventers of type, size, and capacity indicated. Include valves and test cocks. Install according to requirements of plumbing and health department and authorities having jurisdiction.
- B. Do not install backflow preventers with relief drain in vault or other space subject to flooding.
- C. Do not install bypass piping around backflow preventers.
- D. Support three-inch and larger backflow preventers, valves, and piping near floor and on brick or concrete piers.
- E. Access and clearance shall be provided for the required testing, maintenance and repair. Access and clearance shall require a minimum of one foot between the lowest portion of the assembly and grade or platform.

- F. Include tamperproof electrical supervisory switch for connection to tie the fire alarm control panel system.
- G. Domestic water and irrigation backflow prevention devices shall be on a concrete pad with a lockable cage. The cage shall have a rounded top to reduce the likelihood of a student sitting on the top of the cage. The cage shall be of suitable construction to prevent damage due to students sitting on it.
- H. Install unit in accordance with LADWP Rule 16-D, between 12" and 48" above the finish grade, unless noted otherwise.

3.09 FIRE HYDRANT INSTALLATION

- A. General: Install each fire hydrant with separate gate valve in supply pipe, anchor with restrained joints or thrust blocks, and support in upright position.
- B. UL/FM-Type Fire Hydrants: Comply with NFPA 24.

3.10 FIRE DEPARTMENT CONNECTION INSTALLATION

- A. Install fire department connections of types and features indicated.
- B. Install ball drip valves at each check valve for fire department connection to mains.

3.11 IDENTIFICATION

- A. Install continuous underground detectable warning tape during backfilling of trench for underground water-service piping. Locate below finished grade, directly over piping. Refer to Section 22 00 00 Plumbing System Design Criteria, Section 1.1.L for tracer wire specifications.

3.12 FIELD QUALITY CONTROL

- A. Piping Tests: Conduct piping tests before joints are covered and after thrust blocks have hardened sufficiently. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water.
- B. Hydrostatic Tests: The piping shall be subjected for a minimum of two hours to a pressure of one and one-half times the working pressure, but in no case less than 150 pounds per square inch (psi). Examine all exposed pipe, joints, fittings and accessories during the test period. Replace or repair defective portions of the system, and repeat tests until results are satisfactory.
 - 1. Allowable leakage shall be as specified in AWWA C-600, Table 3.
- C. Prepare reports of testing activities.

3.13 CLEANING

- A. Clean and disinfect water-distribution piping as follows:
 - 1. Purge new water-distribution piping systems and parts of existing systems that have been altered, extended, or repaired before use.
 - 2. Use purging and disinfecting procedure prescribed by authorities having jurisdiction or, if method is not prescribed by authorities having jurisdiction, use procedure described in AWWA C651 or as described below:

- a. Fill system or part of system with water/chlorine solution containing at least 50 parts per million (ppm) of chlorine; isolate and allow to stand for 24 hours, or
 - b. Drain system or part of system of previous solution and refill with water/chlorine solution containing at least 200 parts per million (ppm) of chlorine; isolate and allow to stand for three hours.
 - c. After standing time, flush system with clean, potable water until no chlorine remains in water coming from system.
 - d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedure if biological examination shows evidence of contamination.
- B. Prepare reports of purging and disinfecting activities.

SECTION 33 31 00

SANITARY UTILITY SEWERAGE PIPING

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes gravity-flow, nonpressure sanitary sewerage outside the building, with the following components:
 - 1. Cleanouts.
 - 2. Precast concrete manholes.

1.02 PERFORMANCE REQUIREMENTS

- A. Gravity-Flow, Nonpressure, Drainage-Piping Pressure Rating: 10-foot head of water.

1.03 SUBMITTALS

- A. Manufacturer's product data for pipe and fittings.
- B. Field quality-control test reports.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
- B. For Campus specific requirements, refer to the latest version of the "Composite LACCD Campus Standards Matrix"

2.02 PVC PIPE AND FITTINGS

- A. PVC Sewer Pipe and Fittings, NPS 15 and Smaller: ASTM D 3034, SDR 35, with bell-and-spigot ends for gasketed joints with ASTM F 477, elastomeric seals.

2.03 NONPRESSURE-TYPE PIPE COUPLINGS

- A. Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition coupling, for joining underground nonpressure piping. Include ends of same sizes as piping to be joined and corrosion-resistant-metal tension band and tightening mechanism on each end.
- B. Sleeve Materials:
 - 1. For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.

2. For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
- C. Shielded, Flexible Couplings: ASTM C 1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
- D. Ring-Type, Flexible Couplings: Elastomeric compression seal with dimensions to fit inside bell of larger pipe and for spigot of smaller pipe to fit inside ring.

2.04 MANHOLES

- A. Standard Precast Concrete Manholes: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
 1. Diameter: Forty-eight inches, unless otherwise indicated.
 2. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
 3. Base Section: Six-inch minimum thickness for floor slab and four-inch (100-mm) minimum thickness for walls and base riser section and having separate base slab or base section with integral floor.
 4. Riser Sections: Four-inch minimum thickness, and of length to provide depth indicated.
 5. Top Section: Eccentric-cone type, unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
 6. Joint Sealant: ASTM C 990, bitumen or butyl rubber.
 7. Resilient Pipe Connectors: ASTM C 923, cast or fitted into manhole walls, for each pipe connection.
 8. Steps: Individual FRP steps, FRP ladder, or ASTM A 615/A 615M, deformed, one-half-inch steel reinforcing rods encased in ASTM D 4101, PP, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off of step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
 9. Adjusting Rings: Interlocking rings with level or sloped edge in thickness and diameter matching manhole frame and cover. Include sealant recommended by ring manufacturer.
 10. Grade Rings: Reinforced concrete rings, six- to nine-inch total thickness, to match diameter of manhole frame and cover.
 11. Manhole Frames and Covers: Ferrous; 24-inch ID by seven- to nine-inch riser with four-inch-minimum width flange and 26-inch-diameter cover. Include indented top design with lettering cast into cover, using wording "SANITARY SEWER."
 - a. Material: ASTM A 536, Grade 60-40-18 ductile iron or ASTM A 48/A 48M, Class 35 gray iron, unless otherwise indicated.

2.05 CLEANOUTS

- A. Gray-Iron Cleanouts: ASME A112.36.2M, round, gray-iron housing with clamping device and round, secured, scoriated, gray-iron cover. Include gray-iron ferrule with inside calk or spigot connection and countersunk, tapered-thread, brass closure plug.
 1. Top-Loading Classification: Heavy duty.

2. Sewer Pipe Fitting and Riser to Cleanout: ASTM A 74, Service class, cast-iron soil pipe and fittings.
- B. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

2.06 CONCRETE

- A. General: Cast-in-place concrete according to ACI 318/318R, ACI 350R, and the following:
 1. Cement: ASTM C 150, Type II.
 2. Fine Aggregate: ASTM C 33, sand.
 3. Coarse Aggregate: ASTM C 33, crushed gravel.
 4. Water: Potable.
- B. Portland Cement Design Mix: 3,250 pounds per square inch (psi) minimum unless otherwise noted, Aggregate Gradation "C" per SSPWC 201-1.3.2 and 0.45 maximum water/cementitious materials ratio.
 1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
 2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60, deformed steel.
- C. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 3,250 pounds per square inch (psi) minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.
 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.
 - a. Invert Slope: Two percent through manhole unless otherwise noted.
 2. Benches: Concrete, sloped to drain into channel.
 - a. Slope: Four percent.
- D. Ballast and Pipe Supports: Portland cement design mix, 3,250 pounds per square inch (psi) minimum, with 0.45 maximum water/cementitious materials ratio.
 1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
 2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60, deformed steel.

2.07 CORROSION-PROTECTION ENCASUREMENT FOR PIPING

- A. All metallic underground piping shall be encased in a Polyethylene tube or wrapped in a Polyethylene sheet. The Polyethylene shall conform to ASTM A674 or AWWA C105, high density, cross laminated, having a thickness of 0.004 inch or LLDPE having a thickness of 0.008 inches.

PART 3 EXECUTION

3.01 PIPING APPLICATIONS

- A. Pipe couplings and fittings with pressure ratings at least equal to piping rating may be used in applications below, unless otherwise indicated.

1. Use nonpressure-type flexible couplings where required to join gravity-flow, nonpressure sewer piping, unless otherwise indicated.
 - a. Shielded flexible couplings for same or minor difference OD pipes.
 - b. Unshielded, increaser/reducer-pattern, flexible couplings for pipes with different OD.
 - c. Ring-type flexible couplings for piping of different sizes where annular space between smaller piping's OD and larger piping's ID permits installation.

3.02 PIPING INSTALLATION

- A. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.
- B. All sanitary piping shall have at least 36" of cover when leaving the building.
- C. Install manholes for changes in direction if shown on plan, otherwise use fittings. Use fittings for branch connections, unless direct tap into existing sewer is indicated.
- D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
- E. Install gravity-flow, nonpressure, drainage piping according to the following:
 1. Install piping pitched down in direction of flow, at minimum slope of one percent, unless otherwise indicated.
 2. Install PVC sewer piping according to ASTM D 2321 and ASTM F 1668.
- F. Clear interior of piping and manholes of dirt and superfluous material as work progresses. Maintain swab or drag in piping and pull past each joint as it is completed. Place plug in end of incomplete piping at end of day and when work stops.

3.03 PIPE JOINT CONSTRUCTION

- A. Join gravity-flow, nonpressure, drainage piping according to the following:
 1. Join PVC sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-gasket joints.
 2. Join dissimilar pipe materials with nonpressure-type, flexible couplings.

3.04 MANHOLE INSTALLATION

- A. General: Install manholes complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Form continuous concrete channels and benches between inlets and outlet.
- D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops three inches above finished surface elsewhere, unless otherwise indicated.

3.05 CONNECTIONS

- A. Connect nonpressure, gravity-flow drainage piping to building's sanitary building drains specified in Division 15 Section "Sanitary Waste and Vent Piping."
- B. Make connections to existing piping and underground manholes.
 - 1. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe; install wye fitting into existing piping; and encase entire wye fitting, plus six-inch overlap, with not less than six inches of concrete with 28-day compressive strength of 3,250 pounds per square inch (psi).

3.06 FIELD QUALITY CONTROL

- A. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.
 - 1. Do not enclose, cover, or put into service before inspection and approval.
 - 2. Test completed piping systems according to requirements of authorities having jurisdiction.
 - 3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours advance notice.
 - 4. Submit separate report for each test.
 - 5. Hydrostatic Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction and the following:
 - a. Allowable leakage is maximum of 50 gallons/inch of nominal pipe size per mile of pipe, during 24-hour period.
 - b. Close openings in system and fill with water.
 - c. Purge air and refill with water.
 - d. Disconnect water supply.
 - e. Test and inspect joints for leaks.
 - f. Option: Test ductile-iron piping according to AWWA C600, "Hydrostatic Testing" Section. Use test pressure of at least 10 pounds per square inch gauge (psig).
 - 6. Air Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
 - a. Option: Test plastic gravity sewer piping according to ASTM F 1417.
- B. Leaks and loss in test pressure constitute defects that must be repaired.
- C. Replace leaking piping using new materials and repeat testing until leakage is within allowances specified.

SECTION 33 41 00

STORM UTILITY DRAINAGE PIPING

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes gravity-flow, nonpressure storm drainage pipe and drainage structures outside the building.

1.02 PERFORMANCE REQUIREMENTS

- A. Gravity-Flow, Nonpressure, Drainage-Piping Pressure Rating: 10-foot head of water.
- B. Storm drainage piping system will be sized in accordance with two (2) inches per hour of rainfall intensity.

1.03 SUBMITTALS

- A. Product Data: For each type of product installed.
- B. Field quality-control test reports.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
- B. For Campus specific requirements, refer to the latest version of the "Composite LACCD Campus Standards Matrix."

2.02 CORRUGATED HIGH DENSITY POLYETHYLENE (HDPE) HDPE PIPE AND FITTINGS

- A. HDPE Drainage Pipe and Fittings, NPS 4 to NPS 10: AASHTO M252, Type S, with bell-and-spigot ends. Gasketed joints shall be soil-tight with ASTM F 477, elastomeric seals.
- B. HDPE Drainage Pipe and Fittings, NPS 12 to NPS 60: AASHTO M294, Type S, or ASTM F2306 with bell-and-spigot ends. Gasketed joints shall be soil-tight with ASTM F 477, elastomeric seal.

2.03 PVC PIPE AND FITTINGS

- A. PVC Sewer Pipe and Fittings, NPS 15 and Smaller: ASTM D 3034, SDR 35, with bell-and-spigot ends for gasketed joints with ASTM F 477, elastomeric seals.

- B. PVC Sewer Pipe and Fittings, NPS 18 and Larger: ASTM F 679, T-2 wall thickness, with bell-and-spigot ends for gasketed joints with ASTM F 477, elastomeric seals.

2.04 NONPRESSURE-TYPE PIPE COUPLINGS

- A. Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition coupling, for joining underground nonpressure piping. Include ends of same sizes as piping to be joined and corrosion-resistant-metal tension band and tightening mechanism on each end.
- B. Sleeve Materials:
 - 1. For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
 - 2. For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
- C. Shielded Flexible Couplings: ASTM C 1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
- D. Ring-Type Flexible Couplings: Elastomeric compression seal with dimensions to fit inside bell of larger pipe and for spigot of smaller pipe to fit inside ring.

2.05 PUMPED PIPING

- A. For pump discharge below ground and outside of building, refer to Facility Storm and Sanitary Pipe and Fittings, Section 22 13 00.

2.06 CLEANOUTS

- A. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

2.07 MANHOLES

- A. Standard Precast Concrete Manholes: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
 - 1. Diameter: Forty-eight inches minimum, unless otherwise indicated.
 - 2. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
 - 3. Base Section: Six-inch minimum thickness for floor slab and four-inch minimum thickness for walls and base riser section, and having separate base slab or base section with integral floor.
 - 4. Riser Sections: Four-inch minimum thickness, and of length to provide depth indicated.
 - 5. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
 - 6. Joint Sealant: ASTM C 990 bitumen or butyl rubber.
 - 7. Resilient Pipe Connectors: ASTM C 923, cast or fitted into manhole walls, for each pipe connection.

8. Steps: Individual FRP steps, FRP ladder, or ASTM A 615/A 615M, deformed, one-half-inch steel reinforcing rods encased in ASTM D 4101, PP wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off of step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
9. Adjusting Rings: Interlocking rings with level or sloped edge in thickness and diameter matching manhole frame and cover. Include sealant recommended by ring manufacturer.
10. Grade Rings: Reinforced-concrete rings, six- to nine-inch total thickness, to match diameter of manhole frame and cover.
11. Manhole Frames and Covers: Ferrous; 24-inch ID by seven- to nine-inch riser with four-inch-minimum width flange and 26-inch-diameter cover. Include indented top design with lettering cast into cover, using wording "STORM DRAIN."
 - a. Material: ASTM A 536, Grade 60-40-18 ductile iron or ASTM A 48, Class 35 gray iron, unless otherwise indicated.

2.08 CONCRETE

- A. General: Cast-in-place concrete according to ACI 318/318R, ACI 350R, and the following:
 1. Cement: ASTM C 150, Type II.
 2. Fine Aggregate: ASTM C 33, sand.
 3. Coarse Aggregate: ASTM C 33, crushed gravel.
 4. Water: Potable.
 5. Pipe Collars, Ballast and Pipe Supports, Precast Manhole Components, Catch Basins, and Sidewalk Culverts: Portland cement design mix, 3,250 pounds per square inch (psi) minimum unless otherwise noted, Aggregate Gradation "C" per SSPWC 201-1.3.2, and with 0.45 maximum water-cementitious materials ratio.
 - a. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
 - b. Reinforcement Bars: ASTM A 615/A 615M, Grade 60, deformed steel.

2.09 CATCH BASINS

- A. Standard Precast Concrete Catch Basins: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
 1. Base Section: Six-inch minimum thickness for floor slab and four-inch minimum thickness for walls and base riser section and having separate base slab or base section with integral floor.
 2. Top Section: Eccentric-cone type unless flat-slab-top type is indicated.
 3. Joint Sealant: ASTM C 990, bitumen or butyl rubber.
- B. Frames and Grates:
 1. ASTM A 536, Grade 60-40-18, ductile iron designed for A-16 (heavy traffic) structural loading unless otherwise indicated in plans.
 2. Grate Free Area: Approximately 50 percent, unless otherwise indicated.
 3. Compliant with Americans with Disabilities Act (ADA).
 4. Heelproof as indicated per plans.
 5. Grate size as indicated per plans.

2.10 CORROSION-PROTECTION ENCASEMENT FOR PIPING

- A. All metallic underground piping shall be encased in a Polyethylene tube or wrapped in a Polyethylene sheet. The Polyethylene shall conform to ASTM A674 or AWWA C105, high density, cross laminated, having a thickness of 0.004 inch or LLDPE having a thickness of 0.008 inches.

PART 3 EXECUTION

3.01 PIPING APPLICATIONS

- A. Pipe couplings and fittings with pressure ratings at least equal to piping rating may be used in applications below, unless otherwise indicated.
 - 1. Use nonpressure-type flexible couplings where required to join gravity-flow, nonpressure sewer piping, unless otherwise indicated.
 - a. Shielded flexible couplings for same or minor difference OD pipes.
 - b. Ring-type flexible couplings for piping of different sizes where annular space between smaller piping's OD and larger piping's ID permits installation.

3.02 PIPING INSTALLATION

- A. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.
- B. Install manholes for changes in direction if shown on plan, otherwise use fittings. Use fittings for branch connections unless direct tap into existing storm drain is indicated.
- C. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
- D. Install gravity-flow, nonpressure drainage piping according to the following:
 - 1. Install piping pitched down in direction of flow, at minimum slope of one percent, unless otherwise indicated.
 - 2. Install PVC sewer piping according to ASTM D 2321 and ASTM F 1668.
- E. Clear interior of piping and manholes of dirt and superfluous material as work progresses.
- F. Overflow discharges shall not be onto public walkway but rather through a fitting that takes the line under a walkway and discharges through a curb.

3.03 PIPE JOINT CONSTRUCTION

- A. Join gravity-flow, nonpressure drainage piping according to the following:
 - 1. Join PVC sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-gasket joints.
 - 2. Join dissimilar pipe materials with nonpressure-type flexible couplings.

3.04 MANHOLE INSTALLATION

- A. General: Install manholes, complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops three inches above finished surface elsewhere, unless otherwise indicated.

3.05 CATCH BASIN INSTALLATION

- A. Set frames and grates to elevations indicated.
- B. Provide storm drain piping connections to catch basins as indicated in the project drawings. Storm drain connections shall be to the catch basin side wall, not base.

3.06 CONNECTIONS

- A. Connect nonpressure, gravity-flow drainage piping to building's storm building drains specified in Division 22 Section "Facility Storm Drainage Piping."
- B. Make connections to existing piping and underground manholes.
 - 1. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe; install wye fitting into existing piping; and encase entire wye fitting, plus six-inch overlap, with not less than six inches of concrete with 28-day compressive strength of 3,250 pounds per square inch (psi).

3.07 LOW IMPACT DEVELOPMENT STORM WATER MITIGATION SYSTEMS INSTALLATION

- A. All storm water mitigation systems proposed as a part of this project, and as approved by the local jurisdiction, are to be inspected by the Civil Engineer of Record during the installation process, after installation is complete, and prior to obtaining a certificate of occupancy.
 - 1. Notify the Civil Engineer of Record at least 24-48 hours prior to the following (minimum) stages, in addition to those noted above, for inspection purposes:
 - a. Excavation for system installation.
- B. Placement of gravel fills, system liners, piping, inlet and overflow piping, soil backfill, and planting where required.

3.08 FIELD QUALITY CONTROL

- A. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.
 - 1. Do not enclose, cover, or put into service before inspection and approval.
 - 2. Test completed piping systems according to requirements of authorities having jurisdiction.
 - 3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
 - 4. Submit separate report for each test.
 - 5. Hydrostatic Tests: Test sewers according to requirements of authorities having jurisdiction and the following:
 - a. Allowable leakage is maximum of 50 gallons/inch of nominal pipe size per mile of pipe, during 24-hour period.
 - b. Close openings in system and fill with water.

- c. Purge air and refill with water.
 - d. Disconnect water supply.
 - e. Test and inspect joints for leaks.
6. Option: Test ductile-iron piping according to AWWA C600, "Hydrostatic Testing" Section. Use test pressure of at least 10 pounds per square inch gauge (psig).
 7. Air Tests: Test storm drainage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
 - a. Option: Test plastic gravity sewer piping according to ASTM F 1417.
- B. Leaks and loss in test pressure constitute defects that must be repaired.
- C. Replace leaking piping using new materials and repeat testing until leakage is within allowances specified.

END OF SECTION

SECTION 33 47 00
BIOFILTRATION SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

- A. This section specifies materials and procedures for construction of biofiltration systems that are complete and ready for operation. This includes excavating existing soils, removing irrigation piping, installing perimeter geomembrane liner, aggregate base, biofiltration media, mulch, underdrains, outlet structure, piping, and all other incidentals.
- B. Other items of work or details not mentioned above that are required by the Plans or these Special Provisions, shall be performed, placed, and constructed.
- C. Existing utilities shall be protected in place, unless noted otherwise.

1.02 RELATED WORK

- A. Section 31 10 00, SITE CLEARING
- B. Section 31 22 00, GRADING
- C. Section 31 23 23, EXCAVATION AND FILL FOR UTILITIES
- D. Section 32 01 90, LANDSCAPING: Planting Preparation, Plants, Planting Accessories.
- E. Section 32 84 00, LANDSCAPE IRRIGATION SYSTEM: Piping, Sprinklers, Controllers, and Accessories.
- F. Section 33 40 00, STORM DRAIN UTILITIES: Piping, Structures.

1.03 APPLICABLE PUBLICATIONS

- A. The publications listed below form a part of this specification to the extent referenced. The publications are referenced in the text by the basic designation only.
 - 1. American Society for Testing and Materials (ASTM):
 - 2. D422 Standard Test Method for Particle-Size Analysis of Soils
 - 3. D698 Standard Test Method for Laboratory Characteristics of Soil Using Standard Effort
 - 4. D1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort
 - B. American Association of State Highway and Transportation Officials (AASHTO):
 - 1. 200-2 Untreated Base Materials
 - 2. 301-2 Untreated Base

1.04 SUBMITTALS

- A. Information and material submitted under this section shall be marked "SUBMITTED UNDER SECTION 33 47 00, BIOFILTRATION SYSTEMS", with applicable paragraph (subsection) identification and proposed use.
- B. Perimeter Geomembrane Liner
 - 1. Submit copies of the manufacturer's specifications including placement specifications.
- C. Biofiltration Media
 - 1. The supplier shall verify in writing, and provide lab analyses that the material complies with the processes, testing, and standards on the Plans or these Special Provisions. An independent STA Program certified laboratory shall perform the analysis.
 - 2. A list of the feedstock by percentage present in the final compost product.
 - 3. A copy of the producer's STA certification as issued by the U.S. Composting Council.
 - 4. Acceptance will be based upon a satisfactory Test Report from an independent STA program certified laboratory.
- D. Permeable Aggregate Base
 - 1. The supplier shall verify in writing and provide laboratory analyses from an independent laboratory that the permeable aggregate base complies with the processes, testing, and standards on the Plans or these Special Provisions.
- E. Mulch
 - 1. Submit two (2) product sample, specification, and source.

1.05 QUALITY ASSURANCE

- A. Products Criteria:
 - 1. When two or more units of the same type or class of materials are required, these units shall be products of one manufacturer.
 - 2. Manufacturer's data including:
 - a. Geomembrane Liner (Data sheet; installation literature; certificate of conformance)
 - b. Geotextile Fabric (Data sheet; installation literature; certificate of conformance)

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Do not store PVC pipe and fittings in direct sunlight.
- B. Geotextiles shall be furnished in rolls wrapped with a protective covering to protect it against ultraviolet radiation and abrasion. Each roll of fabric shall be marked or tagged to identify the manufacturer, type, length, width, and production identification number. All filter fabric exposed to ultraviolet radiation (the sunlight) for more than three days shall be rejected by the Engineer and replaced with new filter fabric.

1.07 COORDINATION

- A. Coordinate connection to existing storm sewer main with the District's Representative.

1.08 WARRANTY

- A. Guaranty: Warranty of Construction. Refer to Section O1 78 70 for additional requirements.
- B. The Contractor shall remedy any defect due to faulty material or workmanship and pay for any damage to other work resulting therefrom within a period of one year from Substantial Completion. Further, the Contractor will furnish all manufacturers' and suppliers' written guarantees and warranties covering materials and equipment furnished under this Contract.

1.09 AS-BUILT DOCUMENTATION

- A. The installing contractor shall maintain as-built drawings for verification. As-built drawings are to be provided, and a copy of them in Auto-CAD Version 2018, or newer, provided on a flash drive. Refer to Section O1 78 39 for further clarification.

PART 2 PRODUCTS

2.01 PERIMETER GEOMEMBRANE LINER

- A. The impermeable liner shall consist of flexible reinforced or unreinforced tri-polymer gasoline resistant membrane material consisting of polyvinyl chloride (PVC), ethylene interpolymer alloy, and polyurethane or a comparable polymer combination. The geomembrane shall be sufficiently flexible to cover and closely conform to 90 degree edges and corners of the filter bed excavation at ambient temperatures as low as 45°F without application of heat.
- B. Geomembrane shall have the following properties, specified as minimum or maximum, not average roll properties:

Physical Property	Test Reference	Acceptance Value
Thickness (Lowest Individual Reading)	ASTM D5199	36 mil
Density	ASTMD1505	0.940 g/cm ³
Strength at Break	ASTM D6692, Type IV	152 lb/in-width
Strength at Yield	ASTM D6692, Type IV	84 lb/in-width
Physical Property	Test Reference	Acceptance Value
Elongation at Break	ASTM D6692, Type IV	700%
Elongation at Yield	ASTM D6692, Type IV	12%
Tear Resistance	ASTMD1004	28 lbs
Puncture Resistance	ASTMD4833	72 lbs
Carbon Black Content	ASTM D4218	2.0-3.0 %
Notch Constant Tensile Load	ASTMD5397	300 hr
Oxidative Induction Time	ASTM 3895	>100min (200 deg.C, 1atm)

- C. All factory-produced seams shall have a minimum bonded width of 1 ¼ inches, and shall have a minimum shear strength of 320 pounds when tested in accordance with ASTM D 751 (Modified per NSF Standard No. 54).

2.02 BIOFILTRATION MEDIA

- A. Biofiltration Media shall consist of 20% Compost and 80% Sand by volume. The mixture shall be well blended to produce a homogeneous mix, where the final mix to be approved by the Engineer based on samples and test results submitted.
- B. Sand
1. Sand should be free of wood, waste, coating such as clay, stone dust, carbonate, etc., or any other deleterious material. All aggregate passing the No. 200 sieve size should be non-plastic. Sand for Biofiltration Basin should be analyzed by an accredited lab using #200, #100, #40, #30, #16, #8, #4, and 3/8 sieves (ASTM D 422 or as approved by the local permitting authority) and meet the following gradation (Note: all sands complying with ASTM C33 for fine aggregate comply with the gradation requirements below):
 - 2.

Sieve Size (ASTM D422)	% Passing (by weight)	
	Minimum	Maximum
3/8 inch	100	100
#4	90	100
#8	70	100
#16	40	95
#30	15	70
#40	5	55
#100	0	15
#200	0	5

C. Compost

1. Compost should be a well decomposed, stable, weed free organic matter source derived from waste materials including yard debris, wood wastes, or other organic materials not including manure or biosolids meeting standards developed by the US Composting Council (USCC). The product shall be certified through the USCC Seal of Testing Assurance (STA). Compost quality should be verified via a lab analysis to be:
 - a. Feedstock materials shall be specified and include one or more of the following: landscape/yard trimmings, grass clippings, food scraps, and agricultural crop residues.
 - b. Organic matter: 35-75% dry weight basis.
 - c. Carbon and Nitrogen Ratio: $15:1 < C:N < 25:1$
 - d. Maturity/Stability: shall have dark brown color and a soil- like odor. Compost exhibiting a sour or putrid smell, containing recognizable grass or leaves, or is hot (120 F) upon delivery or rewetting is not acceptable.
 - e. Toxicity: any one of the following measures is sufficient to indicate non-toxicity:
 - 1) $NH_4:NH_3 < 3$
 - 2) Ammonium < 500 ppm, dry weight basis
 - 3) Seed Germination > 80% of control
 - 4) Plant trials > 80% of control
 - f. Solvita® > 5 index value
 - g. Nutrient content:
 - 1) Total Nitrogen content 0.9% or above preferred
 - 2) Total Boron should be <80 ppm, soluble boron < 2.5 ppm Salinity: < 6.0 mmhos/cm pH between 6.5 and 8 (may vary with plant palette) Compost for Biofiltration Basin should be analyzed by an accredited lab using #200, ¼ inch, ½ inch, and 1 inch sieves (ASTM D 422 or as approved by the local permitting authority) and meet the following gradation:

Sieve Size (ASTM D422)	% Passing (by weight)	
	Minimum	Maximum
1 inch	99	100
½ inch	90	100
¼ inch	40	90
#200	2	10

2.03 MULCH

- A. Three-inch (3") thick layer of mulch shall be well-aged compost that has been stockpiled or stored for at least twelve (12) months. Mulch shall be non-floatable, pass a 3/8-inch screen, prevent clogging of campus storm drain infrastructure.
- B. Mulch shall not contain any biosolids or manure.

2.04 PERMEABLE AGGREGATE BASE

- A. Permeable Aggregate Base beneath Biofiltration Media shall be washed thoroughly to remove clay, loam, alkali, organic matter, or other deleterious matter. Washing shall be conducted off-site in a manner that does not cause or contribute to water pollution.
- B. The amount of deleterious substances shall not exceed the following values:
 1. Amount finer than No. 200: 1.00 percent by weight
 2. Pieces of specific gravity less than 1.95: 2.00 percent by weight
 3. Clay lumps: 0.5 percent by weight
 4. Wood waste: 0.05 percent by weight
 - 5.
 - 6.
 - 7.

- C. Permeable Base Grading requirements (ASTM D448, Size No. 57):

Sieve Size	Percent Passing
1-1/2 in.	100
1 in.	95-100
½ in.	25-60
No. 4	0-10
No. 8	0-5

2.05 GROUTED RIPRAP PAD

- A. Caltrans No. 3 Backing Rip Rap Class

- B. Local surface irregularities of the slope protection shall not vary from the proposed finished grade by more than two inches measured at right angles to the slope. Broken concrete, asphalt pavement, and other non-rock materials shall not be used as riprap. Rocks shall be of such shape as to form a stable protection structure of the required section. Flat or needle shapes will not be accepted unless thickness of the individual pieces is greater than 1/3 the length.
- C. Apply Special Provision 03 30 00 CAST-IN-PLACE CONCRETE. Use the 1- inch-maximum combined aggregate gradation in the concrete. The water content of the concrete must allow gravity flow into the interstices with limited spading and brooming.

2.06 PERFORATED UNDERDRAIN

- A. 4-inch polyvinyl chloride (PVC) SDR 35 with drilled or punched perforations as indicated on the Plans. The perforations may be located either in the inside crests or in the flat tangent portion of the corrugations, but not in both locations in the same length of pipe.

PART 3 EXECUTION

3.01 GENERAL

- A. If an installation is unsatisfactory to the COR, the Contractor shall correct the installation at no additional cost or time to the District.

3.02 BASIN EXCAVATION

- A. Basin excavation shall comply with Special Provision 31 22 00 GRADING and Section 31 23 23 EXCAVATION AND FILL FOR UTILITIES, as well as the recommendations defined in the Report of Geotechnical Investigation provided under Appendix A.

3.03 PLACEMENT OF PERIMETER GEOMEMBRANE LINER

- A. Impermeable geomembrane shall be placed around the vertical perimeter of the excavation as indicated on the Plans. **No geomembrane liner shall be installed at the bottom surface of excavation or in any horizontal configuration.** Field seams for geomembrane shall have an overlap of 12 inches minimum and bonded with an electrically-heated hot-wedge device as recommended by the manufacturer. Hot air extrusion welding devices or solvent bonding chemicals shall not be used. The bonded geomembrane shall not exceed 165°F immediately before contacting the filter bed excavation.
- B. Before installation of geomembrane, the CONTRACTOR shall demonstrate to the Engineer that the equipment, techniques, and personnel proposed for the bonding of field seams can produce vapor-tight seams under similar weather and work conditions near the job site.
- C. Field seams shall be inspected and, when ordered by the Engineer, shall be tested and pass the Vacuum Box Test. Proper compaction is required to ensure stability and support of the liner. Slopes shall be hand-raked to achieve proper smoothness. To secure the edge of the liner in an earthen pit, an anchor trench shall be provided per Plans. No pins shall be used.

3.04 LAYOUT OF UNDERDRAIN PIPES

- A. Layout and install 4" perforated PVC pipe with 0.5% minimum slope. At least 0.5 feet of permeable aggregate base must be placed to the bottom and to the sides of the underdrain pipe(s). At least 2" of permeable aggregate base must be placed to the top of the underdrain pipe(s).
- B. Use 4" PVC pipe elbows at transitions beneath the proposed drop structures. The role of PVC elbows is to maintain a minimum 12-inch cover of aggregate on top of the underdrain 4-inch perforated PVC pipe.

3.05 PLACEMENT OF BIOFILTRATION MEDIA

- A. Biofiltration Media shall be installed in the Biofiltration Systems per Plan. Filter Bed shall be placed in loose lifts not exceeding 6 inches and compact to a relative compaction of 85 percent of Modified maximum dry density (ASTM D1557), where slopes allow, as determined by the ENGINEER.
- B. Installed Filter Bed should achieve a long-term, in-place saturated hydraulic conductivity of at least 5 inches per hour. Higher infiltration rates of up to 12 inches per hour are permissible. Filter Bed shall retain sufficient moisture to support vigorous plant growth. Three infiltration rate tests shall be performed per basin using an apparatus with minimum diameter of 12 inches (ASTM D5126). Duplicate analyses shall be performed for each batch of media prepared and both tests shall pass this criterion. Placement of Filter Bed prior to receipt of testing results shall be at the CONTRACTOR's risk.
- C. Upon completion of Biofiltration Media placement and compaction and prior to planting and placement of mulch, three in-situ tests of media filtration rate shall be conducted, with observation of the ENGINEER, based on the following protocol:
 - 1. Use a 3-ft long, 12" diameter plastic pipe for testing. Drive pipe approximately 12 inches into BIOFILTER MEDIA layer. If media was loosened during this step, provide light compaction of the soil within pipe to resettle media and ensure short circuiting does not occur along pipe walls.
 - 2. Mark lines on pipe at 0.5 ft intervals from media surface.
 - 3. Fill pipe with water to 1-ft mark above media surface and allow to percolate; maintain water level above basin bottom for at least 2 hours by topping up pipe as needed.
 - 4. Fill pipe to 1-ft mark and allow to percolate without topping up. Record time required to drop 0.5 feet (in hours).
 - 5. Replicate test until difference in time is less than 5 minutes. Record average of last two tests.
 - 6. Multiply average of last two recorded times (in hours) by 17. This is the spot average in inches per hour.
 - 7. Conduct test at two representative locations across each basin.
 - 8. The average of the average values at the three locations shall be between 6 and 10 in/hr and no spot average value shall be less than 4 in/hr or greater than 12 in/hr unless approved by Engineer.
 - 9. Upon completion of tests at each testing location, remove pipe and re-compact soil to eliminate perforations caused by the pipe.
- D. Side Slopes matching existing grades shall not exceed 3H:1V.

3.06 MULCH INSTALLATION

- A. Provide and place new mulch three inches (3") deep over the new Biofiltration Media in the system bottom.

3.07 GROUTED RIPRAP PAD PLACEMENT

- A. Place riprap material to lines and grades as shown on the Plans. Local surface irregularities of the slope protection shall not vary from the proposed finished grade by more than three inches measured at right angles to the slope.
- B. The surface of the rock to be concreted must be cleaned of adhering soil and then moistened. At any one location, place the concrete in a continuous operation during a work day. Deposit concrete by use of chutes, tubes, buckets, pneumatic equipment, or other mechanical methods. Do not allow the concrete to flow more than 2 feet across the rip rap pad.
- C. Immediately after depositing, spade and rod the concrete into place with suitable spades, trowels, or other suitable means. The minimum concrete penetration must exceed a minimum of 10 inches.
- D. After placing the concrete, thoroughly brush the rocks to expose the top surfaces. Outer rocks must project above the concrete by a height of 3" minimum to 4" maximum. After grouting the entire riprap pad, do not allow workmen or loads on the surface for at least 24 hours.
- E. Cure the grouted riprap pads by sprinkling a fine spray of water every 2 hours during the daytime for a period of 3 days.

3.08 PLANTING AND IRRIGATION

- A. Planting and irrigation shall be installed per Section 32 01 90 LANDSCAPING and Section 32 84 00 LANDSCAPE IRRIGATION SYSTEM of these Special Provisions.

3.09 PIPING AND MANHOLE INSTALLATION

- A. Drawing plans and details indicate general location and arrangement of manholes and underground storm drainage piping in the vicinity of biofiltration systems. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- B. Piping and manhole installation shall comply with SSPWC Section 306-7 PREFABRICATED GRAVITY PIPE and per Section 33 40 00 STORM SEWER UTILITIES of these Special Provisions.

3.10 REGRADING

- A. Raise or lower existing manholes and structures frames and covers in regraded areas to finish grade. Carefully remove, clean, and salvage cast iron frames and covers. Adjust the elevation of the top of the manhole or structure as detailed on the drawings. Reset cast iron frame and cover, grouting below and around the frame. Install concrete collar around reset frame and cover as specified for new construction.
- B. Side Slopes shall not exceed 3H:1V.

3.11 CONNECTIONS TO EXISTING DISTRICT-OWNED MANHOLES AND CATCH BASINS

- A. Make pipe connections and alterations to existing manholes and catch basins so that finished work will conform as nearly as practicable to the applicable requirements specified for new manholes and catch basins, including concrete and masonry work, cutting, and shaping.

3.12 CONNECTIONS

- A. Drawing plans and details indicate general location and arrangement of connections in the vicinity of biofiltration basins. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- B. Connections shall comply with the requirements defined in Section 33 40 00 of these Special Provisions.

3.13 FLOOD TESTING

- A. Flood Testing shall be conducted at the conclusion of the 90-day plant grow-in period using the following procedure.
 1. Underdrains shall be plugged at the outlet structure to minimize water consumption during testing.
 2. Prior to testing, broom sweep gutter and other impervious surfaces within the test area to remove sediments and other objectionable materials.
 3. The Engineer/Landscape Architect shall be present during the demonstration. The Contractor shall notify the Engineer/Landscape Architect a minimum of 2 working days prior to testing.
 4. The Contractor shall water test each biofiltration system facility to demonstrate that all inlet curb openings are capturing and diverting all water in the gutter to the facility, outlet structures are engaging at the elevation specified, and the designed ponding depth is achieved. Testing shall include application of water from a hydrant or water truck, at a minimum rate of 10 gallons per minute, into the gutter a minimum of 15 feet upstream of the inlet curb opening being tested. Each inlet shall be tested individually. If erosion occurs during testing, restore soils, plants, and other affected materials.
 5. Engineer/Landscape Architect will identify deficiencies and required corrections, including but not limited to relocating misplaced plants, adjusting streambed gravel, adjusting mulch, adjusting inlets, splash aprons, and forebays, removing and replacing inlets, and removing debris.
 6. Once adjustments are made, the Contractor shall re-test to confirm all test water flows into the facility from the gutter and correct any remaining deficiencies identified by Engineer/Landscape Architect.
 7. Inlets, outlets, and other bioretention facility appurtenances shall not be accepted until testing and any required correction and retesting is complete and accepted by the Engineer/Landscape Architect.
- B. CLEANING
 1. Vacuum any sediment or debris from the biofiltration systems and storm drain system. Sediments and debris shall not be washed out with water.

SECTION 41 34 23

PAINT SPRAY BOOTHS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Spray-Systems [Downdraft] [Cross draft] Spray Booth.
- B. Accessories required to provide a functional and operational spray booth.

1.02 SUBMITTALS

- A. Product Data: Provide unit capacities, physical dimensions, utility requirements and locations, point loads.
- B. Shop Drawings: Show layout and configuration of complete paint booth and suspended maintenance system, including all components and accessories.
 - 1. Clearly indicate design and fabrication details, hardware, rough-in and anchor placement dimensions, tolerances, clearances required and installation details.
- C. Operation Data: Include description of system operation, adjusting and testing required.
- D. Maintenance Data: Identify system maintenance requirements, servicing cycles, lubrication types required and local spare part sources.
- E. Test Reports: Indicate that when products are used in this paint booth, current SCAQMD standards shall not be exceeded.
- F. Warranty: Submit manufacturer warranty and ensure that forms have been completed in College's name and registered with manufacturer.
- G. Maintenance Materials: Furnish the following for College's use in maintenance of project.
 - 1. See Section 01 60 00 - Product Requirements, for additional provisions.
 - 2. Spare Parts: Manufacturer shall certify that he stocks most spare parts for this system with-in 100 miles of the college campus and shall be able to deliver them with-in two working days.

1.03 QUALITY ASSURANCE

- A. Paint Booth be allow for the expected use of the booth to comply with South Coast Air Quality Management District requirements.
- B. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with not less than ten years of documented experience.
- C. Fabricator Qualifications: Either the manufacturer or certified by the manufacturer.

1.04 REGULATORY REQUIREMENTS

- A. Conform to applicable code for operating unit.
- B. Provide certificate of compliance from authority having jurisdiction indicating approval of unit.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Deliver components to project site in original packaging.
- B. Store components under cover and elevated above grade.

1.06 WARRANTY

- A. Correct defective Work within a five year period after Date of Substantial Completion.
- B. Provide five year manufacturer warranty for paint booth, (except for filters).

PART 2 PRODUCTS

2.01 PAINT SPRAY BOOTHS SYSTEM

- A. Basis of Design Manufacturer: Determined by project requirements, www.spraysystems.com., or equal.

2.02 COMPONENTS

- A. Booth Size: *(The following is an example only; each project must determine the specific requirements for the individual project)*
 - 1. Inside dimensions: 26 feet 0 inches long by 14 feet 0 inches wide by 9 feet 0 inches high.
 - 2. Outside dimensions: 26 feet 4 inches long by 14 feet 11 inches wide by 10 feet inches high.
- B. Doors: *(The following is an example only; each project must determine the specific requirements for the individual project)*
 - 1. Product Doors:
 - a. One Set of Single Leaf Solid Doors
 - b. Net opening: 8 feet 9 1/2 inches high x 9 feet 2 1/4 inches wide.
 - c. Structural tube frame.
 - d. Continuously welded.
 - e. Leak proof wiper type seals at the base.
 - f. Heavy duty safety latches.
 - 2. Side Access Door
 - a. 2 access door measuring 36 inches x 84 inches with 2 observation window 18 inches x 36 inches, 1/4 inches clear tempered glass
 - b. 2 Observation window 18 inches x 36 inches, 1/4 inches clear tempered glass
 - c. Door safety latch

- C. Lighting *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. 10 Vapor Tight, Class I, Div. II, Inside Access, High Efficiency, 48 inches, 4-Tube, Universal Ballast.
 2. Industrial rated - White Coated Enamel.
 3. UL Approved.
 4. Electronic ballast for energy efficient T-8 tubes.
 5. Universal Sockets.
 6. Rear hinged access panel for easy maintenance.
 7. Set in framed opening with 3/16 inches clear tempered glass, Glass to comply with Section 08 80 00 Glazing.
- D. Exhaust Fan and Motor: *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. One 42 inches Diameter Spray Systems, High Efficiency, Tubeaxial Exhaust Fan.
 2. Non Sparking blade, enclosed belts and bearings.
 3. Rated for 18,200 CFM @.5 inches S.P.
 4. 50 FPM average face velocity through the booth (Empty).
 5. 3 HP, 208-230/460V - 60 Hz - 3 Phase.
- E. Exhaust Filters: *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. 18 American Air Filters, AG28.
 2. 20 inches x 25 inches with holding hardware.
 3. UL Approved
- F. Intake Filters: *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. 16 Viledon, PA560G.
 2. 20 inches x 50 inches with holding hardware.
 3. 95% efficiency rating.
 4. Supply air plenum located on top of booth.
- G. Draft Gauge *(The following is an example only, each project must determine the specific requirements for the individual project)*
1. 2 Dwyer Mark II manometers to indicate replacement of filters.
- H. Undergrate Exhaust Rack: *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. Durable 18 gauge, G90 filter frames and holdings angles.
- I. Inground Grating *(The following is an example only, each project must determine the specific requirements for the individual project)*
1. Welded steel grates, 36 inches x 48 inches.

2. Safe concentrated mid Span load of 900 lbs.
- J. Exhaust Duct Package: *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. Duct package IS NOT included in base price
 2. Meets all Uniform Fire Code Requirements
 3. 42 inches Exhaust Duct Package to includes:
 - a. One lot of Spiral Straight Duct 34 inches diameter.
 - b. One insulated sleeve 34 inches diameter x 4 feet long.
 - c. One Roof jack (flat).
 - d. One Storm collar.
 - e. One Clean out door 12 inches x 16 inches.
 - f. One 34 inches Diameter weather canopy.
 - g. One Motor Cover.
 - h. One Floor Transition.
- K. Make Up Air VRV Vertical unit. *(The following is an example only; each project must determine the specific requirements for the individual project)*
1. Hot Water Coil: 180 DegreeF EWT, 0% Glycol.
 2. 100% Replacement Air.
 3. 20,000 SCFM / 0.5 Duct SP.
 4. Electric Current: 460/60/3, 3-Wire Service.
 5. Outdoor Safety Switch (Disconnect) and Motor Starter.
 6. Unit Location: Outdoor Installation.
 7. 15 HP Motor - Open Drip Proof - High Efficiency EPACKT.
 8. 1,302 BTUH (in 1000's) / 60 Temperature Rise (deg F).
 9. Temperature Control System:
 - a. Discharge Control (J.C. FX14 DDC & Modulating Valve).
 10. External Discharge Damper with 2 Position Motor and Interlock.
 11. V-bank with Two inch Cleanable Filters.
 12. Vertical Mounting Stand.
 13. G90 Galvanized casing.
 14. Remote Control Panel:
 - a. Supply/ Exhaust Motor Circuits Sub-Fused.
 - b. Two Speed Operation via Supply VFD.
 - c. Supply VFD in Unit Vestibule W/Vent Pkg.
 - d. Serpentine Element Coil Freeze thermostat.
 - e. Exhaust VFD - 1 Exhaust Motor @ 5 HP ea.
 - f. Ex. VFD in Unit Vestibule (Single Point Feed).

- g. Exhaust Fan / Motor by Division 23.
- h. Lighting Contactor in Unit Vestibule.
- i. Separate Light Power - Disconnect/Fuses by Division 26.
- j. Unit Disconnect & Fast-acting Fuses for VFD.
- k. ETL Label.

15. Include Supply Duct: From Discharge of AMU to Booth Supply Plenum.

2.03 FABRICATION

- A. 18 gauge G90 galvanized steel.
- B. CNC pre-punched holes on 6 inches centers.
- C. 12 gauge base angle.
- D. Fasteners: Nuts and bolts.

2.04 MISCELLANEOUS

- A. All necessary hardware and caulking is included
- B. Exploded view CAD assembly drawing
- C. Booth components labeled and identified with a computer-generated label to correspond to the exploded CAD view assembly drawing for easy installation.

PART 3 EXECUTION

3.01 INSTALLERS

- A. Coordinate installation with work of other installers.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions and UL requirements.
- B. Install equipment in accordance with approved shop drawings.

3.03 ADJUSTING

- A. Adjust and leave equipment in proper working order.
- B. Complete Initial Inspection - Certification for Use form included in Equipment Manual and Inspection Log Book.
